An Introduction to Cybersecurity Information Sharing

MISP - Threat Sharing

Team CIRCL

MISP Project
https://www.misp-project.org/

MISP Training @ Luxembourg December Edition 2019
20191203
(10:00 - 10:30) Introduction to Information Sharing with MISP

(10:30 - 12:30) User perspective - diving into MISP functionalities and integration

(12:30 - 13:30) Lunch Break

(13:30 - 15:00) Admin perspective - Synchronisation and figuring out the health of your MISP instance.

(15:00 - 15:15) Small break

(15:15 - 17:00) Building your sharing community and Wrapping up
During a malware analysis workgroup in 2012, we discovered that we worked on the analysis of the same malware.

We wanted to share information in an easy and automated way to avoid duplication of work.

Christophe Vandeplas (then working at the CERT for the Belgian MoD) showed us his work on a platform that later became MISP.

A first version of the MISP Platform was used by the MALWG and the increasing feedback of users helped us to build an improved platform.

MISP is now a community-driven development.
The Computer Incident Response Center Luxembourg (CIRCL) is a government-driven initiative designed to provide a systematic response facility to computer security threats and incidents. CIRCL is the CERT for the private sector, communes and non-governmental entities in Luxembourg and is operated by securymadein.lu g.i.e.
MISP and CIRCL

- CIRCL is mandated by the Ministry of Economy and acting as the Luxembourg National CERT for private sector.
- CIRCL leads the development of the Open Source MISP threat intelligence platform which is used by many military or intelligence communities, private companies, financial sector, National CERTs and LEAs globally.
- CIRCL runs multiple large MISP communities performing active daily threat-intelligence sharing.

Co-financed by the European Union
Connecting Europe Facility
There are many different types of users of an information sharing platform like MISP:

- **Malware reversers** willing to share indicators of analysis with respective colleagues.
- **Security analysts** searching, validating and using indicators in operational security.
- **Intelligence analysts** gathering information about specific adversary groups.
- **Law-enforcement** relying on indicators to support or bootstrap their DFIR cases.
- **Risk analysis teams** willing to know about the new threats, likelihood and occurrences.
- **Fraud analysts** willing to share financial indicators to detect financial frauds.
Many objectives from different user-groups

- Sharing indicators for a **detection** matter.
  - ’Do I have infected systems in my infrastructure or the ones I operate?’

- Sharing indicators to **block**.
  - ’I use these attributes to block, sinkhole or divert traffic.’

- Sharing indicators to **perform intelligence**.
  - ’Gathering information about campaigns and attacks. Are they related? Who is targeting me? Who are the adversaries?’

→ These objectives can be conflicting (e.g. False-positives have different impacts)
Sharing difficulties are not really technical issues but often it’s a matter of social interactions (e.g. trust).

Legal restriction¹
- "Our legal framework doesn’t allow us to share information."
- "Risk of information-leak is too high and it’s too risky for our organization or partners."

Practical restriction
- "We don’t have information to share."
- "We don’t have time to process or contribute indicators."
- "Our model of classification doesn’t fit your model."
- "Tools for sharing information are tied to a specific format, we use a different one."

MISP Project Overview

Open Source Software
- MISP core
- misp-modules
- PyMISP
- misp-dashboard

Intelligence & Knowledge Base
- misp-taxonomies
- misp-galaxy
- misp-noticelist
- misp-warninglists

Open Standards
- MISP exchange core format
- MISP objects template

Intelligence & Sharing Community
- MISP OSINT feeds
- compliance documents such as GDPR, ISO 27010:2015
- threat intelligence best practices & training materials
- ISAC/ISAO best practises
MISP\(^2\) is a threat information sharing free & open source software.

MISP has a **host of functionalities** that assist users in creating, collaborating & sharing threat information - e.g. flexible sharing groups, **automatic correlation**, free-text import helper, event distribution & proposals.

Many export formats which support IDSes / IPSes (e.g. Suricata, Bro, Snort), SIEMs (eg CEF), Host scanners (e.g. OpenIOC, STIX, CSV, yara), analysis tools (e.g. Maltego), DNS policies (e.g. RPZ).

A rich set of MISP modules\(^3\) to add expansion, import and export functionalities.

\(^2\)https://github.com/MISP/MISP
\(^3\)https://www.github.com/MISP/misp-modules
To corroborate a finding (e.g. is this the same campaign?), reinforce an analysis (e.g. do other analysts have the same hypothesis?), confirm a specific aspect (e.g. are the sinkhole IP addresses used for one campaign?) or just find if this threat is new or unknown in your community.
Communities using MISP

- Communities are groups of users sharing within a set of common objectives/values.
- CIRCL operates multiple MISP instances with a significant user base (more than 950 organizations with more than 2400 users).
- **Trusted groups** running MISP communities in island mode (air gapped system) or partially connected mode.
- **Financial sector** (banks, ISACs, payment processing organizations) use MISP as a sharing mechanism.
- **Military and international organizations** (NATO, military CSIRTs, n/g CERTs, ...).
- **Security vendors** running their own communities (e.g. Fidelis) or interfacing with MISP communities (e.g. OTX).
MISP core distributed sharing functionality

- MISPs’ core functionality is sharing where everyone can be a consumer and/or a contributor/producer."
- Quick benefit without the obligation to contribute.
- Low barrier access to get acquainted to the system.
MISP events are encapsulations for contextually linked information.

MISP attributes initially started with a standard set of "cyber security" indicators.

MISP attributes are purely based on usage (what people and organizations use daily).

Evolution of MISP attributes is based on practical usage & users (e.g. the addition of financial indicators in 2.4).

MISP objects are attribute compositions describing points of data using many facets, constructed along the lines of community and user defined templates.

Galaxies granularly contextualise, classify & categorise data based on threat actors, preventive measures, tools used by adversaries.

attributes can be anything that helps describe the intent of the event package from indicators, vulnerabilities or any relevant information.
Indicators

Indicators contain a pattern that can be used to detect suspicious or malicious cyber activity.

Attributes in MISP can be network indicators (e.g. IP address), system indicators (e.g. a string in memory) or even bank account details.

- A type (e.g. MD5, url) is how an attribute is described.
- An attribute is always in a category (e.g. Payload delivery) which puts it in a context.
  - A category is what describes an attribute.
- An IDS flag on an attribute allows to determine if an attribute can be automatically used for detection.

\(^5\)IoC (Indicator of Compromise) is a subset of indicators
MISP integrates at event or attribute level MITRE’s Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK).
SUPPORTING SPECIFIC DATAMODEL
Contributors can use the UI, API or using the freetext import to add events and attributes.

- Modules existing in Viper (a binary framework for malware reverser) to populate and use MISP from the vty or via your IDA.

Contribution can be direct by creating an event but users can propose attributes updates to the event owner.

Users should not be forced to use a single interface to contribute.
Example: Freetext import in MISP

This is a sample text to show how indicators can be extracted. Just paste your text including indicators such as 23.100.122.176, host.microsoft.com, or b447c27a0be3a348881ba0030177000cd in here and the tool will automatically detect the indicators and save them as attributes - after allowing you to make some last minute changes. For more information, visit https://www.github.com/MISP/MISP.
**Supporting Classification**

- Tagging is a simple way to attach a classification to an event or an attribute.
- **Classification must be globally used to be efficient.**
- MISP includes a flexible tagging scheme where users can select from more than 42 existing taxonomies or create their own taxonomy.

</table>
Delegate events publication to another organization (introduced in MISP 2.4.18).

▶ The other organization can take over the ownership of an event and provide pseudo-anonymity to initial organization.

Sharing groups allow custom sharing (introduced in MISP 2.4) per event or even at attribute level.

▶ Sharing communities can be used locally or even cross MISP instances.

▶ Sharing groups can be done at event level or attributes level (e.g. financial indicators shared to a financial sharing groups and cyber security indicators to CSIRT community).
Sightings support

- Sightings allow users to notify the community about the activities related to an indicator.
- In recent MISP versions, the sighting system supports negative sightings (FP) and expiration sightings.
- Sightings can be performed via the API, and the UI, even including the import of STIX sighting documents.
- Many use-cases for scoring indicators based on users sighting.
False-positives are a recurring challenge in information sharing.

In MISP 2.4.39, we introduced the misp-warninglists to help analysts in their day-to-day job.

Predefined lists of well-known indicators which are often false-positives like RFC1918 networks, public DNS resolver are included by default.

---

6[https://github.com/MISP/misp-warninglists](https://github.com/MISP/misp-warninglists)
Even in a single organization, multiple use-cases of MISP can appear (groups using it for dynamic malware analysis correlations, dispatching notification).

In MISP 2.4.51, we introduced the ability to have local MISP servers connectivity to avoid changes in distribution level. This allows to have mixed synchronization setup within and outside an organization.

Feed support was also introduced to support synchronization between untrusted and trusted networks.
We maintain the default CIRCL OSINT feeds (TLP:WHITE selected from our communities) in MISP to allow users to ease their bootstrapping.

The format of the OSINT feed is based on standard MISP JSON output pulled from a remote TLS/HTTP server.

Additional content providers can provide their own MISP feeds. (https://botvrij.eu/)

Allows users to test their MISP installations and synchronisation with a real dataset.

Opening contribution to other threat intel feeds but also allowing the analysis of overlapping data⁷.

---

⁷A recurring challenge in information sharing
Information sharing practices come from usage and by example (e.g. learning by imitation from the shared information).

MISP is just a tool. What matters is your sharing practices. The tool should be as transparent as possible to support you.

Enable users to customize MISP to meet their community’s use-cases.

MISP project combines open source software, open standards, best practices and communities to make information sharing a reality.
A researcher—Borce STOJKOVSKI—from University of Luxembourg (SnT) is conducting a survey about MISP UX.

- You may participate at the following location: https://misp-project.org/ux-survey
- on-voluntary basis: opt-out at any time,
- results will be communicated back to the community and used to improve MISP’s User Interface,
- for any inquiries contact ux@misp-project.org
